#### ABSTRACT

This paper describes the characteristics of the Minimum Skills Diagnostic Tests (MSDTs) components of the statewide testing program in North Carolina. The MSDTs' validity, method for deriving test scores, reliability and other statistics, test content, and test norms are discussed. These tests--given in grades 3, 6, and 8--assess an individual's strengths and weaknesses (degree of mastery) in reading, language arts, and mathematics skills necessary for successful performance at the next grade level. The MSDTs form the second phase of a state program that begins with the Cal\_fornia Achievement Tests. Those who perform at or below an established cut-off score on the MSDTs receive remedial instruction during a state-funded summer program. There are two forms (Forms A and B) of the MSDTs, each of which contains three subtests corresponding to the three srbject areas. Each subtest consists of 99 items in objective sequence, with the exception of grade 3 mathematics, which has 104 items. After the summer program, students retake the MSDTs (Phase III of the state testing program) in long or short versions to show improvement in the mastery of standard objectives. This teen graphs give comparisons of Forms A and B. Nine tables present item difficulty by item number, and three additional tables give state norms. Three appendices show the item content and item representation by objective for the tests. (SLD)

#### FOREWORD

NCDPI Division of Research, in cooperation with NCDPI Instructional Services, has developed diagnostic achievement tests of basic skills for public school students in Grades 3, 6, and 8; survey achievement tests of Science and Social Studies for students in Grades 3, 6, and 8; and end-of-course achievement tests for students taking Algebra I, Algebra II, Biology, and US History. Chemistry and Geometry achievement tests will be added in 1989, and other tests are being planned.<sup>a</sup>

To facilitate the proper technical use of the test scores obtained from the administrations of the tests, the curricular and psychometric characteristic of the tests will be described in a series of technical manuals. This manual a ntains a description of the characteristics of the Minimum Skills Diagnostic Tests (MSDT). These tests are components of the statewide annual testing program.

<sup>a</sup>Readers who have an interest in the origins of the test development program are referred to the North Carolina Elementary and Secondary School Reform Act of 1984, the North Carolina Basic Education Program, the North Carolina Standard Course of Study, and the Teacher Handbook.

North Carolina Promotion Testing Program. In 1984 the state of North Carolina, through the development of the Basic Education Program, established mastery levels in reading, language arts, and mathematics for the promotion of students in grades three, six, and eight. A three-stage promotion/retention process has been implemented to make decisions based on the mastery of the subject matter at these grade levels.

Phase I of the promotion testing program consists of the administration of the California Achievement Tests (CAT) as a component of the Annual Testing Program. The CAT assesses mastery of skills in reading, language, spelling, and mathematics. Students who score at or above the 25th percentile of the national norm group for their grade on the CAT Total Battery satisfy the state's competency requirement for promotion. Students must then meet the promotion requirements of the local school district. Students who score below the 25th percentile on the CAT, have not repeated a grade in their grade sequence (K-3, 4-6, 7-8), and are not classified as educable mentally handicapped, trainable mentally handicapped, or severely/profoundly handicapped are required to proceed to Phase II of the testing program.

In Phase II, a student is tested for mastery of the basic competencies established by the State Board of Education. The North Carolina Minimum Skills Diagnostic Tests (MSDT: Phase 2) were developed to assess an individual's degree of mastery of the reading, languag arts, and mathematics skills necessary for successful performance at the next grade level. Students who perform at or below an established cut-off score on the MSDT receive remedial instruction during a state-funded summer school program.

Following summer school, students complete Phase III of the promotion testing program and take the MSDT again (called the MSDT: Phase 3). Promotion/retention decisions are made in accordance with local school district standards. There is no state cut-off score for the Phase III tests.

Minimum Skills Diagnostic Tests (MSDT). There are two forms of the MSDT (A and B) used in Phase II of the testing program and each form contains three subtests corresponding to the three subject areas (reading, language arts, and mathematics). Each subtest consists of 99 items presented in objective sequence, with the exception of the Grade 3 Mathematics subtest which has 104 items. The tests are designed to be administered over three testing sessions that last approximately 2 hours each and the tests are administered in the following order: Reading, Language Arts, and Mathematics.

The MSDT: Phase 2 tests are designed to be objective-specific, and, as such, they concentrate directly on material presented in the classroom as a basis for measuring performance.

The tests provide a detailed diagnostic profile of each student's strengths and weaknesses in the areas of reading, language arts, and mathematics; consequently, summer school can be tailored to meet the student's needs. Items

1

on the Reading subtest are written at the minimum competency levels established by the State Board of Education and at additional, lower diagnostic levels (i.e., for the Grade 3 Reading subtest there are reading passages at the Grade 1.5, 2.0, 2.5, and 3.0 reading levels).

