Correction

The abstract in the article entitled "Central Pontine Myelinolysis in a Patient with Adrenal Insufficiency" by John E. Brunner, MD (Henry Ford Hosp Med J 1985;33:45-7) should read:

Central pontine myelinolysis is a demyelinating process that has occurred in association with rapid correction of hyponatremia. Presented here is the case of a patient who had adrenal insufficiency and who experienced signs of central pontine myelinolysis after rapid correction of severe hyponatremia (28 mEq/L rise in sodium concentration during the first 24 hours, initial serum sodium level 97 mEq/L). Sustained hyponatremia correction are discussed as possible risk factors in the development of central pontine myelinolysis.
