TITLE Major Gains and Losses. Part Two. A Staff Report on Shifts since 1976 in the Popularity of Various Academic Disciplines as Fields of Study at California's Public Universities. Commission Report 87-26.

INSTITUTION California State Postsecondary Education Commission, Sacramento.

PUB DATE Sep 87

NOTE 110p.; For Part One, see ED 235 728.

AVAILABLE FROM California Postsecondary Education Commission, 1020 Twelfth Street, Third Floor, Sacramento, CA 95814-3985.

PUB TYPE Statistical Data (110) -- Reports - Research/Technical (143)

EDRS PRICE MF01/PC05 Plus Postage.

DESCRIPTORS *Bachelors Degrees; College Programs; Degrees (Academic); *Doctoral Degrees; Enrollment Trends; Females; Foreign Students; Higher Education; Intellectual Disciplines; *Majors (Students); Males; *Masters Degrees; Minority Groups; Nontraditional Occupations; *State Universities; Student Characteristics; Trend Analysis

IDENTIFIERS California; *California State University; *University of California

ABSTRACT

Degree trends in 21 general fields of study and selected majors within the fields are reported for the University of California and California State University. Included are: changes in the number of degrees awarded from 1976-1977 through 1985-1986; the numbers of degrees awarded and percentage changes in specific majors; and changes in men's and women's interests and the increase of women in historically male-dominated specialties and similar data for ethnic minority and foreign students. Detailed descriptions of changes in student degree patterns for 1976-1977 and 1980-1981 and for 1981-1982 and 1985-1986 are reported by discipline, sex, ethnicity, and resident status for both the public universities. Appended are detailed graphic displays for each 5-year period and information on gains and losses for each discipline for men and women, minority and majority students, and resident and foreign students. Findings include: from 1976 to 1985, the number of bachelor's and doctoral degrees increased by 3.5% and 4.7%, respectively, while the number of master's degrees declined by 5.7%; and enrollments shifted away from programs in the humanities, letters, and social sciences and into business, computer science, and engineering. Summary

In 1983, the Commission published *Major Gains and Losses: Recent Shifts in Popularity of Academic Disciplines as Fields of Concentration*, which analyzed trends between 1976-77 and 1980-81 in the number and percentage of bachelor's, master's, and doctoral degrees conferred by California's colleges and universities in various fields of study. This present document constitutes an update of that report for the decade between 1976-77 and 1985-86 at the University of California and the California State University.

Chapter One on pages 7-14 reports changes in the number of degrees awarded by the two universities in 21 general fields of study.

Chapter Two on pages 15-30 describes the number of degrees awarded and percentage changes in selected majors within those fields.

Chapter Three on pages 31-38 discusses changes in men's and women's interests and highlights the dramatic increase of women in historically male-dominated specialties.

Chapters Four and Five on pages 39-48 and 49-57 report similar data for ethnic minority and foreign students, respectively.

The statistical tables on pages 63-85 in Appendices A and B -- the primary source of information used throughout the report -- provide detailed descriptions of changes in student degree patterns between 1976-77 and 1980-81 and from 1981-82 to 1985-86, by field of study, sex, ethnicity, and resident status. Finally, the other materials in the appendices depict various gains and losses for each field between men and women, minority and majority students, and resident and foreign students for both of those five-year periods.

The Policy Evaluation Committee of the Commission discussed this report at its June 8, 1987, meeting. Additional copies of the report may be obtained from the Publications Office of the Commission. Further information about the report may be obtained from Murray J. Haberman of the Commission staff at (916) 322-8001.

COMMISSION

COMMISSION REPORT 87-26
PREPARED JUNE 1987
PRINTED SEPTEMBER 1987

THIS is the fifth in a series of staff reports on important issues affecting California postsecondary education. These reports are brought to the California Postsecondary Education Commission for discussion rather than for action, and they represent the interpretation of the staff rather than the formal position of the Commission as expressed in its adopted resolutions and reports containing policy recommendations.

Like other publications of the Commission, this report is not copyrighted. It may be reproduced in the public interest, but proper attribution to Report 87-26 of the California Postsecondary Education Commission is requested.