The tests used in Phase III of the testing program are identical to the Phase II tests in objective coverage and are primarily intended to provide summary information for evaluating the summer school program.

The MSDT: Phase 3 tests consist of two versions: long and short. The long versions of the MSDT: Phase 3 tests are identical to the Phase 2 tests and, consequently, are able to provide individual diagnostic information. The short versions of the MSDT: Phase 3 tests consist of a random selection of items on the Phase 2 tests. Each short version test form contains 99 items that are evenly distributed across the three content areas. The short version tests are useful in measuring the overall achievement of students in Reading, Language Arts, and Mathematics at the conclusion of summe: school. The Phase 3 tests were designed to have the same means and stundard deviations as the Phase 2 tests so that improvements in mastery of the minimum competency objectives can be assessed.

The development of minimum competency tests in Reading, Language Arts, and Mathematics has a dual purpose: (1) to make decisions about whether a particular student has mastered the current material and whether the next level of instruction may proceed and (2) if inadequate mastery is evident, just how inadequate it is. Teachers and administrators need to know just how far below some standard the student fell before effective remediation can begin. To accomplish these two purposes meaningfully, the test scores must be valid. If the test scores are not valid, one inference drawn from a test score may be valid, while another may not be valid.

Theoreticians insist correctly that only inferences concerning test scores can be said to have validity. Generally, readers understand this, and here the convenient shorthand will be employed of speaking about "test validity" rather than "inferences about achievement drawn from scores obtained from tests."

Test validity is a predominant theme in test development, from the time the idea for a test is conceived until the final test scores have been analyzed and interpreted. For convenience, the various components of test validity will be described as if they were unique, independent components rather than interrelated parts. The first component of test validity to be described will be curricular validity.

Curricular validity. If a test is to be used to measure the degree to which a course of study has been mastered, the first step is to define the curriculum. In the case of Reading, Language Arts, and Mathematics, this was done through a cooperative effort, lead by NCDFI Instructional Services, involving curriculum specialists, teachers, administrators, university professors, and others. The result was a list of goals and objectives for each subject area at each grade level based upon the curriculum and courses of instruction listed and described in the Basic Education Program. Supported by expert opinion and a statewide consensus, these goals and objectives were approved by the State Board of Education as the basis for instruction in reading, language arts, and mathematics in grades three, six, and eight.

The minimum competency objectives were adapted from the objectives stated in the North Carolina Standard Course of Study for each grade level and subject area and were determined to be necessary for successful performance at the next grade level. The objectives are listed in the appendix by grade level and content area within grade level. Where necessary, objectives were interpreted into a specific skill or the recognition of the correct use of the specific skill.

Instructional validity. Items were written that tested the basic minimum competency objectives in reading, language arts, and mathematics. The items reflected the minimum competency levels prepared by the NCDPI Divisions of Communication Skills and Mathematics and adopted by the State Board of Education as the basic minimum competency levels in grades three, six, and eight in reading, language arts, and mathematics.

Content validity of the item pools. Content validity—the degree to which test items reflect the basic instructional program—was defined through a number of operations:

First, the item pools of the Reading, Language Arts, and Mathematics subtests were created. Each item pool was to consist of 600 items per grade level (a total of 1800 items per content area) that were matched to the objectives of the reading, language arts, and mathematics minimum competency level objectives described earlier. The items were purchased from a test development company.

A computer search of the company's item bank was utilized to find items that matched the test specification guidelines. An item was selected for inclusion in an item pool if it met the following criteria: (1) matched a minimum competency objective in one of the three content areas, (2) had appropriate statistical characteristics, and (3) was appropriate for students in grades three, six, or eight scoring below the 25th percentile on a nationally-normed achievement test. Sample items were reviewed by the Annual Testing Commission and personnel in NCDPI Instructional Services (Mathematics and Communication Skills Divisions). Acceptable items were used as models for the development of items written by the test development company personnel for the MSDT. The following percentages of items within each item pool were written specifically for the MSDT: reading - 81%, language arts - 93%, and mathematics - 86%.

Second, the item pools were edited for grammar, syntax, psychometric form, and linguistic bias by the test development company personnel and NCDPI staff.

Third, the item pools were analyzed by curriculum specialists in NCDPI Mathematics and Communication Skills Division, teachers, and the Annual Testing Commission to assure that the items were valid representations of the objectives for which they were developed. Each item was reviewed by six to eight classroom teachers and at least once in each of the eight educational regions of the state. The criteria for evaluating each item included the following: particular characteristics of the item (objective match, artwork, vocabulary, print size/type style, and format), bias (gender, ethnicity, economic, regional, geographical), and appropriateness for students for whom the items were designed.

On the basis of the first three steps in the content validity process, 5400 items were available in the item pools for use in test development. For each subject area at each grade level 600 items were developed for field testing.

