ABSTRACT

This report describes the students who graduated from the Virginia Community College System (VCCS) between July 1974 and June 1975 in terms of demographic characteristics, types of awards granted, curricula, credits earned, and length of time to earn awards. Data for the 6,051 graduates were provided by each of the VCCS community colleges. The data indicated: (1) 58% of the graduates were men; (2) 13% were minority group students; (3) nearly half received the Associate of Applied Science degree while one in three graduates earned an Associate of Arts or Associate of Science degree; (4) occupational-technical graduates accounted for two-thirds and transfer graduates one-third of all awards granted; (5) men and women differed with regard to curricular programs, with men predominantly selecting engineering, public service, and agriculture/natural resources, and women constituting the large majority of graduates in health services, communications/media, and business curricula; (6) a greater proportion of whites than minority graduates selected transfer curricula; (7) overall median age of graduates was 23.5 years; (8) almost half of the graduates fulfilled their program requirements in the traditional two year period while one in four graduates took more than three years to complete their program. Tabular data on graduates' characteristics are appended. (JDS)

INTRODUCTION

This is the second annual report on the graduates of the Virginia community colleges. Information about graduates is vital because it provides one measure of the quality and quantity of the colleges' output. By routinely collecting and assessing graduate data, information about graduates is regularly available for institutional program evaluation, statewide planning, and manpower forecasting. Over a number of years, accumulated information on graduates will provide, in part, the basis for comparing successive populations of community college graduates and for tracing their personal and career development.

The major purpose of this and last year's report is to describe the graduates of Virginia's community colleges in terms of demographic characteristics, types of awards granted, curricula upon graduation, credits earned, and length of time to earn awards. This report has an additional purpose involving, in certain instances, the comparison of 1973-74 with 1974-75 graduate data. Comparisons of the graduate data from the two populations have been presented in the narrative and through tabulations and graphs.

The primary users of this report will be the educational planners, administrators, and instructors in the colleges. The report will also be useful to other persons interested in the colleges' operation and output.

Information for this report was submitted by each of Virginia's 23 community colleges on all students who graduated between July 1, 1974 and June 30, 1975. The findings on the 6,051 graduates who were awarded degrees, diplomas, and certificates are presented in the next section. The report concludes with a summary and a complete set of tables located in Appendix A.

FINDINGS

The findings on 1974-75 graduates are presented in the following order: sex, race, and age; types of awards earned; curriculum; credits earned; and length of time to complete an award.

Sex, Race, and Age

During the 1974-75 year, 6,051 students graduated from Virginia community colleges (Table 1). Of these graduates, 58 percent were men and 42 percent were women. Overall, there were 87 percent white and 13 percent minority graduates.

For 1974-75, the 6,051 graduates represent an increase of 16 percent over the 5,227 graduates of the previous year. The changes in the sex and racial composition of graduates from 1973-74 to 1974-75 are recorded in Figure 1.

Over the two year period, the proportion of white men decreased somewhat and the proportion of white women rose slightly. Male and female minority proportions also increased slightly. In 1974-75, men comprised 60 percent of whites whereas among minorities, 56 percent were women (Table 2).

Graduates represented a wide range of ages. Figure 2 shows the percentage of graduates within age groups for 1973-74 and 1974-75. Although the largest single age group continued to be 21 years or younger, the percentage of graduates within this age group decreased somewhat over the two year period. In 1974-75, graduates who were 30 years or older comprised more than one quarter of the total population. The median age for all graduates was 23.5 years (see Appendix B for methods to determine median). It is evident that the colleges are serving a diverse population in respect to the ages of graduates.

Types of Awards Earned¹

The AAS degree was awarded to almost half of the 1974-75 graduates (Table 3). One in three graduates earned an AA or AS degree. The certificate was awarded to 16 percent of the total group; and the diploma, to two percent of the graduates.² During the past two years, the proportions for types of awards distributed to graduates have remained mostly unchanged.

The distribution of awards among men and women is revealed in Figure 3. Nearly half of all men and women earned the AAS degree. More men than women were awarded AS degrees, whereas women more often than men received the AA degree. On a proportional basis, women were more likely to be awarded certificates and men, diplomas.

