ABSTRACT
                This paper presents a classification system that
assigns each of the 85,131 public elementary and secondary schools in
the United States to one of seven locale settings. The seven mutually
exclusive locale designations are: (1) large city; (2) mid-size city;
(3) urban fringe of large city; (4) urban fringe of mid-size city;
(5) large town; (6) small town; and (7) rural. The paper is presented
in four parts. Part 1 provides an overview of the locale designations
and their definitions. Results of the locale assignment process are
presented by type of locale and state in table form. Part 2 analyzes
the National Center for Education Statistics Common Core of Data
Public School Universe by locale setting. Along with general
observations about national school locales, states are clustered
geographically and by wealth for school locale comparison. Part 3 is
an appendix describing the methodology for assigning locale codes to
the School Universe file. And Part 4 is an appendix containing tables
of the results of the locale assignment. It is pointed out that code
assignment is the first step in developing a uniform designation
system and that several additional steps are planned or in progress
to improve the designations. This paper contains nine tables.

TABLES

INTRODUCTION

This paper presents a classification system that assigns each public elementary and secondary school in the United States to one of seven locale settings. The seven locale designations are: 1) Large City, 2) Mid-size City, 3) Urban Fringe of Large City, 4) Urban Fringe of Mid-size City, 5) Large Town, 6) Small Town and 7) Rural. These categories are intended to describe the size and metropolitan status of the place in which the school is located.

The paper is presented in four parts. Part one is an introduction with an overview of the locale designations and their definitions. Part two analyzes the National Center for Education Statistics (NCES) Common Core of Data (CCD) Public School Universe by locale setting. Part three is an appendix describing the methodology for assigning locale codes to the School Universe file. And part four is an appendix containing tables of the results of the locale assignment project.

Overview of the Type of Locale Classification System

The primary data base for the School Locale study was the 1987-88 CCD School Universe file. This file contains a record for every public elementary and secondary school in the United States and the outlying areas. The file is updated annually by data provided to NCES from State education agencies. The 1987-88 file contains records for 85,131 schools.

Locale code assignment was based on the school mailing address. The city field and the ZIP code in the school address were matched to several files created by the U.S. Bureau of the Census (Census). Information in the Census files used in assigning locale codes was 1) population and population density, 2) Standard Metropolitan Statistical Area (SMSA) codes, and 3) a Census code defining places as rural or urbanized areas. All Census data used in this project were based on the 1980 Census of Population and Housing. Please note, that mailing addresses do not necessarily indicate the geographic position of the school. This is discussed in greater detail in the limitations section (page 19) and in Appendix A.

Census Bureau's Locale Information

Standard Metropolitan Statistical Areas (SMSA)

SMSA's are defined by the Office of Management and Budget (OMB). Each SMSA comprises a central city or urbanized area and one or more neighboring counties. In order to be classified as an SMSA, (a) the central city must have a population of at least 50,000, or (b) an urbanized area with a population of at least 50,000, with the entire area (including the urbanized area) having a total population of 100,000 or more inhabitants (75,000 in New England). Contiguous counties are included if they have close social and economic links with the area's population nucleus. Census assigns each of these SMSA's a unique code. At the time of the 1980 census there were 318 SMSA's in the United States.[1]

---

[1] In 1985, OMB geographically redefined these areas and dropped the word "standard" from the designation, referring to such areas as Metropolitan Statistical Areas after this time. Since most of the Census data that we are using in this project derives from 1980 and 1983 material, we will observe the older convention of referring to SMSA's.

Urban and Rural Areas

The Bureau of the Census defines urbanized areas as consisting of a central city and surrounding densely settled territory with a combined population of 50,000 or more inhabitants. Places designated as urban by Census are within these urbanized areas or in places of 2,500 or more inhabitants outside these areas. All other areas are classified as rural. The urban and rural classifications cut across the SMSA classifications. There can be both urban and rural territory within an SMSA as well as in non-SMSA areas. See figure 1.

Figure 1.--Hypothetical map illustrating Census Bureau locale designations: Central City, SMSA, and Urban and Rural areas
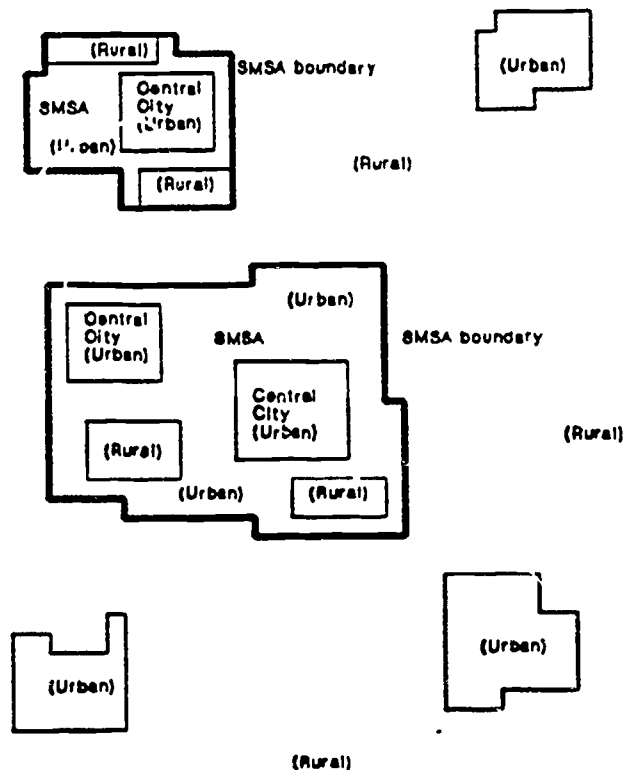