Fourth, the items in each item pool were collected into test forms for field testing. Thirty-six field tests were assembled at each grade level (12 Reading, 12 Language Arts, and 12 Mathematics). Although the forms were not the final forms of the Minimum Skills Diagnostic Tests, they were organized in such a way that all of the objectives were represented across all test forms. Each field test form contained 60 items, 10 of which were common across all test forms of the same content area and grade level. The common items were not part of the original item pools and were included for the purpose of ability equating should that become necessary.

Fifth, test administration instructions were written, test distribution procedures were organized, and administrators were trained to conduct the test

10

administrations. The administration of the test forms followed the routine eventually expected to be used when the tests of record are given.

Sixth, samples of students were selected to take the 36 MSDT field tests at each grade level. All students who had scored at or below the 30th percentile were selected to take the item fieldtests. Scudents scoring between the 25th and the 30th percentile were included because a projected re-norming of the CAT was expected to place students scoring at the 30th percentile below the 25th percentile in the new norms. To insure broad representation, schools were selected from all of the Local Education Associations (LEA) in the state. Approximately 200 to 400 students per grade level within a particular LEA were tested with one form of a given subtest at grade 3, one form of a different subtest at grade 6, and one form of the third subtest at grade 8. Each form of the three subtests was administered in four LEA's randomly selected from across the state.

Seventh, the item field test data were analyzed using the classical psychometric model and the one-parameter Rasch model (BICAL program). Eight statistics were assembled for every item: item characteristics curve groupings, p-value, Rasch difficulty index, Adjusted-Rasch difficulty index, standard error of the mean, fit mean-square, item reliability (point-biseral correlation), and the item validity (point-biseral correlation). These statistics were reviewed and decisions were made about the psychometric adequacy of the items.

Due to the selective nature of the MSDT, the maximization of item-total correlations (point-biseral correlations) was not a primary goal of item development. The subject area domains were selective because they involved only a restricted sample of items which were appropriate to the bottom 25th percentile group on a nationally-normed test. Also, the sample group of students was selective because the test was administered only to those students in the bottom 30% on a national sample; the sample group corresponded to only 10-15% of the North Carolina grade school population.

The psychometric decisions were then conveyed to the curriculum specialists, who also reviewed the items and reached a decision about their curricular adequacy.

This information was then placed on the item record, which became the basic document to which all other records were referred. The item record contains the goal, objective, historical information, a copy of the item itself, the item tryout statistics, and the psychometric and curricular decisions concerning the item's suitability for use in a test. Each item had a separate item record.

Of the 1800 field-tested reading items, 273 (15%) were deleted due to statistical flaws or as a result of review by curriculum specialists. Forty-six items were transferred to other objectives to yield a better item-objective match. The items that were psychometrically deleted were revised where possible (239) or rewritten (34) for use in further test development. After psychometric and curricular evaluation, 1784 items remained in the reading item pool for use in the development of test forms for statewide testing. The following numbers of items remained in the pool for each grade level: 3rd - 597 items, 6th - 597 items, and 8th - 590 items.

Of the 1800 field-tested language arts items, 120 (7%) were deleted due to

statistical flaws or as a result of review by curriculum specialists. One item was transferred to another objective to yield a better item-objective match. The items that were p-sychometrically deleted were revised where possible (84) or rewritten (36) for use in further test development. After psychometric and curricular evaluation, 1786 items remained in the language arts item pool for use in the development of test forms for statewide testing. The following numbers of items remained in the pool at each grade level: 3rd - 300 items, 6th - 599 items, and 24 n - 587 items.

Of the 1800 field-tested mathematics items, 259 (14%) were initially deleted due to statistical flaws or as a result of review by curriculum specialists. The items that were psychometrically deleted were revised where possible (185) or rewritten (74) for use in further test development. After psychometric and curricular evaluation, 1799 items remained in the mathematics item pool for use in the development of test forms for statewide testing. The following numbers of items remained in the pool for the grade level: 3rd - 600 items, 6th - 600 items, and 8th - 599 items.

Content validity of the tests. After a consideration of the logistics involved and the size of the item pools at each grade level, it was decided to prepare two forms of the MSDT. The item selections for each of the subtests were based on a different content specification. The Reading subtest items were selected by sampling reading passages rather than specific items. This procedure led to an irregular representation of objectives by items. The Language Arts objective representations were weighted by curriculum specialists and, consequently, resulted in an irregular representation of items. The rule was employed that each objective was to be measured by at least six items. The Mathematics subtest items were distributed as evenly as possible, with three or four items per objective.

