Committee:

James E. Hooker, Professor - Chair Person Laura J. Moriarty, Ph.D., Assistant Professor Wayne R. Conners, M.Ed., Instructional Media Designer

> Virginia Commonwealth University Richmond, Virginia Presented November, 1995

Acknowledgements

I wish to personally acknowledge and thank several people whose help made this thesis possible. I sincerely apologize to anyone I may have inadvertently omitted.

I would like to express my gratitude and appreciation to the three members of my thesis committee. To Professor Jim Hooker - Chair Person, for all his Thursday night trips to the FBI Academy at Quantico, Virginia. Professor Hooker brought a new understanding and meaning to Attila the Hun. To Doctor Laura Moriarty for her instructional ability concerning research methodology matters. Doctor Moriarty's patience and enthusiasm was greatly appreciated. And Mr. Wayne Conners for his writing expertise, suggestions and many telephone calls.

A debt of gratitude is owed to Ms. Kathy Turner for her time, wordperfect skills and proof reading ability. Ms. Turner was always available to help recover my manuscripts after the computer vaporized them. Her efforts and attention to detail are gratefully acknowledged.

Finally, I would like to acknowledge the conscientious work done by Lieutenant Dennis Wilson, Supervisor of the Fairfax County Police Department's Cold Case Squad. Lieutenant Wilson's experience of investigating homicides will contribute to additional resolution of unsolved cases.

Dedication

This thesis is dedicated to the three persons who mean the most to me in my life. To my eight year old son Zac, four year old daughter Becky and thirty something year old wife Shelley. Several times during the course of my graduate program Zac and Becky highlighted my text books with crayons and edited my thesis drafts with magic markers. Their contributions will hold a special place in my heart and will never be forgotten. Successfully completing this graduate program would not have been possible without Shelley's years of patience and support. Shelley placed a great deal of faith in my ability to complete this thesis and graduate program.

And in memory to those innocent victims of homicide and their surviving families, who must find the strength to go on without their loved ones. May justice prevail.

Abstract

"COLD CASE" INVESTIGATIONS WITHIN FAIRFAX COUNTY:
TURNING THE LIABILITY OF TIME INTO AN ASSET

By: Rodney L. Gohn, Master of Science

A thesis submitted in partial fulfillment of the requirements for the degree of Master of Science at Virginia Commonwealth University.

Virginia Commonwealth University, 1995.

Director: James E. Hooker, Professor Department of Criminal Justice

No department or individual involved in the investigation of homicides is ever going to have a 100% closure rate. Therefore, many departments will be faced with a situation where another homicide happens before they are finished handling the previous one.

How does one manage these open cases; how often are they reviewed; and who is responsible once the assigned detective is either transferred or leaves the unit or department? Someone has to be able to answer questions from the family, media and anyone else who might inquire about the case.

Based on the number of unsolved homicide cases within Fairfax County, the concept of a "Cold Case Squad" was explored. During January 1995, the Fairfax County Police Department implemented a Cold Case Squad consisting of one supervisor, three veteran detectives, two auxiliary police officers and one cadet. The Cold Case detectives inherited approximately 75 unsolved homicides which occurred in Fairfax County, Virginia, from 1964 through December 31, 1994. More than half of the unsolved homicides (42) have occurred in the past nine years.

The hypothesis for this thesis was: The formulation of a Cold Case Squad would measurably reduce the number of unresolved homicides within Fairfax County. The primary evaluation factor for the thesis was the Cold Case Squad's "close-ability" rate.

The thesis identified and evaluated nine solvability factors utilized by the Cold Case Squad Supervisor. The solvability factors are considered when prioritizing case investigation, assigning personnel to an investigation and suspending investigate efforts. One of the goals for utilizing solvability factors is to develop a clear profile of cases with the most potential for close-ability.

The study population for this thesis is the 42 unsolved homicides which have occurred in Fairfax County, Virginia, between January 1, 1986, and December 31, 1994. Solvability factor work sheets were completed and computated for the study population.

The hypothesis has been proven as there is a measurable reduction in the number of unsolved homicides. From the study population, two cases have been closed by arrest, one case closed by exceptional means and one case is pending approval from the Commonwealth Attorney's Office to obtain arrest warrants. These four cases represent a 9.5% reduction of unsolved cases within the study population.

A copy of this thesis was given to the Cold Case Squad Supervisor for review and application. It is hoped the research from this thesis will be applied to the Cold Case Squad so it will become more effective and continue to turn the liability of time into an asset.

The Lord God said...

Thou Shalt Not Kill

THE FIFTH COMMANDMENT Book Of Exodus The Holy Bible

THE OATH OF PRACTICAL HOMICIDE INVESTIGATION

HOMICIDE INVESTIGATION IS A PROFOUND DUTY. AS AN OFFICER ENTRUSTED WITH SUCH A DUTY, IT IS INCUMBENT UPON YOU TO DEVELOP AN UNDERSTANDING OF THE DYNAMICS AND PRINCIPLES OF PROFESSIONAL HOMICIDE INVESTIGATION.

PRACTICAL HOMICIDE INVESTIGATION SUGGESTS THAT "THINGS BE DONE RIGHT THE FIRST TIME," AND "KNOWLEDGE IS POWER." KNOWLEDGE WHICH HAS BEEN ENHANCED WITH EXPERIENCE, FLEXIBILITY AND COMMON SENSE.

PRACTITIONERS MUST BE PREPARED TO USE TACTICS, PROCEDURES AND FORENSIC TECHNIQUES IN THEIR PURSUIT OF THE TRUTH; AND THEN FOLLOW THE COURSE OF EVENTS AND THE FACTS AS THEY ARE DEVELOPED TO THEIR ULTIMATE CONCLUSION.

DEATH INVESTIGATION CONSTITUTES A HEAVY RESPONSIBILITY, AND AS SUCH, LET NO PERSON DETER YOU FROM THE TRUTH AND YOUR OWN PERSONAL COMMITMENT TO SEE THAT JUSTICE IS DONE, NOT ONLY FOR THE DECEASED, BUT FOR THE SURVIVING FAMILY AS WELL.

AND REMEMBER: "YOU ARE WORKING FOR GOD."

Lt. Cmdr. (Ret.) Vernon J. Geberth
New York City Police Department
Commanding Officer
Bronx Homicide Task Force
1988

Chapter One

The Problem and Its Setting

Introduction

Photographs of their smiling faces are packed away in dusty boxes, but they still haunt the investigators who tried to catch their killers. Farnum L. Burton was discovered 20 years ago at the bottom of a pond. Heidi Berg was shot six times in the back while jogging in 1984. Jeannie Herholtz was strangled in her car at a shopping center in 1987.

At an all-too-steady pace, new names are added to the list of unsolved homicides. Robin Warr Lawrence, stabbed to death in her Springfield home in November; Jenning Kettleson, gunned down outside a Centreville movie theater in January -- and even so investigators rarely have time to look back. But this is about to change.

The Fairfax County Police Department has recently added a four-person "Cold Case Squad" to their Homicide Section to specifically investigate unsolved homicides. Fairfax County has approximately 75 unsolved homicides dating back as far as 1964. There are several more

suspicious "undetermined" cause of death cases that were considered closed which will now be reinvestigated.

It is hoped the passage of time may help in many of the cases. As years go by, relationships change. People divorce. Witnesses once reluctant to come forward may have a change of heart.

Technology is improving on a daily basis. New forensic technology may give today's detectives tools so they can use once-marginal evidence. Through DNA analysis, useless blood stains from the past suddenly may reveal a killer. Through more sophisticated laboratory detection what once appeared to be a clean surface on a murder weapon now may yield a fingerprint.

Overall, Fairfax County's number of homicides has remained unchanged during the past eight years (1987 through 1994), holding steady at an average of 21 homicides per year, a small number for a county with a growing population of more than 840,283 residents.

Nevertheless, it is anticipated the Cold Case

Squad will resolve more "whodunit" homicides by

utilizing solvability factors to help prioritize cases

that with a little more information, can be solved.

Demographics of Fairfax County

The Fairfax County Police Department is the largest, local law enforcement agency in the Commonwealth of Virginia. Presently, the department has authorized staffing for 1,042 sworn personnel and 421 non-sworn personnel (Statistical Information, 1994).

Fairfax County is approximately 399 square miles in size and is an affluent suburb of Washington, D.C. The most recent income computations available (Statistical Information, 1994) for Fairfax County residents were as follows:

- Median family income (1991) \$70,000
- Median household income (1991) \$61,000
- Per capita income (1991) \$29,937

The median housing value for calendar year 1994 in Fairfax County (<u>Statistical Information</u>, 1994) was calculated at:

Single f	amily	detached	\$222,050
Townhous	e		\$142,483
Condomin	ium		\$86,615
All unit	S		\$184,400

Population data for both Fairfax County as a whole, (including Dulles, Vienna, Herndon and Fort Belvoir) and the Fairfax County Police Department service area only is presented in Table One.

Base year (1995 and 2000) population estimates were provided by the Fairfax County Office of Research and Statistics: population data for other years was interpolated from the base year data.

Population figures reflect estimates, as of

January 1 of each year as prepared by the Office of

Research and Statistics.

Changing demographics, increasing business activity and accompanying affluence have produced different crime trends. All of these factors have combined to shape the Fairfax County Police Department as it is today.

Ensuring the safety of the hundreds of thousands of people who live and work in Fairfax County is an enormous responsibility and a monumental job. To stay

in step with these changes, the department has responded in several key ways. It has grown in size, become more specialized and improved its training programs. The department also continuously submits to self-evaluation as well as to scrutiny by outside organizations in further improving the services it provides. One of the very first law enforcement agencies in the country to receive national accreditation, the Fairfax County Police Department maintains its quality and integrity through ongoing reaccreditation procedures, and has become a model by which other police departments evaluate their own levels of service. Table Three provides the reader with a comparison of the Fairfax County Police Department to other police departments within the Washington Metropolitan area.

Table Three

Overview of Investigative Responsibilities Within Fairfax County

Most police departments have established guidelines and procedures which will allow the organization to function efficiently within their jurisdictional purview. The structure of the department and how it is organized to perform investigative functions will determine which units are responsible for conducting criminal investigations.

¹ Information has been provided by the individual police jurisdictions as noted. This budgetary information is part of a statistical package presented by the Fairfax County Police Department, Planning and Research Bureau.

Due to the diverse nature of criminal complaints reported to the Fairfax County Police Department and the various complexities which may arise during investigations, it is necessary to delineate the areas of investigative responsibility. Normally, the preliminary investigation begins when the first police officer arrives at the scene and continues until a postponement of the investigation or transfer of investigative responsibility is made. There are two levels or transfers of investigative responsibility within the Fairfax County Police Department.

Criminal Investigation Sections: The first transfer of investigative responsibility involves those crimes commonly referred to as "crimes against property," ie. burglary, larceny, vandalism and so forth. These crimes are investigated at station level by Criminal Investigation Section (CIS) detectives.

Each of the seven district stations has a Criminal Investigation Section and their detectives investigate all crimes against property incidents that occur within their district (General Order 501.2, 1994). Crimes against property scenes are normally processed for physical evidence by squad/station evidence

technicians. Station evidence technicians are trained and equipped to take still photographs of scenes and powder process for latent prints.

Criminal Investigations Bureau: The second transfer of investigative responsibility is for crimes commonly referred to as "crimes against person," ie. abduction, homicide, malicious wounding, robbery, sexual assault and so forth. These crimes against person incidents are investigated by a centralized Criminal Investigations Bureau (CIB) detective (General Order 501.2, 1994). No matter where the crime against person incident occurred within Fairfax County, a Criminal Investigations Bureau detective will respond for the investigation. When there is large amounts of physical evidence and/or advanced scene processing technology required, members of the Crime Scene Section are requested. Crime Scene Section personnel are available 24 hours a day.

It is the practice of Fairfax County Police
Homicide Detectives to assume all death scenes are
homicides until proven otherwise. The homicide crime
scene is, without a doubt, the most important scene a
police officer or detective will be called upon to

investigate. Because of the nature of the scene, the answer to the question "What has occurred?" can only be determined after the professional and medical evaluation of the various bits and pieces of evidence gathered by the detective and/or evidence technician.

Obviously, homicide investigation should be a highly professional and specialized undertaking which requires years of practical experience coupled with a process of continual education and training. Whether it be the call taker who initially takes the call and obtains a crucial piece of information, or the officer in a patrol car who responds to a "homicide" and detains a key witness or suspect, the fact is that homicide investigation is based on the cooperation of all members of the department and detectives working together toward the common goal of solving the homicide.

The Problem

No department or individual involved in the investigation of homicides is ever going to have a 100% closure rate. In fact, closure rates for homicides are decreasing. According to the 1962 <u>Uniform Crime</u>

Reports, during 1961 there were 8,740 homicides reported in the United States. At that time the rate of homicide per 100,000 of population was 4.7 with a 94% closure rate. By 1991 the number of homicides increased to 24,703. The rate of homicide per 100,000 of population was 10 with a decreased closure rate of 67% nationwide (<u>Uniform Crime Reports</u>, 1992).

Therefore, many departments (especially larger departments) will be faced with a situation where another homicide happens before they are finished handling the previous one. As detectives transfer in and out of the Homicide Section, their unresolved homicides remain open and unworked. How does one manage these open cases; how often are they reviewed; and who is responsible once the assigned detective is either transferred or leaves the unit or department?

There are several approaches to this dilemma.

Naturally, if the detective who originally was assigned

the investigation is still in the section, he or she would remain "in-charge" of the case. If this individual has been transferred or reassigned, someone has to be able to answer questions from the family, media and anyone else who might inquire about the case.

The Hypothesis

If there is a need for a separate, investigative unit based on the number of unsolved homicide cases, as is the situation within Fairfax County, the concept of a "Cold Case Squad" should be explored.

This researcher's hypothesis is: The formulation of a Cold Case Squad would measurably reduce the number of unresolved homicides within Fairfax County.

The Cold Case Squad's responsibilities will be to review inactive, open homicide cases where the original lead detective is no longer in the Homicide Section; be reactive to incoming leads; and investigate "missing person" complaints where the individual is missing under suspicious circumstances.

The primary evaluation factor for this thesis will be the Cold Case Squad's "close-ability" rate.

The Cold Case Squad's close-ability rate will come under close scrutiny by various decision makers to plan and analyze police activities. Additional resource needs may also be determined by the section's effectiveness. All of the homicide cases that have been and will be assigned to the Cold Case Squad are classified as "Inactive." The Fairfax County Police Department's Report Writing Manual allows a case to be classified as inactive when:

all investigative leads have been exhausted and no information exists which would lead to an arrest or exceptional clearance. Inactive cases may be reopened at any time additional information is received or developed that would positively aid the investigation of the offense (p. II-7).

One of the ways to evaluate the Cold Case Squad's success will be how many inactive cases were investigated and reclassified as "Closed by Arrest" or "Closed by Exceptional Means." The Report Writing Manual allows a case to be closed by arrest when "at least one person is arrested for the offense under investigation and turned over to the courts for prosecution."

A case may qualify for an exceptional clearance if all of the following questions can be answered yes:

- a. Has the investigation specifically established the identity of the offender?
- b. Does sufficient information exist to support an arrest and place the offender before a court for prosecution?
- c. Is the exact location of the offender known so that custody could take place now?
- d. Does some reason outside the Department's control prevent the offender from being arrested and prosecuted?