¹The community colleges in Virginia offer five types of awards. The Associate of Arts (AA) and the Associate of Science (AS) programs are designed to lead to transfer to a baccalaureate program. The Associate of Applied Science (AAS) programs are designed to provide competence for employment in a general occupational field and to include general education. The diploma award normally represents a two-year program which usually includes limited general education and provides employment competence in a specific field. Certificate programs generally require one to less than two years' study and provide competence in a specific job or family of jobs.

²Diploma programs are not widely available in the Virginia Community College System.

Figure 1. Sex and Racial Composition of 1973-74 and 1974-75 Graduates

Figure 2. Age Distribution of Graduates for 1973-74 and 1974-75

Some differences appear when types of awards are examined by race (Table 3). A greater proportion of whites than minorities received AAS, AS, and diploma awards. Equal percentages of whites and minorities earned the AA degree. More minority graduates than whites received certificates.

Figure 4 presents types of awards as earned by each sex and racial group. Greater proportions of white men and women were granted AA and AS degrees than their minority counterparts. The AA and AS degrees were earned, in fact, by about percent more white men than minority men and by 15 percent more white than minority women. Almost equal percentages of all groups earned the AAS degree, with the exception of minority women, who received a smaller proportion of AAS degrees. No white women and only one percent of the minority women were awarded the diploma. The largest percentage of certificate graduates were minority women. White men earned the fewest certificates on a proportional basis.

In examining the distribution of awards by sex and race, the findings indicate that more minorities, especially women, than whites chose programs which were designed for fast entry into the job market. More whites were enrolled in programs which allowed for formal education beyond the community college.

The following tabulation presents the distribution of awards across age groups (Table 4).

	<u>Up to 21</u>	<u>22-24</u>	<u>25-29</u>	<u>30-34</u>	<u>35 and Above</u>	<u>Total</u>
AA	46%	19%	15%	8%	12%	100%
AS	32	18	19	15	16	100
AAS	35	20	19	11	15	100
Diploma	46	24	16	5	9	100
Certificate	41	15	17	9	18	100

The tabulation shows that AS and AAS graduates are distributed across all age groups. AA and diploma graduates tend to be younger than the average graduate age. Certificate graduates tend to include more of the very young, up to 21, and the oldest, 35 and above. The 1974-75 data, like those of 1973-74, support the conclusion that the community colleges serve citizens of all ages, in many types of programs.

Curriculum

On the section above, the graduate population was assessed by types of awards earned. This section examines graduates according to their curricular program preferences. In 1974-75, occupational-technical graduates accounted for two-thirds of all awards granted and college transfer, one-third. The two-to-one ratio of awards distributed to occupational-technical and college transfer graduates for 1973-74 and 1974-75 was identical.

In the Virginia Community College System, 151 different occupational-technical curricula were offered (Table 5). Figure 5 shows the percentages of graduates by curricular groups.

Figure 3. Sex Distribution of 1974-75 Graduates By Type of Award

Figure 4. Types of Awards By Sex and Racial Groups, 1974-75

Figure 5. The Distribution of Graduates By Occupational-Technical Curricula

As noted previously, two-thirds of all graduates had taken occupational-technical programs. Of the 67 graduates, the largest percentage were in business, followed by engineering, health services, and public service. The agriculture/natural resources program and the communications/media program were each represented by one percent of the graduates.

Men and women tended to select different curricular programs (Table 6). The distribution of curricular choices by sex are displayed in the following tabulation:

<u>Curricular Group</u>	<u>Men</u>	<u>Women</u>	<u>Total</u>
Occupational-Technical	66%	44%	100%
Agriculture/Natural Resources	6%	5%	100
Business	15	57	100
Communications/Media	1%	61	100
Engineering	92	5	100
Health Services	1%	87	100
Public Service	77	24	100
College Transfer	6	53	100

Men represented the majority in both occupational-technical and college transfer programs, and they comprised the larger majority in college transfer. Engineering was predominately selected by men, as were public service and agriculture/natural resources. Women were the large majority of graduates in health services, communications/media, and business curricula.

Curricular preferences differed by race (Table 7). A greater proportion of white than minority graduates selected college transfer curricula. More minority graduates chose occupational-technical curricula. Whites were more frequently represented in engineering and agriculture/natural resources programs, while minorities were more prevalent in business and public service. Equal proportions of whites and minorities selected communications/media and health services programs.