After the subject area specifications had been met, items were chosen at random from the available items for an objective. This method of item selection is a modified domain sampling model, with the various forms of the tests randomly equivalent. The domain sampling model in its pure form in highly inefficient because it allows the entry of items that are grossly inappropriate for normative measurement—items that no one can answer or that everyone can answer, or items that have psychometric deficiencies of a more complex form. In the modification used here, the domains of items were limited to those items that had satisfactory psychometric characteristics and were related to the subject areas. This was determined by the analyses of the item fieldtest data, which were used to verify the psychometric adequacy of the item pools and to direct where item revisions should be made.

Once the tests were assembled into test forms, they were reviewed by one curriculum supervisor and two teachers in each educational region. The criteria for evaluating each form of the MSDT included the following: answer key (correct/incorrect), artwork (accurate/inaccurate and clear/unclear), representativeness for sample to be tested, and bias (gender, ethnic, socioeconomic status, geographic, and other).

Although the initial equating of the forms of the MSDT depended upon random selection of the items from the pools, the final equating was based on statistics obtained at the time the first test of record was administered. This

second psychometric analysis, described next ,was used to eliminate random differences between the forms and thus facilitate the precision of measurement from one year to the next.

Standardization samples. The first administration of the North Carolina Minimum Skills Diagnostic Tests consisted of Form A administered in 1986 to all third, sixth, and eighth grade students who scored below the 25th percentile on the CAT Total Battery, Form E. The tests was administered to 2,762 3rd grade students; 5,263 6th grade students; and 5,092 8th grade students. The state norm population comprises these students at each grade level.

At approximately the same time, Form B of the MSDT was administered to random samples of the students required to take Form A of the MSDT. At grade 3, approximately 560 students took both forms of the MSDT; at grade 6, approximately 500 students took both forms of the MSDT; and at grade 8, approximately 450 students took both forms of the MSDT.

Construct validity of the tests. The construct validity of a test is the extent to which the test may be said to measure a theoretical construct or trait. One way to assess the construct validity of a test is to compare scores on a test before and after an intervention is administered that is believed to affect the individual's performance on the test.

The MSDT: Phase 2 test (pretest) is administered at the end of the school year and prior to the beginning of the summer school program. At the end of the summer school program the MSDT: Phase 3 test (posttest) is administered to assess the student's improvement in reading, language arts, and mathematics. Table 1 presents the average scores on the Phase 2 and Phase 3 tests for individuals in grades 3, 6, and 8. The average gain in percentage of correct responses is also presented.

All of the gains in percentage of correct responses from the pretest to the posttest are statistically significant at the .01 level. From the data in Table 1 it can be concluded that students are mastering the minimum competency objectives that are being assessed by the MSDT.

Criterion-related validity of the tests. Criterion-related validity indicates the effectiveness of a test in predicting in individual's behavior in a specific situation. Criterion-related validity is established when the performance of an individual on a test is checked against an external criterion, i.e., a direct and independent measure of that which the test is designed to measure.

An often used criterion is performance in a specialized training program, such as summer school. The decision to promote individuals to the next grade level or retain them in the present grade level is assessed by their performance in summer school. The promotion/retention decision is based mainly on the following criteria: teacher recommendation, principal recommendation, classroom observation, and summer school attendance. The promotion/retention decision is an independent measure of achievement and, therefore, may be used as a criterion measure to assess the validity of the MSDT as a measure of achievement.

Table 1

Statewide Results of the MSDT: Phase 2 and Phase 3a Tests
Administered in 1986 (Form A) and 1987 (Form B)

	Long	1829	5.3	51	3.4	1.9

\*p < .05

<sup>&</sup>lt;sup>a</sup>Based on students who took the MSDT: Phase 2 and Phase 3 tests.

For the MSDT to have satisfactory criterion-related validity, students who gain the most during summer school should be the ones who are promoted to the next grade level based on local recommendations. Table 2 presents the average scores on the MSDT posttest for students who were promoted to the next grade and for students who were retained in the current grade.

The only significant difference in average gain scores between promoted and retained students was at the third grade level for students who took the long version of the MSDT: Phase 3 tests. The other differences in gain scores are in the hypothesized direction, but are not statistically significant. While the data is not conclusive about the criterion-related validity of the MSDT, it is positive.

#### METHOD FOR DERIVING TEST SCORES

Item information was available to support the classical scoring model and the Rasch scoring model. The classical scoring model gives a unitary weight to each item; a correct choice adds 1 to the total score and an incorrect choice adds 0. The one-parameter Rasch model also uses unitary weighting. (The two- and three-parameter item response models give more credit for answering some items correctly, and less credit for answering other items correctly. These models assume that each item has a fundamental, unchanging difficulty level.) The classical scoring model was utilized to score the North Carolina Minimum Skills Diagnostic Tests because it was fundamentally sound, simple to use, and easy to interpret.

In addition to total scores for each subtest on the MSDT, diagnostic scores are computed for each objective. A diagnostic profile is developed for each student so that his/her individual needs may be met by the summer school program.