Locale code definitions are based on Census designations of urban and rural, and OMB designations of SMSA, central city of SMSA and non-SMSA. In addition, for the public elementary and secondary schoo' universe, SMSA's are divided into SMSA's of large cities and SMSA's of mid-size cities. Urban places in non-SMSA areas were separated into large towns and small towns.

Public School Locale Typology

The NCES model for assigning all schools to a type of locale is represented by a typology with seven mutually exclusive locale designations. The seven types of locale are as follows:

1.   Large City - Central city of an SMSA, with the city having a population greater than or equal to 400,000 or a population density greater than or equal to 6,000 people per square mile.

2.   Mid-Size City - Central city of an SMSA, with the city having a population less than 400,000 and a population density less than 6,000 people per square mile.

3.   Urban Fringe of Large City - Place within an SMSA of a Large Central City and defined as urban by the Census Bureau.

4.   Urban Fringe of Mid-size City - Place within an SMSA of a Mid-size Central City and defined as urban by Census.

5.   Large Town - Town not within an SMSA, with a population greater than or equal to 25,000.

6.   Small Town - Town not within an SMSA and with a population

less than 25,000 and greater than or equal to 2,500 people.

7. Rural - A place with less than 2,500 people or a place
    having a ZIP Code designated rural by the Census Bureau.

A hypothetical map illustrating these seven locale designations is presented in figure 2. It is designed to correspond with the map presented in figure 1. A simplified diagram of locale assignment is presented in figure 3. The locale assignment process (along with more accurate flow charts) is described in greater detail in Appendix A.

Figure 2.--Hypothetical map illustrating NCES locale designations
Figure3.--School locale typology
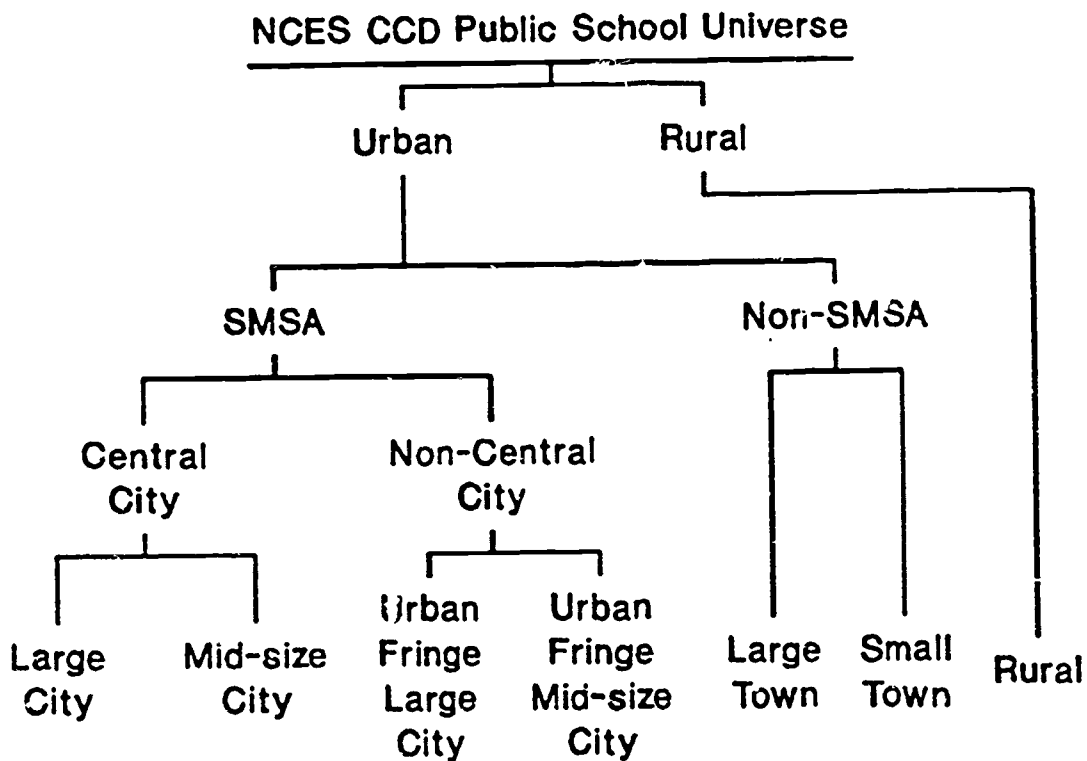

