ABSTRACT

This is one form of three performance checks booklets (A, B, and C) for Level II of the Intermediate Science Curriculum Study (ISCS). The three booklets are considered one of four major subdivisions of a set of individualized evaluation materials for Level II of the ISCS. This booklet (form B), developed to assess the students' achievement of the cbjectives of Level II, contains a set of performance checks equivalent to the performance checks of the other two forms (A and C). Each performance check has its own code number which indicates the unit number and identifies whether it is based on core material or excursions. Directions for students' use of performance checks are also included. (HM)

#### FOREWORD

To implement an educational approach successfully, one must match the philosophy of evaluation with that of instruction. This is particularly true when individualization is the key element in the educational approach. Yet, as important as it is to achieve this match, the task is by no means simple for the teacher. In fact, without specific resource materials to help him, he is apt to find the task overwhelming. For this reason, ISCS has developed a set of individualized evaluation materials as part of its Individualized Teacher Preparation (ITP) program. These materials are designed to assist teachers in their transition to individualized instruction and to help them tailor their assessment of students' progress to the needs of all their students.

The two modules concerned with evaluation, *Individualizing Objective Testing* and *Evaluating and Reporting Progress*, can be used by small groups of teachers in inservice settings or by individual teachers in a local school environment. Hopefully, they will do more than give each teacher an overview of individualized evaluation. These ITP modules suggest key strategies for achieving both subjective and objective evaluation of each student's progress. And to make it easier for teachers to put such strategies into practice, ISCS has produced the associated booklets entitled *Performance Objectives, Performance Assessment Resources*, and *Performance Checks*. Using these materials, the teacher can objectively assess the student's mastery of the processes, skills, and subject matter of the ISCS program. And the teacher can obtain, at the moment when they are needed, specific suggestions for remedying the student's identified deficiencies.

If you are an ISCS teacher, selective use of these materials will guide you in developing an individualized evaluation program best suited to your own settings and thus further enhance the individualized character of your ISCS program.

## NOTES TO THE STUDENT

Now that you have completed several chapters, excursions, and self-evaluations, you are ready to help your teacher determine how well you are doing. The performance checks in this book will provide your teacher with this information. Then your teacher can help you with things you may not understand and can keep a record of your progress.

Read the next section carefully. It explains some important things about the performance checks in this book, and it gives you specific suggestions for using them.

#### What YouNeed To Know about Performance Checks

1. You do performance checks when you are ready. Performance checks are somewhat like the questions in the selfevaluations – you do them when you are ready, not when the whole class is ready.

2. Your teacher or both of you decide how many you do. Your teacher or you and your teacher together will decide which ones you should do. You are not expected to do all of the performance checks.

3. There are three forms for each performance check. Every performance check is written in three forms – A, B, and C. (The title of this booklet tells you whether it is Form A, B, or C.) Usually the answers for each form are different. When you do a check, you will use only one form. The A, B, and C forms are always in different booklets. Within each booklet all the performance objectives for the same unit are listed together. A unit contains two or three chapters and their related excursions. These units are in numerical order. Each unit has performance checks based on core material and performance checks based on excursions.

4. Each performance check has its own number. The number is in the outside margin of the page and will look like this: 03-Core-17A or 05 Exc 17-2-2A. These numbers mean

| • | <u>03</u> | -  | <u>Core</u> -         | <u>17</u> <u>A</u>                | : | and | <u>05</u> - | Exc                         | <u>17-2</u> -    | <u>2</u>     | <u>A</u>          |  |
|---|-----------|----|-----------------------|-----------------------------------|---|-----|-------------|-----------------------------|------------------|--------------|-------------------|--|
| - | unit      | Ъ. | based on core materia | form of the check<br>check number | • | •   | unit        | based on excursion material | excursion number | check number | form of the check |  |

AM I

**READY?** 

5. Each performance check is separated from the other. There is a fine before each performance check and one after it. Some performance checks have several parts, so do everything called for between the lines. If there is no line at the bottom of a page, the check is continued onto the next page. 6. Sometimes you will need to use equipment. If special materials are needed, they will be in boxes labeled with the same number and sometimes the same letter too as the performance check for which you need them.

7. Some performance checks have two or more answers. If more than one answer is correct, you must select all the correct choices. In such cases selecting just one answer is not enough.

8. Some performance checks have no answers. Occasionally, you may be asked to do something that is impossible and to explain your answer. If so, say that the task is impossible and explain why.

9. You share books of performance checks and YOU DO NOT WRITE IN THEM. Write your answers on other paper. Give the number and form of the performance check for each answer you write. If you are to draw a graph, your teacher may provide you with grid paper.

10. Your teacher or his assistant will collect and mark your checks. And sometimes you must ask him to watch or assist you as you do a check.

11. Sometimes a review procedure will be suggested. If you can't do a performance check, you may be asked to review a part of the text or a self-evaluation question. You may then be checked on the same material, so be sure you understand the material you-review. Get help if you need it.

An Antarctic exploration team sent back only the information given in the table below about samples X and Y. Nothing else is known about them. 01-Core-1B

01-Core-38

01-Core-4B

01-Core-58

- 1. Can you be certain that substances X and Y are different substances?
- 2. Explain your answer.

| •       | SAMPLE X | SAMPLE Y |
|---------|----------|----------|
| Volume  | 23 cc    | 27.6 cc  |
| Color   | blue     | blue     |
| Mass    | 20 g     | 24 g     |
| Texture | rough    | smooth   |

What are two actions you would take if you spill an unknown or a dangerous chemical on yourself or someone else? 01-Core-2B

Get any materials you need in addition to those in box 01-Core-3 to complete this item. Place  $\frac{1}{4}$  of a teaspoon of powder from the bag into a beaker. Add about 5 drops of the acid in bottle D to the powder. Record the observations that you make.