In addition to answering <u>all</u> of the previous questions affirmatively, <u>one</u> of the following circumstances must exist:

- a. The victim refuses to cooperate in the prosecution of the case.
- b. Prosecution of the offender is not possible because the offender is being prosecuted in another jurisdiction and cannot be released for return to Fairfax County.
- c. Extradition has been denied.
- d. There is a confession by an offender already in custody or serving a sentence for some other offense.
- e. The offender is deceased.
- f. The offense is one of the following: a double homicide; two people who have killed each other; or a homicide in which the perpetrator then commits suicide.
- g. The offender has been granted immunity by the Commonwealth's Attorney in a plea bargain agreement.

When the qualifying questions have been answered affirmatively, and one of the previously listed circumstance exists, the case shall be closed exceptionally.

When a case is new and fresh, most detectives will agree time is essential. The first 48-72 hours are generally recognized as the most critical. During this initial time period, the information is the freshest in the mind of the witness and is usually more accurate. Additionally, the witnesses are easier to locate. However, what usually happens when this period passes is the probability of a quick closure decreases.

It is anticipated the Cold Case Squad will turn the liability of time into an asset. Time, the enemy that usually works so hard against solving a case, may eventually become the detectives ally.

This thesis project will identify and evaluate solvability factors which will be used by the Fairfax County Police Department's Cold Case Squad. The findings of this thesis will be made available to the Cold Case Squad for review and utilization so that the Squad may better resolve open homicide cases within Fairfax County.

The Need for the Study

Many violent crimes, especially murder, have no simple motive and no easy solution. Homicide is generally thought to be the most serious crime committed against persons and its grave implications make its detection, solution and adjudication matters of vital importance to every citizen and the entire community. Confronted by a criminally violent death, society demands that the assailant be promptly identified and apprehended.

Homicide detectives everywhere are finding their work loads increasing with each passing month, creating a backlog of murders that remain unsolved. The caseload of most homicide detectives today prevents them from focusing on specific cases for extended periods of time and from following these cases through to a solution.

The Fairfax County Police Department Homicide
Section is comprised of one supervisor and eight
detectives. The Homicide Section is responsible for
investigating the following types of incidents
(Supervisor's Training Manual, 1995):

• Accidental shootings of one person by another

- Homicides
- Suicides
- Abduction cases involving the abduction of a minor child by a stranger or unrelated person where circumstances indicate the child's life is in danger
- Found body cases
- Drowning
- Sudden Infant Death Syndrome (SIDS) cases
- Construction fatalities
- Fire fatalities
- Police shooting-other than accidental discharge with no injuries
- Felony assaults, if victim is hospitalized other than/or in addition to emergency room treatment
- Attempted murder cases (ie. shooting case in which the victim is unharmed)

Lieutenant Dennis Wilson² stated the Homicide
Sections' workload is approximately 525 cases per year
with an average workload of seven cases a month per
investigator. The homicide rate has almost doubled in
the past seven years when compared to the preceding

Personal interview conducted on May 23, 1995, with Lieutenant Dennis Wilson, Supervisor of the Cold Case Squad. Prior to Lieutenant Wilson being assigned supervisor of the newly formed Cold Case Squad, he was the supervisor of the Homicide Section for approximately four years. Lieutenant Wilson has been a Criminal Investigations Bureau supervisor for approximately 10 years and employed by the Fairfax County Police Department for 17 years.

seven year period. There are approximately 75 unsolved homicides from 1964 to present. More than half of these (42) have occurred in the past nine years. Table Four represents the number of homicides, unsolved homicides and percentage of unsolved homicides per year which have occurred in Fairfax County from 1964 through 1994.

The increase in unsolved homicides during recent years may be a reflection of the murder profile nationwide. Whereas in earlier years the victim and murderer were known to each other, the trend during the last few years has been the victim and murderer are unknown to each other prior to the homicide. Often the unsolved homicide is related to another crime such as robbery, rape or drugs.³

Homicide cases have become more complex requiring extensive case preparation due to legal defense strategies created by a more liberal judicial system. The intricacy of homicide investigation requires a total commitment of the investigator's time often lasting months.

Presently, detectives charged with the investigation of several homicides are also assigned additional service-type cases which detracts from their primary responsibility of homicide investigation.

Every effort is made to limit the caseload of the detectives during the investigation of a homicide.

However, due to the restricted number of detectives and an overall increased caseload, this has become

Wilson interview.

increasingly more difficult to accomplish.4

Often a detective, while investigating a homicide, will have to redirect his efforts to other cases such as suicides, unattended deaths, missing persons and other investigations. Additionally, a detective may have to suspend an investigation because he has to prepare for a trial regarding another homicide. types of distractions create two specific problems. First, it is extremely difficult for a detective to maintain a "focus" on the case when he is being pulled in other directions. Second, the detective begins feeling fatigue or what is commonly referred to as "burn out." In an effort to try to accomplish everything expected of them, the detective works extended hours in addition to getting called out and going many nights with little or no sleep. In addition to being physically harmful for the detective, the thoroughness of the investigation suffers as fatigue fosters errors and eclipses clear thinking.5

Wilson interview.

⁵ Wilson interview.

Recently, a phenomena the Homicide Section has experienced is the increased questioning of suicide investigations by the deceased family and the media. It has always been difficult for families to accept the idea that a relative committed suicide. With the emergence of investigative media such as Unsolved Mysteries, Current Affair, Inside Edition, Case Closed and others, families are receiving support and encouragement to challenge the validity of a suicide determination. Responding to these persistent inquires consumes additional staffing hours.

Ethically, the department has an obligation to the family of homicide victims and the community to keep these unsolved cases active until they are resolved.

To not try to resolve old cases is an injustice to the families.

During January 1995, the Fairfax County Police
Department implemented a Cold Case Squad. The squad
consists of one supervisor, three veteran detectives,
two auxiliary police officers and one cadet. The two
auxiliary officers and cadet will be used for
administrative and clerical tasks. Although in its

Wilson interview.

infancy, the Cold Case Squad was assigned all of the unsolved homicides where the "lead" detective is no longer in the Homicide Section and missing person reports/investigations.

The Cold Case Squad will be looking at various criteria during case screening. The objective of case screening is to prioritize cases that have the best chance of being investigated to a successful conclusion. One of the criteria for prioritization will be solvability factors. These factors will be considered when assigning personnel to an investigation and also used for suspending investigative effort (Case Management Procedures for the Cold Case Squad, 1995).

Chapter Two

Review of Literature

Chapter Two is presented in two sections. The first section titled Related Literature in Criminal Justice identifies what resources were employed and exhausted in an effort to locate information regarding the extent and prevalence of Cold Case Squads and solvability factors. It also provides a concise discussion addressing the Violent Criminal Apprehension Program (VICAP) managed by the Federal Bureau of Investigation and the Homicide Assessment and Lead Tracking Systems (HALT), managed by the Virginia State Police. Lastly, this section identifies which law enforcement agencies were queried for Cold Case Squad information and their responses.

The second section titled Related Literature in Other Fields begins with a flow chart showing the process a case will travel through once it is assigned to the Cold Case Squad. Nine solvability factors are identified which will be used by the Fairfax County Police Cold Case Squad supervisor to aid in prioritizing cases. Key aspects of each solvability factor

is discussed and how related literature supports their significance.

In short, this section focuses exclusively upon supportive literature and other information sources for the nine solvability factors. "Case in point" studies are provided to the reader for micro-analyses to illustrate the potential complexities of the solvability factors.

Related Literature in Criminal Justice

The succeeding information services were contacted in an effort to obtain Criminal Justice literature on the general theme of "Cold Case Squads/Solvability Factors." This researcher contacted each of the listed information services by telephone and talked with a representative. The information services contacted include:

- Bureau of Justice Assistance (BJA)
- Department of Criminal Justice Services (DCJS)
- Forensic Science Information Resource System (FSIRS)
- International Association of Chiefs of Police (IACP)
- Police Executive Research Forum (PERF)
- Police Foundation

- National Criminal Justice Reference Service (NCJRS)
- National Sheriff's Association (NSA)

None of the services had written information on the topic of "Cold Case Squads." During the conversations, this researcher also requested any information on "solvability factors," "major case management" or other related data which may be used to add validity to my research.

The NCJRS provided dated information that alluded to solvability factors in a research study conducted during 1975. Under a grant from the Urban Institute by the National Institute of Law Enforcement and Criminal Justice, Law Enforcement Assistance Administration, U.S. Department of Justice, under the Omnibus Crime Control and Safe Streets Act of 1968, a manual was created entitled Managing Criminal Investigations. The authors, Peter Bloch and Donald Weidman, created the manual to assist police managers in improving the success of their departments' criminal investigation function. This manual detailed the processes and results observed while conducting on-site research with selected police departments.

Bloch and Weidman acknowledged that while skilled

detectives are essential, there are a number of "new" methods police managers can use to improve the success of the investigation process. Vis-a-vis one of the most significant aspects of this management system is the utilization of solvability factors to screen out the cases which hold little or no investigative information (Bloch & Weidman, 1975).

This screening works to insure the detectives being assigned cases to investigate will only receive those which merit follow up. The key to the success of the screening process is the proper completion of the initial report. Bloch & Weidman (1975) allude to the Rochester Police Department, New York, who participated in their study and were utilizing solvability factors.

The Rochester Police Department designed a new preliminary report form that identified items of information which should be obtained during a preliminary investigation and arranged those items in the logical sequence for obtaining them. The form requires the preliminary officer to indicate whether specific "solvability factors" have been identified - items of information which might lead to the solution of the case. By asking the officer to check a box if

he/she cannot identify a particular factor, the form requires the officer to go through a mental checklist of the items which should be considered. If a particular box is not checked, then the officer must give a justification for not doing so (Managing Criminal Investigations, 1975).

The report form makes it easier for a reviewing officer to decide whether a case should have a follow-up investigation. If any of the proceeding 12 solvability factors is present, then a follow-up is conducted. The 12 solvability factors identified by Bloch & Weidman (1975) on the Rochester Police Department Crime Investigation Report were:

- 1. Was there a witness to the crime?
- 2. Can a suspect be named?
- 3. Can a suspect be located?
- 4. Can a suspect be described?
- 5. Can a suspect be identified?
- 6. Was a vehicle known to have been involved with the suspect?
- 7. Is stolen property traceable?
- 8. Is there a significant M.O. present?
- 9. Is there significant physical evidence present?
- 10. Has an evidence technician been called?

- 11. Is there a significant reason in the judgement of the police officer or supervisor to believe that the crime may be solved with a reasonable amount of investigative effort: e.g. the crime may arouse significant public interest giving rise to the possibility of the public supplying useful information on the case?
- 12. Was there a definite, limited opportunity for anyone except the suspect to commit the crime?

According to Bloch & Weidman (1975), the Rochester Police Department's solvability factors serve as the basis for deciding if additional investigative efforts should be dedicated to the case and whether there is a reasonable chance for case solution. Appendix A is the current "Crime Investigation Report" being used by the Rochester Police Department.

In another early study, researchers Peter

Greenwood and Joan Petersilia (The Criminal

Investigative Process, 1975) secondarily mentions

"solvability factors" while discussing and proposing
reforms in the primary topic of "Screening and Case

Assignment." Greenwood and Petersilia (1975) state
that:

In some departments formal "solvability factors" or the judgement of the unit supervisor may be used to determine whether or not a specific case should be followed up by the investigator assigned, or simply suspended until any new facts develop (p. 9).

Greenwood and Petersilia did not identify or list specific solvability factors in their research report.

Solvability factors were also discussed by Steven Egger in his book Serial Murder: An Elusive Phenomenon. Egger (1990) recognizes that resources are scarce and most law enforcement agencies must allocate on a cost-effective basis. Egger believes solvability factors as well as currency of the event lead to higher priorities and allocation of investigative staffing, especially as part of a serial sequence. The utilization of solvability factors in a homicide investigation, or more specifically, in a serial homicide investigation may become more utilized in the near future pending the results of current, ongoing research. Egger gives credit to Robert D. Keppel, who in 1986, analyzed over 1,200 homicide cases in the state of Washington and used a combination of solvability factors in his research. According to Egger, one of Keppel's research objectives was "to determine the critical solvability factors present in homicide investigations in order to provide the ability of the police to apprehend murderers."

Keppel lists in his book, <u>Serial Murder: Future</u>

<u>Implications for Police Investigations</u> (1990) the

following solvability factors which may contribute to a

successful completion of an investigation:

- The quality of police interviews with eyewitnesses.
- The circumstances which led to the initial stop of the murderer.
- 3. The circumstances which established the probable cause to search and seize physical evidence from the person and or the property of the murderer; specifically, the solvability factors in each case.
- 4. The quality of the investigation at the crime scene(s).
- 5. The quality of the scientific analysis of the physical evidence seized from the murderer and or his property and its comparison to physical evidence recovered from the victims and the homicide scenes.

Keppel states that:

It is surprising that more empirical research has not been generated from the appellate cases which have criticized the quality of police investigations. Nor have detectives, traditionally, researched these investigative factors to make themselves more effective. To date, advances in the quality of detective work have been motivated and accomplished primarily by the ingenuity and drive of individual detectives (p. 4).

Keppel analyzed five notorious serial murderers; Larry Eyler, Wayne Williams, John Gacy, Theodore Bundy and Juan Corona. Each of the five was convicted of at least one murder and suspected in at least 20 other murders. Keppel's text focuses on the major investigative and legal implications exhibited by these cases. It also identifies common investigative factors and trends that have been raised on appeal by convicted murderers in an effort to improve the investigative understanding of serial murder investigations.

The FSIRS also provided limited and dated information. All of the information provided by the FSIRS were articles that appeared in past issues of the Federal Bureau of Investigation's Law Enforcement
Bulletin. All of FSIRS's information was provided to this researcher. These articles were reviewed and they discussed the National Center for the Analysis of Violent Crime (NCAVC), Violent Criminal Apprehension Program (VICAP) and state managed Homicide Assessment and Lead Tracking Systems (HALT). The most recent article was dated December 1986.

The concept for the NCAVC came about in November 1982, when the Criminal Personality Research Project Advisory Board met at the FBI Academy in Quantico, Virginia. The main idea of the NCAVC was to "bring together the fragmented efforts from around the country

so they could be consolidated into one national resource center available to the entire law enforcement community" (FBI Law Enforcement Bulletin, 1986).

As it was originally conceived, the NCAVC consisted of four programs:

- Research and Development
- Training
- Profiling and Consultation
- VICAP

The overall goal of the NCAVC has been to reduce the amount of violent crime in American society. The NCAVC serves as a law enforcement clearinghouse and resource center for the most baffling and fearful of the unsolved, violent crimes such as homicide, forcible rape, child molestation/abduction and arson. The NCAVC collects and analyzes violent crime data and provides assistance to the law enforcement agencies in their attempts to identify, locate, apprehend, prosecute and incarcerate the persons responsible for these and other violent crimes and to develop new programs for the prevention of violent crime victimization (FBI Bulletin, 1986).

It is often said that two questions spring to a detective's mind when faced with a new case: what has happened like this before? And, whom do we know who could have done this? Answers to these questions will identify offenders and can also identify occurrences of different offenders using a similar modus operandi (M.O.). There are systems in other countries and the United States that store information about cases for comparison and crime analysis. Two systems that are systematically used by the Fairfax County Police Department are VICAP and HALT. Both systems will be described briefly at this time so the reader may better understand the importance of entering information into these systems.