Results of the locale assignment process are presented by type of
locale and State in table 1. This table shows the number and
percentage of student membership in regular public schools by State.
Regular schools are defined as having one or more grade groups
(pre-kindergarten - 12th grade) and with no specific focus on
vocational, special or alternative education. Analysis in this report
is limited to regular public schools only. Similar tables reporting
the number of schools per locale by State and other results from the
type of locale assignment project are presented in Appendix 3. All
locale assignments were made to schools in the 50 States and the
District of Columbia. Information available for the outlying areas is
inadequate at this time to permit classifying schools in those areas.

It is possible for States to have schools in the Urban Fringe of
Large Cities, without having any schools in Large Cities. This occurs

Table 1.--Number and percent of students in membership, by type of locale and State: Regular public schools: School year 1987-88

Based on school mailing address and student membership in the 1987-88 Common Core of Data "Public Elementary/Secondary School Universe" file, NCES, U.S. Department of Education.

when a Large City exists near the border of one State, and the surrounding SMSA (urban fringe) crosses the border into another State that does not have a Large City.

Another special situation exists in instances where there are two central cities in a single SMSA, and one of the central cities is designated a Large City and the other a Mid-size City. In such cases, all urban areas within the SMSA (excluding the central cities) are coded as Urban Fringe of a Large City.

ANALYSIS OF THE CCD PUBLIC SCHOOL UNIVERSE BY TYPE OF LOCALE

United States regular public school and membership totals and percentages by type of locale are presented in tables 2 and 3 below.

Table 2.--National total of schools and percentages by type of locale: Regular public schools: School year 1987-88

Large City	Mid-size City	Urban Fringe Large City	Urban Fringe Mid-size City	Large Town	Smɑ˖ Town	Rural
6,997 (9%)	11,092 (14%)	10,696 (13%)	7,701 (10%)	1,828 (2%)	18,659 (23%)	22,319 (28%)

Table 3.--National student membership and percentage by type of locale: Regular public schools: School year 1987-88

(In thousands of students)						
Large City	Mid-size City	Urban Fringe Large City	Urban Fringe Mid-size City	Large Town	Small Town	Rural
5,208 (13%)	6,642 (17%)	6,631 (17%)	4,747 (12%)	968 (2%)	8,736 (22%)	6,510 (16%)

United States totals for each locale category show that the largest percentage of schools (28 percent) are in rural areas, followed by Small Towns (23 percent.) Fifty-three percent of all

10
16

public elementary and secondary schools are in large towns, small towns and rural areas--the areas outside the large population centers.

Total student membership across schools is highest in small towns (22 percent) followed closely by mid-size cities and urban fringe of large cities (17 percent each.) Nearly 60 percent of all students are served by schools located in the large population centers: central cities and their urban fringe. The remaining 40 percent of the students attend schools in large towns, small towns and rural areas.

The apparent discrepancy between most schools being outside the large population centers, and most students attending schools within the large population centers is resolved by looking at school sizes in each of the locales. Figure 3 illustrates that schools tend to be larger (in terms of student membership) in urbanized areas than in rural areas. Primary schools in figure 3 are defined as containing any of grades pk-6 with no grades higher than grade 6, and high schools as schools containing any of grades 7-12, with no pk-6 grades. (Combined schools were deleted from the analysis presented in this table.)

Using the data presented in table 1, and the State rankings based on that table in Appendix B (table B-4) it is possible to make the following observations:

Twenty two States and the District of Columbia have more than half of their students attending schools in SMSA's--the nation's most urban areas (locale codes Large City to Urban Fringe of Mid-size City). The remaining 28 States have more than half of their students attending non-SMSA schools (Large Town, Small Town, and Rural locales).

Only Washington, D.C. and New York State have more than 25 percent of their students attending Large City schools.

Figure 4.--School size by locale type: Regular public schools: School
year 1987-88

Median membership per school

	Primary School	High School
Large City	538	948
Mid-size City	444	781
L City Fringe	444	776
M City Fringe	454	763
Large Town	387	688
Small Town	380	501
Rural	241	231