### RELIABILITY AND OTHER STATISTICS

The descriptive statistics, the standard errors of measurement, and the alpha reliability coefficients from the administration of the first test of record (May 1986) of the Minimum Skills Diagnostic Tests (Forms A and B) are presented in Table 3. The alpha reliability estimates range from .88 to .97.

The first fieldtest administration of the MSDT was in October 1985. The purposes of the administration were to determine alternate-form reliability, to measure administration time of the two test forms (A and B), and to set promotion/retention standards. The two forms of the subtests were field-tested with samples of students in grades three, six, and eight. Three groupings of the subtests were given at each grade level: (1) Reading-A, Reading-B, & Language-A; (2) Language-A, Language-B, & Mathematics-A; and (3) Mathematics-A, Mathematics-B, & Reading-A. Approximately 500 students were administered each grouping of the three subtests at each grade level. The alternate form reliability estimates are presented in Table 3 and range from .74 to .90.

The alpha reliability, although respectfully high, is based on an attenuated sample of the population: students who scored below the 30th percentile on the California Achievement Tests, Form E. The alternate form reliability is based on an even more attenuated sample: students who scored below the 25th percentile. This accounts for the alternate form's reliability being slightly less than expected (generally 5-8 points below alpha).

Table 3

Descriptive Statistics for the Minimum Skills Diagnostic Tests (MSDT)

						Relial	bility
Subject	Form	Mean	SD	Median	se <sub>meas</sub>	Alternate Form	Coefficient Alpha

<sup>\*</sup> Equated (adjusted) Form

Of special significance to the comparability of student scores across the years is the equivalence of Form B to Form A (the first statewide test of record). An equipercentile analysis was made of the relationship of Form B to Form A. To make this equipercentile comparison, the mean of a block of scores within successive five percentile points on Form A was taken to compare with the mean of a block of scores within the same successive five percentile points on Form B. This yielded twenty reasonably reliable points of comparison.

In Figures 1 through 5, 7, 8, 10, and 12 the differences of the data points from perfect agreement (a slope of 1.00) for Forms A and B of each subtest at each grade level are small. The differences between Forms A and B of the grade 3 Reading, Language Arts, and Mathematics subtests and of the Grade 6 Mathematics and Reading subtests are minimal, and it was therefore not necessary to equate Form B any further.

The differences between Forms A and B of the Grade 6 Language Arts subtest and of the Grade 8 Language Arts, Mathematics, and Reading subtests could be adjusted statistically by providing a separate set of norms for each form. A simple and efficient alternative is to redevelop Form B of each subtest slightly so that even the small differences disappear. To accomplish this transformation, the items and associated psychometric data were available from the administration of Form A. The results of the adjustments on these subtests are given in Table 3 and Figures 6, 9, 11, and 13

The required changes were minimal, with the alternate form reliability increasing for all of the equated subtests. Two items were changed on the Grade 6 and the Grade 8 Language Arts subtests to equate Form A with Form B at each grade level. Six items were changed on the Grade 8 Mathematics subtest to equate Form A with Form B. Eleven items where changed on the Grade 8 Reading subtest to equate Form A with Form B.

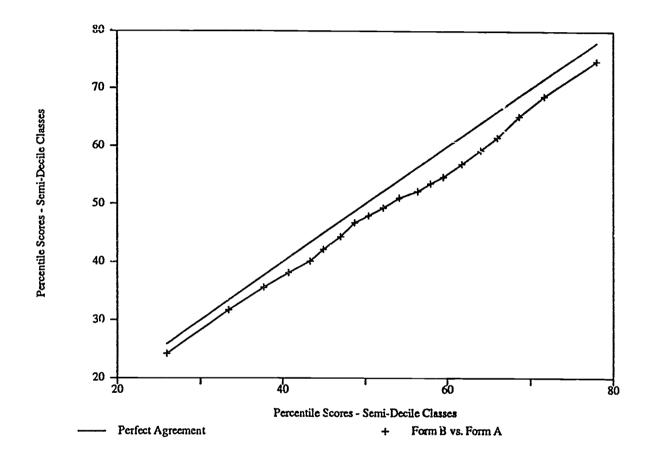

Figure 12. Equipercentile comparison of the Grade 8 MSDT Mathematics subtest Form A (administered statewide) with the field test Form B.

