

A Semantic Ontology based Concept for Measuring Security Compliance of Cloud Service Providers

قياس الأمتثال الأمني لمقدمي الحوسبة السحابية مبني على مفهوم الأنتولوجي الدلالي

By

Mustafa Nouman Murad Al-Hassan

Supervisor

Dr. Mohammad Alharibat

This thesis is submitted to the Department of Computer Information Systems, Faculty of Information Technology, Middle East University in partial fulfillment of the Requirements for Master Degree in Computer Information Systems.

> Faculty of Information Technology Middle East University Amman, Jordan (August, 2013)

Examination Committee Decision

This is to certify that the thesis entitled "A Semantic Ontology based Concept for Measuring Security Compliance of Cloud Service Providers" was successfully defended and approved on August 25th 2013.

Authorization Statement

I'm Mustafa Nouman Murad Al-Hassan, authorize the Middle East University to supply a copy of my thesis to libraries, establishments or individuals upon their request.

Signature: 7 Letu Luco Date: 3/08/2013

Dedication

To the light of my life ... My Wife , My Son "Ali" And My Daughter "Ula" ..

Acknowledgement

I would like to express my sincere appreciation to Prof. Reyadh Naoum and Dr. Mohammad Alharibat for their guidance, support and motivation throughout my Master's Thesis.

Also I'am particularly grateful to Dr. Ahmed Kayed helping and encouraging my efforts during this research.

I owe more than thanks to my family members which includes my parents, my relatives and my wife's family for their financial support and encouragement.

For the past seven months, my son and daughter kept on reminding me to go to office and write the thesis! I'm very grateful to them.

Finally, and most importantly, I would like to thank my wife. Her support, encouragement, quiet patience and unwavering love were undeniably the bedrock upon which the past fifteen years of my life have been built. She was always there cheering me up and stood by me through the good times and bad. For her constant love, support, and remembering to feed me when I couldn't remember to feed myself!

Thank You All ..

Abstract

Cloud computing is Internet-based computing, whereby shared resources, software and information, are provided with computers and devices on-demand. It also makes security problems more complicate and more important for Cloud Service Provider (CSP) and consumer than before. International standard organizations issue security-related standards and guidance which can be used in cloud environment such as ISO/IEC 27001. This thesis explores the possibility to measure security compliance for data breaches threat based semantic similarity measure between the documents of standard compliments and CSP response against data breaches threat.

We developed a model that measures security compliance of CSP with the major international standard organization against data breaches threat.

Our model consists of three stages: (1) Extracting ontology concepts of CC threat (2) Extracting ontology concepts of CSP (3) Matching Process among the both ontology concepts. The matching process has done by using semantic similarity measure. Also during our study, we collected and studied many documents and reports that discussed data breaches threat. Then we classified it into group of (Control Area), identify the items that cover each control area. Also tested 5 CSPs to measure their security compliance by collection their data related to each control area; then convert it into text file in order extracting ontology concepts.

Our results were promising (0.885 %) Mean Square Error (MSE) between our measure and human judges.

Keywords: Cloud Computing, Security Compliance, Ontology Concept, Semantic Similarity.

الملخص

تعتمد الحوسبة السحابية على أستخدام الشبكة العنكوبوتية (الأنترنت) ، وبواسطتها يمكن مشاركة الموارد ، التطبيقات ، المعلومات ، يتم توفير ها مع أجهزة الحواسيب حسب الطلب. وهذا بالتأكيد يجعل أمن المعلومات أكثر خطر وعملية مهمة لكل من مقدمي الخدمة والزبائن أكثر من اي زمن مضى. هناك مجموعة من المنظمات الدولية (مثل ISO/IEC 27001) التي تضع المواصفات القياسية لأمن المعلومات يمكن استخدامها في بيئة الحوسبة السحابية. ان في أطروحتنا هذه نستعرض أمكانية قياس الأمني مئاركة ISO/IEC 27001) التي تضع المواصفات القياسية لأمن المعلومات يمكن استخدامها في بيئة الحوسبة السحابية. ان في أطروحتنا هذه نستعرض أمكانية قياس الأمنتال الأمني لمقدمي خدمة الحوسبة السحابية. مع هذه المواصفات القياسية ، فقد أخذنا قياس الأمتثال الأمني من ناحية تهديد الخروقات الأمنية. القياس الذي استخدمناه القياسية ، فقد أخذنا قياس الأمثال الأمني من ناحية تهديد الخروقات الأمنية. القياس الذي استخدمناه القياسية ، فقد أخذنا قياس الأمثال الأمني من ناحية تهديد الخروقات الأمنية. والامثال الذي المؤمن المواصفات القياسية ، فقد أخذنا قياس الأمثال الأمني من الحدمة والأمتثال القياسية مع هذه المواصفات القياسية ، فقد أخذنا قياس الأمثال الأمني المقدمي خدمة الحوسبة السحابية مع هذه المواصفات القياسية ، فقد أخذنا قياس الأمثال الأمني من ناحية تهديد الخروقات الأمنية. القياس الذي استخدمناه هو قياس تشابه دلالي بين مستندات مقدم الخدمة والأمتثال القياسي العالمي من ناحية تهديد الخروقات الأمنية. القياس الذي المنورة المواحنات الخروقات الأمنية القياسية الحربة الدوالية الخروقات الأمنية من ناحية تهديد الخروقات الأمنية من ناحية تهديد الخروقات الأمنية القياسية الدوالية الخروقات الأمنية المواحفات الدوالية الخروقات الأمنية المواحفات الدولية الخروقات الأمنية التواحفات الدولية الخرمة والأمتثال القياسي من ناحية تهديد الخروقات الأمنية الذي المواحفة الدولية الخرمة ما الخدمة ما الخدمة مع المنظمات الدوالية الخروقات الأمنية المواحفات الدولية الخرمي الغالية الخروقات الأمنية الدولية الخرمة ما الخدمة ما الخروفات الدولية الدولية الدولية الخرمة المواحفات الدولية الخرمة الدولية الحومة الخرمة ما الخرمة مع المنظمات الدولية الدولية الدولية الخرمة مع المواحفات الدولية الدولية الدولية الدولية الخرمة الولية الخرمية الخرمية

هذا النموذج يتكون من ثلاثة أقسام: (1) أستخراج مفهايم للتهديد المطلوب قياسه (2) أستخراج مفاهيم مزود الخدمة (3) عملية التطابق بين المفاهيم المستخرجة. وأستخدمنا قياس التشابه الدلالي في عملية التطابق. وخلال بحثنا هذا جمعنا ودرسنا العديد من المستندات والتقارير التي ناقشت تهديد الخروقات الأمنية وبالتالي صنفناها الى مجموعة من (منطقة تحكم) ، وعرفنا العناصر التي تغطي كل منطقة تحكم. وأختبرنا عدد (5) من مزودي خدمة الحوسبة السحابية لقياس مدى أمتثالهم الأمني من خلال جمع البينات المتعلقة بكل منطقة تحكم ثم تحوليها الى ملف نصي لأسترخاج مفاهيم الأنتولوجي.