■ Primary School   ▨ High School
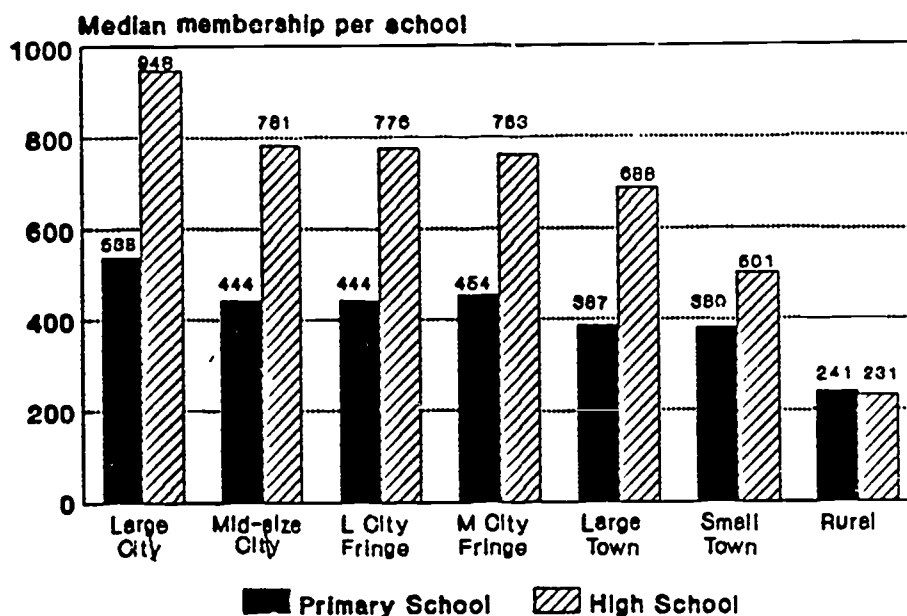

Twenty four States have 25 percent or more students enrolled in
schools in the two urban fringe locales. Eight States have more than
25 percent of their students in Large City Urban Fringes, and seven
States have 25 percent or more students in Mid-size City Urban
Fringes.

More States (30) have at least 25 percent of their students
attending schools in small towns than attending schools in any other
type of locale. Nearly all States have a substantial portion of their
students attending Small Town and Rural schools, 23 States have 50
percent or more of their students in these categories, and 37 States
have more than a third of their students attending schools in these
locales.

Table 4 presents land area, population, and student membership and
school counts by State. States are then presented in order of rank by
various demographic and locale code statistics. The "average locale

Based on school mailing addresses and student membership from the 1987-88 Common Core of Data "Public Elementary/Secondary School Universe" file, NCES, U.S. Department of Education. Land area and population from the Census Bureau 1980 census.

code" assumes a continuum from Large Central City ("1") to Rural ("7")
and is averaged over schools. The locale code numbers are only
rankings and have no interval measurement properties, however the
average does give an indication of the general urbanicity of all
schools in a given state. Urban areas referred to in the last two
entries on the right agree with Census defined urban areas (places
with populations greater than or equal to 2,500 inhabitants) and
contain school locale codes Large City to Small Town. The table is
presented as a means of comparison between States along various
urbanicity measurements.

Many of the changes in State rankings between students per square
mile and percent urban students can be explained by the fact that in
many States with low population density, most of the people live in
urbanized areas.

School Locale Clusters

In order to compare statistics and programs across States, it is
useful to make comparisons among similar States. In the past States
have been clustered into geographic regions for comparisons.
Recently, clustering has included grouping States according to
relative wealth measures. The school locale clustering scheme is an
attempt to group States together on the basis of predominant school
locale classifications within each State.

Using the student membership per locale data reported in Table 1,
States have been grouped into seven locale clusters. Grouping States
involved a three step process, as follows:

> Step 1. The seven locale settings were condensed into four
> locale groupings: City, Urban Fringe, Town and Rural. Large
> City and Mid-size City locale categories were combined to form
> the City grouping. The Urban Fringe grouping was composed of
> the two Urban Fringe locales. Large Town and Small Town

categories were combined to form the Town grouping. The Rural
locale category formed the Rural grouping by itself.

Step 2. States were assigned to one of 15 locale group
combinations on the basis of where ...e greatest percentage of
their student membership went to school within each grouping
(City, Urban Fringe, Town, and Rural). Alabama, for example,
with 21 percent in the City grouping, 27 percent in the Urban
Fringe grouping, 27 percent in the Town grouping and 25 percent
in the Rural grouping was assigned to the City-Urban
Fringe-Town-Rural combination because its membership was more or
less evenly distributed across all four groupings.

Step 3. Locale group combinations with less than four States
were re-assigned to other group combinations, and further
adjustments were made with the aim of reducing the standard
deviation among the group percentages within each combination.
The resulting seven combinations then became the locale
clusters.

The locale clusters with their States, average percent of student
membership and standard deviation for each locale grouping are
presented in table 5. A map of the United States with each State
coded by its cluster assignment is presented in figure 4.

The most striking thing about these clusters are the States which
end up being grouped together. The idea that the District of Columbia
would be similar to Arizona or Nevada, or that Utah would have the
some of the same characteristics as New York and Hawaii appears
strange at first glance. However, in looking at these clusters it is
important to remember that we are looking at states linked together on
the basis of the type of locale(s) where the majority its schools are
located, and not the geographic or strict. demographic similarities.