The following information concerning VICAP was obtained by interviewing Mr. Eric Witzig⁸ at the FBI Academy. The interview began with Mr. Witzig explaining the mission of VICAP is to facilitate

The abbreviation M.O. represents "modus operandi" - the manner of operation; the means of accomplishing the act; characteristic method deployed by defendant in performance of repeated criminal acts, e.g., the M.O. of the murder was suffocation by pillow (<u>Law Dictionary</u>, 1991, p. 306).

Personal interview conducted with Mr. Eric Witzig on June 1, 1995, at the FBI Academy, Quantico, Virginia. Mr. Witzig is a faculty member of the FBI Academy and VICAP Specialist.

cooperation, communication and coordination between law enforcement agencies and provide support in their efforts to investigate, identify, track, apprehend and prosecute violent offenders. VICAP is a nationwide data information center designed to collect, collate and analyze crimes of violence - specifically murder. The types of homicides VICAP deals with fall into three categories:

- Solved or unsolved homicides or attempts, especially those that involve an abduction; are apparently random, motiveless or sexually oriented; or are known or suspected to be part of a series.
- Missing persons, where the circumstances indicate a strong possibility of foul play and the victim is still missing.
- 3. Unidentified dead bodies where the manner of death is known or suspected to be a homicide.

Mr. Witzig stressed that cases in which the offender has been arrested or identified should be submitted to permit unsolved cases in the VICAP system to be evaluated for possible linkages to the known offender.

The term "linkage" and "linkage blindness" has been coined (Eggar, 1984, p. 161) to describe the situation in which the sheer number of police forces in the United States makes it difficult to circulate information that might be of mutual benefit.

It was explained that once a case is entered into the VICAP database, it is compared continually against all other entries on the basis of certain aspects of the crime such as type of weapon, body recovery site, firearm caliber and many other details. The purpose of this is to detect signature¹⁰ aspects of homicide and similar patterns of M.O.'s, which will in turn allow VICAP personnel to pinpoint those crimes that may have been committed by the same offender and notify the agencies involved.

Appendix B is the VICAP Crime Analysis Report and presents to the reader an overview of the volume of information required to accurately complete the report.

When a murderer has been identified, VICAP can assist law enforcement agencies which may have relevant cases by coordinating a multi-agency investigation conference. This becomes important when the suspect has committed crimes in multiple jurisdictions. The value of this conference is the resultant coordination of activities such as search warrants, interview matters and laboratory testing.

¹⁰ Sometimes the murderer will leave a distinct or unique "signature" at the crime scene. Detectives may not recognize the similarity of the killings and the pattern will go undetected due to the sheer volumes of cases, particularly in large cities (Eggar, 1990, p. 166).

Furthermore, Mr. Witzig explained that VICAP offers services including investigative support such as timelines, investigative matrix, etc., major case management consultation and facilitation and training in crime analysis.

For years police detectives working in different jurisdictions on similar cases have worked independently of one another. They did not have access to the information available elsewhere that could speed and enhance investigations in their own jurisdiction. With the advances in computer technology, several agencies have (and are) developing programs that help detectives work better by allowing them access via computer to a wide range of information about serious crimes and to the resources that can help solve them (Keppel & Weis, 1993).

Examples of these programs are the Homicide
Investigation and Tracking System (HITS) that began in
Washington State and the Homicide Assessment and Lead
Tracking System (HALT) managed by the Virginia State
Police. These types of programs are similar to VICAP
and provide several major services to local, law
enforcement. Most of these programs, after data is

entered into their files, will automatically reformat the information and create a report to be submitted to VICAP (Keppel & Weis, 1993).

Several of the information representatives suggested this researcher contact agencies who were known or rumored to have some form of a Cold Case Squad. None of the representatives could locate any written documentation that lists agencies with Cold Case Squads.

Initially, this researcher made random phone calls to several of the agencies inquiring about their Cold Case Squads. It quickly became apparent that phone calls would not be very productive (and created an outrageous phone bill). Of those agencies where personnel were available to talk over the phone, it was learned that either the agency did not have a Cold Case Squad or, if they did have a Cold Case Squad, no written information and/or data was available.

On May 22, 1995, a letter of inquiry was mailed to 13 agencies requesting assistance and information.

Appendix D represents the inquiry letter.

The following are the queried agencies and their responses:

- Baltimore City Police Department, Maryland:
 no response.
- Baltimore County Police Department, Maryland:
 received a telephone call on June 22, 1995, from a
 Cold Case Squad Detective. The detective advised
 written information would be mailed "during the
 next few days." No information was received.
- Broward County Sheriff's Office, Florida:
 no response.
- Charlotte Police Department, North Carolina:
 no response.
- Henrico County Police Department, Virginia:
 responded on May 24, 1995, by telephone to advise
 they do not have a Cold Case Squad.
- Los Angles County Sheriff's Office, California:

 responded on June 6, 1995, by telephone to advise
 they do have an "Unsolved Case Squad." This squad
 consists of five investigators. Their primary
 functions are to reinvestigate old cases,
 prosecute cases in foreign jurisdictions and
 psychological profiling. The squad only inherits

cases if the lead investigator is no longer in the homicide section. The Unsolved Case Squad only reinvestigates inherited cases if new information is received. The section supervisor advised they barely "keep their heads above water" and they do not have the time or resources to reinvestigate a case unless there are new, viable leads. They do not use solvability factors. This is partially because of the homicide section's large case load of 500-700 homicides per year.

Metro-Dade Police Department, Florida:

responded on June 7, 1995, to advise they have had a Cold Case Squad since 1988. The section supervisor advised they inherit unsolved homicides when the lead detective is no longer in the homicide section. Metro-Dade's Homicide Section is involved with 1700-1900 unsolved murders per year. Their Cold Case Squad uses a limited form of solvability factors. Because of the volume of unsolved cases, most reinvestigations are generated from a fresh lead being obtained. The section supervisor feels Cold Case Squads are a "luxury" and very expensive to operate due to

required travel during the course of an investigation. In the supervisor's experience, some form of a cold case squad customized to the individual department needs would definitely contribute to cases being resolved that otherwise would go unsolved. Written information was to be mailed, but none was received.

- Metropolitan Police Department, Washington, D.C.:
 no response.
- Montgomery County Police Department, Maryland: responded on May 31, 1995, by telephone to advise they do not have a Cold Case Squad. However, they will occasionally look at unsolved cases by utilizing personnel on injury "light duty." From 1989 through 1994 Montgomery County has sustained 165 homicides, 36 which are "open" cases.
- Orange County Sheriff's Office, California:
 no response.
- Prince Georges County Police Department, Maryland:
 no response.
- Richmond City Police Department, Virginia:
 no response.

San Diego County Sheriff's Office, California:
 no response.

Also contacted were the following publication companies to obtain their title lists:

- Aldine de Gruyter, Hawthorne, NY
- Anderson Publishing Company, Cincinnati, OH
- Chapman & Hall Publications, New York, NY
- Charles C Thomas, Publisher, Springfield, IL
- CRC Press, Boca Raton, FL
- Elsevier Science Publishing Company, New York, NY
- Facts on File, New York, NY
- Gould Publications, Longwood, FL
- Greenwood Publishing Group, CT
- J.B. Lippincott Company, Philadelphia, PA
- National Institute of Justice Publications List,
 Rockville, MD
- Rand Corporation, CA
- Waveland Press, Prospect Heights, IL
- Waverly Publishing, Baltimore, MD

A variety of title lists were acquired in the areas of Criminal Justice, Criminal Law, Criminology, Forensic Medicine, Forensic Science, Law Enforcement, Police Science, Sociology and so forth.

The publication synopses were reviewed. If the book synopsis appeared to have related information, an effort was made to come into possession of the book and/or purchase a text, if available. This researcher has reviewed numerous books with related information. The texts reviewed are included in the Bibliography. The majority of the finite information related to Cold Case Squads and solvability factors involves "serial killers." Most of this literature involves serial killer case management and exchange of information between agencies involved with serial killer investigations. It is not this writer's intent to research the serial killer murder phenomenon per se, but to extract useful information for this thesis and department's Cold Case Squad.

During April 10-12, 1995, this researcher attended the Virginia Homicide Investigators Association annual Homicide Symposium. There were approximately 154 persons present. Those in attendance represented two countries (United States and Canada), seven states, eight federal agencies and a variety of police departments, sheriff offices, coroner/medical examiner offices and Commonwealth's Attorney Offices. After a

break, this researcher was allowed to ask those in attendance if anybody was familiar with Cold Case Squads and/or had written information concerning Cold Case Squads. Several people approached this researcher during the symposium. All of the ideas and information given to this researcher were already explored.

This researcher also utilized <u>Homicide: A</u>

<u>Bibliography</u>, (1993). The authors state they have:

Extensively searched the world literature on homicide. References from hundreds of journals and publications have been included. All major indexes have been searched, including some...which are not universally available. Twenty-three indexes have been utilized in the compilation of this work. There is no other single source available which can provide the researcher with such a complete selection of homicide literature. All essential elements of the ecology and epidemiology of homicide are reflected in the organization of the various chapter and subchapter headings. Chapters on the murderer, the victim, the mode, and the environments that produce all three are included. This format guides the user to articles of particular interest to their specialty and highlights the many components necessary for prevention in each. The subject index refers to specific key-word headings (pp. vi-vii).

This researcher checked the Subject Index for keyword headings to include cold case squad, solvability factors, solving murders and closure rate. Nothing was listed under any of the key-word headings.

Another area where solvability factors is mentioned is in the written standards from the Commission on Accreditation for Law Enforcement Agencies (CALEA). Standard 42.1.2 states: "the agency uses a case-screening system and specifies the criteria for continuing and/or suspending an investigative effort." In the commentary of standard 42.1.2, among other things, it states:

The written directive should specify how such screening is to be conducted, by whom, and what criteria (solvability factors) should be used. Screening of preliminary investigative information should assist in the decision on whether a follow-up investigation should be made. The decision about the extent of follow-up or the suspension of investigative efforts should be made at a management level. Decision making involves the continued application of solvability and degree-ofseriousness factors plus operational input from periodic reporting by investigators on the progress of assigned cases. Suspension criteria may include lack of further leads or solvability factors, unavailability of investigative resources, and/or insufficient degree of seriousness (p. 42-1).

The CALEA is a national program which was formed in 1979 and is currently sponsored by the International Association of Chiefs of Police (IACP), the National Sheriff's Association (NSA), the National Organization of Black Law Enforcement Executives (NOBLE) and the Police Executive Research Forum (PERF). This commission has developed a comprehensive set of written standards covering every aspect of law enforcement policies, procedures, practices and operations. The Fairfax County Police Department became accredited on May 3, 1985, and maintains compliance with the professional standards called for by the commission.

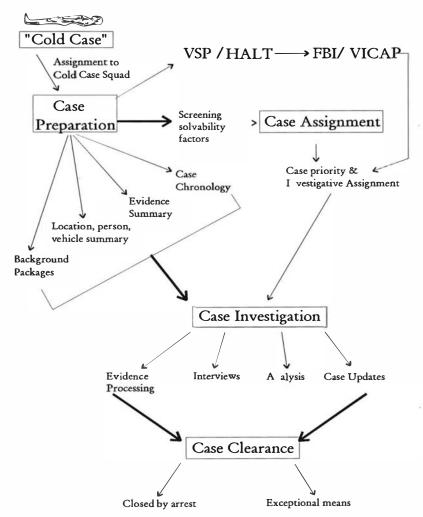

Related Literature in Other Fields

There are volumes of information related to the investigation of crime. There is a large amount of literature in other fields to include information for the uniformed officers who are invariably first to arrive on the scene; how to conduct a preliminary scene investigation; specific duties at the scene; crime scene processing and collection of evidence; forensic identification of suspects; criminal personality profiling; major case management and a myriad of other related topics. There is information for newly assigned detectives, experienced detectives, members of the court and other legal specialists. Information is provided from the view point of law enforcement, legal strategists, social workers, clergy, prevention and control analysts, statisticians, medicolegalists and psychologists. View points are abundant.

This wealth of information has been reviewed with an emphasis placed on related literature which supports the utilization of solvability factors.

Figure One illustrates this process and identifies the major steps a case will travel through once it is assigned to the Fairfax County Police Cold Case Squad.

Figure One
The process a case will travel through after being assigned to the Cold Case Squad.

The first step of the process is case preparation. Case preparation involves preprocessing the case. This is intended to save valuable, investigative time that would otherwise be lost by having a detective perform routine clerical and administrative tasks. This routine preprocessing is done by two Auxiliary Police Officers who have been assigned to the Cold Case Squad since its inception. Preprocessing also allows supervisors to quickly assess a case relative to other ongoing investigations to determine at what priority it should be worked.

In addition to physically organizing the case, the case preparation phase will yield the following investigative aids for detectives:

Homicide Assessment and Lead Tracking System (HALT) Report.

All unsolved homicides will be submitted to the HALT system. The intent is to enter all cold cases into the HALT system to determine if there are similar cases that may be located in other Virginia jurisdictions. After HALT system personnel enters the crime analysis report into the system, it is then given to NCAVC to be entered into the VICAP. The HALT report will be

reviewed for accuracy and completeness by the Cold Case Squad supervisor before submission to the Virginia State Police.

Screening Solvability Factors.

This set of questions will be answered during the preprocessing. These solvability factors are covered in depth beginning on page 52.

Case Chronology.

This section will provide a brief summary of all events regarding the actual case as well as case handling (assigned detective, search warrants, etc.).

Evidence Summary.

This section will detail all evidence held in the case, its location and status.

Location, Persons, Vehicle Summary.

This section will provide an index into the case according to any vehicles, persons and locations relative to the case.

Background Packages.

These packages will include current criminal history, driver's license history, wants and warrant checks on all persons involved in the

case. This will be used by the detective if there is a decision to recontact any persons involved in the case.

Gap Report.

This is an unstructured report that lists any gaps of information in the case. This will be done without consideration of the importance of the gaps of information. Examples of the types of gaps expected to be listed are persons mentioned in statements that do not have a corresponding interview report in the case file, undocumented investigative actions, etc.

Case Assignment.

The case assignment process will take a preprocessed case and prioritize it relative to other
cases assigned to the Cold Case Squad. Investigative resources will be directed to cases that
have a high solvability potential. A combination
of solvability factors and other elements of the
case will be evaluated during supervisory review
before the case is assigned to a detective.

Case Investigation.

The Cold Case Squad will record all activities to maintain a complete, investigative log. Case activity will be recorded in a word processor with a data time stamp to allow easy review of all case activity.

The Significance of Solvability Factors.

The Fairfax County Police Cold Case Squad supervisor will use nine solvability factors as an aid to help determine the priority of cases. The nine solvability factors are:

Has the death been ruled a homicide?

Has the scene location been determined?

Has the victim been identified?

Is there physical evidence that can identify a suspect?

Can any evidence be reprocessed to yield further clues?

Is the evidence still available?

Are there named suspects in the case?

Are there witnesses in the case?

Have there been leads in the last six months?

At this point, a succinct explanation of each

solvability factor is going to be provided to the reader. The explanations are being given for the purpose of better understanding solvability factors and to appreciate how significant these factors may become in a complex death scene investigation.

Has the death been ruled a homicide?

The burden is on the state to prove that the deceased's death was the result of a criminal act.

Until this is done, it is presumed the death was due to natural causes (Moenssens, Inbau & Starrs, 1986).