نتائجنا توعد بنسبة خطأ (% 0.885) من خلال حسب متوسط مربع الخطأ ، بين قياسنا وحكم الأنسان.

CHAPTER ONE

Introduction

1.1 Overview

In this chapter we review the thesis. A brief background about the scope of the thesis is given; Cloud Computing, Cloud Computing security, and semantic similarity measure. Then we give an idea about our research problem and how it has been addressed, our own contribution, and the outline of the thesis chapters.

1.2 Cloud Computing

Cloud Computing (CC) is a term used to describe both a platform and type of application. As a platform it supplies, configures and reconfigures servers, while the servers can be physical machines or virtual machines. On the other hand, CC describes applications that are extended to be accessible through the internet and for this purpose large data centres and powerful servers are used to host the web applications and web services (Boss et al., 2007). CC (Almorsy M., 2010) provides the next generation of internet based, highly scalable distributed computing systems in which computational resources are offered 'as a service'. The most widely used definition of the cloud computing model is introduced by NIST (Peter Mell, 2011) as "a model for enabling ubiquitous, convenient, on-demand network access to a shared pool of configurable computing resources (e.g., networks, servers, storage, applications, and services) that

can be rapidly provisioned and released with minimal management effort or service provider interaction.".

Cloud Service Providers (CSPs) offer cloud platforms for their customers to use and create their web services, much like internet service providers (ISP) offer customers high speed broadband to access the internet. CSPs and ISPs both offer services. The cloud provides a layer of abstraction between the computing resources and the low level architecture involved. The customers do not own the actual physical infrastructure but merely pay a subscription fee and the CSP grants them access to the clouds resources and infrastructure. A key concept is that the customers can reduce expenditure on resources like software licenses, hardware and other services (e.g. email) as they can obtain all these things from one source, the CSP (Curran, K.,2011).

1.3 CC Security

CC is designed to be successful by reducing overhead and improving efficiency. With those improvements come the loss of control and possible security risk to the data (Townsend M., 2009) the leading U.S. market research firm Gartner released a report "Assessing the Security Risks of Cloud Computing" in June 2008. This report stated that cloud computing has great risk to data integrity, data recovery and privacy, etc. (Jing X, 2010).

There are still many open and interesting issues regarding CC paradigm and standards are still evolving. But, it is a general opinion that security is indeed one of the most important issues (Mell P.,2011). In the recent IDC report over 74.6% in 2008 (Figure 1.1) and 87.5% in 2009 (Figure 1.2) of users think that security is a dominant issue for widespread use of CC services.

Figure 1.1: Importance of Security for CC Environments 2008

Figure 1.2: Importance of Security for CC Environments - 2009

🟅 للاستشارات

Like traditional computing environments, CC brings risks and security concerns to the organizations that need to be considered appropriately. Such risks and security concerns include challenges in handling privileged user access, ensuring legal and regulatory compliance, ensuring data segregation, maintaining data recovery, difficulty in investigating illegal activities, and lack of assurance of long-term viability of the (CSP) (Kandukuri, B. R., 2009). CSP has recognized the cloud security concern and are working hard to address it. In fact, cloud security is becoming a key differentiator and competitive edge between cloud providers. By applying the strongest security techniques and practices, cloud security may soon be raised far above the level that IT departments achieve using their own hardware and software (Kumar V., 2012).

In CC environment, overall security issues can be evaluated from the points of CSP and the consumer. While the CSP focus on the continuity of their services against configuration updates for performance and QoS, spam and virus threats and proper customer accountability, clients mainly look for the security of their data and the reliability of the provider (Yildiz M.,2009).

Academics and security products manufacturers are actively studying CC data security (Shuanglin R., 2010). However there still exist many problems with cloud computing today. A recent survey shows that data security and privacy risks have become the primary concern for people to shift to cloud computing (Shuanglin R.,2012). Due to the above challenges and threats cloud customers therefore need to institute mechanisms to measure and improve the security of their information assets operating in the cloud. Among the alternatives available to the cloud customer for monitoring, measuring and hence improving information security of the assets managed in the cloud is to develop information security metric (Putri N. R.,2011).

1.4 Data Breaches Threat

A Data Breach is the intentional or unintentional release of secure information in an untrusted environment. Other terms for this phenomenon include unintentional information disclosure, data leak and also data spill (Wikipedia, 2013). In CC and according the Cloud Security Alliance (CSA) report "Top 10 threats in Cloud Computing" (Cloud Security Alliance, 2011); the data breaches threat is ranking No.5 in 2011 and No.1 in 2013 (Cloud Security Alliance, 2011); and it's in the high risk level Risk Matrix (Figure 1.3,1.4).

Figure 1.3: Data Breaches Threat Top Ranking 2013

Figure 1.4: Data Breaches Threat in very high in Risk Matrix

1.5 Security Compliance

Security compliance distinguishes it from security itself. While security refers to a mechanism that have to be used in order for a system to be in a safe state from

prospective threats, security compliance refers to a state of compliance with a given set of security requirements. Therefore, while security it is used to protect a system from threats, security compliance has nothing to do with this protection. Rather, security compliance ensures that the security measures taken to protect the system are compliant with the necessary requirements (Ullah K. W. ,2012). Klaus Julisch from IBM Research has defined the security compliance as follows (Julisch K., 2009) :

"Security compliance, in IT systems, is the state of conformance with externally imposed functional security requirements and of providing evidence (assurance) thereof."

These days security compliance generally indicates the compliance with industry accepted security standards such as NIST, ISO 270001/27002, HIPAA, PCI, etc. While compliance helps drive security, it does not equal actual security.

The 2011 Data Breach Investigation Report (Baker W., 2011) outlined the fact that noncompliance is one of the main reasons for data breaches in the Payment Card Industry (PCI). In this report, it was stated that 96% of the companies that suffered the breach have not achieved compliance with the PCI DSS. Only the remaining 4% of companies were still under attack despite having achieved the compliance with PCI DSS. This is a clear indication of how much difference can it make to have the security compliance.

1.6 Ontology and Semantic Similarity

Ontology; is an abstract description system for knowledge composition in a certain domain. By organizing concepts (terms) in a domain in a hierarchical way and describing relationships between terms using a small number of relational descriptors, an ontology supplies a standardized vocabulary for representing entities in the domain. (Jiang, R. 2013).

Semantic similarity is a concept whereby a set of documents or terms within term lists assign a metric based on the likeness of their meaning / semantic content. Various semantic similarity techniques are available which can be used for measuring the semantic similarity between text documents (Nagwani N.,2011).