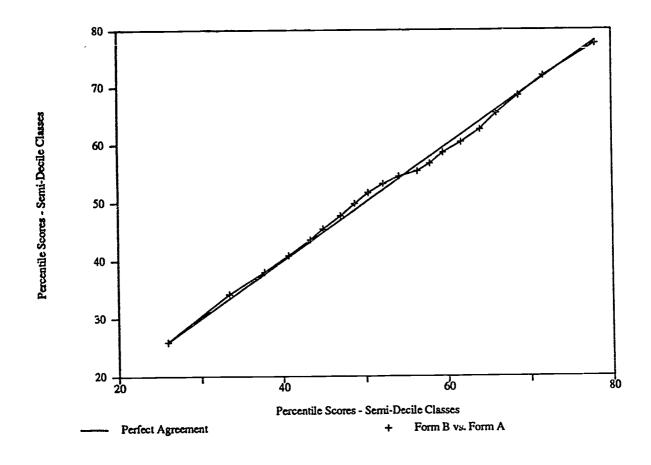

Figure 13. Equipercentile comparison of the Grade 8 MSDT Mathematics subtest Form A (administered statewide) with the revised field test Form B.

The Minimum Skills Diagnostic Tests for grades three, six, and eight each contain three subtests: Reading, Language Arts, and Mathematics. Each subtest contains 100 items, with the exception of the Grade 3 Mathematics subtest which contains 104 items. Within each subtest, objectives are represented randomly by items and are presented in objective order.

The appendices list each minimum competency objective at each grade level and its associated numerical item representation for each subtest on the Minimum Skills Diagnostic Tests (Forms A and B).

Tables 4 through 9 list the difficulty level for each item tested on Forms A and B of each subtest at each grade level in terms of the proportion of all students answering the item correctly.

#### TESTNORMS

Students who correctly answer all of the items on the Reading, Language Arts, or Mathematics subtests of the MSDT could be assumed to be students that do not need remedial instruction in the basic competency skills. If everyone answered all of the items correctly, however, a different interpretation would be placed on the scores. At some point, scores must have a reference grounded in the experience of all students. In some respects, at least, everything is good or bad by comparison. Norms tables provide that reference. Given a norms table, a student's score can be compared with other students' scores.

Norms tables commonly have two points of reference: a scale of percentiles and a scale of standard scores. The former permits the location of a score within percentile ranks; thus a student is said to have exceeded the performance of 80% of the students in the norm group (in this case third, sixth, or eighth grade students taking the Minimum Skills Diagnostic Tests in May 1986). The latter, standard scores, permits the location of a score within normally-distributed standard scores. This reference is appropriate if the student abilities are believed to be normally distributed. In a normal distribution, raw scores are given greater and greater weight as they diverge from the mean in either direction.

The choice of a metric for the standard score is arbitrary. To avoid inappropriate and confusing comparisons with some of the more common metrics, such as those employed in IQ scores or NCE scores, a metric having a mean of 50 and a standard deviation of 10 was chosen. Most curriculum research studies involving the summation of scores will find the standard score to be the basic statistic of choice.

The norms for student scores on the Minimum Skills Diagnostic Tests are given in Table 10 for the Reading subtests, Table 11 for the Language Arts subtests, and Table 12 for the Mathematics subtests. These scores set a baseline for comparison for present and future achievement in Reading, Language Arts, and Mathematics. Thus a student score in 1986, 1987, and future years can be referenced to the scores of all 1986 third, sixth, and eighth graders who took the MSDT in North Carolina.

#### APPENDIX A

#### MINIMUM SKILLS DIAGNOSTIC TESTS - GEADE 3

### Test Content and Item Representation by Objective

		No. Items		
Objective	Description	Form A	Form B	
Reading				
1.	Read a passage with a reading level of 3.1 and demonstrate comprehension of the main idea by selecting the best title for the passage.	15	13	
2.	Read a passage with a reading level of 3.1 and identify details stated in the passage.	17	15	
3.	Read a passage with a reading level of 3.1 and demonstrate comprehension of sequence by identifying the event that happens first or last in the passage.	15	17	
4.	Read a passage with a reading level of 3.1 and understand the story setting by identifying where the story took place.	17	11	
5.	Read a passage with a reading level of 3.1 and predict the most probable outcome of an event in the passage.	12	15	
6.	Read a passage with a reading level of 3.1 and identify either the cause or the effect of an explicitly stated cause/effect relationship occurring in the passage.	14	. 14	
7.	Read a passage with a reading level of 3.1 and select either a synonym, antonym, homonym, or a multiple meaning word for an underlined word in the passage.	10	15	

Objective	Description	No. 1 Form A	tems Form B
Language	•		
1.	Given a sentence, select the part of the sentence with a mistake in capitalization.		
	<ul> <li>a. Pronoun I</li> <li>b. First Word</li> <li>c. Names and Places</li> <li>d. Days and Months</li> <li>e. Words not to be capitalized</li> </ul>	7 8 4 10 10	7 8 4 10
2.	Given a sentence, select the correct way to punctuate it.		
	a. Comma b. Question mark c. Period d. Exclamation Point e. Comma and Period f. No punctuation needed	3 7 7 6 2 3	3 7 7 6 2 3
<b>ర.</b>	Given an incomplete sentence, the student will select the correctly spelled word to complete the sentence.	33	33
Mathemat	tics		
1.	Add three 1-digit numbers.	4	4
2.	Compare two numbers less than 100 without using symbolic notation.	4	4
3.	Order numbers less than 1000.	4	4
4.	Add two 2-digit numbers, regrouping ones.	4	4
5.	Add a 1-digit number to a 2-digit number, regrouping ones.	4	4
6.	Add three 2-digit numbers, regrouping ones.	4	4
7.	Add two 3-digit numbers with no regrouping.	4	4