The following tabulation presents the median age of graduates by curricular groups:

<u>Curricular Group</u>	<u>Median Age</u>
Occupational-Technical	23.3
Agriculture/Natural Resources	21.4
Business	22.2
Communications/Media	22.0
Engineering	25.0
Health Services	25.9
Public Service	28.4
College Transfer	24.1
Overall Median	23.5

College transfer graduates were almost a year older than occupational-technical graduates.

Among occupational-technical programs, public service graduates were the oldest group by far, and agriculture/natural resources graduates were the youngest (Table 8).

Graduates who were enrolled in occupational-technical curricula received either AAS, diploma, or certificate awards (Table 9). Of the AAS graduates, 42 percent were in business, 20 percent were in engineering, 19 percent in health services, and 15 percent in public service. Two percent of the AAS graduates were distributed into each of the agriculture/natural resources and communications/media programs. Most of the diploma graduates, 86 percent, had been enrolled in engineering programs, while eight percent or less of the diploma graduates completed communications/media, business, agriculture/natural resources, and public service programs. No diploma graduates were in health services. Certificates were distributed across occupational-technical programs with 42 percent of these awards accruing to graduates of business, 28 percent to engineering, 16 percent to health services, and 14 percent to public service programs. No certificates were awarded to agriculture/natural resources graduates, and only one graduate earned a certificate in communications/media.

Credits Earned

For the 1973-74 and 1974-75 years, the number of credits that graduates earned varied considerably by type of award (Table 10). Almost all of the AA/AS and AAS graduates earned more than 96 credits. This corresponds closely to the minimum of 97 credits required for these awards. Credit requirements for diplomas and certificates differed according to the program and the college. Seventy-two percent or nearly three-fourths of the diploma graduates earned more than 110 credit hours. A majority of certificate graduates, 58 percent, compiled between 46 and 95 credits.

These data should be interpreted carefully. Often the number of credits a student compiles in earning a specific award may be greater or fewer than the VCCS requires for the award. For example, students who change programs may accumulate more credits than are required for an award, while students who transfer to the community college may have fewer credits reported for them than were actually earned. Other reporting disparities are known to distort the relationship between the number of credits earned and those required for an award.

Length of Time to Complete an Award

The time required for 1973-74 and 1974-75 graduates to complete their awards varied according to program credit hour requirements and student persistence (Table 11). The following tabulation compares AA/AS, AAS, and diploma graduates with certificate graduates, in terms of length of time taken to complete an award:

<u>Length of Time</u>	<u>Percent of AA/AS, AAS, and Diploma Graduates</u>	<u>Percent of Certificate Graduates</u>
Through 1 Year	2	20
Over 1 to 2 Years	46	50
Over 2 to 3 Years	27	20
Over 3 to 4 Years	11	5
Over 4 to 5 Years	7	2
Over 5 Years	7	3

Almost half of the AA/AS, AAS, and diploma graduates fulfilled their program requirements in the traditional two year period. About one-fourth took an additional year, and the remaining fourth took more than three years.

Certificate graduates generally took less time to complete their programs. One in five finished in a year or less, and three-fourths finished by the end of the second year. One in four graduates took more than two years to complete their programs.

These data should also be interpreted cautiously. It is not unusual for a certificate program at one college to have the same or similar requirements as a diploma program at another college, the major difference being nomenclature.

It appears that students at Virginia's community colleges take more than the minimal -- and traditional -- time required for a full-time student to earn an award. Separate data on full-time and part-time students who graduated were not available and therefore prevent further interpretation.

SUMMARY

During the 1974-75 year, 6,051 students graduated from Virginia community colleges, an increase of 16 percent over the previous year. Of the 1974-75 graduates, 58 percent were men and 42 percent were women. Racial minorities comprised 13 percent of the graduates. Half the graduates were under age 23.5 (median), and of the total group, 36 percent were age 21 or younger.

In regard to sex, race, and age characteristics, some differences were noted between the 1973-74 and 1974-75 graduate populations. Women and minorities comprised a slightly larger proportion of graduates in 1974-75 than in 1973-74. The percentage of graduates 30 years of age or older rose from 23 percent in 1973-74 to 25 percent in 1974-75.