This thesis explores the possibility to measure security compliance for data breaches threat based semantic similarity measure between the documents of standard compliments and CSP response against data breaches threat.

1.7 Problem Definition

The CC offers dynamically scalable resources provisioned as a service over the Internet. Each CSPs has own security requirements. We need to unify and measure the majority of cloud security compliance and requirements in order to the evaluate the level of the security of his cloud. This will lead to several problems to be identified as follows:

- 1- How can we classify the different parameters of CC threats?
- 2- How can we build a unified classification measure of the data breaches threat?
- 3- How to automate the measure (semantically) for the each CSP compliances to mitigate data breaches threats?
- 4- How to deploy semantic similarity measure to rank the CSP according CC threat.

1.3 Questions

This research represents a new approach in combining between CC security and ontology concept extraction in unified model that CSPs can benefit from this technology. Thus, this research will answer the following questions:

- 1. How can we identify the aspect of the cloud threat and challenges?
- 2. How can we extract ontology concept of each (Control Area) related to the threat?
- 3. How can we extract ontology concept of each CSP?
- 4. How can we measure the similarity concept between the above extract ontology concepts?

1.4 Contribution

This thesis contributes the following:

- Collections and classify data breaches of CSP security response against data breaches threat by using ontology concept.
- 2- Explains how to measure CSP security plans for different CC threats.
- 3- Support CSPs toward asset their security issues.

1.4 Motivation

CC is an evolving paradigm with lots of benefits. It can be seen as an integration of traditional computing technologies and network technologies. The CC security has become a hot topic in the industry and academic research. In particular data security is concerned with organizations and users which use cloud computing.

Thus motivates this to propose a new measure depend on matching of ontology concepts semantically in each CA of data breaches threat with CSPs.

1.5 Objectives of the Thesis

The main objective of this research is:

- 1. Unify security compliance against data breaches threat of CSP.
- 2. Provide cloud developers and users with a model to evaluate the security respond of different type of cloud.
- 3. Spread awareness of the security requirements for the CSP.
- 4. Collaborate with the researcher in the field to develop this research and the tool in the future.

1.6 Methodology

The methodology that will be used to develop our model contains the following phases:

- Study and Analysis Phase.
- Design and Implementation Phase
- Test Phase

Study and Analysis Phase

The first step in the studying and analysis will be the collection of data, acquiring information and knowledge for the following:

- 1- Different security issues in CC and focusing on the data security in CC and protect it from threats.
- 2- CSP's security response or their security actions against the security compliance.

3- Studying and understanding different traditional and CC security measure method.

Design and Implementation Phase

In this phase we are going to design a model and implantation it with the necessary collection data and information in order to create ontology concepts of data security for each parameter (CA) of it. Also create ontology concepts for the CSP security respond.

Test Phase

This phase consists testing our model, to effectiveness measure of CSP security responsiveness.

1.7 Organization of the Thesis

Chapter 2: Presents a theoretical background about the CC ,its security, semantic similarity matching measure and focusing on data security aspects, what is security compliance for CSP, what is the security measure method in cloud computing.

Chapter 3: Presents the process of applying the effectiveness measure the security of CC. Also describe in detail of our approach to measuring the CSP security actions.

Chapter 4: Presents in detail the component of our model and matching process in details also presents the experimental our proposed model.

Chapter 5: Conclusion and future works.

CHAPTER TWO

Literature Review & Related Works

2.1 Introduction

This chapter gives a brief idea about the most relevant work in the literature that relates to our study. We provide a background and literature review of the four main concepts covered by this research, namely, Cloud Computing, General Security Issued in CC, Data Security Issued in CC, Ontology and Semantic Similarity Measure. The most important related studies in the field of measurement CC security in Section 2.3. Finally, in Section 2.3, we present the tools that are used for our research.

2.2. Literature Review

This part investigation of existing study and research which is relevant to our theme and present some background reading required to give context to our research.

2.2.1 Cloud Computing (CC)

(Curran K., 2011) provided an overview of the key aspects of CC which has five key attributes which grant it some advantages over similar technologies and these attributes include: •Multitenancy (shared resources): Unlike previous computing models, which assumed dedicated resources dedicated to a single user or owner, cloud computing is based on a business model in which resources are shared at the network, host and application level. •Massive scalability: Cloud computing provides the ability to scale to tens of thousands of systems, as well as the ability to massively scale bandwidth and storage space. •Elasticity: Users can rapidly increase and decrease their computing resources as needed, as well as release resources for other uses when they are no longer required. • Pay as you go: Users pay for only the resources they actually use and for only the time they require them. • Self-provisioning of resources: Users self-provision resources, such as additional systems (processing capability, software & storage) and network resources.

(Zissis D, 2012) explained the available service model in CC: Infrastructure as a Service (IaaS) provides the consumer with the capability to provision processing, storage, networks, and other fundamental computing resources, and allow the consumer to deploy and run arbitrary software, Platform as a Service (PaaS) provides the consumer with the capability to deploy onto the cloud infrastructure consumer created or acquired applications, produced using programming languages and tools supported by the provider and Software as a Service (SaaS) provides the consumer with the capability to use the provider's applications running on a cloud infrastructure. These services are delivered and consumed in real-time over the Internet. Also this research

presents the CC four deployment models: Private Cloud, Public cloud, Hybrid cloud and Community cloud.

2.2.2 General Security Issue in CC

(Subashin S., 2011) surveyed of the different security risks that posed a threat to the cloud. Also surveyed more specifically to the different security issues that has emanated due to the nature of the service delivery models of a CC system and define the elements key for each. Security issues in SaaS: the following key security elements should be carefully considered as an integral part of the SaaS application development and deployment process: Data security, Network security, Data locality, Data integrity, Data segregation, Data access, Authentication and authorization, Data confidentiality, Web application security, Data breaches, Virtualization vulnerability, Availability, Backup, Identity management and sign-on process. Security issues in PaaS: in the PaaS model, the provider might give some control to the people to build applications on top of the platform. Hackers are likely to attack visible code, including but not limited to code likely to attack the infrastructure and perform running in user context. They are extensive black box testing. Security issues in IaaS : the security responsibilities of both the provider and the consumer greatly differ between cloud service models. Some CSP offering, includes vendor responsibility for security up to the hypervisor, meaning they can only address security controls such as physical security, environmental security, and virtualization security. The consumer, in turn, is responsible for the security controls that relate to the IT system including the OS. This survey also presented the current security solutions from several groups and organization are interested in developing security solutions and standards for the cloud. CSA is gathering

solution providers, non- profits and individuals to enter into a discussion about the current and future best practices for information assurance in the cloud.