Get a piece of rock and a piece of shell from the supply area and enough of the powder from bottle 01-Core-4B to cover the bottom of a test tube. You may use any or all of the following: a balance, a bottle of hydrochloric acid (HCl), a magnifying glass, safety glasses, and a graduated cylinder.

- 1. Is the powder more like rock or shell?
- 2. Explain your answer.

Get two baby-food jars. Label one X and the other Y. At the supply area are two bags, one labeled 01-Core-5X and the other labeled 01-Core-5Y. Now get a small sample of powder from each of the two bags. Also get a dropper bottle of hydrochloric acid (LICI). If your room has an acid area, do your test there.

- I, Which sample is rock powder?
- 2. Which sample is shell powder?

3. How did the observations you made allow you to identify which powder more from rock and which powder came from shell?

came from rock and which powder came from shell?

Jean crushed a solid object that she found on the bottom of a stream. Which of its 01-Core-6B properties will probably change the least?

- a. Its roughness
- b. Its size
- c. Its reaction with HCl
- d. Its shape

| 01-Core-7B   | Suppose you were to shrink in size so that you were able to walk inside a pie iron.  |

01-Exc 2-3-1B

Suppose that it's the year 2050, and you have just landed on the planet Xeno in a distant galaxy. Somehow you feel that your weight is much different than it was on earth. Your weight on the planet Xeno is determined by three factors. Name two of them.

- à.' Mass
- b. Weight -
- c. Volume
- d. Color

Select the letter of the choice below which lists the important factors that determine 01-Exc 2-3-3B your weight on earth.

a. Your mass and distance from the center of the earth, and the earth's mass

b. Your mass and distance from the center of the earth, and the earth's

volume

c. Your mass and volume, and the earth's mass

d. None of these

Get jars D and C from box 02-Core-1 at the supply area. What is the state of the -02-Core-1B matter, if any, in each of the jars? Jean and Sandy decided to do exactly the same experiment separately. Later each 02-Core-2B described her experiment. Both said they were doing the same things, but their results and conclusions were very different. Jean and Sandy argued that at least one of them must have done something that was different from what she thought she had done. 1. Is it possible that both girls had done exactly the same experiment? •• \*\* 🔍 2. Explain your answer. 🍢 Kevin mixed nitric acid and shell. A gas was given of f. He tested the gas with a burning match, which went out. Mr. Thorn asked him if the gas was nitrogen. Kevin 02-Core-3B said, "It might be, but I don't know for sure." 1. Was Kevin right in saying that he could not tell what the gas was even though he had tested it with a burning match? 2. Explain your answer. Operational definition I: Hydrogen is a gas which explodes or pops in a flame, 02-Core-4B doesn't affect limewater, and doesn't affect phenol red. Operational definition II: Hydrogen is a gas which is colorless, odorless, and taste less. •Operational definition II says hydrogen can be detected or identified by observing the properties of the gas itself. It takes less work than the first operational definition. 1. Is operational definition II as useful as operational definition I? \*2. Explain your answer. Bill observed the behavior of the gases hereon and thereon. His data are shown in 02-Core-5B the table below. GAS · / TEST Thereon Hereon -turns yellow turns yellow Reaction with a certain solution. goes out explodes Reaction with a lighted match turns it green turns it green Reaction with phenol red no odor no odor Effects on the nose Bill then wrote the following operational definition for hereon. Hereon (1) turns a certain solution yellow, (2) turns phenol red to green, and (3) has no odor. 1. Is this a good operational definition for hereon? 2. Explain your answer.

Copy the list of words below onto your answer sheet. Place a G after the things which are gases. Place an M after those things which are matter. You may place both a G and an M after a word.

1. Oxygen

- 2. Air
- 3. Sand
- 4. Steam
- 5. Carbon dioxide

Bill studied the reactions below.

- A: dark green solution  $+ zinc \rightarrow white solid (A) + colorless liquid$
- B: yellow-green solution + zinc  $\rightarrow$  orange solid (B) + colorless liquid
- C: greenish-blue solution + zinc  $\rightarrow$  orange solid (C) + colorless liquid
- D: green solution + zinc  $\rightarrow$  orange solid (D) + colorless liquid

He then tested the orange solids and collected the data below.

| ORANGE<br>SOLIDS | E   | REACTION<br>WITH ACID | BURNED   | DISSOLVED<br>IN WATER |
|------------------|-----|-----------------------|----------|-----------------------|
| B                | · \ | pink gas              | slowly   | all                   |
| C                |     | pink gas              | slowly   | all                   |
| D                | •   | colorless gas         | explodes | some                  |

Which of the colored solutions in the reactions above probably contain similar matter particles?

Select any of the procedures below in which a control is used.

a. Jake wanted to know if rats grew faster if they were fed meat and cereal or just cereals. He divided his rats into three groups. He fed group 1 just cereal. He fed groups 2 and 3 cereal and different amounts of meat.
b. Rob heated solid, blue copper sulfate. It turned white, and something that looked like water came out of the test tube. Rob wondered if it was water. He didn't have any water, but he had a colorless salt solution handy. He added half the salt solution to the white crystals, and they turned blue.
c. Gina wanted to see if a new plant food worked. She added the plant food to a tray of pepper plants. The plants grew very well.

d. Joan wanted to know if sugar candy cauled cavities. She checked the teeth of a person who ate a lot of candy and one who ate some candy.