The City Cluster contains three States (Arizona, Nevada and
Texas) and the District of Columbia. The District has all of its

Table 5.--State clusters based on percentage of student membership in locale groupings

UNITED STATES (50 States and the District of Columbia)	City	Urban Fringe*	Town	Rural

26

students attending city schools. The other three States have large sparsely populated land areas and concentrations of people in central cities. More than half their students attend city schools. (Note: the standard deviation for the City Cluster is high because of the unusual case of the District of Columbia with 100% of its students attending city schools. If D.C is dropped from this cluster the mean for City is 51.7 and the standard deviation is 2.5.)

The City-Urban Fringe Cluster contains ten States (California, Colorado, Florida, Hawaii, Illinois, Maryland, New Jersey, New York, Utah, and Washington). This cluster is the largest in terms of student membership, more than one-third (36 percent) of all public school students in the United States attend schools in these States. These States have the largest number of Large Cities of any cluster (25 of the 52 Large Cities) and have extensive urban fringes surrounding these cities. Nearly three quarters (74 percent) of its students attend schools in SMSA's.

The City-Urban Fringe-Town Cluster contains five States (Connecticut, Massachusetts, Michigan, Oregon, and Rhode Island). These States have a relatively even mix of schools across the three types of urban areas (central cities to small towns). States in this cluster tend to have central cities surrounded by extensive urban fringe areas with the rest of the area dotted with small towns. Less than 10% of the students in this cluster attend rural schools.

The City-Town Cluster also contains five States (Indiana, Louisiana, New Mexico, Oklahoma, and Tennessee). This cluster consists of States with nearly two-thirds of their population residing in cities and towns. The remaining population is found spread out in the rural areas and in the fringe areas surrounding the cities.

The City-Urban Fringe-Town-Rural Cluster consists of States whose population is evenly distributed among the four locale groupings. Nine States are in this cluster (Alabama, Delaware, Georgia, Minnesota, Missouri, Ohio, Pennsylvania, South Carolina, and

Virginia).

The City-Town-Rural Cluster is made up of seven States (Alaska, Iowa, Kansas, Nebraska, North Carolina, North Dakota and Wisconsin). These States have smaller cities with less densely populated urban fringes than other clusters. Sixty percent of the students in this cluster attend schools outside SMSA's. This cluster contains the highest percent of students attending rural schools (nearly one-third).

The Town-Rural Cluster contains 11 States (Arkansas, Idaho, Kentucky, Maine, Mississippi, Montana, New Hampshire, South Dakota, Vermont, West Virginia, and Wyoming). This cluster has the largest number of States in it and the smallest number of students of any cluster. Four out of five students in this cluster attend schools outside the metropolitan areas. Nearly one-third of the students attend rural schools.

Limitations

This study is limited by the following factors:

- Locale assignment was based on school mailing addresses and not the actual site address. Some school districts and even States list the address of the local education agency as the school address for every school in the agency.

- Locale code assignments depended on matching school addressees to Census data based on city and place names. Mailing addresses generally follow post office mail distribution boundaries, whereas places used in Census listings are legally recognized entities. The post office mail distribution boundaries and the Census (legal) boundaries are not always in agreement. In addition, spelling and abbreviation conventions for places may differ from State to State and even within States, making it

difficult to match places on the computer. As a result,
the school addresses of some schools could not be matched
to any of the Census files and locale codes had to be
assigned by default procedures explained in Appendix A.

- ! :e school mailing addresses have undergone one extensive
  edit to correct addresses and are currently being edited
  again to detect and correct inaccurate addresses.
  Subsequent use of the school locale model will reflect the
  improved editing of addresses.

- Some schools may be missing. A study is being undertaken
  with each State to ensure complete coverage

Next Steps

Assigning the locale codes to the public elementary and secondary
schools in this country was the initial step in developing a
comparable and uniform designation system. Several additional steps
are in progress or are planned to improve the designations. They are
as followed:

- School locale designations will be made a regular part of
  the CCD School Universe file.

- NCES regularly collects from State education agencies
  mailing addresses for local school districts and schools
  for release to the public, and has requested that State
  agencies provide separate site address files to be used by
  NCES for the purpose of assigning locale types to schools.

- The school locale assignments will be updated when more
  current data are available from the Bureau of the Census.

Finally, State education agencies are being requested to verify

the individual school assignments based on their knowledge of school locations. This verification process is expected to be an ongoing process by NCES and State agencies.

APPENDIX A

THE LOCALE CODE ASSIGNMENT PROCESS

Locale code assignment was based on U.S. Bureau of the Census (Census) data defining geographical places, listing their populations and population densities, coding them with respect to Standard Metropolitan Statistical Areas (SMSA's) and designating them as rural or urbanized areas. All Census data used in this project were based on the 1980 Census. The National Center for Education Statistics (NCES), Common Core of Data (CCD) 1987-88 School Universe file was merged with Census files, matching cities in the address field of the school file with place names on the Census files.

It should be noted that place names may have different meanings to different people and organizations. The Census Bureau only recognizes political entities as places (Except in Hawaii, where the Census Bureau has identified "Census Designated Places"). Places as used by the U.S. Postal Service are Post Offices for distribution of the mail. Boundaries for mail distribution do not necessarily adhere to the boundaries of cities, counties or other jurisdictions.