		No. Items		
Objective	Description	Form A	Form E	
8.	Subtract two 2-digit numbers, regrouping tens.	4	4	
9.	Subtract a 1-digit number from a 2-digit number, regrouping tens.	4	4	
10.	Subtract two 3-digit numbers with no regrouping.	4	4	
11.	Use addition or subtraction to solve word problems appropriate to computational level.	4	4	
12.	Write the value of one dollar, dimes, and pennies.	4	4	
13.	Write the standard form for hundreds, tens, and ones.	4	4	
14.	Use repeated addition to develop multiplication facts in multiples of 2, 3, 5, and 10.	4	4	
15.	Multiply two 1-digit numbers, using facts through 25.	4	4	
16.	Use arrays to develop division facts through 35.	4	4	
17.	Use 1-digit numbers as factors and divisors, using facts through 25.	4	4	
18.	Use multiplication (facts through 25) to solve word problems appropriate to computational level.	4	4	
19.	Tell time to the nearest quarter hour.	4	4	
20.	Measure length to the nearest centimeter and inch.	4	4	
21.	Identify fractional parts of a region $(1/2, 1/3, 1/4)$ .	4	4	
22.	Identify cubes, cylinders, and spheres.	4	4	
23.	Identify circles, trimigles, squares, and rectangles.	4	4	
24.	Recognize ordinal numbers to tenths.	4	4	
25.	Extend sequence of given pattern.	4	4	
26.	Read and interpret bar and picture graphs.	4	4

# APPENDIX B MINIMUM SKILLS DIAGNOSTIC TESTS - GRADE 6

#### Test Content and Item Representation by Objective

Objective	Description	No. I Form A	tems Form B
Reading		,	
1.	Recognize synonyms and multiple meanings for words.	10	10
2.	Identify root words and affixes.	10	10
3.	Recognize word categories.	10	10
4.	Read a passage with a reading level of 5.0 and identify a detail stated in the passage.	14	11
5.	Read a passage with a reading level of 5.0 and identify the main idea.	11	12
6.	Read a passage with a reading level of 5.0 and identify the setting within the passage.	7	6
7.	Read a passage with a reading level of 5.0 and select the correct sequence of events in the passage.	10	11
8.	Read a passage with a reading level of 5.0 and identify either the cause or effect of a relationship within the passage.	9	10
9.	Read a passage with a reading level of 5.0 and select the best conclusion for the passage.	10	8
10.	Read a passage with a reading level of 5.0 and identify the characters' traits, attitudes, and actions.	9	1.2
Language			
1.	Identify a group of words as a sentence.	6	6
2.	Identify the correct spelling of words.	25	25

Objective	Description	No. I Form A	tems Form B
3.	Identify the correct plurals of nouns and verbs.	7	7
4.	Select forms of verbs to agree with subjects.	7	7
5.	Choose the correct pronoun to represent $n$ given noun.	7	7
6.	Choose the correct punctuation for a short paragraph.	15	15
7.	Capitalize correctly:		
	<ul> <li>a. The pronoun "I" and first words in sentences</li> <li>b. Names of persons and places, days of the week,</li> <li>and months of the year</li> </ul>	9 8	9 8
	c. Words not to be capitalized.	4	4
8.	Identify correct abbreviations.	6	6
9.	Locate information in directories and reference materials.	6	6
Mathema	tics		
1.	Write the standard form of a number up to millions.	3	3
2.	Compare numbers to millions.	3	3
3.	Add two 4- or 5-digit numbers with regrouping.	3	3
4.	Subtract two 4- or 5-digit numbers with regrouping.	3	3
5.	Multiply a 2-digit number or a 3-digit number by a 1-digit number with regrouping.	3	3
6.	Multiply a 3-digit number or a 2-digit number by a 2-digit number.	4	4
7.	Divide a 3- or 4-digit number by a 1-digit number with a zero in the quotient.	4	4
8.	Divide a 3- cr 4-digit number by a 2-digit number.	4	4