03-Core-15B

03-Core-14B

| 03∔Core-17B | Select any of the choices below which will complete the sentence. Dan brought<br>sample of purple substance to school. It is possible that the substance contain<br>kind(s) of atoms.   |
|-------------|---|
| · · · · · . | a, 6<br>b. 2  |
| •           | - c. ,1   |
| 1           | d. a or c<br>e. a, b, or c<br>}   |
| 03-Core-18B | Bonnie brought her brothers Clyde and Skeeter an unknown rock and asked the what kind of things were in it. Skeeter said, "There's more than a million differe substances and so there are millions of different elements. It's impossible to the   |
| • : •       | what's in that rock." Clyde said that it was possible to find out what elements the rock contained.   |
| °           | <ol> <li>Do you agree with Skeeter or Clyde?</li> <li>Explain why he is correct.</li> </ol>   |
| 03-Core-19B | You and lggy have developed a particle model. The model claims that only a smanumber of different kinds of atoms are needed to make all known substances. Ho can this be true?  |
| 03-Core-20B | Kate dissolved salt in water, sugar in coffee, and instant tea in water. What are the mixtures Kate formed called?  |
| 03-Core-21B | When ammonium chloride is added to water and the two are stirred, the solid disa pears. What happens to the solid?  |
| 03 Core-22B | When 11 grams of solid, purple iodine crystals are dissolved in 50 grams of alcoho<br>the purple solid disappears and the alcohol turns purplish. The solution weighs 6<br>grams.   |
| •           | 1. The number of atoms present in the iodine and alcohol before dissolvir<br>is (equal to, greater than, or less than) the number of atoms present in the<br>61 grams of solution. Choose the phrase in parenthesis which completes the<br>sentence correctly.  |
|             | 2. Explain your answer.   |
| 03-Core-23B | Sandy has a beaker of a solution. She tests a 30 ml sample of it and finds that it contains a dissolved gas. She says she cannot be sure if the rest of the liquid contain the dissolved gas because she has tested only a sample.<br>1. Could other samples of the liquid differ?<br>2. Explain your answer. |
| 03-Core-24B | Cover the bottom of a test tube with solid, white lead nitrate and sodium chlorid<br>Have your teacher check the amount of the solid you have in the test tube. Use a<br>alcohol burner and any other materials you need, and heat the substance for tw<br>minutes. List your observations.                   |
| ·           |   |

| Carol mixed two colorless solutions and produced a canary yellow solid in a colorless solution. What happened to the atoms of the reactants to make the products so different from the reactants?   | 03-Core-25B |
|---|-------------|
| Art was experimenting with two elements, onium and offium. He knew that onium<br>reacted with many other elements, but offium was unknown to him. He heated the<br>elements together and no reaction took place. Art concluded that offium wouldn't<br>react with any element because it did not react with onium.<br>1. Do you agree with Art's conclusion?  | 03-Core-26B |
| 2. Explain your answer.   | · ·         |
| Sharon prepared the following reaction.<br>hydrochloric acid + calcium carbonate (shell) →<br>calcium chloride + carbon dioxide + water   | 03-Core-27B |
| If there were 888 atoms of calcium used as reactants, how/many atoms of calcium   | • • •       |
| <ul> <li>are present in the products?'</li> <li>a. Impossible to tell</li> <li>b. Exactly 888</li> </ul>  |             |
| c. Probably 888 minus a few<br>d. Probably 888 plus a few<br>e. Either c or d   | • • •       |
| A silver nitrate solution reacts with a sodium bromide solution and forms a yellow solid called <i>silver bromide</i> . Amy mixes a solution of silver nitrate with a solution of   | 03-Core-28B |
| sodium bromide. A yellow solid forms and settles to the bottom. Tell how Amy can find out if all the bromide particles are used up.   | i •         |
| find out if all the bromide particles are used up.<br>Dave did the following reaction.<br>iron,+ copper chloride $\rightarrow$ 9.1 g iron chloride + 6.4 g copper<br>(15.5 g total products)  | 03-Ćore-29B |
| find out if all the bromide particles are used up.<br>Dave did the following reaction.<br>iron,+ copper chloride → 9.1 g iron chloride + 6.4 g qopper   | 03-Ćore-29B |
| find out if all the bromide particles are used up.          Dave did the following reaction.         iron.+ copper chloride → 9.1 g iron chloride + 6.4 g copper         (15.5 g total products)         1. Select the phrase which makes the following statement true. The mass of the reactant was (greater than, equal to, less than) 15.5 g.         2. Since you weren't there when Dave did the reaction, on what basis could | 03-Ćore-29B |
| find out if all the bromide particles are used up.          Dave did the following reaction.         iron.+ copper chloride → 9.1 g iron chloride + 6.4 g copper         (15.5 g total products)         1. Select the phrase which makes the following statement true. The mass of the reactant was (greater than, equal to, less than) 15.5 g.         2. Since you weren't there when Dave did the reaction, on what basis could | 03-Ćore-29B |

Steve had a bottle of an iodide solution. He put 40 ml of it into a graduated cylinder and 10 ml of it into a test tube. There are 30 iodide atoms in the 10 ml of solution in the test tube. How many iodide atoms are there in the graduated cylinder?

a. 30

- b. 15
- c. About 7

d: 120

e. There is no way to tell.