(Jensen M., 2009) focused on technical security issues arising from the usage of Cloud services and especially by the underlying technologies used to build these cross domain Internet-connected collaborations. The authors presented a selection of issues of CC Security. They investigated ongoing issues with application of XML Signature and the Web Services security frameworks (attacking the Cloud Computing system itself), discussed the importance and capabilities of browser security in the Cloud Computing context (SaaS), raised concerns about Cloud service integrity and binding issues (PaaS), and sketched the threat of flooding attacks on Cloud systems (IaaS).

(**Che J.,2011**) the authors proposed some security strategies against common security issues of cloud computing. These security strategies as follows: (1) Securely Construction Strategies of Cloud Computing (a) Traditional Security Practice Mechanism (b) Virtualization Security Risks Assessment (c) Development Outsourcing Risk Control (d) Portability and Interoperability (2) Securely Operation Strategies of Cloud Computing (a) Business Continuity Assurance (b) Attack Proactive Alerting (c) Data Leak Prevention (d) Security Accident Notification & Response (e) Security Incidents Audit.

(**Parek M. D. H., , 2013**) this study is presented and so as to effectively refine the crude security issues under various areas of cloud. This study also aimed at revealing different security threats under the cloud models as well as network concerns to stagnate the threats within the cloud, facilitating researchers, cloud providers and end users for

noteworthy analysis of threats. Also represented the schematic diagram showing the hierarchy of the cloud computing, with security challenges as showing in Figure 2.1:

Figure 2.1: The hierarchy of the CC, with security challenges

(**Pal D. G., 2012**) proposed a framework consists of eight domains which can be further divided into sub domains. All these domains should comply with various regulations and government policies like SOX, FISMA, HIPAA, COBIT, ISO/IEC 27001/2, etc. accordingly. (Figure 2.1) shows their proposed framework for cloud security.

2.2.4 Data Security Issue in CC

This section presents the necessary theoretical background for understanding the data security aspects and challenges in CC:

(Malik A., 2012) this paper defined a methodology for cloud providers that will protect users' data, information which is of high importance. When data deleted without any backup or encoding key loss/unauthorized access, data is always in danger of being lost or stolen. To provide a solution for this, we need to: • Implement fault free API access control. •Mechanism used for encryption and protection of data should be secure. •Data

protection analysis done at both design and run time. •Provider backup and preservation strategies must be defined.

(Shuanglin R., 2012), put forward management ideas of user data classification and designed a cloud-based data security policy through user demand for data security protection. The whole strategy is divided into technical support and management to protect the entire strategy more effective. (1) Technical support section (a) Strong Authentication (b) Classification of data evaluation (c) Filtering sensitive information (d) CC security gateway (2) Management to protect (a) To establish a safety management system (b) To establish rules and regulations (c) Safety education.

(Yuefa D., 2009) built a data security model for cloud computing. The model used three level defence system structure, in which each floor performs its own duty to ensure that the data security of cloud layers. The first layer: responsible for user authentication, the user of digital certificates issued by the appropriate, manage user permissions. The second layer: responsible for user's data encryption, and protect the privacy of users through a certain way. The third layer: The user data for fast recovery, system protection is the last layer of user data.

(Mohamed E. M., 2012) proposed a new data security model (in the previous research) based on studying of cloud computing architecture. The model used three-layer system structure. The first layer: responsible for user authentication, almost this is two factor authentications. The second layer: responsible for user's data encryption, and protect the privacy of users through a certain way by using one symmetric encryption algorithms. Also allow protection from user. The third layer: The user data for fast recovery this

depends on the speed of decryption. They implemented software to enhance work in a data security model for cloud computing. This software provided to the cloud provider and implemented with two factor authentication. This software compares between eight modem encryption algorithms. This comparison based on Statistical Tests to get the most security algorithms. This software gets the faster and the highest security algorithm based on cloud infrastructure. They proposed to CSP the suitable, more security encryption algorithm to its platform. Finally, by this evaluation the authors ensured that data retrieve faster to the user and ensure security of user data. In addition, they make software to the cloud user. This software allows user to choose between eight encryption algorithms to ensure data security. This software gives the cloud user some advices to select the most security or most security and faster algorithm that suitable to its cloud infrastructure.

(Chen Z., (2010) discussed the evolvement of CC paradigm and present a framework for secure CC through IT auditing. The research approach is to establish a general framework using checklists by following data flow and its lifecycle. The checklists are made based on the cloud deployment models and cloud service models. The contribution of the paper is to understand the implication of cloud computing and what is meant to secure cloud computing via IT auditing rather than propose a new methodology and new technology to secure cloud computing. Their checklist focuses on the following: Data location Aware, Data ownership aware, Data protection plan and best practice, Data processing isolation, Data Lock-in, IaaS IT architecture, Regulatory Compliance.

(**Dai Yuefa W. B., 2009**) the authors built a data security model for cloud computing. The model used three level defense system structure, in which each floor performs its own duty to ensure that the data security of cloud layers. The first layer: responsible for user authentication, the user of digital certificates issued by the appropriate, manage user permissions. The second layer: responsible for user's data encryption, and protect the privacy of users through a certain way. The third layer: The user data for fast recovery, system protection is the last layer of user data.

(EI-Khameesy N., 2012) highlighted the security aspects of data storage from perspectives of threats and attacks from one side and approaches for solutions from the other side. The paper proposed an effective and flexible security policy and procedure with explicit data support, including block update, delete, and append. Control Access Data Storage that includes the necessary policies, processes and control activities for the delivery of each of the Data service offerings. The collective control Data Storage encompasses the users, processes, and technology necessary to maintain an environment that supports the effectiveness of specific controls and the control frameworks. The Security, correctness and availability of the data files being stored on the distributed cloud servers must be guaranteed by the following: • Providing Security Policy & Procedure for Data Storage. • Defense in Depth for Data Storage in cloud computing. • Layer 1 – Devices on the Storage Network. • Layer 2 – Network connectivity.

2.2.5 Ontology and Semantic Similarity Measure

(Jiang, R. 2013) defined the Ontology; is an abstract description system for knowledge composition in a certain domain. By organizing concepts (terms) in a domain in a hierarchical way and describing relationships between terms using a small number of

relational descriptors, an ontology supplies a standardized vocabulary for representing entities in the domain. They reviewed a majority of existing methods that rely on ontologies to calculate semantic similarity between terms. Authors classified existing methods into five categories: methods based on semantic distance, methods based on information content, methods based on properties of terms, methods based on ontology hierarchy, and hybrid methods.

(Talib A. M, 2012) presented the semantically structure of cloud computing security knowledge, an ontology based security approaches have been increasingly adopted by several expertise from diverse security domains. CC issues represent the main class concept (Figure 2.3) containing several sub concepts such as Legal Issues, Flexibility/Elasticity, Compliance, Open Standard, Security, Freedom, Reliability and Privacy. Slots (not shown in the figure) are attributes associated with a class.