The burden in any homicide prosecution rests on the state to show that the cause of death was due to a criminal act of the accused and the deceased is, in fact, dead. The burden of proof in homicide, as with all crimes, is placed on the prosecution. It encompasses proof, beyond a reasonable doubt and all of the essential elements of the offense (Moenssens et al., 1986).

A primary way to determine whether or not death was the result of homicide, suicide, accident or natural causes is through a medicolegal investigation.

A pathologist can often make useful contributions to

the investigation through postmortem examination. The pathologist's efforts supplement, but do not replace those of the police (Adelson, 1974).

There are two general types of medicolegal investigative systems in the United States: coroner systems and medical examiner systems. The coroner system is the older of the two medicolegal systems, dating back to feudal England. In the pure form of this system, an individual who is not a physician is elected the coroner. The coroner makes rulings as to the cause and manner of death in cases that fall under the coroner law (DiMaio, 1989).

The medical examiner system was first introduced in the United States in 1877 in Massachusetts. The first true medical examiner system came into existence in 1918 in New York City. In the pure form of this system, the medical examiner is a physician experienced in the field of forensic pathology (DiMaio, 1989).

Since the Commonwealth of Virginia is under the purview of a medical examiner system and has been since its inception in 1946 (Medical Examiner's Handbook, 1982), this researcher will confine the importance of the medical examiner to Virginia specific guidelines

and procedures.

In 1946, by Act of the General Assembly, Virginia became one of the first states to institute a state-wide Medical Examiner System. The Office of the Chief Medical Examiner is now comprised of four district offices: Richmond (1946), Norfolk (1957), Roanoke (1967) and Fairfax (1972). Figure Two is a map of the district offices of the Chief Medical Examiner and depicts the four districts' boundaries.

District Offices of the Chief Medical Examiner

Northern Virginia District (Fairfax)

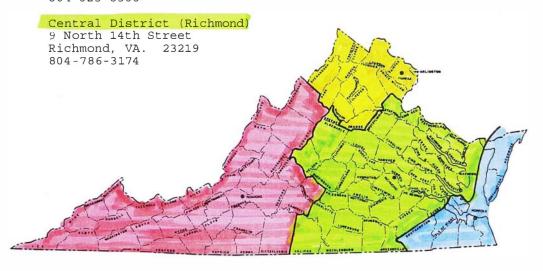

9797 Braddock Rd., Suite 100 Fairfax, VA. 22032 703-764-4640

Western District (Roanoke)

920 South Jefferson Street Room 301 Roanoke, VA. 24006 703-982-7290

Tidewater District (Norfolk)

401-A Colley Avenue Norfolk, VA. 23507 804-623-8366

Each office is staffed by two certified forensic pathologists, an administrative aid, appropriate clerical and morgue personnel. The Chief Medical Examiner, housed in the Richmond Office, is responsible for the overall operation of the system (Medical Examiner's Handbook, 1982).

The Medical Examiner is authorized by the Commonwealth of Virginia to investigate violent, suspicious or unnatural deaths. The purpose is to bring trained medical evaluation into the investigation of those deaths which are of concern to the public health, safety and welfare. The office and functions of the Medical Examiner are established by the Code of Virginia, §32.1-277 et seq.

According to Dr. Francis Field¹², two of the most important functions of the medical examiner are the determination of the cause and manner of death. Dr. Field explained that persons in law enforcement, lawyers and the lay public often have difficulty understanding the difference between cause of death and

Personal interview conducted on May 31, 1995, at the Northern District Medical Examiners Office. Dr. Francis Field is a Deputy Chief Medical Examiner for the Commonwealth of Virginia, assigned to the Northern District.

manner of death. Simply put, the cause of death is any injury or disease that produces a physiological derangement in the body that results in the individual dying. Thus, the following are causes of death: a gunshot wound of the head, a stab wound of the chest, adenocarcinoma (cancer) of the lung and coronary atherosclerosis ("hardening of the arteries"). The manner of death explains how the cause of death came about. In Virginia there are five manners of death. All deaths are ruled one of the following:

- Natural
- Homicide
- Suicide
- Accident
- Undetermined

The manner of death as determined by an Assistant Chief Medical Examiner is an opinion based on the known facts concerning the circumstances leading up to and surrounding the death in conjunction with the findings at autopsy and the laboratory tests.¹³

Table Five, Office of the Chief Medical Examiner
Statistical Data Report, for January 1, 1993, to
December 31, 1994, lists the five manners of death (and other pertinent data) as reported from the four districts. This is the most recent data available.

The manners of death may appear simple, but become very complex in certain situations, especially when investigating gun shot deaths. Dr. Field provided this example.

If we have an individual found with a contact gunshot wound of the temple, without a weapon present and no history of any suicidal threats, one might then conclude that this case is a homicide. If subsequently it turns out that the individual had embezzled half a million dollars from his company and was about to be indicted by the grand jury, and his body was initially found by his wife, who removed a gun and a suicide note from the scene, one would change the manner of death to suicide.

An "undetermined" manner of death is also a complex issue to deal with, especially when dealing with skeletal parts or when only portions of tissues and organs are found. It has been this researcher's experience that such bodies or their remains are most frequently discovered outdoors (although we have investigated cases where they are found indoors under a floor, or other interior place). The remains may be those of a person who was murdered or run over by a vehicle, committed suicide or was lost and became the victim of exhaustion or exposure or was suddenly overcome by sickness and death.

Case in point:

During 1977 Deborah Fitzjohn, age 25, was reported missing by her parents. In 1978, a hunter found skeletal remains in the woods and through dental records, Fitzjohn's identity was determined. Because there was no signs of trauma to the few skeletonized remains recovered, the Medical Examiner officially ruled the manner of death as "undetermined." The Medical Examiner could not classify the manner of death as an accident, homicide or suicide, since the cause of death is unknown.

In this particular incident it is well documented who the last known person was with Fitzjohn and their activities before she was reported missing. This person is identified as John B. Crutchley and he is presently serving 25 years in a Florida state prison for kidnapping and assaulting a 19-year-old hitchhiker in Brevard County, Florida. Crutchley is eligible for parole next year. Crutchley gained notoriety during his trial after testimony revealed he kept the hitchhiker in bondage for 22 hours, draining and drinking her blood. Obviously, Crutchley is a prime suspect in this case and it is believed he killed Fitzjohn. (Synopsis from Fairfax County case #782886831).

It is anticipated that incidents such as this, when reworked by the Cold Case Squad, will find that piece of evidence or lead needed to have the case reclassified and bring the case to a successful conclusion.

Has the scene location been determined?

This is another factor that at first glance appears to be straightforward. However, establishing the actual scene location of an old homicide can be a valid, legal defense. Normally, it is assumed that "where they lie is where they die" and the jurisdiction where the victim was found will be responsible for the investigation and subsequent actions taken to bring the case to a successful conclusion. Ouestions that must be answered before declaring investigative venue include: Is the location the victim was found the actual location of death or the "dump site"? Was the body moved from an unknown location? Is the location the victim was found the same location as where the assault leading to death took place? Case in point:

On September 18, 1994, Fairfax County Police Homicide Detectives and Crime Scene Section personnel responded to the Residence Inn, located in the Tyson's Corner area of Fairfax County at the request of the Nassau County Police Department, New York. Nassau County detectives requested assistance for an investigation they were conducting. Nassau County personnel requested a motel room be checked for the presence of blood and or other circumstances that may give them investigative guidance in their investigation. It was learned from Nassau County personnel that they had responded to a suicide in their jurisdiction on 9-16-94. The victim was

identified as Richard Ablamsky. Prior to his death, Ablamsky was in the company of his girlfriend, Deborah Taylor. The couple had stayed at the Residence Inn approximately one week prior to the suicide. According to the Nassau County Police, they were unable to locate Taylor and believe Ablamsky killed her prior to taking his own life.

The cleaning staff/maids were interviewed by Fairfax County Police Homicide Detectives and it was learned that several sheets and knives were missing from the suite. This was noticed just after Ablamsky checked out. The missing sheets and knives were not reported to management. The cleaning crew saw Ablamsky in the suite, but never saw Taylor. The cleaning crew had performed the usual sanitary procedures to the suite and didn't notice anything else unusual.

A systematic, forensic search was conducted of the motel suite by Crime Scene Section personnel and blood stains were located in several areas within the suite. Specifically, a sizable amount of dried blood was located under a mattress in an upstairs loft; the underside of the box springs and on the interior side of a lamp shade. The dried blood was identified as coming from a human source. (Synopsis from Fairfax County case #94260001768).

This "suspicious event" raises several questions.

- Is Ms. Taylor, in fact, dead?
- If she is dead and her corpse is ever found, will there be enough remains/forensic evidence to determine she was murdered?
- If it is determined Ms. Taylor was murdered, did Ablamsky kill her and where? Was she murdered in the Residence Inn located in Fairfax County, or at an unknown location somewhere between Fairfax County and Nassau County, New York?

The answer to these questions will be scrutinized by any number of persons, including family members, judicial personnel and other professional persons such as insurance companies, when there is a potential for large death pension settlements to be paid.

Has the victim been identified?

Snyder (1977) states "identification of either living persons or dead bodies is treacherous." If you stop to realize that among your own acquaintances there are usually several persons whom it is difficult to distinguish from one another, you can see what are the possibilities for error in identifying a corpse found days, weeks, months or even years from the time of demise.

Obviously, there are difficulties identifying a found body that has undergone a great amount of alteration. The alteration may be from intentional dismemberment or destruction by the action of insects and their larvae. When only skeletal parts and/or portions of tissues are found, the usual methods for identification such as documents or possessions found on the body, visual identification and fingerprints are

limited. Forensic anthropology and odontology techniques may prove useful in making an identification under these circumstances.

Occasionally, the identity of the dead person is not known, and the body has to be buried as that of an unnamed individual. Prior to burial, pain staking steps are taken to document other important information which may be used in the future for identification.

Another factor bearing on potential success in establishing identification is whether the deceased has been listed as a missing person, and if so, where.

Increased mobility has diminished to some extent the value of "missing persons" reports. It could be possible for a person, who disappears from San Francisco yesterday morning and subsequently reported "missing" last night, be found dead in Fairfax County this evening. If no personal identification is found with the corpse, identifying this victim would be a monumental challenge, especially if the victim has no fingerprints on record.

Is there physical evidence that can identify a suspect?

Physical evidence plays a very important role in the initial crime scene investigation and all subsequent judicial proceedings (Lee, 1994). Physical evidence can take any form. It can be large or so small that it can only be seen under a microscope. It may be fleeting as an odor. In short, physical evidence is any type of evidence having an objective existence, that is, anything with size, shape and dimension (Fisher, Svensson & Wendel, 1987).

Fisher et al. (1987) asks the question: "What is the value of physical evidence and why should detectives concern themselves with an understanding of the uses and ways to collect physical evidence?" (p.

- 6). Fisher et al. (1987) identifies, lists and discusses ten uses for physical evidence. Listed below are four of Fisher's potential uses for physical evidence as related to this solvability factor.
- Physical evidence can place the suspect in contact with the victim or with the crime scene.
- Physical evidence can establish the identity of persons associated with the crime.
- 3. Physical evidence can exonerate the innocent.
- A suspect confronted with physical evidence may make admissions or even confess.

In further evaluating the contribution of physical evidence, one cannot overlook an important reality in the courtroom: The weight or significance accorded physical evidence is a determination left entirely to the trier of fact, usually a jury of laypersons. Given the high esteem in which scientists are generally held by society and the infallible image created by books and television for forensic science, it is not hard to understand why scientifically evaluated evidence often takes on an aura of special reliability and trustworthiness in the courtroom. Often physical evidence is accorded great weight during jury deliberations and becomes a primary factor in reinforcing or overcoming lingering doubts about guilt or innocence (Saferstein, 1987). In short, physical evidence is expected by the judge and jury.

Can any evidence be reprocessed to yield further clues?

As science and technology continues to advance, the information that may be obtained from physical evidence will increase, and hence the importance of reevaluating dated physical evidence. It must be kept in mind that yesterday's state of the art technology used

to examine physical evidence may be antiquated by today's standards.

The Fairfax County Police Department Crime Scene Section has kept abreast of new and changing technologies. Of current technologies, this researcher believes three specific technologies readily available to the Fairfax County Police Department should be identified and summarized so the reader has a basic understanding of these potential assets. The three technologies to be summarized are:

- DNA testing
- Forensic Light Sources
- Automated Fingerprint Identification Systems

The goal is for the reader to be enlightened to the importance of evaluating and reprocessing dated physical evidence. The reader must keep in mind a central problem for the homicide detective is the establishment of personal identity - usually of the criminal, sometimes of the victim. It is a grave error for a detective to believe that any item of evidence can be directly related to a specific person, place or thing.

There are only a few kinds of physical evidence that can be individualized. In other words, an item is

unique when the item can be shown to be directly associated with a specific individual source. Fingerprints, tool marks and fired bullets are examples of evidence capable of being specifically associated with a unique source. Although DNA typing cannot technically be considered a unique source of identification; today's genetic findings are statistically stating that an individual may have a DNA profile of one in a few million or even billions of individuals. In other words, they can be virtually unique in the human population.

DNA Testing: It seems there isn't a day goes by that there isn't some mention of DNA on the television or in the printed media. Especially with the "O.J. Simpson Trial" in progress. There is no escaping the Simpson trial. The case is the staple of television and radio shows, articles, editorials and commentaries, jokes and cartoons. Coleman and Swenson (1994) predict this case, by the time it is over, will have received more news coverage than any event since the Viet Nam War.

Within the forensic community and news media, it is generally thought DNA testing represents the most

important breakthrough in crime detection since the discovery of the fingerprint. DNA technology may represent the future of forensic medicine; the experts have only begun to scratch the surface with this technology.

The forensic use of DNA started with the work of Alec Jeffreys, a geneticist at the University of Leicester in Britain's Midlands. In 1984, Jeffreys invented the techniques that took human identification from the laboratory to the courtroom (DNA in the Courtroom, 1994). Jeffreys used his new form of genetic typing to resolve an immigration case. A boy from Ghana, seeking immigration to Britain, claimed his biological mother was already a resident. Conventional blood tests could only confirm the two were related. DNA analysis showed beyond reasonable doubt the relationship was as claimed and the home office put its stamp of approval on the new technology (DNA in the Courtroom, 1994).

A detective in the East Midlands read of the case and sought Jeffreys' help in solving the vicious murder and rape of two British schoolgirls. The police held a prime suspect in the case. Semen samples from the

murder scenes and a blood sample from the suspect were compared. Jeffreys confirmed that the same person committed both crimes but it was not the suspect the police held. On November 21, 1986, this suspect became the first person in the world to have his innocence proven by DNA testing (DNA in the Courtroom, 1994).

Since forensic DNA testing was introduced in 1986, it already has been used in approximately 50,000 criminal investigations in the United States alone (DNA in the Courtroom, 1994).

During May 1989, the Commonwealth of Virginia became one of the first states in the country to have DNA testing capability in a state forensic laboratory and go on-line with a DNA data bank. During July 1989, legislation was passed which required all convicted felony sex offenders to submit a sample of their blood to be entered into the data bank. At that time only convicted sex offenders were required to submit to blood samples being taken because of the disproportional high recidivism rate of sex offenders.

During July 1990, legislation was passed which now requires all convicted felons to submit a sample of their blood to be entered into the data bank as

prescribed in <u>Code of Virginia</u>, §19.2-310.2 through §19.2-310.11.