Karl found during tests that 16 particles of sodium reacts with 8 particles of oxygen, producing 16 particles of sodium oxide.

1. If Karl is given 12 particles of sodium, can he predict the number of particles of oxygen needed to use up all the particles?

- . 2. Can he predict how many sodium oxide particles will be produced?
- 3. Explain your answers.

Sam has two solutions. One contains silver particles, and the other contains chloride particles. Suppose each ml of the chloride solution contains 4 chloride particles, and each ml of the silver solution contains 4 silver particles. He mixes 5 ml of the solution containing silver particles with 5 ml of the solution containing chloride particles. Select any of the combinations below which would cause you to predict that silver particles would be left over.

Each pin and button combination shown above represents a different compound. In that case, what do the symbols shown in the box represent?

1. Do you agree with Luke's reason for not looking at the other model? 2 Explain your answer.

Suppose Dr. Lenz made a microscope through which he could see all the atoms in a piece of matter. In a certain piece of material all the atoms were just alike. What sort of a material was it?

Select the best statement below about the models that scientists use.

a. It is not known if the models used by scientists are correct, but they are used because they help to predict and explain observations.

b. The models that scientists use are correct because they come from nature.

c. Models used by scientists state what actually happens in nature and therefore are correct.

d. A model used by scientists can predict new experiments. If one of the  $\neq$  experiments does not work, the model is thrown out.

Pretend that a particle model for gravity is accepted by scientists. This would mean **04-Core-14B** that a. thinking about gravity as though it is made up of tiny particles has ex-

plained most of the observations made to date."

b. at least the best scientists have seen gravity particles.

c. scientists have direct proof that gravity exists as particles.

d gravity is exactly like matter particles.

e. no other model can explain the observations made to date.

| 04-Core-15B                             | Chapters 7 and 8 in your textbook asked whether atoms combine with each other in definite numbers. First, you worked with lead and iodine, and you answered the question yes. You then answered the same question, using copper sulfate ( $CuSO_4$ ) and zinc (Zn). Why wasn't it enough to answer the question once?   |

Ask your teacher to have someone observe you for this performance check. Get 04-Core-20B bottle 04-Core-20 and weigh out 4 grams of the white solid it contains. You may use any equipment you need.

In box 04-Core-21 you will find eight solutions labeled A through H. Get five test 04-Core-21B tubes and any equipment you need. Mix the solutions as shown in the table below. For each numbered mixture,

(a) tell whether or not a reaction takes place and

(b) if there is a reaction, state the evidence for it.

|   | MIXTURE | ½ DROPPER + | ½ DROPPER |
|---|---------|-------------|-----------|
| Ī | 1       | В           | C .       |
|   | 2       | Α           | F         |
|   | 3       | Ĥ           | G         |
|   | 4       | E           | · C       |
| } | 5       | D           | · · · E   |

For each situation below:

(a) state whether a reaction has occurred or not and

(b) if a reaction has occurred, state the evidence of the reaction.

Situation 1: When clear, blue solution A is mixed with colorless solution B, the beaker in which they are mixed grows hot. No gas is released, and the resulting solution is clear and blue.

Situation 2: Clear, blue solution A and colorless solution B are mixed in a beaker. A light yellow solid forms, no gas is released, the solution becomes light green, and the temperature of the beaker remains unchanged.

Situation 3: Solutions of two chemicals are clear and colorless. When the solutions are mixed, no gas is given off, and there is no temperature change. The resulting solution is clear and colorless.

Situation 4: Two colorless solutions are mixed. A colorless gas is given of f, the resulting solution is colorless, and no solid is formed.

Examine the table, below which shows the data collected in three trials.

| ĺ | TRIAL | MASS OF PINK<br>REACTANT | MASS OF ORANGE<br>REACTANT | MASS OF PRODUCT |
|---|-------|--------------------------|----------------------------|-----------------|
|   | 1     | 4 g                      | 80 g                       | 6 g             |
|   | . 2   | 4 g                      | 110 g                      | 6 <b>g</b>      |
|   | 3     | 4 g                      | 125 g                      | 6 g             |

Notice that in each trial the amount of the orange reactant changes. Yet the amounts of the product is exactly 6 g in each case. Explain why.

Barry put 50 ml of milk into each of the five beakers shown below. Then in each beaker, he dissolved the different amounts of milk shake mix (MSM) shown.

- 1. Starting with the least concentrated solution, list the solutions in order of concentration.
- 2. Which is the more concentrated solution, c or d?

In 200 ml of Brand X cleaning solution, there are 120 grams of lye. What is the **04-Exc 7-2-2B** concentration of lye in the solution? State your answer in grams per milliliter (g/ml).

In 500 ml of Brand X solution used to clean ovens, there are 100 g of lye. Mrs. 04-Exc 7-2-38 Smith used 100 ml of Brand X yesterday to clean her oven. How many grams of lye were in the 100 ml of solution she used?

04-Exc 8-1-1B

Get the following equipment.