Also explained a generalization and specification ontology for the (Cloud Data Storage) security can be met. They have described an OWL-based ontology with its core concepts cloud asset, cloud threat, security goal, cloud users and CSPs. All the core concepts are subclasses or instantiated to provide the domain vocabulary of information security. Ontology can be developed based on three main steps, 1) domain, purpose and scope setting, 2) important terms acquisition, classes and class hierarchy conceptualization and 3) instances creation. Their approach used to enhance the security goals, CSPs and cloud users collaborations, and ontology to maintain consistency within a heterogeneous cloud computing environment.

(Michelizzi J., 2005) described the different types of the semantic similarity: 1) Path Length Similarity Measures: a- Path b- Wu & Palmer c- Leacock & Chodorow 2) Leacock & Chodorow 2) Information Content Similarity Measures: a- Resnik b- Lin c-Jiang & Conrath 3) Semantic Relatedness Measures a- Extended Gloss Overlaps (Adapted Lesk) b- Context Vectors c- Hirst & St-Onge. Also define the WordNet as a machine readable dictionary created at the Cognitive Science Laboratory at Princeton University. Unlike most dictionaries, WordNet contains only open-class words (nouns, verbs, adjectives, and adverbs). WordNet does not contain closed-class words such as pronouns, conjunctions, and prepositions.

(**Budanitsky**, **2006**) proposed to evaluate similarity measurements based on WordNet. However, the authors have evaluated five measurements lexical semantics distance. The authors mentioned that most of their work was limited to the narrower notion of similarity measures. These relationships include not just hyponymy and the nonhyponymy relationships in WordNet such as meronymy but also *associative* and *ad*

hoc relationships. As the authors mentioned, these can include just about any kind of functional relation or frequent association in the world.

2.2 Related Work

(Fenz S., 2010) proposed a methodology for automatically generating ISO 27001-based IT-security metrics and showed how the security ontology can be used to generate concrete and organization-specific knowledge regarding existing control implementations. In the example of ISO 27001, author showed that the developed methodology supports organizations in evaluating (1) their compliance to information security standards, and (2) the effectiveness of existing control implementations.

The authors took some concept from this research to create ontology for the controls of the data breaches threat on the CC base on major compliance international standards.

(Tariq M. I., 2012) discussed security issues of cloud computing, and proposed basic building blocks of information security metrics framework for cloud computing. The information security metrics framework has four major stages: 1) Metrics Preparation the IS metrics preparation phase involves information security metrics development team to develop useful information security metrics. 2) Threat Identification and Analysis The 2nd Phase of this proposed framework is about threat elicitation and analysis. In this phase, the threats are identified from information security metrics and different techniques like threat tree are applied to analyze the threat 3) Threat Processing After Analysis of threat, this phase is defined different activities that help cloud users to process on identified IS threats. This phase is very critical & technical and required due concentration of the threat solving team.4) Application The last act of this framework focuses on the use of the security metrics and threat severity levels by

the decision makers. They evaluate the security and take suitable actions. This research determined the (Drive information security metrics) and (Security requirements) in phase 2 from standard and guide for guidance in metric development. The author was using the majority of this guidance as data security requirements in this project. The author has mentioned a set of international accepted frameworks; standards and guides are available for guidance in metrics development. IT Infrastructure Library (ITIL) and Control Objectives for Information and related Technology (CobiT) are renowned frameworks. International Organization for Standardization (ISO) has ISO/IEC 27002 information security and control standards which also can be used to drive information security metrics. At present, SANS has also published an information security metrics.

(**Bhensook N., 2012**) presented an initial attempt to assess security requirements compliance of CSP by applying the Goal Question Metric (GQM) approach to quality measurement and defining a weighted scoring model for the assessment. The security goals and questions that address the goals are taken from CSA, Cloud Control Matrix (CCM) and CAIQ (Figure 2.1), then transform such questions into more detailed ones and define metrics that help provide quantitative answers to the transformed questions based on evidence of security compliance provided by the cloud providers. The scoring is weighted by the quality of evidence, i.e. its compliance with the associated questions and its completeness. This research proposed scoring system architecture.

Figure 2.4: Relation between GQM, CCM, and CAIQ

(Luna J., 2011) this paper presented the view on the importance and challenges of developing a security metrics framework for the Cloud, also taking into account ongoing research with organizations like the Cloud Security Alliance (CSA) and European projects like ABC4Trust, CoMiFin and INSPIRE. The authors also introduced the basic building blocks of a proposed security metrics framework for elements such as a CSP security assessment, taking into account the different service and deployment models of the Cloud.

Figure 2.5: Basic building blocks of the proposed security metrics framework for the Cloud

2.3 Software Used in the Research

We used many tools in order to reach some necessary results, below is a brief description of those tools used in this research:

2.5.2 KAON TextToOntoTool

TextToOnto (Maedche A., 2001) is a tool suite built upon KAON in order to support the ontology engineering process by text mining techniques; providing a collection of independent tools for both automatic and semi-automatic ontology extraction (Figure 2.2).

Figure 2.6: The front-end of the KAON TextToOnto Tool

WS4J provides (Figure 2.3) a pure Java API for several published Semantic Relatedness/Similarity algorithms¹.

	(WordNet Simil	10 arity for Java) measures semantic similarity/relatedness between words.

CHAPTER 3

Data Extraction Ontology Concepts

3.1 Introduction

In this chapter we will show in detail the steps of our approach to design a model of measuring the CC security semantically. In this study we will discuss the aspects related to the data breaches threat in CC to gathering the necessary data that covered its parameters to be measured. Also will discuss the preparation of documents to extracting the ontology concepts of the data breaches threat in order to match them with CSP response against that threat semantics. The research mentioned above consists of two stages as shown in Figure 3.1:

Figure 3.1: Stages of preparing CC security measurement

Our approach aims to measure the CSP security response, by matching semantically his response with international standard compliance.

We have begun with The CSA CCM (Cloud Security Alliance, 2013); it's specifically designed to provide fundamental security principles to CSP and to assist prospective cloud customers in assessing the overall security risk of a CSP. The CSA CCM provides a controls framework that gives a detailed understanding of security concepts and principles that are aligned with the CSA guidance in 13 domains. The foundations of the CSA CCM rest on its customized relationship with other industry-accepted security standards, regulations, and control frameworks such as the ISO 27001/27002, COBIT, PCI DSS... etc). The CSA documents are the foundation of our data collection.

3.2 Extracting Data Breaches Threat Ontology Concepts

This step to studying the aspects related to data breaches threat from the standpoint of major international standard (Ullah K. W., 2012) . Then we collected the documents that describe the target domain.