Ms. Ambrozy¹⁴ explained that although legislation requires all felons to submit to blood samples, limited funding allows for only convicted sex offender blood samples to be processed and entered into the data bank.

As of April 1995, there are 4,638 samples on-line in the data bank - all convicted sex offenders.

Another 99,915 samples are preserved and awaiting to be processed and entered into the data bank when funding becomes available. 15

It should be obvious to the reader that DNA testing is a powerful tool for justice used by both the prosecution and the defense. DNA testing is available to both the prosecution and defense in homicide and sexual assault cases.

 $^{^{14}}$ Personal interview conducted on May 31, 1995, at the Northern Region State Forensic Laboratory. Ms. Karen Ambrozy is the supervisor of the Serology Section at the northern laboratory.

Ambrozy interview.

Forensic Light Sources: For years, the primary fingerprint search tool was a brush with black fingerprint powder. "Dusting" for latent fingerprints¹6 is routinely done at crime scenes. Fingerprint powder is designed to adhere to the moisture in latent fingerprints. Items with smooth, slick surfaces such as bottles, cans, glass and so forth have conducive surfaces for retaining latent prints. Except for paper products that could be processed with a chemical such as ninhydrin, porous surfaces were not considered conducive to latent processing.

In the early 1980's, research began to show promise for the use of laser light as a method of searching for fingerprints. As research turned into practical application, various lasers were marketed for criminalistic application. These early forensic light

Each ridge of the fingers, palms and soles bear a row of sweat pores, which in the average person, constantly exude perspiration. Also, the ridges of the fingers and palms are in intermittent contact with other parts of the body, such as the hair and face, and with various objects, which may leave a film of grease or moisture on the ridges. In touching an object, the film of moisture and/or grease may be transferred to the object, thus leaving an outline of the ridges of the fingers or palm thereon. This print is called a latent impression, the word "latent" meaning hidden, that is, the print many times is not readily visible (The Science of Fingerprints, 1984, p. 170).

sources were certainly a major aid in fingerprint and trace evidence¹⁷ detection, but had several drawbacks: high costs (up to \$100,000), weight and bulk, with most units requiring high-power water cooling systems and a limited area of light output (<u>Law Enforcement</u>

Technology, March 1995).

During the mid 1980's, units were introduced that were much more affordable, portable and user friendly. The latter 1980's and early 1990's saw the introduction of forensic light sources, also known as alternate light sources (ALS). These units are priced up to \$20,000, are quite portable and project wide patterns of light, allowing the search to progress much faster.

Forensic light sources produce powerful invisible and visible filtered light at various wavelengths.

Many models have the ability to vary the wavelength of light. The projected light excites latent print residues (Inherent Fluorescence), fluorescent powders and various chemical dyes. Fingerprint searches are

[&]quot;Trace evidence" is a generic term for small, often microscopic material. Such evidence may easily be overlooked in crime scene investigation unless proper care is exercised in the search. The variety of trace evidence is almost endless. The more common types of trace materials found at scenes of crimes include: body fluids, fibers, hairs and so forth. In short, the scope of trace evidence is such that anything of a small or microscopic size can potentially be trace evidence.

usually conducted on evidence that has first been exposed to "superglue" fumes, stained with one of the various liquid stains that have been formulated for fingerprint processing or is dusted with a fluorescent fingerprint powder. If a luminescent print is found, it can be photographed using the light source with the appropriate filter over the camera lens (Journal of Forensic Identification, November/December 1994). The film is then developed and "life size" images of the latent is printed and used to compare against suspect inked prints or automated computer searches.

Forensic light sources can also facilitate the discovery of hair, fiber and biological stains at both the crime scene and in the forensic laboratory.

In short, forensic light sources have evolved significantly in the last several years, have come down in price and are user friendly for those agencies that

^{18 &}quot;Superglue" is a cyanoacrylate based adhesive which was developed in the late 1950's as a bonding material for plastics and metals. Superglue was first used as a method to visualize latent fingerprints in 1978 and through use, experimentation and publication has gained wide acceptance as an effective means to develop latent fingerprints. The object to be fingerprinted is placed in contact with the fumes which causes the ridge structure of the latent print on the object to appear white. The print can be photographed, lifted by means of print powder/tape or other lifting procedures. Because superglue is cyanoacrylate based, the technique is commonly referred to as "superglue" or the "superglue procedure" (Techniques of Crime Scene Investigation, 1987, p. 86).

have personnel trained in crime scene processing.

Forensic light sources are tools which have added significantly to the search for latent fingerprints as well as for trace evidence.

Automated Fingerprint Identification Systems:

It has long been recognized that the pattern of the friction ridges of the fingers, palms, toes and soles of the feet are, for practical purposes, individual and constitute a positive means of identification of an The inherent complexity of large numbers of ridges located with a high degree of randomness has led to an almost infinite diversity of pattern, no two of which have ever been found to be identical. other words, no two individuals have ever been found to have identical fingerprints. Within forensic science circles, the basic factors that fingerprints are permanent and individually unique is universally accepted. In short, fingerprints and fingerprinting have been treated guite thoroughly in the literature and well understood in police circles. Therefore, this researcher will only clarify the general knowledge of this subject without reconsidering the extensive

details of the field.

Prior to 1984, latent fingerprints recovered at a crime scene by Fairfax County Police crime scene technicians had to be manually compared with those of a known suspect. A magnifying glass and keen eyes were an investigator's only tools and the task was slow and laborious. During March 1984, the Northern Virginia Regional Identification System (NOVARIS) went online.19

This computerized fingerprint analysis system represents impressive technological advances. Housed in Fairfax, Virginia, NOVARIS is operated jointly by the Fairfax County Police Department and nine other Northern Virginia law enforcement agencies. NOVARIS utilizes a computer to scan latent fingerprints recovered from scenes of crimes and inked tenprint cards²⁰ and compares them with all existing finger-

Personal interview conducted on June 6, 1995, with 2nd Lieutenant Steve Hall, Supervisor of the Northern Virginia Regional Identification System (NOVARIS). Lt. Hall has been the NOVARIS supervisor for approximately five years.

Inked tenprint cards display the fingerprints of identified individuals that are on standardized cardstock. This is accomplished by rolling the known persons fingers in black printers ink and them systematically rolling each finger from side to side in the appropriate box on the print card. The fingers are rolled in such a way as to obtain all available ridge detail on each finger. The ridge detail is then used for classification and comparison.

prints of known offenders placed on file by the participating agencies. The computer can classify and compare fingerprints thousands of times faster than a technician, allowing the identification of criminals who otherwise might go undetected.²¹

Typically, after a latent fingerprint is recovered at a homicide scene occurring within Fairfax County, the latent print is entered into the NOVARIS data base to be searched against the approximate 195,000 known inked tenprint cards. These cards consist of persons who have been arrested and fingerprinted among the nine participating jurisdictions.²² If an identification is not made within the NOVARIS, the unknown latent is then searched against fingerprint data bases from Washington, D.C., Montgomery County, Maryland, and Prince George's County, Maryland. The NOVARIS has the capability to interface with these jurisdictions. The automated search is done from the NOVARIS site by NOVARIS technicians.²³

²¹ Hall interview.

²² Hall interview.

²³ Hall interview.

If the automated searches are negative to this point, the latent print will then be entered into the Virginia State Automated Fingerprint Identification System by NOVARIS technicians at the NOVARIS site. The latent is searched against the state's approximately 800,000 known inked tenprint cards. These cards consist of persons who have been arrested and fingerprinted throughout the Commonwealth of Virginia.²⁴

If the latent search is unproductive, the latent will be submitted to the Federal Bureau of Investigation (FBI) to be entered and searched in their automated fingerprint identification system. It is estimated the FBI's data base has more than 20 million known inked tenprint cards.²⁵

A big advantage of the NOVARIS and state AFIS system is that once the unknown latent print is entered into the data base and an immediate identification is not made; the systems will continually search and compare the unknown latent to all known cards entered in the future. This search will continue until such

²⁴ Hall interview.

²⁵ Hall interview.

time as a technician commands the system to cease searching. 26

The NOVARIS has already proven itself as an invaluable tool. Since it's inception, the NOVARIS has identified eleven suspects in homicide cases.²⁷

Is the evidence still available?

As per departmental policy, after physical evidence is collected and analyzed, it is secured in the Fairfax County Police Department's Property Section. Any officer introducing evidence in a court case must be able to account for the whereabouts of that evidence continuously since its recovery, and be able to certify that only police personnel had access to it. This is commonly referred to as "chain of custody" (Moenssens et al., 1986, p. 62).

The Fairfax County Police Department came into existence July 1, 1940. Since the department's beginning, all items of evidence and property were manually submitted to the Property Room. "Property cards" were completed by those persons submitting

²⁶ Hall interview.

²⁷ Hall interview.

evidence. Property cards were the main tracking documents used to locate all evidence up through the early 1980s. At one point, there were over 30,000 items of evidence and other miscellaneous articles in the Property Room.²⁸

During January 1986, the computer aided Recovered Evidence Management System (REMS) was implemented. The REMS allows Property Room clerks to locate and track by automated means approximately 20,000 items.²⁹

During this transition an unknown number of property cards were inadvertently destroyed for various reasons. Without the original property cards, locating old evidence is very difficult, if not almost impossible.³⁰

Since 1985, mandatory, semi-annual audits are systematically conducted on all items in the Property Room. Occasionally, an unaccounted-for piece of evidence is located. However, without the original property card, the unaccounted-for item cannot be

Personal interview conducted on June 5, 1995, at the Fairfax County Police Department Property Section with Mr. James P. Henderson, Supervisor of the Property Section. Mr. Henderson has worked in the Property Section over 20 years and has been the supervisor of that Section for approximately three years.

²⁹ Henderson interview.

³⁰ Henderson interview.

traced back to its origin.31

Add to this difficult task of securing and maintaining physical evidence human errors such as improper 11 digit case numbers; improper six digit property numbers; improper storage location codes; illegible hand writing; and so forth, it should become apparent that evidence from years past may have been discarded or its present whereabouts unknown.

Case in point:

On March 8, 1979, a 14 year old female was stabbed to death in the western part of Fairfax County. Several latent prints of comparison value were lifted from the scene and did not identify to any possible suspects.

Within a short period of time, a juvenile acquaintance was developed as a suspect. This suspect was requested to submit to a polygraph examination. The parents denied the polygraph exam, moved the child to Connecticut, and refused any further cooperation. Since this juvenile was a suspect only, and his finger prints were not on file, he could not be eliminated.

The original detectives exhausted all leads and eventually this case became "inactive." During the early part of 1995, this case was given to the Cold Case Squad for consideration. During the case preparation phase, criminal history checks were conducted on all named suspects. It was learned that during October 1993, the juvenile suspect, now an adult, was arrested and fingerprinted for a "bad check." With known inked prints of the suspect available, a very viable lead could be pursued. When Cold Case Squad

³¹ Henderson interview.

personnel attempted to obtain the latent prints from the Property Room, they could not be located. After an exhaustive review of the original case jacket, it is unclear if the latent prints were ever placed in the Property Room or retained in the original crime scene technician's case jacket. The technician that processed the homicide scene and lifted the unknown latent prints retired from the department several years ago. The technician was located and questioned about the latent lifts. The retired technician does not remember the details of the case and thought his case jacket/latent lifts may be stored in the general county archives.

A written request was submitted to the management of County Archives to initiate a location search for the latent print cards. Without any further written documentation or starting point, this is the proverbial "finding a needle in a hay stack."

Unfortunately, this is a classic example of a "no" answer to the solvability factor "Is the evidence still available?" (Synopsis of case #790672667).

The solvability factor questions "Are there named suspects in the case?" and "Are there witnesses in the case?" have similar implications and will be discussed in tandem.

In general, a suspect is an individual believed to be the offender in a case but for whom the detective has insufficient information to establish probable cause for an arrest. From an investigative stand point, it must always be kept in mind that witnesses

could be suspects and visa versa.32

There are numerous reasons to reinterview witnesses and suspects, when appropriate. Before reinterviewing a witness, it must be kept in mind that an interview may alert a suspect to a reinvestigation or bring false hope to the victim's family. It would be appropriate to explain to the family what has brought about the new or continuing interest in the case (unless, of course, they are the suspects).³³

Justifications for reinterviews with witnesses and suspects include the following: 34

- An interview may enlighten the detective and provide insight into changing relationships and associations.
- Witnesses that were friends of the suspect at the time of the homicide may not be any longer. In some cases, they may even be adversaries.
- The witness may have been afraid of the suspect at the time.

Personal interview conducted on June 6, 1995, at the Criminal Investigations Bureau with members of the Cold Case Squad. Members present included Lieutenant D. Wilson and Detectives S. Hendren, R. Smith and R. Walker. Detective Hendren has been a detective for 14 years and with the Fairfax County Police Department 23 years. Detective Smith has been a detective for four years and with the Fairfax County Police 16 years. Detective Walker has been a detective ten years and with the Fairfax County Police Department 21 years.

Wilson, et al, interview.

³⁴ Wilson, et al, interview.

- Time may have made the witness stronger or the suspect weaker.
- The witness may now be in need of help with another aspect of the Criminal Justice System.
- The witness may have become a better person, gotten married, found religion or any number of other things.
- The witness just doesn't mind getting involved now.
- People have been known to purposely not identify suspects or give false information because of business considerations.
- Experience has shown that many times an offender tells at least one person about his/her involvement. Locating these witnesses can provide the final element for arrest and/or closure.

Have there been leads in the last six months?

As previously described, cases assigned to the Cold Case Squad are classified as "Inactive," i.e. all investigative leads have been exhausted and no information exists which would lead to an arrest or exceptional clearance. The reality of this solvability factor is that if no new leads or information are available to further advance the investigation, then resources should not be expended on this case.

On the other hand, if a viable lead is obtained for an otherwise, inactive case, the lead should be

explored. It is anticipated leads will come available from other law enforcement agencies and through anonymous phone calls from persons who provide information to Crime Solvers.³⁵
Case in Point:

For 15 years Fairfax County police have had few clues that would lead to the arrest of the person who shot and killed an Alexandria builder in a wooded area near Lorton on July 14, 1980. that day in 1980, a clean-cut man in his early 20's walked into the Alexandria Redevelopment Company office and asked to see the victim, Terry Blackstock. The man, who called himself "Bob Anderson, " had telephoned twice before but never left a message. Anderson told Blackstock he had a small parcel of land he wanted to develop. two talked for about 15 minutes in Blackstock's office and then left together. Several hours later, Blackstock was found shot to death approximately seven miles from his business office.

An audit of Blackstock's business and financial records revealed he was in debt and there was suspicion that several insurance documents were fraudulent. Detectives suspect Anderson was hired to kill Blackstock. All leads were exhausted and the case became inactive.

During March 1995, an Arlington County Police Detective came upon some information and a "tip" was passed onto the Cold Case Squad.

The Crime Solvers program is a joint effort of the police department, the business community and the news media to deter crime through the identification and apprehension of suspects. Business leaders serve on a local board of directors for the program and solicit funds for rewards from area businesses. The board determines the amounts of reward to be paid to anonymous callers who provide information leading to arrests and indictments for serious crimes committed in Fairfax County. News media feature an unsolved crime each week and encourage individuals with information to call the Crime Solvers telephone number.

Because of the potential of this lead, squad members are once again combing through the information gathered on Blackstock's death. It is believed that with a little more information this case can be solved. The Fairfax County Police Crime Solvers is offering a \$1,000 reward to anyone who can provide information for an arrest and indictment. This case is periodically given to local media to be featured in the news and on Crime Solvers. (Summary of Fairfax County case #801961770).