1 250-ml beaker

1 Celsius thermometer

water

Get your teacher or an appointed observer to watch you. Measure and record the temperature of the water.

e. .•

In several activities in your text, you tried to determine whether or  $not_{\ell}$  copper suffate (CuSO<sub>4</sub>) in a solution will conduct electricity. First you put distilled water into the beaker and tested to see if it would conduct electricity, as shown below. Then you dissolved solid CuSO<sub>4</sub> in the water to make the solution and tested it. Why didn't you just put a solution of CuSO<sub>4</sub> into the beaker in the first place and skip the step using only distilled water?

05-Core-1B

05-Core-2B

In an activity, you were asked to find out if the copper sulfate (CuSO<sub>4</sub>) in a solution would conduct electricity. First you tested distilled water, as shown below. Then you made the test with a solution of CuSO<sub>4</sub> and water. What do you call something used in the way the distilled water was used in that activity?

- a. Control
- b. System
- c. Compound
- d. Reactant

Look at the diagram. When the charging apparatus is plugged in, the motor lifts **05-Core-6B** the sinkers.

- 1. What kind of particles does this tell you are in the solution?
- 2. Explain your answer.

In the 1700's, Ben Franklin discovered that there were two types of electrical 05-Core-7B charge. What are they?

State the rule which tells what would happen if objects with like charges or objects 05°Core-8B with opposite charges are brought together.

The balloons in the diagram below are repelling each other. Balloon 2 has a positive **05-Core-9B** charge.

- 1. What is the charge on balloon number 1?
- 2. State the rule on which you based your answer.

The two glass rods in the diagram attract each other. Glass rod 2 has a positive **05-Core-TOB** charge. What is the charge on glass rod 1?

2 (+)

|             | 5 m <sup>2</sup>   |

|--|---|
| and a second   |   |
| The ISCS text has asked you many times to label things and to record any observa-<br>tions as you make them. The main reason for doing these things is that<br>a. this stops you from making any mistakes.<br>b. in this course you are a scientist. Historians don't have to be so careful.   | 05-Core <sup>1</sup> 20B                  |
| <ul><li>c. it is a helpful procedure for any investigation.</li><li>d. you aren't a scientists yet, so you still tend to forget.</li></ul>   |   |
| Textbooks X and Y were written for students like you. Both books discuss the results of passing an electric current through a solution of zinc sulfate.  | 05-Core-21B                               |
| Textbook X then says:  |   |
| <ul> <li>The tiny zinc and sulfate ions do move toward the charged rods.</li> <li>The movement of the zinc and sulfate ions proves that matter is held together by the differently charged ions.</li> </ul>  | • • • •                                   |
| Textbook Y says:<br>A particle model for matter assumes that atoms of zinc are very tiny.<br>Therefore, they could move, and you wouldn't see them. This<br>model is useful and may be applied to other substances as long as it<br>is supported by your observations. To apply it to other substances,<br>you will need more data.      |   |
| Select the answer below which states both which book a scientist probably would prefer and why he would prefer it.   |   |
| <ul> <li>a. Book X; these are all facts that were proved in class.</li> <li>b. Book Y; it involves a model.</li> <li>c. Book Y; it says that the data supports the conclusion but experimenting must continue.</li> <li>d. Book X; it states more facts than Book Y.</li> <li>e. Either book; both talk about the same thing.</li> </ul> |   |
| Assume that Dr. Margery Brown is a noted scientist who is well accepted by other scientists. She said, "Virus X is the cause of the St. Louis Flu." Other scientists   | 05-Core-22B                               |
| would accept Dr. Brown's statement if she<br>, a. put it into a textbook she was writing.  |   |
| <ul> <li>b. produced a pure sample of the virus in her laboratory.</li> <li>c. reported experiments with monkeys, some of which were injected</li> <li>with the virus and some of which were not.</li> <li>d. found 100 people who would sign a statement saying that she was right.</li> </ul>  |   |
|  |   |
| In Chapter 10 of your text, matter particles called <i>ions</i> were discussed. Which is the best statement about ions?  | 05-Core-23B                               |
| <ul> <li>a. Scientists have seen ions in solutions.</li> <li>b. The idea of ions was thought up by scientists to explain the behavior of some matter particles.</li> </ul>   | • •                                       |
| c. No other model could explain your observations.<br>d. Because $CuSO_4$ and $CoSO_4$ are both composed of ions, all matter, is   | Y   |
| made up of ions.   |   |

•

All the cobalt sulfate  $(CoSO_4)$  samples were taken from the same bottle and diluted with the volume of water recorded in the table above. Place the numbers 1 through 5 on your paper. Using the concentrations listed below and the beaker letters from the table, match each final solution described in the table with the proper concentration.

- 1. Most concentrated
- 2. Second most concentrated
- 3. Third most concentrated
- 4. Fourth most concentrated
- 5. Least concentrated

# 07-Core-7B

The graphs below show the results of two reactions of the same chemical system. The reactants in the system are sulfuric acid  $(H_2SO_4)$  and a colorless solution. One of the products is a gas. A different amount of  $H_2SO_4$  is used in each reaction, but the amount of the colorless solution is the same in both reactions.

1. In which reaction is the greater amount of  $H_2SO_4$  used?

2. How do you know?

07-Core-8B

Reaction A: 5 ml copper sulfate + 10 ml water + 1 g zinc  $\rightarrow$  copper Reaction B: 5 ml copper sulfate + 5 ml water + 1 g zinc  $\rightarrow$  copper

- 1. Would both of the reactions above have the same reaction rates?
- 2. If so, explain why. If not, name the variable that accounts for the difference.