3.2.1 Classification of Data Breaches Threat

It is not easy to identify the classification of the security threats in CC. We searched and reading many documents (academic research, white papers, technical report... etc.) related to data breaches threat. Our start point was the latest CSA report called "A Security Guidance for Critical Areas of Focus in Cloud Computing V3.0"; this report shows us the outline of the beginning to identify the classification of the data breaches threat in CC. The data breaches in CC associated with the (11) parameters called Controls Area (CA) (Cloud Security Alliance, 2013) as shown in Table 3.1. The full specifications of each CA for data breach threat:

No.	Control Area (CA)	Control ID	Control Specification
1	Data Governance - Retention Policy	DG-04	Policies and procedures for data retention and storage shall be established and backup or redundancy mechanisms implemented to ensure compliance with regulatory, statutory, contractual or business requirements. Testing the recovery of backups must be implemented at planned intervals.
2	Data Governance - Secure Disposal	DG-05	Policies and procedures shall be established and mechanisms implemented for the secure disposal and complete removal of data from all storage media, ensuring data is not recoverable by any computer forensic means.
3	Data Governance - Non- Production Data	DG-06	Production data shall not be replicated or used in non-production environments.
4	Data Governance - Information Leakage	DG-07	Security mechanisms shall be implemented to prevent data leakage.
5	Data Governance - Risk Assessments	DG-08	 Risk assessments associated with data governance requirements shall be conducted at planned intervals considering the following: Awareness of where sensitive data is stored and transmitted across applications, databases, servers and network infrastructure Compliance with defined retention periods and end-of-life disposal requirements Data classification and protection from unauthorized use, access, loss, destruction, and falsification
6	Information Security - Encryption	IS-18	Policies and procedures shall be established and mechanisms implemented for encrypting sensitive data in storage (e.g., file servers, databases, and end-user workstations) and data in transmission (e.g., system interfaces, over public networks, and electronic messaging).
7	Information Security - Encryption Key Management	IS-19	Policies and procedures shall be established and mechanisms implemented for effective key management to support encryption of data in storage and in transmission.

Table 3.1: The specification of the classification for data breaches threat

No.	Control Area (CA)	Control ID	Control Specification
8	Security Architecture - User ID Credentials	SA-02	 Implement and enforce (through automation) user credential and password controls for applications, databases and server and network infrastructure, requiring the following minimum standards: User identity verification prior to password resets. If password reset initiated by personnel other than user (i.e., administrator), password must be immediately changed by user upon first use. Timely access revocation for terminated users. Remove/disable inactive user accounts at least every 90 days. Unique user IDs and disallow group, shared, or generic accounts and passwords. Password expiration at least every 90 days. Minimum password length of at least seven (7) characters. Strong passwords containing both numeric and alphabetic characters. Allow password re-use after the last four (4) passwords used. User ID lockout after not more than six (6) attempts. User ID lockout duration to a minimum of 30 minutes or until administrator enables the user ID. Re-enter password to reactivate terminal after session idle time for more than 15 minutes. Maintain user activity logs for privileged access or access to sensitive data.
9	Security Architecture - Data Security / Integrity	SA-03	Policies and procedures shall be established and mechanisms implemented to ensure security (e.g., encryption, access controls, and leakage prevention) and integrity of data exchanged between one or more system interfaces, jurisdictions, or with a third party shared services provider to prevent improper disclosure, alteration or destruction complying with legislative, regulatory, and contractual requirements.
10	Security Architecture - Production / Non-Production Environments	SA-06	Production and non-production environments shall be separated to prevent unauthorized access
11	Security Architecture - Remote User Multi-Factor Authentication	SA-07	or changes to information assets. Multi-factor authentication is required for all remote user access.

Table 3.1: The specification of the classification for data breaches threat

32

3.2.2 Data Collection

In this section we will talk about data collection of the compliance items issued from major international standard organizations. These items are associated with the classification of the data breaches threat (Cloud Security Alliance, 2013) as shown in Table 3.2.

Control	Control	Scope	Applicability from In	ternational Sta	ndard Organ	izations

Table 3.2: Compliance Map for Classification of Data Breaches Threat

We have collected the details of each compliance item and related item in the above table into Text file for each CA separately. This means has collected (11) Text files in order to use them in the next section.

3.2.3 Extracting Ontology Concepts

These steps involved extracting ontology concepts; this word isn't easy and protracted procedure. We need to extract the ontology concepts for each CA of the data breaches threat; in order to do this task should be considered about the information knowledge. We has converted each of CA documents (as mentioned above) into a text file, we used KAON TextToOnto tool in order to extract the ontology concepts.

We are talking about the first CA called (Retention Policy) as an example; we added the prepared text corpus (from related documents) to the tool by using the new corpus function as showing in Figure 3.2.

Figure 3.2: Create new corpus function using KAON TextToOnto Tools

Later we used the (New Term Extraction) function in order to extract concepts from the

provided text corpus as showing in (Figure 3.3).

Figure 3.3: New Term Extraction function using KAON TextToOnto Tool

This tool extracts concepts using parameters; we set the frequency threshold parameter to 5,8,10,12,15 and 20 (Figure 3.4), the number of words for retrieving concepts that on one unique word as a term. The results were 64,42,37,31,27 and 24 concepts respectively. We refined the results of extraction ontology concepts by applying an elimination process for stopping words and characters (it, c, g... etc.). Then the results of the concept after refining process are 57, 37,30,29,23 and 20 concepts respectively.

3.3 Cloud Service Provider Security Issue

This section describes the data collection for CSP data breaches threat security action and countermeasures, then extracting the ontology concepts.

3.3.1 Data Collection

We visited different CSP websites and read what they published (documents, sites, white papers.. etc) regarding their security issues and countermeasures. These documents need to read and analysis carefully because some technician points are contained as indirect answers. And in the other hand some CSPs published a few lines regarding their security issues and countermeasures. It leads us to find more clear information. Our research will include five providers: Amazon Web Service (AWS), Windows Azure, Krescendo, CloudSigma and License12. These providers are chosen based on the availability level of data describes security issues, different service, size (small, medium and large), also AWS and Windows CSPs are certified from different international organizations and included the top 100 CSPs ranking (Cloud Times and TalkinCloud); the last three CSPs are out on those ranking web sites. During collection data procedure we associate any terms or items necessary to be defined by more information in the Text file as possible, as showing in Figure 3.4.

Figure 3.5: Data Collection Procedure of CSP

Here we took AWS and collected their response documents against (Retention Policy); according the above figure we collected the text file. The AWS response it was²:

"AWS provide customers with the ability to delete their data. However, AWS customers retain control and ownership of their data so it is the customer's responsibility to manage data retention to their own requirements. Refer to AWS Overview of Security Processes Whitepaper for additional details - available at http://aws.amazon.com/security".