Data Files

The primary data file was the 1987-88 CCD "Public Elementary/Secondary School Universe" file, which contains 85,131 records, one for each public school in the United States and its outlying areas. This file is created annually by NCES from State

supplied data. The city name, ZIP code, and school district
identification number (LEAID) fields from this file were used in the
locale assignment operation. Due to the limitations of the Census
files for the outlying territories, locale codes were assigned to the
50 states and the District of Columbia.

The Census data files, each followed by a descriptor in
parentheses, and the data elements which were used in the project, are
listed below:

- 1983 County City Data Book (Place)
    Census place name, State, population, population
    density

- Geographic Identification Code Scheme, 1983 (GIC)
    Census place name, State, size code, SMSA code

- MARF5 Zip Code Equivalency File, 1983 (MARF5)
    Census place name, State, ZIP code, urban/rural
    designation

All of the Census files required a great deal of manipulation to
perform merges based on the place name field. The place name fields
in the Census files have several pieces of additional information
which had to be carefully removed so as not to effect any changes in
the place name. This additional information was inconsistent across
the three Census files used in the project.

In addition to the preceding three Census files, the following
three files were used in the locale code assignment process:

- OMB Listing of Central Cities

- The U.S. Postal Service 1987 National Five-digit ZIP Code
    and Post Office Directory

- NCES Large Central City Listing

The 1985 OMB listing of Central Cities of SMSA's was used to
identify central cities of SMSA's. This file contains more SMSA's
than existed in 1980, so that central cities of SMSA's had to match
both this file and the GIC file.

The U.S. Postal Service 1987 National Five-Digit ZIP Code and
Post Office Directory was used to determine schools with city names in
the addresses, but with ZIP codes identifying them as being outside
the city limits.

A file containing the cities defined as "Large Central Cities"
was created containing the city name, SMSA code and State code. These
cities were chosen by plotting all of the central cities by population
and population density and then selecting out a large grouping of
cities, whose borders were defined as population of 400,000 and
population density of 6,000 people per square mile. This left 52
cities each having a population greater than or equal to 400,000 or a
population density greater than or equal to 6,000. These cities are
listed below.

Atlanta, GA	Fort Lauderdale, FL	Minneapolis, MN
Baltimore, MD	Fort Worth, TX	Nashville, TN
Berkeley, CA	Hartford, CT	New Haven, CT
Boston, MA	Hialeah, CT	New Orleans, LA
Bridgeport, CT	Houston, TX	New York City, NY
Buffalo, NY	Indianapolis, IN	Newark, NJ
Chicago, IL	Jacksonville, FL	Oakland, CA
Cleveland, OH	Jersey City, NJ	Oklahoma City, OK
Columbus, OH	Kansas City, MO	Paterson, NJ
Dallas, TX	Long Beach, CA	Philadelphia, PA
Denver, CO	Los Angeles, CA	Phoenix, AZ
Detroit, MI	Memphis, TN	Pittsburgh, PA
El Paso, TX	Miami, FL	Providence, RI
Elizabeth, NJ	Milwaukee, WI	Rochester, NY

23

Saint Louis, MO	San Jose, CA	Syracuse, NY
San Antonio, TX	Santa Ana, CA	Washington, DC
San Dieg', CA	Seattle, WA	Yonkers, NY
San Francisco, CA		

Locale Assignment Methodology

Below is a description of the methodology used in assigning
locale codes to the school universe file. A flow chart of the major
steps of the process is presented in figure A-1.

First, place and city names in all files were manipulated to a
attain a common spelling and abbreviation convention so that they
could be matched and merged on the basis of the city in the mailing
address field. Spelling and abbreviation conventions for places
differ from State to State and even within States. In addition,
accepted local definitions of place, mailing address designations, and
Census recognized boundaries are not always in agreement. As a
result, the school address of some schools could rot be matched to the
Census files. The MARF5 Zip Code file was often used to assist in
matching schools with the other two Census files.

The primary data file was the CCD School Universe file which
contains 85,131 school records. The schools from the outlying
territories were extracted from the Universe file, leaving 83,248
school records for the 50 States and the District of Columbia. The
school file was first merged with the MARF5 ZIP Code file (matching on
the ZIP code fields). Ninety-three percent of the schools were
matched to this file (77,429 of 83,248). Successive merges to other
files were merged first on the city name from the school address in
the CCD file, and if unmatched, then tried again using the place name
from the MARF5 ZIP Code file. Following the merge with the MARF5 ZIP
Code file, the CCD file was matched and merged with the GIC
Identification file. Forty-seven percent or 38,865 of 83,248 schools
were matched with the GIC file. Unmatched schools from this operation

were then matched and merged with the Place file. Fifty percent of these unmatched schools were matched to the Place file (22,265 of 44,264). This left 22,118 schools, or 27 percent of the schools matched to neither the GIC file nor the Place file. These schools were coded Rural or Small Town depending upon the urban/rural code found on the MARF5 ZIP code file.