- 6. Particle speed

07-Core-13B

Walt poured two samples of 35 ml of copper sulfate  $(CuSO_4)$  into two beakers. The samples were of the same concentrations, but one of the samples was at 25°C and the other was at 40°C. He added 2.5 g of zinc to each CuSO<sub>4</sub> sample. The warmer sample reacted faster. How does your model explain how temperature differences ~ cause the reaction rates of two reactions to be different?

07-Core-14B

| TRIAL | TEMPERATURE | REACTION                  | RATE    |
|-------|-------------|---------------------------|---------|
| · 1   | 25°C        | 10 g iron + oxygen → rust | slowly  |
| 2.    | ?           | 10 g iron + oxygen 4 rust | rapidly |

1. What can you tell about the temperature of trial 2 as compared to that of trial 1?.

2. How can you tell?

07-Core-158

According to the graph below, which of the following temperature intervals produce the greatest change in reaction rate? Select the letter of the correct answer.

- a. 70° to 80°C
- b. 60° to 70°C
- c.  $40^{\circ}$  to  $50^{\circ}$ C
- d.  $30^{\circ}$  to  $40^{\circ}$  C

Lois collected the data shown in the table below.

07-Core-16B

| . [ | TRIAL | CONCENTRATION                           | TEMPERATURE   | CATALYST |
|-----|-------|---|---------------|----------|
|     | 1     | 10 ml HCl + 4 pieces shell + 5 ml water | 2 <b>3°</b> C | none     |
|     | 2     | 10 ml HCl + 4 pieces shell + 8 ml water | 35°C          | none     |

Trials 1 and 2 have the same reaction rates.

1. Are the collision rates the same in 1 and 2?

2. How would your particle model explain your answer?

Give an operational definition of *catalyst* which includes all the characteristics of a **07-Core-17E** catalyst.

1. Consider the two trials of the reaction below.

07-Core-18B

Trial A.

A 15 g sample of hydrogen peroxide  $(H_2O_2)$  is heated gently. This reaction gives off 5 ml of oxygen in 70 seconds.

Trial B.

A 15 g sample of  $H_2O_2$  is heated with a little gold dust. This gives off 50 ml of oxygen in 70 seconds. The gold dust is unchanged.

Is gold dust a catalyst for the reaction?

2. Consider the two trials of the reaction below.

Trial A.

A 15 g sample of potassium chlorate (KCl $O_3$ ) is heated. The reaction produces 2.5 ml of oxygen in one minute.

Trial B.

A 15 g sample of  $KClO_3$  is heated with a little copper nitrate (bluegreen). The reaction produces 2.6 ml of oxygen in one minute, and the blue-green crystals turn black.

Is copper nitrate a catalyst in the reaction?

3. Consider the two trials of the reaction below.

Trial A.

A 10 ml sample of sulfuric acid and 5 g of sodium sulfate react to produce 25 ml of sulfur dioxide gas in 30 seconds.

⇒ Trial B.

Some water is added to the 10 ml of sulfuric acid and 5 g of sodium sulfate. Only /15 ml of sulfur dioxide gas are produced in 30 seconds.

Is water a catalyst for the reaction?

Kay wanted to find out if aluminum is a catalyst for the zinc-hydrochloric acid reaction. Design a procedure to find out. The reaction rate is indicated by the rate at which hydrogen gas is produced. Include statements of (1) which variables should be kept constant (HINT): What things cause a reaction rate to change?) and (2) which variables should vary. Also (3) include a test to show if aluminum reacts or causes the reaction. 07-Core-19B

50

07-Exc 13-1-1B

07-Exc 13-1-2B

Study the graph.

- 1. In which trial is there the greatest number of collisions between particles
- of reactants per second?
- \*2. Explain your answer in terms of concentration and reaction time

Janet studied the effect of changes in the concentration of HCI on the reaction time of the reaction shell + HCl + carbon dioxide. She defined *reaction time* as the time needed to produce 20 ml of carbon dioxide gas. Which of the graphs below is probably the correct graph for her experiment?

| 07-Exc 13-2-1B | Consider the two cases below.   |
|----------------|---|
|                | Case 1. Cement in a sack won't burn, even when heated with a torch.<br>Case 2. Cement dust in the air in a cement plant reacts so quickly at room tem-<br>perature that a small spark can cause it to explode violently.  |
|                | How can you explain the difference in reaction rates between Case 1 and Case 2?   |
| 07-Exc 14-1-1B | You saw in Excursion 14-1 that burning, a reaction involving air, takes place more<br>slowly in cold air than in warm air. How would the particle model explain this in terms of the speed and collisions of particles?   |
| 07-Exc 15-1-1B | Before putting beans into the freezer, Mrs. Kaplan puts them into boiling water for 3 to 5 minutes. She does this because heating them nearly stops reactions in the beans which would cause them to spoil even when they are frozen. Explain what heat does that stops reactions in living things such as the beans.         |
| 07-Exc 15-1-2B | Temperatures well above 80°C are needed for breakfast cereals to react with oxygen<br>to produce carbon dioxide + water rapidly enough to produce noticeable heat. /Yet<br>the same reaction – breakfast cereals plus oxygen – produces carbon dioxide and<br>water and noticeable amounts of heat at 37°C in your body. Why? |
|                |   |

|                           |   |   |   | 4 ·                                       |                         |            |
|---------------------------|---|---|---|---|-------------------------|------------|

no Green yes no no no Blue yeş no. no ·Yellow no yes yes White no

08-Core-6B

Gordon tested a green solid  $[Fe(NO_3)_2]$  and a blue solid  $[Cu(NO_3)_2]$  by putting each into a different flask with 10 ml NaOH and heating the two flasks. He bubbled each of the gases given off through test tubes of Nessler's solution. No color change was observed in the test tubes for gases from either of the substances. Gordon concluded that the substances did not contain nitrogen.