3.	Percentage Change in the Number of Master's Degrees Awarded in 20 Subject Areas by the University of California and the California State University, 1976-77 to 1985-86	8
4.	Percentage Change in the Number of First Professional Degrees Awarded in Six Professions by the University of California, 1976-77 to 1985-85	9
5.	First Professional Degrees Awarded in Six Professions by the University of California to Men and Women, 1976-77 to 1985-86	10
6.	Percentage Change in the Number of Doctoral Degrees Awarded in 17 Subject Areas by the University of California and Jointly by the California State University, 1976-77 to 1985-86	10
7.	Number of Percent of Total Degrees Conferred in 21 Fields of Study by the University of California and the California State University, 1976-77 to 1985-86	11-12
8.	Percent Change in the Number of Degrees Conferred in Selected Engineering Majors by the University of California and the California State University, 1976-77 to 1985-86	16-17
9.	Percent Change in the Number of Degrees Conferred in Selected Letters Majors by the University of California and the California State University, 1976-77 to 1985-86	18-19
10.	Percent Change in the Number of Degrees Conferred in Selected Area Studies and Social Science Majors in the University of California and the California State University, 1976-77 to 1985-86	21-26
11.	Additional Fields in Which the Number of Degrees Increased or Decreased by 20 Percent or More Between 1976-77 and 1980-81	27
12.	Additional Disciplines in Which the Number of Degrees Increased or Decreased by 20 Percent or More Between 1981-82 and 1985-86	28-29
13.	Percentage Change in the Number of Bachelor's Degrees Awarded to Men and Women by the University of California and the California State University, 1976-77 to 1930-81, 1981-82 to 1985-86, and 1976-77 to 1985-86	32
14.	Ratio of Degrees Awarded to Men and Women in 21 Fields of Study by the University of California and the California State University, Selected Years, 1976-77 to 1985-86	33
15.	Percent Change in Bachelor's Degrees Awarded to Men, Women, and . . . Students in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1985-86	34
16.	Percentage Change in the Number of Master's Degrees Awarded to Men and Women in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1980-81, 1981-82 to 1985-86, and 1976-77 to 1985-86	36

17.	Percent Change in Master's Degrees Awarded to Men, Women, and All Students in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1985-86	37
18.	Percent of Bachelor's Degrees Awarded in 20 Fields of Study to Underrepresented Minorities and All Minorities, Expressed as a Percent of Those Students Who Declared Their Ethnicity, by the University of California and the California State University, 1976-77 to 1985-86	41
19.	Percentage Change in the Number of Bachelor's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, Students Who Declared Their Ethnicity ("SWDTE"), and All Graduates by the University of California and the California State University, 1976-77 to 1985-86	42
20.	Percent Change in the Number of Bachelor's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, and All Graduates by the University of California and the California State University, 1976-77 to 1985-86	43
21.	Percentage Change in the Number of Master's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, Students Who Declared Their Ethnicity ("SWDTE"), and All Graduates by the University of California and the California State University, 1976-77 to 1980-81, 1981-82 to 1985-86, and 1976-77 to 1985-86	44
22.	Percent Change in the Number of Master's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, and All Graduates by the University of California and the California State University, 1976-77 to 1985-86	45
23.	Percent of Master's Degrees Awarded in 20 Fields of Study to Underrepresented Minorities and All Minorities, Expressed as a Percent of Those Students Who Declared Their Ethnicity, by the University of California and the California State University, 1976-77 to 1985-86	46
24.	Percent of Doctorates Awarded in 20 Fields of Study to Underrepresented Minorities and All Minorities, Expressed as a Percent of Those Students Who Declared Their Ethnicity, by the University of California and the California State University, 1976-77 to 1985-86	48
25.	Percentage Change in Bachelor's Degrees Awarded in 21 Fields of Study to Foreign Students and U.S. Residents by the University of California and the California State University, 1976-77 to 1980-81, 1981-82 to 1985-86, and 1976-77 to 1985-86	50
26.	Degrees Awarded to Foreign Students in 21 Fields of Study by the University of California and the California State University, Expressed as a Percent of the Total Graduating Class in Each Field, 1976-77 Through 1985-86	51
27.	Percent Change in the Number of Bachelor's Degrees Awarded in 21 Fields of Study to Foreign Students and U.S. Residents by the University of California and the California State University, 1976-77 to 1985-86	52
28.	Percentage Change in Master's Degrees Awarded in 21 Fields of Study to Foreign Students and U.S. Residents by the University of California and the California State University, 1976-77 to 1985-86	54
29.	Percent Change in the Number of Master's Degrees Awarded in 21 Fields of Study to Foreign Students and U.S. Residents by the University of California and the California State University, 1976-77 to 1985-86	55
30.	Percentage Change in Doctorates Awarded in 21 Fields of Study to Foreign Students and U.S. Residents by the University of California and the California State University, 1976-77 to 1980-81, 1981-82 to 1985-86, and 1976-77 to 1985-86	56