3.3.1 Extracting Ontology Concepts

In this section we extracted ontology concept for a CSP response for each CA. Practically, we extracted ontology concept for the AWS response (as mentioned above) by using the TextToOnto KAON tool for this task. We got (11) concepts as Table 3.3 with frequency threshold (1):

² http://media.amazonwebservices.com/AWS Risk and Compliance Whitepaper.pdf

AWS Concepts	AWS Concepts
availability	privacy
backup	relation
data	retention
database	storage
law	time
option	

Table 3.5 : Results of extracting ontology concepts for AWS

AWS Concepts	AWS Concepts
availability	privacy
backup	relation
data	retention
database	storage
law	time
option	

Threshold Frequency=1

It's necessary to get more accurate concepts when associates the above text (AWS response) with more information (Figure 3.4) regarding the (Retention Policy) from the AWS website as mentioned in their "http://aws.amazon.com/security" response. Then we got (18) concepts as Table 3.4 with frequency threshold (2):

44

Table 3.6 : Results of extracting ontology concepts for AWS

AWS Concepts
production
recovery
relation
retention
service
storage
time

Threshold Frequency=2

We repeated the preceding steps for all CSP with their response for each CA, as shows in Table 3.6. The extracted concept number differs from one CSP to another depending on the collected document size.

The details of the final step, matching process between concepts which we present how calculate the matching percentage is mentioned in the next chapter.

Chapter 4

Proposed Model and Matching Process

4.1 Overview

This chapter explains, in detail, the use of the proposed model. This will be done through the design and implementation of A Reference Model to Measure the Effectiveness of CC Security. This model measures the security compliance of the CSP semantics and matching their response to major international compliance guidance.

4.2 Proposed Model

Our proposed model consists of three phases:

- 1) Extracting ontology concepts of CC threat.
- 2) Extracting ontology concepts of CSP.
- 3) Matching Process between both ontology concepts.

4.2.1 Phase One

The goal of this part is to get the ontology concepts extractions for each CA. We have taken 11 CA in our study. These CAs describe their specifications in CCM (Appendix B)

4.2.1.1 Cloud Threats

In this work have addressed which CC threat can be measured. As mentioned earlier we studied the (Data Breaches Threat), CSA reported "TOP 10 CC Threats in 2013", and (Data Breaches Threat) was the 1st threat should be considered from CSPs and consumers. In this report can be defined the main parameters (CA) that cover this threat.

4.2.1.2 Cloud Control Area

This section addressed by two parts:

- 1- Cloud Control Matrix (CCM): This is designed to provide fundamental security principles to guide CSP and to assist prospective cloud customers in assessing the overall security risk of a CSP. The CCM provides a controls framework that gives a detailed understanding of security concepts and principles that are aligned to the Cloud Security Alliance guidance in 13 domains" (Cloud Security Alliance, 2013).
- 2- Consensus Assessments Initiative Questionnaire (CAIQ): This effort is focused on providing industry-accepted ways to document what security controls exist in IaaS, PaaS, and SaaS offerings, providing security control transparency, and it's associated with CCM for more descriptions about CA with questions (Cloud Security Alliance, 2011).

4.2.1.3 Compliance Guidance

This part represents a several international standard compliance guidance items that associated with each CA, complete items presented in Appendix B.

4.2.1.4 Miscellaneous Related Guidance

This part of several efforts has already taken place to offer guidance for cloud security. These include (Winkler, V. J. 2011):

- 1- Security Guidance for Critical Areas of Focus in CC V3.0: Published in 2011 presented security guidance for a number of areas in cloud computing; these include architecture, governance, traditional security, and virtualization. (Cloud Security Alliance, 2011).
- 2- Domain 12: Guidance for Identity & Access Management V2.1: Published in April 2010 discusses the major identity management functions as they relate to cloud computing. This work forms a cornerstone of the CSA's Trusted Cloud Initiative (Kumaraswamy, S., 2010).
- 3- Cloud Computing: Information Assurance Framework: Published in November 2009. Presents a set of assurance criteria that address the risk of adopting cloud computing (Catteddu, D., 2009).
- 4- The Federal CIO Council's Proposed Security Assessment and Authorization for U.S. Government Cloud Computing. The core importance of this document is that it adopts the NIST 800-53R3 security controls for cloud computing in low- and moderate-risk systems (Council I. A., 2012).

4.2.1.5 Data Source

It contains a set of the text files which are collected from the above documents.

4.2.1.6 Cloud Security Ontology Concepts (for each Control Area):

It contains the ontology concept extraction (by KAON TextToOnto Tool) for each CA separately, in our work we were extracted ontology concepts for 11 CA (Appendix C).

4.2.2 Phase Two

The goal of this part is to get the ontology concepts extractions for each CSPs response. We have taken 5 CSPs in our study.

4.2.1.1 CSP Security Response

It contains a different security response or actions of the CSPs for their compliances for each CA. We have taken 5 CSPs and searches to find 55 responses.

4.2.1.2 Data Source

It contains a set of the text files which are collected from the above section.

4.2.1.3 Cloud Security Ontology Concepts (for each Control Area):

It contains the ontology concept extraction (by KAON TextToOnto Tool) for each CSPs has a response for 11 CA separately, in our work we were extracted 55 state of ontology concepts totally. (Appendix C).

4.2.3 Phase Three

This is the last component, it presents the matching process between the each output of the ontology concepts in part1 with the each output of the ontology concepts in part2 (Figure 4.2), then present the results.

The symbolic description of the (Figure 4.2) is :

$CA_1 \dots CA_n$:	Ontology concepts of CC Threat "Control Area CA"
CA' ₁ CA' _n	:	Ontology concepts of CSP response for each CA
MP ₁ MP _n	:	Semantic similarity measure between concepts of CA and
		CA'
m ₁ m _n	:	Results (Total Measure Ratio)
n	:	Number of CA

4.2.3.1 Matching Process

As mentioned before about the matching concept extraction. We have used:

First:

Exact matching between the concepts extractions as below; we took for ontology concepts (e.g., CA_1 and CA'1):

No.	Concepts	No.	Concepts	No.	Concepts	No.	Concepts
1	access	16	documentation	31	organization	46	risk
2	area	17	example	32	paper	47	security
3	assessment	18	facility	33	part	48	service
4	audit	19	framework	34	period	49	site
5	availability	20	guidance	35	plan	50	software
6	backup	21	handle	36	point	51	storage
7	business	22	identification	37	policy	52	store
8	capability	23	impact	38	process	53	supplement
9	contingency	24	incident	39	protection	54	support
10	control	25	information	40	record	55	system
11	critic	26	infrastructure	41	recovery	56	test
12	data	27	integrity	42	response	57	time
13	disaster	28	list	43	restoration		
14	disposal	29	loss	44	resumption		
15	disruption	30	management	45	retention		

Table 4.1: Ontology Concepts for CA₁ "Retention Policy"

No.	Concepts	No.	Concepts
1	availability	16	service
2	backup	17	storage
3	business	18	time
4	capacity		
5	data		
6	database		
7	enforcement		
8	instance		
9	law		
10	option		
11	period		
12	production		
13	recovery		
14	relation		
15	retention		

Table 4.2: Ontology Concepts for AWS response (CA'₁) "Retention Policy"

When we see for the above two tables and matching measure between the concepts, we find (11 from 18) concepts are exact matching (in the gray highlight).