In conclusion, this researcher has enthusiastically and methodically reviewed the literature in the criminal justice arena and related fields. This researcher feels confident in stating that a comprehensive literature review was conducted.

Chapter Three

Methodology

The Research Design

The objective of screening unsolved homicide cases involves a process that predicts which cases would have the best chance of being resolved. At a management level, determining the extent of follow-up, amount of resources committed/exhausted and when to suspend investigative efforts is a monumental determination. Decision making involves the continued application of solvability factors plus operational input from assigned detectives on the progress of assigned cases. Suspension determination may include lack of further leads, solvability factors or unavailability of investigative resources.

One of the goals for utilizing solvability factors is to develop a clear profile of cases with the most potential for close-ability and identify cases with a low potential for close-ability. Armed with this data, the Cold Case Squad supervisor is in a position to make qualitative decisions as to which cases should be assigned for follow-up investigation,

which cases should be deferred, or which cases should simply be filed pending receipt of additional information.

The decisions that will be made, based on the totality of such data, are qualitative decisions that result in quantitative actions. Therefore, it is very important that the historical data on which such decisions are based is continually updated and the analysis of this data is as comprehensive and accurate as possible.

The Population

The population for this thesis is the 75 unsolved homicides which have occurred in Fairfax County,
Virginia, from January 1, 1964 through December 31,
1994. The study population is the 42 unsolved homicides which have occurred in Fairfax County,
Virginia, between January 1, 1986 and December 31,
1994. The population is listed in Table Six.

Τа		x

1964	2	1980	3
1965	1	1981	2
1966	0	1982	3
1967	1	1983	2
1968	0	1984	2
1969	0	1985	0
1970	2	1986	3
1971	0	1987	4
1972	3	1988	4
1973	2	1989	6
1974	1	1990	3
1975	2	1991	7
1976	1	1992	5
1977	2	1993	4
1978	1	1994	6
1979	3	TOTAL	75

The rationality for the study population and its time frame is twofold. First, more than half (42 or 56%) of the 75 unsolved homicides have occurred during the past nine years (1986 - 1994). To management personnel, this sizable percentage of unsolved cases is of great concern. Because of limited resources and staffing for the Cold Case Squad, management decided to give a higher priority to the 42 unsolved cases.

Secondly, experience has shown that the older the case, the more difficult it is to locate physical evidence, witnesses and other specific information. Practically speaking, no detective, no matter how many homicides he or she has investigated, can know for sure at the

beginning just what witness, suspect, feature, or piece of physical evidence will be important. Therefore, note taking is of the utmost importance in death scene investigation. The further back one goes into the unsolved homicide archives, the more obvious it becomes that comprehensive, accurate and detailed notes are lacking. It seems the more complex the homicide, the more accumulative vast amounts of information became. Detectives from "days of old" did not have the luxury of personal computers and related automated case management tools. It appears homicide supervisors from past decades, when reviewing cases, did not place an emphasis on systematic written notes and preserving them for later review and/or admission into evidence.

In describing the purposes of note taking and submitting written reports, many texts mention that it represents the official memory of a department.

Regrettably, trying to locate and decipher notes and reports from some of the older cases into distinct phases of the investigation is very difficult, if not impossible. Police officers are not renowned for sharing information with each other. What knowledge that is shared between detectives is often times

informally disseminated. Unfortunately, there are situations when the original detective left the homicide section, a wealth of undocumented information was gone. From a management position, unless viable leads or other pertinent information is "rediscovered" or received, unsolved cases prior to 1986 will be given a low investigative priority.

Data Collection Procedures

The 42 unsolved homicides comprising the study population will be reviewed and a brief summary of each case will be presented in an appendix. The format for each unsolved case will be as follows:

Victim:
Case No:
Date:
Location:
Synopsis:
Motive:
Weapon:
Suspect:

Because these cases are unsolved, intimate details of each incident will remain confidential. The details in the summaries will intentionally be vague so as not to compromise any investigations. For example, when a gun was the weapon of choice, the response "firearm" will be used. Identifying additional

descriptors of a firearm such as pistol, rifle, revolver, semi-automatic, shotgun, caliber and so forth may jeopardize an investigation. Ambiguous descriptors such as "shot several times" or "stabbed numerous times" will be used. The exact number of times a victim was shot or stabbed and the specific location(s) on the body will not be included so as not to compromise any cases. Being intentionally vague eliminates the possibility of a suspect claiming to have learned the details of an investigation from outside sources. The ambiguity also protects strategic aspects of the cases, maintains confidentiality of the investigation, protects the rights of the suspects and the sensibilities of the family of the victim. Being this protective of the details of the cases may seem extreme, but there are many well documented cases where a suspect claims to have intimate knowledge of the crime obtained from public sources.

As each of the 42 homicides are reviewed, a solvability factors work sheet will be completed. The solvability factors work sheet is depicted in Figure

Three.

Figure Three

SOLVABILITY FACTORS	YES	NO
Has the death been ruled a homicide?		
Has the scene location been determined?		
Has the victim been identified?		
Is there physical evidence that can identify a suspect?		
Can any evidence be reprocessed to yield further clues?		
Is the evidence still available?		
Are there named suspects in the case?		
Are there witnesses in the case?		
Have there been leads in the last six months?		

All of the solvability factors are questions which will be answered with a yes or no response.

Each of the nine solvability factors is an independent variable. Resolving the case is the dependent variable.

The answers to the nine solvability factor questions will then be combined into a single score and summarized in a table. The compilation of the nine questions for the 42 cases will be computated by the statistical/analytic software of SPSS: The Statistical Package for the Social Sciences.

The 42 cases will be placed in rank order from highest to lowest solvability factor score. The rank order will by listed in table form by the victim's name, if the victim has been identified and case number. The case number provides basic information which will easily allow the reader to cross reference between the sample population and rank order list. The first two digits of a case number identifies the year. The next three numbers identifies the Julian Day. The remaining digits are sequential event numbers.

For example, the case number 8019661770 is decoded as follows: 80 represents the year 1980; the Julian Day 196 is the 196th day of the year, or July 15th; the remaining digits 1770 is the event number and reveals this event was the 1,770th event reported to the Fairfax County Police Department Emergency Operations Center on that day.

All unsolved cases which are resolved between January 1, 1995, through September 15, 1995, will be identified and evaluated. Each resolved case will include an explanation of the factor(s) which were instrumental in their resolution.

Special attention will be given to resolved cases to isolate any factor(s) which contributed to the resolution which was not among the original nine solvability factors. If significant new solvability

factors are identified, the original nine factors may be modified so as to improve investigative guidance. Ultimately, the evaluation of existing solvability factors and identifying additional factors will contribute to the Cold Case Squad in resolving cases which otherwise would remain unsolved.

Chapter Four

Results

Chapter Four is presented in two sections. The first section titled **Findings and Discussion**, summarizes the study population and responses to each of the nine solvability factors. A final synopsis is provided for each solvability factor.

The second section titled Interpretation of
Findings, addresses whether the hypothesis has been
proven and summarizes the three cases which were
resolved between January 1, 1995 and September 15,
1995. The solvability factor(s) which primarily
contributed to each case resolution is/are identified
and discussed.

Findings and Discussion

The study population of 42 unresolved cases was reviewed and a solvability factors work sheet was completed for each case. Appendix E presents a summary of each case within the study population and completed solvability factors work sheets. Figure Four highlights

the compilation of the nine solvability factors from the study population analysis.

Figure Four

SOLVABILITY FACTORS	YES	NO		
Has the death been ruled a homicide?	39	3		
Has the scene location been determined?	36	6		
Has the victim been identified?	41	1		
Is there physical evidence that can identify a suspect?	23	19		
Can any evidence be reprocessed to yield further clues?	2	40		
Is the evidence still available?	42	0		
Are there named suspects in the case?	24	18		
Are there witnesses in the case?	9	33		
Have there been leads in the last six months?	13	29		

Has the death been ruled a homicide?

Three cases have not been ruled homicides. They are:

Case No.	<u>Victim</u>		
86050212630	BARROWS,	Cindy	W/F/19
92036000652	BRACKENN,	Richard	W/M/53
94168001234	JONES,	Gail	W/F/36

Although the three cases have not been ruled homicides, any new information or leads would be acted upon by the Cold Case Squad.

Has the scene location been determined?

The location where the victim was killed has not been determined in six cases. They are:

Case No.	<u>Victim</u>		
86050212630 88292000357	BARROWS,	Cindy John	W/F/19 B/M/41
88303000828	DUNBAR, LEWIS,	Leader	B/M/41 B/M/27
89183001286	GORDON,	Riannon	W/F/9
90125000978	DARAB,	Sheila	W/F/28
93340000646	 Unknown 	-	W/F/27-34

Has the victim been identified?

In one case the victim has not been identified. The case is:

93340000646 - Unknown - W/F/27-34

In the remaining solvability factors summaries specific information will not be given. The summaries will remain intentionally vague so as not to compromise any investigations.

Is there physical evidence that can identify a suspect?

There are 23 cases where physical evidence has the potential to identify a suspect. In general, 12 of the 23 cases where physical evidence can identify a suspect involves a bullet and/or bullets that were removed from

the victim during the autopsy. Three cases yielded a cartridge case or cases which were recovered at the scene. The identification and examination of bullets, cartridge cases and firearms are often an integral part of the forensic investigation in homicide cases. If a weapon is recovered which is believed to be the murder weapon, a firearms examination will be performed. The firearms examiner usually compares the bullet(s) recovered from the victim to known test fired bullets from the recovered weapon by comparison microscopy. The recovered bullet(s) can be said to match the test bullet(s) if the major portions of their striations are identical around the periphery and it can be concluded the two were fired from the same weapon.

As with the individual characteristics which may be reflected in the markings on bullets, markings can be impressed and scratched onto the cartridge casing by various parts of the gun's mechanism. The firearms examiner can compare these markings and link a cartridge case to a specific weapon.

As a matter of routine, the firearms examiner would enter the markings on the cartridge cases into

the Drugfire³⁶ data base. Obviously, a conclusive firearms examination is a vital investigative aid, especially when the murder weapon is recovered in the possession of an individual.

In four cases usable amounts of DNA were recovered. If and/or when a suspect is developed, a sample of the suspect's blood will be obtained for DNA typing and genetic profile comparison to the DNA recovered at the scene. At present, genetic profiling can discriminate the question sample to the known sample to less than one in a few million or even billions of individuals in the overall population. In other words, the profile of the suspect can be unique or virtually unique when compared to the overall human population.

Drugfire was conceptualized by the FBI during the late 1980's and went on-line during July 1992. Drugfire's goal is to increase the solution rate of gang, drug-related and other types of serial shootings through the automation of forensic firearms identification. Drugfire's objective is the collection and sharing of forensic firearms information through data imagery. Forensic firearms information is used to link unsolved shootings to other shooting incidents and confiscated firearms. The Drugfire system consists of a high-speed telecommunications network which links Drugfire work stations in six regional forensic laboratories throughout the Baltimore/Washington area. Drugfire allows federal, state and local authorities to compare firearms evidence from unsolved shootings in a regional database to determine if the sameguns are being used repeatedly. (Personal interview with Julien J. Mason, Senior Forensic Scientist/Firearms Examiner, on September 1, 1995, at the Northern Virginia Regional Forensic Laboratory).

Latent prints were recovered from two cases which are of comparison value. If/when a suspect is developed, inked ten prints will be obtained and compared to the latent prints recovered from the scene.

Although identifiable latent prints are not often recovered from crime scenes, they remain one of the most valuable types of physical evidence in criminal investigations.

Two cases involve foreign hairs which were recovered from the victim. Hairs are among the most common types of physical evidence encountered and recovered at scenes of crimes. Human head hair and pubic hairs are often found at homicide scenes. Known and questioned hairs can be unequivocally excluded from having a common origin, if they are found to be significantly different. If the samples are similar, it is common for an examiner to conclude the hairs "could have shared a common origin." Although this opinion is normally the strongest which can be given in a hair comparison case, hair examinations often provide investigative guidance and are frequently used by the prosecution during trial.

Can any evidence be reprocessed to yield further clues?

There are two cases in which evidence was reprocessed. One case involved additional DNA testing and the other case involved firearm examinations between a gun recently recovered from a suspect to the bullet recovered from the victim.

Is the evidence still available?

In all 42 cases, the evidence is available.

Generally, evidence which is recovered from the crime scene and at the autopsy is packaged and stored in the police evidence room. It has been this researcher's experience that most recovered evidence is never analyzed until a suspect is located. Often times recovered evidence is such that it does not lend itself to laboratory analysis. Examples of this type of evidence could include, but are not limited to the victim's personal effects such as jewelry, rings, watch and clothing. Recovered at the autopsy from the victim could be blood for toxicology, fingernail scrapings, head and pubic hair samples, inked fingerprints of the victim and personal effects still on the body.

Are there named suspects in the case?

In 24 cases there are named suspects. The degree of involvement of the suspects varies greatly. The spectrum of involvement may range from the named suspect actually being the perpetrator to no involvement at all and legitimately being in the area at the time of the homicide.

Are there witnesses in the case?

There are named witnesses in nine cases. The significance of the witnesses varies immensely. For example, the witness may be a neighbor who took the initiative to call the police after observing the victim's accumulated mail and car had not been moved for several days. Often times the witness saw a suspicious person or vehicle just prior to the homicide or heard noises which provided investigative guidance.

In a few of the cases, the witness actually observed the homicide and has personal knowledge of the perpetrator. Unfortunately, some witnesses no longer live in the immediate area, have died, or for whatever reason, cannot be located.

Have there been leads in the last six months?

In 29 cases, leads have been developed or calledin to the Cold Case Squad. Many of the leads are from
unidentified callers who only give fragmented
information. Concerted efforts are made to follow-up
all leads. This becomes a monumental task and is very
time consuming. There is no reliable way to quickly
measure a lead's veracity. Therefore, a fresh lead
must be systematically investigated and independently
corroborated.

Interpretation of Findings

As stated in **Chapter One**, page 12, this researcher's *hypothesis* is:

The formulation of a Cold Case Squad would measurably reduce the number of unresolved homicides within Fairfax County.

The hypothesis has been proven as there is a measurable reduction in the number of unresolved homicides within Fairfax County. From the 42 cases comprising the study population inclusive January 1, 1995 through September 15, 1995, two cases have been closed by arrest, one case closed by exceptional

clearance and one case is pending approval from the Commonwealth Attorney's Office to obtain arrest warrants.

The SPSS Program computated the two "closed by arrest" cases and the one "exceptional clearance" case as 7.1% of the study population. The "pending" case is 2.4% of the study population. When combining the closed by arrest/exceptional clearance cases with the pending case, the computation is 9.5% of the study population.

Table Seven is the study population presented in rank order from highest to lowest potential of solvability. The rank order was determined by the SPSS Program based on yes or no answers to the nine solvability factor questions.

It is interesting to note, the two cases closed by arrest are at rank order position one with eight solvability factors present and rank order position six with seven solvability factors present. The one pending case is at rank order position three with eight solvability factors present and the exceptional clearance case is at rank order position 30 with five solvability factors present.