Following the merging operation, locale codes were assigned to schools based on the city name in the school's address field meeting the following criteria:

1. Large City - Schools in cities matched to both the GIC file and the Large Central City file we created for this project.

2. Mid-size City - Schools in cities matched to both the GIC file and OMB listing of central cities, and not matched to the Large Central City file.

3. Urban Fringe of Large City - Schools in cities matched to the GIC file, not matched to the OMB listing of central cities and found to have the same SMSA code as cities coded Large City above.

4. Urban Fringe of Mid-size Central City - Schools in cities matched to the GIC file and not found on the OMB listing of central cities nor having the same SMSA code as cities listed on the Large Central Cities file.

5. Large Town - Schools in places not matched to the GIC file, but found on the Place file to have a population greater than or equal to 25,000.

6. Small Town - Schools in places not matched to the GIC file, but meet either of the following two conditions, 1) found on the Place file to have a population greater than or

equal to 2,500 and less than 25,000, or 2) not matched to the Place file, yet found on the MARF5 file to be urban.

7. Rural - Schools in places not matched on the GIC file and meet any one of three criteria, 1) found on the Place file to have a population less than 2,500, 2) not matched to the Place file and found on the MARF5 file to have a rural code, 3) not matched to any file at all.

Defaults and contrary information were decided in the following manner:

- Schools that could not be matched to any file were coded as rural.

- Places matched to the ZIP Code file indicating urban, but unmatched to the either the GIC or County City Databook files, were coded as Small Town.

- Schools in places matched to the ZIP code file indicating rural, matched to the Place file indicating a population greater than 2,500 inhabitants, and unmatched to the GIC file, were coded Large Town or Small Town depending on the data in the Place file.

These default coding procedures were decided upon after looking at 50 randomly selected schools in each of the three problem areas and determining by local education agency location, maps, and personal knowledge that the majority of them were most likely to be classified as the above procedures dictate.

A flow chart illustrating this locale code assignment process is presented as Figure A-1.

After this initial locale assignment procedure the entire file was checked and locale codes adjusted using the following methods:

Figure A-1. Initial locale assignment chart

CCD — School Universe

MARF5 — ZIP Code file (urban/rural)

GIC — SMSA Code

PLACE — population and pop. density

Locale codes
1. Large City
2. Mid-size City
3. Urban Fringe of Large City
4. Urban Fringe of Mid-size City
5. Large Town
6. Small Town
7. Rural

OMB Central Cities

NCES Large Central Cities

If pop. GE 25,000 then code=5.
If pop. < 25,000 and pop. GE 2,500 then code=6.
If pop <2,500 then code=7

If urban/rural = urban then code=6, else code=7.

Code=4   Code=3   Code=2   Code=1

• Schools matched to the ZIP Code file and coded rural by Census were coded by NCES in the following manner:

  1. If matched to the OMB Central City file, then coded "Large City" or "Mid-size City";

  2. If matched to the GIC file and has a SMSA code, but matched to neither the Large City file nor the OMB Central City file, then coded "Rural";

• The file was checked to make sure that schools assigned "Large City" or "Mid-size City" codes were located in the city and not outside the city - using the city name in the address. This was done by matching the ZIP code with a file of branch Post Office ZIP codes created from the U.S. Postal Service's Post Office Directory. Following this process, the file was checked to ensure that all schools using the same ZIP code received the same locale code. Locale codes for these schools were changed to the lowest or most urban locale code assigned to that ZIP code. The locale codes of 1,060 schools (one percent of all schools) were changed by this routine.

• Finally, the file was checked to ensure that if more than four schools within a school district were coded as being in an SMSA, then all schools within that district would be coded as being in an SMSA. This was justified because most school districts lie within county boundaries and SMSA boundaries follow county lines, and necessary because of the number of schools in small communities in SMSA's using names in addresses not recognized by the Census Bureau. One percent or 979 of 83,248 schools were recoded as a result of this operation.

Figure A-2 presents a flow chart of the locale assignment adjustment operation.