In order to compute the matching ration:

Exact Matching Ratio =
$$\frac{\text{No. of Concepts by Exact Matching}}{\text{No. of Concepts of CA'1}}$$
(1)

Exact Matching Ratio = $\frac{11}{18}$

Exact Matching Ratio = 0.611

Second:

We applied Semantic Similarity Measure (SSM) for matching between concepts by using WS4J Tool (Figure 4.3). We have used similarity measure developed by Lin (Lin,

LIN

D., 1998) and it is intended to be useful in nearly any environment (Warin, M., 2004) with accepted correction value is (0.834) and it is range (0-1) (Jarmasz M., 2012).

Figure 4.3: Sample for using Lin Similarity Measure for AWS by WS4J Tool

After applied the Lin similarity measure we found (4) new concepts are similar with variant similar correction value (Table 4.3):

AWS Concepts (CA' ₁₎	Ontology Concepts for CA ₁	Lin Similarity Measure (Correction Value)
database	list	1
instance	example	1
production	business	0.9209
relation	part	0.9182

 Table 4.3: Correction value for new (4) concepts

We used the below equation In order to compute the total measure ratio $(m_1...m_{11})$:

Total Measure =
$$\frac{\text{No. of Concepts by Lin Similarity Mesure}}{\text{No. of Concepts of CA'1}}$$
 (2)

Total Measure $=\frac{15}{18}$

Total Measure = 0.833

We applied the above equations for all CSP, and compare it with human judges (professors, doctors, and practitioners we asked them during our study) (Table 4.4 - Table 4.8)

No.	СА	Human Ratio	Total Measure Ratio (m ₁ m ₁₁)	Exact Matching Ratio	No. of Concepts by SSM	No. of Concepts

4.3 Experimental Results and Discussion

1- We have computed the total error among human judge's ratio and total measure ratio $(m_1 ... m_{11})$ by using Mean Square Error (MSE):

$$MES = \frac{\sum_{n}^{1} (Human Ratio - Total Measure Ratio)^{2}}{n} \times 100$$

Table 4.9 and Figure 4.4 presents the error percentage using MES for all CSPs of (11 CAs)

Threat Domain	Error Percentage (%)							
	AWS	Azure	License12	Krescendo	CloudSigma			
Data Breaches	1.268	1.164	0.480	1.135	1.776			
Average Error	1.165 %							

Table 4.9: Average Error for MSE (11 CAs)

Figure 4.4: Average Error for MSE (11 CAs)

We note that the error percentage of (License12) is (0.480%) about the half percentage from other CSPs due its security compliance's for (8) CAs. Therefore, we have computed the error percentage for the (8) participates CAs.

2- Table 4.10 and Figure 4.5 present the error percentage using MES for all CSPs of (8 CAs).

Threat Domain	Error Percentage (%)									
	AWS	Azure	License12	Krescendo	CloudSigma					
Data Breaches	0.861	0.797	0.480	1.090	1.195					
Average Error	0.885 %	0.885 %								

 Table 4.10: Average Error for MSE (8 CAs)

Figure 4.5: Average Error for MSE (8 CAs)

The error percentage of (AWS) and (Azure) have decreased, and the last two CSP remained almost the same percentage. We believe due availability of the published security compliance documents.

3- Table 4.11 and Figure 4.6 presents the measurement comparison between human and our measure (Total Measure).

Threat		Average (%)									
Domain	AWS		Azure		License12		Krescendo		CloudSigma		
	Human	SSM	Human	SSM	Human	SSM	Human	SSM	Human	SSM	
Data				- 4 4				40.0			
Breaches	90.5	80.3	84.5	74.6	56.3	52.1	55.5	49.9	41.4	41.5	

Table 4.11: Average Error for MSE (8 CAs)

The highest score of the security compliance is for (AWS) and (Azure) due they are certified from international standard organizations that support our measure.

4.3 Validation

We have validated and compared our approach measurement with other approach. This approach presented in paper (Bhensook N., 2012) by using Goal Question Metric Approach (GQM). The authors used CCM (Cloud Security Alliance, 2013); each domain as goal, used some metrics by questions then make score for each answer. Authors have scored two domains for example in their experimental approach on AW (G-compliance = 20%.) and (G-05 Information Security = 40%.), these scores for example to use their approach. The reliability of assessment results depend on the security information that is provided by cloud providers and experts questions.

CHAPTER FIVE

Conclusions and Future work

5.1 Conclusions

1- The reliability of the semantic measure result depends on the security information that is provided from CSP.

2- CSPs do not disclose more about his security issues.

3- The highest score to security compliance is for CSP (AWS and Azure), due they has certified from the major international standard organizations (Table 4.11).

4- Number of ontology concepts assigns the level of the security compliance.

5- Uncertified CSP has a limitation for their security response.

6- Human Judge Percentage score some time less than our semantic similarity measure in uncertified CSP due limitation for their security information (Table 4.7).

7- Some concepts matching have full matching by using Lin similarity measure (Table

4.3) that enhances our measure.

5.2 Summary

1- In our research we studied the CC, its security, ontology concepts and the semantic similarity measure. Also presented the importance of the CC security.

- 2- We defined data breaches threat in CC and classified its parameters. These parameters are (11) called (Control Area) are covered data breaches threat; each (Control Area) is a part with domain of (Cloud Control Matrix).
- 3- In order to extracting ontology concepts, we collected data (documents, reports, white papers... etc) for both (Control Areas) and CSP then prepared text corpora from them to be used in a tool to extract them. In our study we have taken (5) CSP. Then converted all documents into Text file.
- 4- Extraction ontology concepts for the (11) CA and CSPs security action for each CA. that is mean we worked (11) ontology concepts for (CA) and (55) ontology concepts for CSPs. Then we refined them from stopping words.
- 5- We have matched the concepts first with exact matching then by semantic similarity measure (by Lin similarity measure) among the concepts of (Control Area) and CSPs. Then we checked the enhancement among them.
- 6- We presented the results for each CSPs and CA, the total error is (0.885 %) Mean Square Error.

5.3 Future Work

Through conducting this research, many ideas and issues were unfolded but not accomplished yet because of time, resources, and other constraints. We would like to suggest a few ideas for future study:

- 1- Possibility to use our approach to measure other CC threats (like Account Hijacking, Data Loss ... etc) semantically.
- 2- Build full otology domain for each CA as security requirements.
- 3- Providing full coverage for all ontology domains, to let the measure be more accurate and reliable.
- 4- Develop a graphics user interface to present the results.