> 51 }:

1. Do you agree or disagree?

2. Explain your answer.

Margo collected the data from three trials of the reaction between NaOH and egg white. She then drew the graph shown below. How many grams of NaOH will react with 12 g of egg white? **08-Core-13B** 

08-Core-14

Sue plotted data from three trials of the reaction between NaOH and egg white. Her data are shown on the grid above.

- . 1. How many grams of NaOH will react with 12 g of egg white?
  - 2. The reason you can answer question 1 is that
- a. the relationship between egg white and NaOH changes only if more
- than 16 g of egg white is used.
  - b. you have worked with NaOH and egg white before.
  - c. reactants always combine in definite numbers.
- ·d. egg white particles have special reactions.

ERIC Protect Transfer UP

Get the bottles from box 08-Exc 17-3-1B. Test each solution with litmus, using clean glass stirring rods. After the number of each solution, indicate whether the solution is an acid, a base, or neither.

08-Exc 17-3-1B

Linda used pH paper and found the pH of samples of acid solutions as shown in the **08-Exc 17-3-2B** chart below.

|     | SAMPLE<br>LETTER | • pH |
|-----|------------------|------|
| •   | • a.             | 6    |
|     | · b              | I.   |
|     | с                | 3    |
| • • | d."              | 5    |
|     | e                | 2    |

- 1. Which solution has the highest hydrogen ion  $(H^+ ion)$  concentration?
- 2. Which solution is the strongest acid?

Acid, strong
 Acid, weak
 Neutral
 Base, weak
 Base, strong

Get the numbered bottles from box 08-Exc 17-3-3, the pH paper, the pH color scale, and 5 clean glass stirring rods. Copy the list of solutions below. Match each item with the letter of the bottle of solution it describes.

08-Exc 17-3-3B

Lorrie set up the equipment as pictured above. Before connecting the system to the charger, she observed that both rods were black and that the solution was yellow. After the system had been connected to the charger for five minutes, she noticed that one of the rods was covered with a bright silverish metal and that the solution had become colorless.

- 1. What kind of change occurred?
- , 2. What kind of energy caused it?

09-Core-5B

In Chapter 18, you put a gray zinc powder into a blue solution. A reaction occurred. The zinc disappeared, the solution became colorless, and a red-brown copper formed. The reactants and products were very different.

1. Were new particles (atoms) formed?

2. If so, name them. If not, how do you explain the fact that the reactant and products had such different properties?

Art assembled the system shown in the above diagram. He found that it produced electrical energy.

1. What was happening to the chemical energy of the system?

- 2. Was any energy lost or gained?
- 3. Explain your answer to question 2.

Gene put two rods of the same silver metal into a beaker of an orange solution. He connected the system to a charger. One of the rods turned blue-black and the other turned whitish. The solution turned green. He disconnected the system from the charger. He then connected the system to a bulb, and the bulb lit. Describe any visible changes that would occur in the beaker as the bulb continued to burn.

Beaker Sandra's new cassette tape recorder contains rechargeable batteries. About once a week, she has to recharge the batteries. Name the process which describes the changes involving the particles inside the batteries when they are charged or dis-Charged.

Bill put two gold strips into a solution of copper sulfate and connected them as shown below. No changes in the strip or solution occurred. Gene put a carbon rod and a magnesium strip into a copper sulfate solution and again completed the circuit. The magnesium strip became smaller and the solution became colorless.

- 1. Whose system is more likely to have produced electricity?
- 2. Explain your answer.

61

Metal rod

Solution of copper sulfate

Larry recharges the batteries for his tape recorder on a charger which works the same way as the charger you used in class.

- 09-Core-11B
- 1. What kind offenergy is used to charge the battery?
- 2. What is the form of energy in the battery after it is disconnected from the charger?
- 3. What form of energy does the battery give off when it is in use?

|---------------------------------------|---|
| 10-Core-7B                            | Bob put two ICR's into each of two jars, A and B. Each jar already contained 120 m<br>of water and 4 drops of hydrogen peroxide (H <sub>2</sub> O <sub>2</sub> ). After 15 minutes, he remove<br>the ICR's from jar A and tested the water for the amounts of oxygen and carbo<br>dioxide it contained. Twenty minutes after the start of the activity, he removed th<br>ICR's from jar B and tested for amounts of oxygen and carbon dioxide.<br>1. Which sample, if either one, will contain less oxygen?<br>2. Which sample, if either one, will contain more carbon dioxide?<br>3. Explain why you answered as you did. |
| 10-Core-8B                            | <sup>3</sup> Barb had a gallon of pond water. She tested a sample of it, using phenol solution, an<br>found that the water contained carbon dioxide. Barb said she was not sure if th<br>rest of the water contained carbon dioxide because she had tested only a smal<br>sample.   |
|                                       | <ol> <li>Does the rest of the water contain carbon dioxide?</li> <li>Explain your answer.</li> </ol>  |
| 10-Core-9B                            | In the Apollo missions in which the U.S. landed men on the moon, there were thre astronauts per mission. Suppose the concentration of men had been five per spac capsule.   |
| •                                     | 1. What would the increase in concentration of men do to the rate at whic oxygen was used up?   |
|                                       | <ul><li>2. What would it have done to the rate at which carbon dioxide was produced?</li><li>3. Why?</li></ul>  |
| 10-Core-10B                           | Look at Activities 21-8 and 21-9 in your text. In these activities, you studied th effect of temperature on the reaction rate of fish. The temperature in the jar cor taining the fish dropped slowly during the 20 minutes in which the jar was in the ic water. Why not put the fish directly into distilled ice water so that they would be a the lower temperature for the full 20 minutes?   |
| 10-Core-11B                           | In Lake Delaware, the temperature in early spring is about 4°C. In July, the wate temperature rises to 25°C.  |
| · · · · · · · · · · · · · · · · · · · | <ol> <li>How would this warming of the lake water affect how often a turtle mus<br/>surface to take in new oxygen and release carbon dioxide?</li> <li>2. Explain your answer in terms of reaction rates.</li> </ol>  |
| 10-Core-12B                           | Selects all of the following things which are evidences that chemical reactions tak place in living things.   |
| · .                                   | a. Concentrations are altered.<br>b. New materials (products) are formed.   |
| · .<br>·                              | c. Some materials (reactants) are used up.  |