In the John Toland homicide, the solvability factor "Have there been leads in the last six months?" was the factor that broke the case. During November 1994, the Cold Case Squad received a confidential telephone call from a person in prison who stated there was a fellow inmate identified as David Petruska bragging about killing a "fag" in the Northern Virginia area. After interviewing the caller, it became apparent David Petruska was revealing specific details of the homicide that only a person who was at the homicide scene would know. Further investigation identified a companion of Petruska. This companion also had knowledge of intimate details that only a person who was at the scene would know. Petruska's companion agreed to testify for a reduced sentence in an unrelated case. On February 28, 1995, David Petruska was found guilty of first degree murder by jury and sentenced to 50 years in prison for Toland's murder.

In the Amilcar Menjivar case, the primary solvability factor "Have there been leads in the last six months?" is credited for potentially closing this homicide. Anonymous information was received which identified the shooter, where the shooter could be

found and where the murder weapon was located. Additional investigation corroborated the lead and the firearm was recovered from the suspect. The secondary solvability factor "Is there physical evidence that can identify a suspect?" is also credited for potentially closing this homicide. The recovered firearm was identified as the weapon firing the fatal bullets which were recovered from the victim during the autopsy. During March 1995, this case was given to the Commonwealth Attorney's Office for review and approval to obtain murder warrants. As of September 15, 1995, the Commonwealth Attorney's Office has not made a decision to proceed forward with this case. This may seem like a long period of time for the Commonwealth Attorney's Office to have this case but it isn't. Since the suspect and his whereabouts are known to the Cold Case Squad, the Commonwealth Attorney's Office need not be in any rush.

In the Paul Harley homicide the solvability factor "Have there been leads in the last six months?" was the factor that broke the case. An anonymous caller gave information which implicated Charles Shank and Steven King as the persons who murdered Harley. Additional

investigation revealed Charles Shank was the shooter and Steven King was an accomplice. On April 3, 1995, Charles Shank was found guilty of first degree murder by jury and sentenced to 40 years in prison. On April 21, 1995, Steven King was found guilty of second degree murder by jury and sentenced to 20 years in prison.

In the Richard Brackenn incident, the facts of the case (to include the physical evidence was inconsistent with the wife's statement and there was a six million dollar insurance payoff) were given to the Commonwealth Attorney's Office for review and approval to obtain murder warrants. During January 1995, the Commonwealth Attorney's Office decided not to prosecute the case because "there is no provable motive and/or criminal culpability." Since the Commonwealth Attorney's Office will not prosecute this case, it has been reclassified as "Closed by Exceptional Means."

Chapter Five

Conclusions

Chapter Five is a summary of conclusions based upon the data, findings and knowledge gained while conducting research for this thesis project.

In the Toland, Menjivar and Harley cases, the solvability factor "Have there been any leads in the last six months?" was the primary factor which broke each case. Although this writer doesn't have any research data to back up this conclusion, it is safe to say that many murderers are not arrested due to criminal investigative efforts by the police, but rather from information that comes to the police from the people in the community. For this reason, it is important that members of the media and general public be given as much information as possible about the crime. Information which should be withheld from the public are the critical points and related physical evidence that only the murderer would know.

Nationally, television programs like *Unsolved*Mysteries and America's Most Wanted have demonstrated that such programs can be powerful tools in

apprehending dangerous criminals. Locally, programs such as *Crime Solvers*, broadcasting over the radio, television and printing in the newspapers are very effective means of helping to catch the perpetrator. It is important for people of the community to believe their police department will follow through if they take the time and effort to call in information on a case.

Since the leads that broke the Toland, Menjivar and Harley cases were confidential and/or anonymous, it is unclear what relationship the callers had with the murders. However, it is clear their lead along with other investigative information was the cornerstone for the successful apprehension and prosecution of the perpetrator. Most incidents which require police assistance will generate a written report that may later become the foundation of the detective's case in court. Obviously, a homicide investigation has the potential to produce volumes of hand written notes and other recorded information. A large-scale, continuing homicide investigation, involving a relatively substantial number of detectives will create vast amounts of information which will need to be processed quickly

and permanently recorded so this information is available to any one of a number of detectives when needed.

While researching unsolved homicide case files for this thesis project, it quickly became apparent some of the detectives from the past were very lax in preparing complete, accurate, detailed notes and reports. In some cases, original field notes were never found and supplemental reports were ambiguous.

With the O.J. Simpson trial just ending, it must be anticipated courtroom lawyers will try many tricks and tactics to convince the jury to allow their defendant to go free. In several of the unsolved homicide cases, lack of detailed notes could result in grave consequences. The detective's inability to locate pertinent information and familiarize himself with important elements of the case most likely will lead to unfavorable results in a criminal prosecution.

Most detectives from past decades never thought to look to the future and consider if the homicide in question is not solved by the original detective, what can be done to make future follow-ups easier?

Within the past decade, there seems to have been a concerted effort to apply scientific methodology to criminal investigations, especially in the form of computerized information management. The Fairfax County Police Department routinely utilizes outside resources such as HALT and VICAP. Within, the department depends on sophisticated computer systems to store and access its vast data bases.

Computer usage may create a paradox. Unless properly synthesized and analyzed, this data will do little except produce large informational archives. Computers have no doubt made homicide investigation analyses many more times effective than in the past.

Presently, the use of computers provides the detective with the ability to quantify and extrapolate information contained in volumes of case reports. The types of information that can be analyzed is limited only by what is recorded by the investigating officers and the imagination of the person(s) designing the computer input screen. Such information would otherwise be and once was, lost in paper files.

An area which was not researched and appears to have a tremendous impact on how the Cold Case Squad

(and in general, the Fairfax County Police Department) is perceived is the "Fairfax Peer Survivors' Group" (FPSG). The FPSG was established by the Fairfax County Police Department's Victim/Witness Assistance Unit. 37 The FPSG began in 1991 and is comprised of "homicide survivors" whose family member or loved one was the victim of a homicide within Fairfax County. Director, Ms. Ellis, explained the FPSG meets every other Wednesday evening and offers emotional support and understanding to individuals who are left behind after a death due to homicide. The idea for the support came when Ms. Ellis (and other Victim/Witness counselors) who help Fairfax County crime victims through the various stages of the criminal justice system saw relatives and friends of homicide victims suffering a different kind of grieving process. The families of homicide victims are inflicted by devastating, emotional trauma. Ms. Ellis has seen

The Victim/Witness Unit is positioned in the Criminal Investigations Bureau in order to ensure immediate and direct help to victims of violent crime. The Victim/Witness Unit function is to assist victims of felony crimes or crimes causing injury or death and help witnesses in prosecution cases to participate effectively in the criminal justice process. The Victim/Witness Unit was established by the Fairfax County Police Department to demonstrate that the criminal justice system is responsive to the needs, concerns and rights of all victims and witnesses. (Personal interview with Ms. Carol Ellis, Director of the Victim/Witness Unit, on September 16, 1995).

shock and apathy, helplessness and terror, overwhelming rage, guilt and intense yearning for the one who is dead. Moreover, relatives and friends of homicide victims also have the added burden of dealing with police, lawyers and others in the criminal justice system. The criminal justice system is not structured for emotions; it's structured for law, said Ms. Ellis.

From a management point of view, the question may be asked: Is it advantageous for the department to have a Cold Case Squad when staffing and funding is limited? Especially when three cases out of 75 unsolved homicides have been resolved and a fourth case is pending. Overwhelming, the answer to this question is yes. There is no way to place a monetary value on the emotions of homicide survivors. The Cold Case Squad is in a win - win situation. Whenever a cold case is being reopened, as a matter of routine the victim's family is contacted. The Cold Case Squad detective is especially careful not to unjustly raise their hopes. It is explained to the family what has brought about the new, or continuing interest.

³⁸ Ellis interview.

This contact with the family lets them know the department has not forgotten them. Additionally, when an arrest is made in a case that is many years old, several things happen. First, any article or other media coverage which depicts a positive image of the department is always welcomed. Secondly, it makes others in the community realize that we as police officers do care about the old cases. Lastly, media coverage on resolving cold cases may generate calls on other unsolved cases.

This researcher can foresee the Cold Case Squad resolving additional unsolved homicides. The members of the squad are experienced, veteran detectives who are self-motivated. The squad is left alone to work the old, unresolved cases and is given sufficient resources. The Cold Case Squad also has the support of the administration. Written guidelines and procedures are now in place for the day to day operations of the squad. The Cold Case Squad's effectiveness will only be limited by the detective's imagination and ingenuity. With these factors in their favor, it is believed the Cold Case Squad will become more effective and continue to turn the liability of time into an asset.

The Homicide Detective

No greater honor will ever be bestowed or a more profound duty imposed than when entrusted with the investigation of the death of a human being.

It is the detective's duty to find facts, regardless of color or creed, without prejudice and to let no power on earth deter the detective from presenting these facts to the court without regard to personality.

Appendix B

Violent Criminal Apprehension Program Crime Analysis Report (VICAP) FD-676 (Rev. 3-22-91) OMB No. 1110-0011

U.S. Department of Justice Federal Bureau of Investigation

VICAP

Crime Analysis Report

NATIONAL CENTER FOR THE ANALYSIS OF VIOLENT CRIME

HOW TO COMPLETE THE VICAP CRIME ANALYSIS REPORT FORM

VICAP SUBMISSION CRITERIA

The VICAP Crime Analysis Report form has been designed to collect information regarding the following types of crimes whether or not the offender has been arrested or identified:

- (1) Solved or unsolved homicides or attempts, especially those that involve an abduction; are apparently random, motiveless, or sexually oriented; or are known or suspected to be part of a series.
- (2) Missing person, where the circumstances indicate a strong possibility of foul play and the victim is still missing.
- (3) Unidentified dead bodies, where the manner of death is known or suspected to be homicide.

Cases where the offender has been arrested or identified should be submitted so unsolved cases in the VICAP system can be linked to known offenders.

INSTRUCTIONS

- Use black ink or pencil. Legibly print all written responses.
- Unless stated otherwise, check as many boxes as apply for each item.
- If in doubt about how to respond to a given item, be guided by your experience and good judgment. Proof beyond a reasonable doubt is not required, but do not guess either.
- If there are details of the case that you feel are important but that do not fit well into the items
 provided in the VICAP Crime Analysis Report, describe them in the narrative.
- If you wish to supplement or correct information previously reported to VICAP, submit a new VICAP Crime Analysis Report but complete only Items 1 through 18, 27 and 36 plus the Item(s) you wish to supplement or correct. You need not resubmit unchanged items.
- For advice or assistance regarding this report or its completion, call VICAP at (703) 640-6131.
- If you are submitting this VICAP Crime Analysis Report in conjunction with a request for a criminal personality profile evaluation, you must contact the CRIMINAL PROFILE COORDINATOR assigned to the FBI Field Division in your area. The CRIMINAL PROFILE COORDINATOR is charged with the responsibility of assisting you with your request for a criminal personality profile and will advise you of additional materials that must be submitted in order to evaluate your case properly. He/she will review the materials and will submit the entire profile package to the National Center for the Analysis of Violent Crime on your behalf. Do not submit Criminal Personality Profiling case materials directly to VICAP. Only the VICAP Crime Analysis Report should be submitted directly to VICAP.

Multiple victims & multiple offenders

If your incident has MULTIPLE VICTIMS, you must complete a separate VICAP Crime Analysis Report form for each victim. Offender information need not be duplicated.

If your incident has MULTIPLE OFFENDERS, submit only one complete VICAP Crime Analysis Report per victim; xerox and attach additional offender page(s) (Items 55 through 84) to each Report as needed.

Examples:

- For two (2) victims and one (1) offender, you must complete two (2) VICAP Crime Analysis Report forms (one for each victim). Do not duplicate the Offender information (Items 55 through 84) in the second Report.
- For two (2) victims and two (2) offenders, you must complete two (2) VICAP Crime Analysis Report forms. Victim #1 and offender #1 would go on the first Report form and victim #2 and offender #2 would go on the second Report form.
- 3) For one (I) victim and two (2) offenders, you must complete one (I) VICAP Crime Analysis Report form. The victim and offender #1 would be reported in the body of the VICAP Crime Analysis Report form, and offender #2 would be reported by copying an additional offender page (Items 55 through 84), completing it, and attaching it to the VICAP Crime Analysis Report.
- Before submitting the VICAP Crime Analysis Report, make a copy for your records.
- Mail all VICAP Crime Analysis Reports, Supplements, and/or Corrections to:

VICAP National Center for the Analysis of Violent Crime FBI Academy Quantico, VA 22135.

- Enclosing Crime Scene Photographs with the VICAP Crime Analysis Report will assist the VICAP staff in the
 evaluation of the case.
- A VICAP Case Number will be assigned to your case when it is processed and will be provided to you as soon
 as possible. The VICAP Case Number should be referenced in any subsequent correspondence or telephone
 communications with VICAP regarding the case.
- The Narrative Summary is intended to provide VICAP Analysts with a general overview of the case. Minute details of the investigation need not be provided here; the VICAP Crime Analysis Report will capture most of the detail necessary to complete the analysis. A person unfamiliar with your case, however, should have at least a general idea of what happened after reading your brief narrative.

Examples:

- The partially decomposed body of an adult female was discovered in a wooded area of a state park, one-quarter mile from a major state highway. There are indications of sexual assault. Victim died of gunshot wounds. It appears that the victim was not killed at the body recovery site. The victim's whereabouts prior to her death have not been established.
- 2) Female juvenile was last seen at school. Investigation indicates that she was possibly abducted at or near the school while en route home. The victim has not returned nor has her body been recovered. Investigation indicates that it is unlikely that the victim is a runaway or that she disappeared of her own accord. This case is strikingly similar to one that occurred approximately 8 months ago in the same vicinity.
- 3) The reported offender entered a locked single-family residence occupied by a man, his wife, and 2 infant children. While the offender was gathering property in the residence, the husband confronted the offender. The husband was shot immediately and died. The wife responded after hearing the gunshot and was physically restrained by the offender. The offender hit her repeatedly with his fists, forced her to commit oral sex, and raped her repeatedly. The wife survived the attack. The children were not assaulted. The offender left the residence, and a vehicle was heard to leave the area. Offender arrested during the commission of a burglary in the same neighborhood one week later.

TABLE OF CONTENTS

SUBJEC	T AREA	ITEM NUMBERS
I.	ADMINISTRATION	
	Case administration	1 - 17
	Crime classification	18 - 20

Public Reporting Burden for this collection of information is estimated to average two hours per response, including the time for reviewing the instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to: VICAP, FBI Academy, Quantico. Virginia 22135; and to the Office of Management and Budget, Paperwork Reduction Project: OMB #1110-0011; Washington, D.C. 20503.

Appendix C

Virginia State Police Homicide Assessment and Lead Tracking System Crime Analysis Report (HALT)

VIRGINIA STATE POLICE

HALT

HOMICIDE ASSESSMENT AND LEAD TRACKING SYSTEM

CRIME ANALYSIS REPORT

IN CONJUNCTION WITH

US DEPARTMENT OF JUSTICE FEDERAL BUREAU OF INVESTIGATION

NATIONAL CENTER FOR THE ANALYSIS OF VIOLENT CRIME

VIOLENT CRIMINAL APPREHENSION PROGRAM

BOW TO COMPLETE THE HALT/VICAP CRIME ANALYSIS REPORT FORM

SUBMISSION CRITERIA

The BALT/VICAP Crime Analysis Report is designed to be submitted on the following types of crimes, whether or not the offender has been arrested or identified:

- Solved or unsolved homicides or attempts, especially those that involve an abduction; are apparently random, motiveless, or sexually oriented; or are known or suspected to be a part of a series.
- (2) Missing persons, where the circumstances indicate a strong possibility of foul play and the victim is still missing.
- (3) Unidentified dead bodies, where the manner of death is known or suspected to be homicide.