Objective		No. Items	
	Description	Form A	Form B
9.	Use an estimate to check the reasonableness of a given sum, difference, product, or quotient.	4	4
10.	Write decimals to thousandths.	4	4
11.	Add decimals to thousandths.	3	3
12.	Subtract decimals to thousandths.	3	3
13.	Write decimals greater than 1 using tenths and hundredths.	3	3
14.	Find the least common multiple of two numbers.	3	3
15.	Find the greatest common factor of two numbers.	4	4
16.	Write the simplest form for a fraction.	3	3
17.	Write a fraction or mixed number with a denominator of 10 or 100 as a decimal and a decimal as a fraction.	3	3
18.	Multiply two unit fractions or a fraction by a whole number.	3	3
19.	Multiply a mixed number by a fraction or a whole number.	4	4
20.	Multiply a decimal and a whole number or 2 decimals in tenths.	3	3
21.	Add fractions.	4	4
22.	Read and interpret bar, line, circle, and picture graphs.	3	3
23.	Add, subtract, multiply, and divide to solve word problems appropriate to computational level.	4	4
24.	Determine appropriate metric unit using centimeter, meter, or kilometer.	3	3
25.	Solve word problems involving money.	5	3

		No. Items	
∪bjective	Description	Form A	Form B
26.	Solve problems involving perimeter and area when a formula is given.	2	4
27.	Compare decimals.	4	4
28.	Find the average of a group of numbers.	4	4
29.	Identify angles, parallel lines, and perpendicular lines.	4	4

#### APPENDIX C

## MINIMUM SKILLS DIAGNOSTIC TESTS - GRADE 8

Test Content and Item Representation by Objective

Objective	Description	No. I Form A	Items Form B
Reading			
1.	Recognize synonyms and multiple meanings for words.	10	10
2.	Identify word meanings using context clues and identify root words and affixes.	10	10
3.	Recognize word categories.	10	10
4.	Read a passage with a reading level of 6.6 and identify a detail stated in the passage.	12	14
5.	Read a passage with a reading level of 6.6 and identify the main idea.	10	11
6.	Read a passage with a reading level of 6.6 and identify what is implied but not directly stated in the passage.	10	11
7.	Read a passage with a reading level of 6.6 and select the correct sequence of events in the passage.	10	10
8.	Read a passage with a reading level of 6.6 and select either the implied similarities of differences between characters, objects, or events in the passage.	8	6
9.	Read a passage with a reading level of 6.6 and select the best conclusion for the passage.	13	10
10.	Read a passage with a reading level of 6.6 and identify a statement about the passage as either fact or opinion.	7	8

		No. Items	
Objective	Description.	Form A	Form F
Language	•		
1.	Identify a group of words as a sentence.	6	6
2.	Identify the correct spelling of words.	24	24
3.	Identify tive correct plurals of nouns and verbs.	7	7
4.	Select forms of verbs to agree with subject.	7	7
5.	Choose the correct pronoun to represent a given noun.	7	7
6.	Choose the correct punctuation for a short paragraph.	15	5
7.	Capitalize correctly:		
	<ul><li>a. The pronoun "I" and first words in sentences</li><li>b. Names of persons and places, days of the week,</li></ul>	4 6	4 6
	and months of the year c. No capitalization needed.	5	5
8.	Identify correct abbreviations.	6	6
9.	Cocate information in directories and reference materials.	7	7
10.	Arrange sentences in the best logical order to form a coherent paragraph.	6	6
Mathema	tics		
1.	Write the standard form for numbers up to 12 digits.	4	4
2.	Round whole numbers to a designated place.	4	4
3.	Compare numbers to millions.	ò	5
4.	Round a decimal to a designated place.	4	4
5.	Compare decimals and fractions.	5	5
6.	Add, subtract, multiply, and divide whole numbers.	5	5

ERIC Full Text Provided by ERIC

Objective	Description	No. Items Form A Form B	
7.	Add, subtract, multiply, and divide decimals.	5	5
8.	Add, subtract, and multiply fractions.	4	4
9.	Write a fraction or mixed number with a denominator of 10, 100, or 1000 as a decimal and a decimal as a fraction.	5	5
10.	Multiply or divide a decimal by a power of 10.	4	4
11.	Divide two decimals, rounding quotient to the nearest tenth or hundredth.	4	4
12.	Estimate the sum, difference, product, or quotient of two whole numbers.	4.	4
13.	Write fraction, decimal, and percent equivalents.	4	4
14.	Find a percent of a number.	4	4
15.	Find what percent one number is of another number.	5	5
16.	Find the perimeter of a polygon.	5	5
17.	Find the circumference of a circle when given the formula $C = \pi d$ and the value for $\pi$ .	4	4
18.	Find the least common multiple (LCM) of two numbers.	4	4
19.	Find the greatest common factor (GCF) of two numbers.	5	5
20.	Determine appropriate metric units for length using centimeters, meters, or kilometers.	4	4
21.	Determine appropriate customary units for length using inches, yards, or miles.	4	4
22.	Write decimals greater than 1 using tenths and hundredths.	4	4
23.	Write decimals to thousandths.	4	4