The Associate of Applied Science degree, which is an occupational-technical award, was earned by nearly half of the 1974-75 graduates. Two-thirds of the graduates were in occupational-technical programs.

Some differences appeared in the male and female selection of types of degrees. Almost equal proportions of men and women were awarded the AAS degree. More men than women earned diplomas while women received a larger proportion of certificates. For graduates of college transfer programs, women were more frequently granted the AA degree; and men, the AS degree.

An examination of types of degrees granted to white and minority graduates revealed that large percentages of both groups earned the AAS degree. More whites than minorities were granted college transfer degrees, while minorities earned a larger proportion of certificates. A small proportion of both white and minority graduates received diplomas. Graduates among all age groups were granted substantial numbers of each type of award.

Among occupational-technical programs, business was the curriculum most often selected by graduates, followed by engineering, health services, and public service. The agriculture/natural resources program and the communications/media program were each represented by one percent of the graduates.

When occupational-technical programs were examined according to male and female graduate preferences, it was found that men predominated in the engineering, public service, and the agriculture/natural resources curricula. Health services, communications/media and business programs were primarily selected by women.

Differences were found in the curricular preferences of white and minority graduates. Whites were more frequently represented in engineering and agriculture/natural resources, while minorities were more prevalent in business and public service. Equal proportions of whites and minorities selected communications/media and health services programs.

Graduates generally took more time than the traditional two years to fulfill their program requirements. Half of the associate degree and diploma graduates completed their programs within a two year period. One-fourth took an extra year, and the remainder took more than three years.

APPENDIX B

PROCEDURES FOR CALCULATING MEDIAN AGES OF 1973-74 AND 1974-75 GRADUATES

In 1973-74 and 1974-75, the Research and Evaluation staff obtained comparable results from different sets of procedures used in calculating graduates' median ages. The difference in procedures arose from computing medians from uneven interval data in 1973-74 and even interval data in 1974-75.

Each approach in calculating medians assumes that the large majority of community college students graduate in June of each academic year. It is further assumed that 1974-75 graduates born in 1953 would not be just 22 years of age but would range in ages from 21.5 to 22.5 years. This relationship between student year of birth and age at graduation is represented in the table below:

Relationship Between Years of Birth
and Ages at June 1975 Graduation

Both approaches utilize the standard statistical method for determining medians.

Determining Medians from Uneven Interval Data

The median ages of 1973-74 graduates were interpolated from graduate data grouped into five age categories: up to 21, 22-24, 25-29, 30-34, 35 and above. This method is shown in the steps below:

Determine the number of graduates within each age group.

<u>Age Groups</u>	<u>No.</u>	<u>Cumulative</u>
Up to 21	2153	2153
22-24	1123	3276
25-29	1110	4386
30-34	722	5108
35 and Above	943	6051
	<u>6051</u>	

Divide the total number of graduates by 2 to locate the median class interval.

Apply the formula for determining medians.

$$\text{Median} = \frac{\frac{n}{2} - \sum_{j=0}^{m-1} f_j}{f_m} (U-L) + L$$

where n = total number of graduates
 $\sum_{j=0}^{m-1} f_j$ = sum of graduates up to the median class
 f_m = number of graduates in median class
 U = upper boundary of median class
 L = lower boundary of median class

$$\text{Median} = \frac{\frac{6051}{2} - 2153}{1123} (24.5 - 21.5) + 21.5$$

The median is 23.8 years.

Determining Medians from Even Interval Data

The median ages of 1974-75 graduates were interpolated from graduate data by year of birth. The calculations involved in this procedure are presented below:

Determine graduates' years of birth.

<u>Year of Birth</u>	<u>No.</u>	<u>Cumulative</u>
1959	2	2
1958	-	2
1957	7	9
1956	106	115
1955	1129	1244
1954	910	2154
1953	547	2701
1952	325	3026
.	.	.
.	.	.
1900	.	6051
	<u>6051</u>	

Divide the total number of graduates by 2 to locate the median class interval.

Apply the same formula for determining medians.

$$\text{Median} = \frac{\frac{6051}{2} - 2701}{325} (23.5 - 22.5) + 22.5$$

The median is 23.5 years.