Cases where the offender has been arrested or identified should be submitted so unsolved cases in the BALT/VICAP system can be linked to known offenders.

If a crime meets any of the three criteria listed above, the entire <code>HALT/VICAP</code> Crime Analysis Report <code>must</code> be filled out, as accurately and completely as possible.

It is understood that a homicide may meet the general criteria established in (1), above, but, is an apparent singular incident. For example, a domestic homicide, or a bar fight which results in a homicide. If you, the principal investigator, feel that the likelihood of the offender being involved in other crimes is negligible, or the likelihood of the weapon being linked to other crimes is negligible, it is necessary to complete only the <code>Doxed numbers</code> of the form. To aid in determining whether or not to fill out the complete form, consider such things as the relationship between the victim and the offender, the motive for the crime, or the offender's frame of mind. Strong consideration should be given to filling out the complete form in cases involving a male spouse killer, parents who kill children, or children who kill parents or grandparents.

The HALT/VICAP system is designed to provide usable information to benefit all law enforcement, in addition to gathering specific areas of information. The quality of the benefit returned through the system will be commensurate with the quality of the information entered.

INSTRUCTIONS

- Use black ink or pencil. Print legibly.
- Unless stated otherwise, check as many boxes as apply for each item.
- If in doubt about how to respond to a given item, be guided by your experience and good judgement. Proof beyond a reasonable doubt is not required, but do not guess, either.
- If there are details of the case that you feel are important but that do not fit well into the items provided in the BALT/VICAP form, describe them in the narrative.

SUBMISSION CRITERIA con't

- If you wish to supplement or correct information previously reported, submit a new form, but complete only Items H1. 27 and 36 plus the items(s) you wish to supplement or correct. You need not resubmit unchanged items.
- For advice or assistance regarding this report or its completion, call the Virginia State Police Violent Crimes Investigative Unit at (804) 323-2333 or 323-2326.
- If you are submitting this HALT/VICAP Crime Analysis Report in conjunction with a request for a criminal investigative analysis, you must contact Virginia State Police Violent Crimes Investigative Unit at (804) 323-2333 or the NCAVC COORDINATOR assigned to the FBI Field Division in your area.

Multiple victims & multiple offenders

If your incident has NULTIPLE VICTIMS, you must complete a separate HALT/VICAP Crime Analysis Report for each victim. Offender information need not be duplicated.

If your incident has MULTIPLE OFFENDERS, submit only one complete HALT/VICAP Crime Analysis Report per victim; xerox and attach additional offender page(s) (Items 55 through 84) to each report as needed.

Examples:

- For two victims and one offender, you must complete two HALT/VICAP Crime Analysis Reports (one for each victim). Do not duplicate the offender information (Items 55 through 84) in the second report.
- For two victims and two offenders, you must complete two BALT/VICAP Crime Analysis Reports. Victim No. 1 and offender No. 1 would go on the first report, and victim No. 2 and offender No. 2 would go on the second report.
- 3) For one victim and two offenders, you must complete one BALT/VICAP Crime Analysis Report. The victim and offender No. 1 would be reported in the body of the BALT/VICAP Crime Analysis Report, and offender No. 2 would be reported by copying additional offender pages (Items 55 through 84), completing them, and attaching them to the BALT/VICAP Crime Analysis Report.
- Before submitting the BALT/VICAP Crime Analysis Report, make a copy for your records.
- Mail all HALT/VICAP Crime Analysis Reports, supplements and/or corrections to:

HALT

Department of State Police

P.O. Box 27472

Richmond, Virginia 23261-7472

Telephone: 804/323-2333

- Enclosing photographs of the crime scene in the HALT/VICAP Crime Analysis
 Report will assist the HALT and VICAP staffs in the evaluation of the case.
- A HALT/VICAP Case Number will be assigned to your case when it is processed, and will be provided to you as soon as possible. That Case Number should be referenced in any subsequent correspondence or telephone communications with HALT or VICAP regarding the case.
- The Narrative Summary is intended to provide HALT/VICAP Analysts with a general overview of the case. Minute details of the investigation need not be provided here, the HALT/VICAP Crime Analysis Report will capture most of the detail necessary to complete the analysis. A person unfamiliar with your case, however, should have at least a general idea of what happened after reading your brief narrative.

Examples:

- The partially decomposed body of an adult female was discovered in a wooded area of a state park, one-quarter mile from a major highway. There are indications of sexual assault. Victim died of gunshot wounds. It appears that the victim was not killed at the body recovery site. The victim's whereabouts prior to her death have not been established.
- 2) Female juvenile was last seen at school. Investigation indicates that she was possibly abducted at or near the school while en route home. The victim has not returned nor has her body been recovered. Investigation indicates that it is unlikely that the victim is a runaway or that she disappeared of her own accord. This case is strikingly similar to one that occurred approximately 8 months ago in the same vicinity.
- 3) The reported offender entered a locked single-family residence occupied by a man, his wife, and 2 infant children. While the offender was gathering property in the residence, the husband confronted the offender. The husband was shot immediately and died. The wife responded after hearing the gunshot and was physically restrained by the offender. The offender hit her repeatedly with his fists, forced her to commit oral sex, and raped her repeatedly. The wife survived the attack. The children were not assaulted. The offender left the residence, and a vehicle was heard to leave the area. Offender arrested during the commission of a burglary in the same neighborhood one week later.

IT IS ONLY NECESSARY TO FILL OUT A HALT FORM TO HAVE YOUR CASE ENTERED INTO BOTH HALT AND VICAP.

I. ADMINISTRATION

CASE ADMINISTRATION

If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure 5 Implied family emergency/illness 9 Phony police traffic stop 2 Posed as business person 6 Wanted to show (something) 10 Solicitation for sex 3 Asked victim to model/pose for photos 7 Asked for/offered assistance 11 Offered ride or transportation 4 Offered job, money, treats or toys 8 Caused/staged traffic accident 12 Other deception 98. If the offender initiated contact with the victim by means of surprise, indicate the type of surprise below: 1 Lay in wait—out of doors 4 Victim sleeping 2 Lay in wait—in vehicle 99. If the offender initiated contact with the victim by direct and immediate physical assault, indicate the type of direct and immediate physical assault, indicate the type of direct and immediate physical assault, indicate the type of direct and immediate physical assault below: 1 Immediately and physically overpowered victim (picked up, 3 Choked victim carried away, etc.) 2 Hit victim with hand, fist, or clubbing 5 Shot victim
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure
	3 By surprise: lay in wait or stepped from concealment. (go to item 98 and then go to item 100) 4 By "Blitz": direct or immediate physical assault. (go to item 99) 97. If the offender initiated contact with the victim by means of deception, indicate type of deception below: 1 Posed as authority figure

LOCATION OF EVENTS
BODY RECOVERY SITE
101. Description of general area of the body recovery site (one only): 1 Rural 2 Suburban 3 Urban 99 Unknown
102. The neighborhood of the body recovery site is predominantly (check one): 1 Business, industrial or commercial 3 Residential 99 Unknown 2 Farm or agricultural 4 Uninhabited or wilderness
103. The body recovery site was (check as many as apply):
1 Any residence 5 In a vice area 9 On public transportation 2 At or near a school or playground 6 A densely wooded area 88 Other (specify)
3
104. The body recovery site was the victim's residence:
1 Yes 2 No 99 Unknown
105. The body recovery site was the victim's workplace: 1 Yes 2 No 99 Unknown
106. Potential witnesses at the time the offender left the body recovery site:
1 Other people were present in the immediate area 99 Unknown
2 Area was essentially deserted
MURDER OR MAJOR ASSAULT SITE
107. Was the murder or major assault site the same as the body recovery site? 1 Yes (go to item 113) 2 No 99 Unknown
108. Description of general area of murder or major assault site (check one):
1 Rural 2 Suburban 3 Urban 99 Unknown
109. The neighborhood of murder/major assault site is predominantly (check one):
1 Business, industrial or commercial 4 Uninhabited or wilderness
2 Farm or agricultural 99 Unknown 3 Residential
110. The murder or major assault site was (check as many as apply): 1 Any residence 5 In a vice area 9 On public transportation
2 At or near a school or playground 6 A densely wooded area 88 Other (specify)
3 In a retail shopping district 7 In an open field
4 On a public street 8 In a vehicle 99 Unknown
111. The murder or major assault site was victim's residence: 1 Yes 2 No 99 Unknown
112. The murder or major assault site was victim's work place:
1 Yes 2 No 99 Unknown
113. Potential witness at the time of the murder or major assault:
1 ☐ Other people were present in the immediate area 2 ☐ Area was essentially deserted 99 ☐ Unknown
AA Oukknown
SITE OF OFFENDER'S INITIAL CONTACT WITH VICTIM
114. Was the site of the offender's initial contact with the victim the same as the murder or major assault site? 1 Yes (go to item 120) 2 No 99 Unknown
115. Description of general area of initial offender/victim contact (check one):
1 Rural 2 Suburban 3 Urban 99 Unknown

116. The neighborhood of initial contact is predominantly (check one): 1 Business, industrial or commercial 3 Residential 2 Farm or agricultural 4 Uninhabited or wilderness	99 Unknown
117. The initial offender/victim contact was (check as many as apply):	
1	9 On public transportation 88 Other (specify)
118. The offender victim contact was victim's residence: 1 Yes 2 No 99 Unknown	
119. The offender/victim contact was victim's workplace: 1 Yes 2 No 99 Unknown	
120. Potential witness at the time of the initial offender/victim contact: 1 Other people were present in the immediate area 99 Unknown 2 Area was essentially deserted	
VICTIM'S LAST KNOWN LOCATION	
121. Was the site of the victim's last known location the same as the site of the initial of last Known location the same as the site of the initial of last Yes (go to item 127) 2 No 99 Unknown	ontact between victim and offender?
122. Description of general area of victim's last known location (check one): 1 Rural 2 Suburban 3 Urban 99 Unknown	
123. The neighborhood of victim's last known location was predominantly (check one) 1	
	On public transportation Other (specify) Unknown
125. The victim's last known location was victim's residence: 1 Yes 2 No 99 Unknown	
126. The victim's last known location was victim's workplace: 1 Yes 2 No 99 Unknown	
1 Yes 2 No 99 Unknown EVENTS AT ASSAULT SITE 127. There is evidence that the offender disabled the telephone, other utilities or securing the secu	ty devices: Unknown

1 Yes 2 No 99 Unknown EVENTS AT ASSAULT SITE 127. There is evidence that the offender disabled the telephone, other utilities or securingly Yes 2 No 99 128. The property at the crime scene(s) was ransacked, vandalized or burned: 1 Yes (specify) 2 No 99 129. There are indications that the offender took steps to obliterate or destroy evidence	Unknown Unknown
1 Yes 2 No 99 Unknown EVENTS AT ASSAULT SITE 127. There is evidence that the offender disabled the telephone, other utilities or securingly Yes 2 No 99 128. The property at the crime scene(s) was ransacked, vandalized or burned: 1 Yes (specify) 2 No 99 129. There are indications that the offender took steps to obliterate or destroy evidence	Unknown Unknown at the scene: Unknown
1 Yes 2 No 99 Unknown EVENTS AT ASSAULT SITE 127. There is evidence that the offender disabled the telephone, other utilities or securing No 99 128. The property at the crime scene(s) was ransacked, vandalized or burned: 1 Yes (specify) 2 No 99 129. There are indications that the offender took steps to obliterate or destroy evidence 1 Yes 99 1	Unknown Unknown at the scene: Unknown

OFFENDER'S WRITING OR DRAWING AT THE CRIME SCENE
132. Writing or drawing at crime scene(s): 1 Yes (describe) 2 No
133. Instrument used to write or draw at crime scene(s):
1 Knife or other sharp instrument 4 Writing instrument (pen, etc.)
2 Blood 88 Other (specify)
3 Lipstick
SYMBOLIC ARTIFACTS AT CRIME SCENE
134. Was there evidence to suggest a deliberate or unusual ritual /act/thing had been performed on, with, or near
the victim (such as an orderly formation of rocks, burnt candles, dead animals, defecation, etc.)?
1 Yes (describe)
99 Unknown
OFFENDER'S COMMUNICATIONS
Item 135 deals with communications initiated by the offender with respect to the crime. Examples would be: an offender
sending a letter or a tape recording to the police or media claiming responsibility for the crime; a ransom note;
or a suspicious communication received by the victim prior to the crime. (This item does not refer to conversation between the offender and victim during commission of the crime.)
135. Was there any communication from the offender before or after the crime?
1 Yes (enclose a copy or synopsis of the communication) 2 No 99 Unknown
VII. CONDITION OF VICTIM WHEN FOUND
136. There is reason to believe the offender moved the body from the area of the death site to the area of the body
recovery site: 1 ☐ Yes 2 ☐ No 3 ☐ Unable to determine
137. Evidence suggests the offender disposed of the hody in the following manner:
137. Evidence suggests the offender disposed of the body in the following manner: 1 Openly displayed or otherwise placed to insure discovery 3 With an apparent lack of concern as to
1 Openly displayed or otherwise placed to insure discovery 3 With an apparent lack of concern as to 2 Concealed, hidden, or otherwise placed in whether or not body was discovered

Appendix D

Letter of Inquiry Concerning Cold Case Squads

FAIRFAX COUNTY POLICE DEPARTMENT

10600 PAGE AVENUE, FAIRFAX, VIRGINIA 22030-4081

May 22, 1995

Dear Supervisor:

Greetings from Fairfax County, Virginia!

Please let me explain why I am writing to you. Recently, our department formed a "Cold Case Squad." The Cold Case Squad is a branch of our Homicide Section and is tasked with the responsibility of reinvestigating old, unresolved homicides.

It is my understanding your agency has a Cold Case Squad. I am conducting thesis research for a Masters of Science Degree in Criminal Justice from Virginia Commonwealth University. My thesis research involves Cold Case Squads and I am requesting any information you may have available. I am specifically interested in:

- Closure rate data
- Number of cases handled
- Solvability factors
- Any other information you believe may help add validity to my research.

Information may be mailed to the above address. I can be reached at from 7:00 am to 3:30 pm, Monday through Friday. I am thanking you in advance for your assistance.

Sincerely,

Rodney L. Gohn, Lieutenant Supervisor, Crime Scene Section

YEAR 1992

1. VICTIM: BRACKENN, Richard E. - W/M/53

Case No: 92036000652

Date: 02/05/92

Location: 148 River Park Drive

Synopsis: Suspect states she retrieved a pistol from her

closet so her husband could give her lessons on gun safety. The husband was sitting at his desk in the master suite of their bedroom. As the wife was carrying the pistol in the palms of her hands to

give deliver it to her husband, the pistol

"accidently" went off. The wife claims she did not have her finger on the trigger. Her husband was struck in the rear lower left portion of the head above the neck and the projectile exited in the hairline area above the left eye. He was medivaced to Fairfax Hospital where he was pronounced dead. There was a multi-million insurance pay off for the "accidental" death. Because of several inconsistences in the wife's statement and physical evidence that is inconsistent with the wife's statement, this incident is still unresolved. The Commonwealth's Attorney will not prosecute this case unless a provable motive and criminal culpability is found

against the wife.

Motive:

Unknown Pistol

Weapon: Suspect:

Wife