Get your textbook, and use it to do this check. In the left-hand column are statements of five assumptions from the particle model. In the right-hand column is a list of ISCS activities that you have done, each of which involves one of these assumptions. Number your answer sheet 1 through 5. After the number of each assumption, write the letters of all of the activities listed which are related to it. A number may have more than one letter matched with it. (Hint: Read all, the assumptions before reading any of the activities. If you have trouble matching any of the activities, look in your text for that activity and find out what assumptions are related to it.)

#### Assumptions of the Particle Model

1. All matter is composed of particles.

2. Some matter is composed of electrically charged particles called *ions*.

3. Chemical reactions are rearrangements of matter particles.

4. Chemical reactions often release heat energy or absorb it.

5. Increasing the temperature of reactants increases the rate of a reaction.

#### Activities

a. When particles such as lead (Pb) and nitrate  $(NO_3)$  in lead nitrate  $[Pb(NO_3)_2]$  crystals are separated by dissolving, the temperature drops.

12-Core-18

b. It took more phenol red to get a pink color in warm water from which a goldfish had been removed than in cold water from which a goldfish had been removed.

c. This idea is proposed to explain the behavior of water when heated.

d. A goldfish used up more oxygen in warm water than in cold water.

e. This idea is used to explain differences in the reactions of rock and shells with HCl.

f. When the colorless solutions of lead nitrate  $[Pb(NO_3)_2]$  and potassium iodide (KI) reacted, a yellow solid, lead iodide (PbI<sub>2</sub>), was formed. The yellow solid contained atoms of lead (Pb) and iodide (I<sub>2</sub>). No new elements were found in the solid.

g. Foods burn, and body temperature is often above room temperature.

h. Zinc (Zn) and HCl produced hydrogen at a faster rate when hot than when cold.

i. Solutions of copper sulfate ( $CuSO_4$ ) and cobalt sulfate ( $CoSO_4$ ) let electricity pass through them to light a light bulb.

i j. The amount of reaction between zinc (Zn) and copper sulfate (CuSO<sub>4</sub>) could be determined by measuring  $\Delta T$ .

12-Core-1BB

Get your textbook, and use it to do this check. In the left-hand column are statements of five assumptions from the particle model. In the right-hand column is a list of ISCS activities that you have done, each of which involves one of these assumptions. Number your answer sheet 1 through 5. After the number of each statement, write the letters of all of the activities listed which are related to it. A number may have more than one letter matched with it. (Hint: Read all the assumptions before reading any of the activities. If you have trouble matching any of the activities, look in your text for that activity and find out what assumptions are related to it.)

## **Assumptions of the Particle Model**

1. Compounds are combinations of different atoms in definite numbers.

2. In chemical reactions, matter particles are not created or destroyed.

3. All matter is composed of particles.

4. Some matter is composed of electrically charged particles called *ions*.

5. Molecules are made of atoms and can be broken down into atoms or simpler molecules.

#### Activities

a. When different quantities of zinc (Zn) were reacted with a fixed quantity of copper sulfate (CuSO<sub>4</sub>), there was either Zn or CuSO<sub>4</sub> left over when the reaction stopped.

b. Solutions of copper sulfate (CuSO<sub>4</sub>) and cobalt sulfate (CoSO<sub>4</sub>) let electricity pass through them to light a light bulb. c. When sucrose is heated, water and carbon are formed.

d. This idea is used to explain differences in the reactions of rock and shells with HCl.

e. When different quantities of lead nitrate  $[Pb(NO_3)_2]$  were reacted with the same quantity of potassium iodide (KI), sometimes iodide (I) atoms were left over and sometimes lead (Pb) atoms were left over.

f. When sucrose is heated with HCl, fructose and glueose are formed.

g. Potassium iodide (KI) solution and lead nitrate  $[Pb(NO_3)_2]$  solution were mixed and reacted. The combined mass of the solutions after they reacted was the same as the total masses of the two before they reacted.

h. The copper particles in a solution of copper sulfate ( $CuSO_4$ ) move toward a negatively charged rod, whereas the sulfate particles move toward a positively charged rod.

i. When electricity is passed through water, the elements oxygen and hydrogen are released.

j. This idea is proposed to explain the behavior of water when heated.