Figure A-2. Locale code adjustment chart
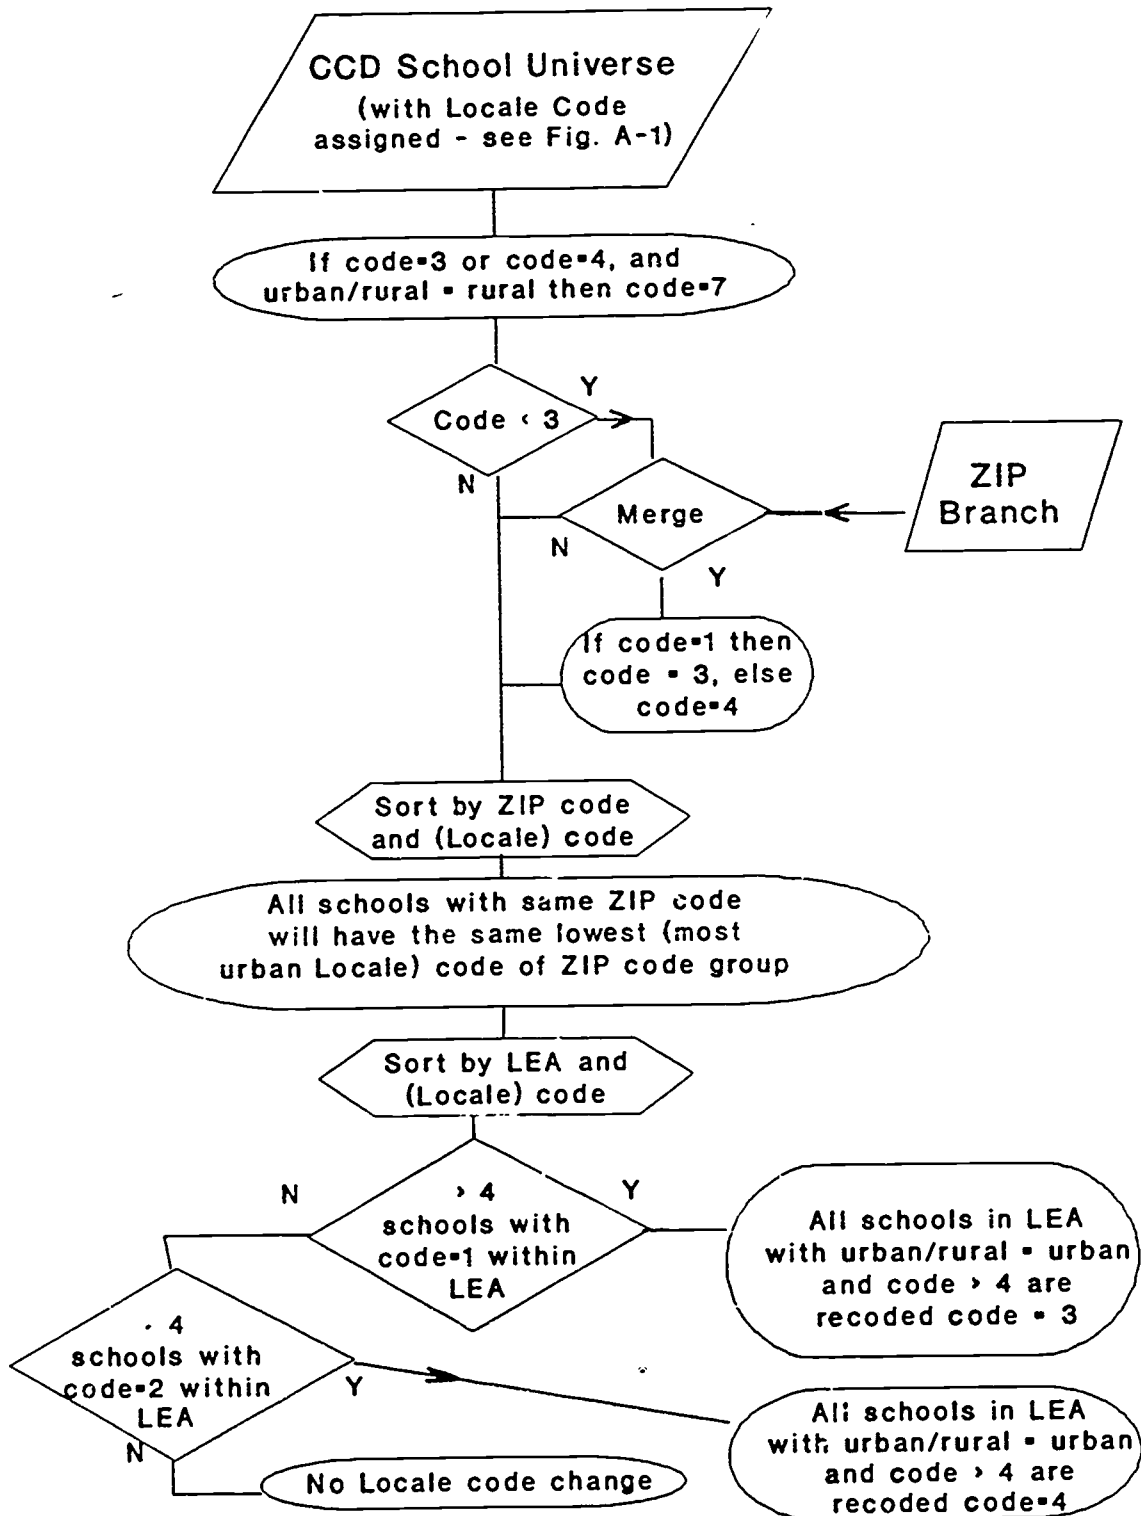

APPENDIX B