31.	Percent Change in the Number of Doctorates Awarded in 7 Fields of Study to Foreign Students and U.S. Residents by the University of California and the California State University, 1976-77 to 1985-86	57
32.	Percentage Change in Bachelor's Degrees Awarded in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1980-81	61
33.	Percentage Change in Bachelor's Degrees Awarded in 20 Fields of Study by the University of California and the California State University, 1981-82 to 1985-86	61
34.	Percentage Change in Master's Degrees Awarded in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1980-81	62
35.	Percentage Change in Master's Degrees Awarded in 20 Fields of Study by the University of California and the California State University, 1981-82 to 1985-86	62
36.	Bachelor's and Master's Degrees Awarded in 21 Fields of Study at the University of California and the California State University, by Sex, Minority Group Members, and Non-Resident Aliens, 1976-77 and 1980-81	63
37.	Bachelor's and Master's Degrees Awarded in 21 Fields of Study at the University of California and the California State University, by Sex, Minority Group Members, and Non-Resident Aliens, 1981-82 and 1985-86	68
38.	Percentage Change in Doctoral Degrees Awarded in 17 Fields of Study by the University of California and the California State University, 1976-77 to 1980-81	77
39.	Percentage Change in Doctoral Degrees Awarded in 17 Fields of Study by the University of California and the California State University, 1981-82 to 1985-86	77
40.	Doctoral Degrees Awarded in 21 Fields of Study at the University of California and the California State University, by Sex, Minority Group Members, and Non-Resident Aliens, 1976-77 and 1980-81	78
41.	Doctoral Degrees Awarded in 21 Fields of Study at the University of California and the California State University, by Sex, Minority Group Members, and Non-Resident Aliens, 1981-82 to 1985-86	81
42.	Percentage Change in the Number of Doctoral Degrees Awarded in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1985-86	85
43.	Percentage Change in Bachelor's Degrees Awarded to Men, Women, and All Students in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1980-81	89
44.	Percentage Change in Bachelor's Degrees Awarded to Men, Women, and All Students in 20 Fields of Study by the University of California and the California State University, 1981-82 to 1985-86	90
45.	Percentage Change in Master's Degrees Awarded to Men, Women, and All Students in 20 Fields of Study by the University of California and the California State University, 1976-77 to 1980-81	91
46.	Percentage Change in Master's Degrees Awarded to Men, Women, and All Students in 20 Fields of Study by the University of California and the California State University, 1981-82 to 1985-86	92
47.	Percentage Change in the Number of Bachelor's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, and All Graduates by the University of California and the California State University, 1976-77 to 1980-81	97

48.	Percentage Change in the Number of Bachelor's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, and All Graduates by the University of California and the California State University, 1980-81 to 1985-86	98
49.	Percentage Change in the Number of Master's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, and All Graduates by the University of California and the California State University, 1976-77 to 1980-81	99
50.	Percentage Change in the Number of Master's Degrees Awarded in 20 Fields of Study to All Minorities, Underrepresented Minorities, and All Graduates by the University of California and the California State University, 1980-81 to 1985-86	100
51.	Percentage Change in Bachelor's Degrees Awarded in 20 Fields of Study to Foreign Students and Resident Students by the University of California and the California State University, 1976-77 to 1980-81	103
52.	Percentage Change in Bachelor's Degrees Awarded in 20 Fields of Study to Foreign Students and Resident Students by the University of California and the California State University, 1981-82 to 1985-86	104
53.	Percentage Change in Master's Degrees Awarded in 20 Fields of Study to Foreign Students and Resident Students by the University of California and the California State University, 1976-77 to 1980-81	105
54.	Percentage Change in Master's Degrees Awarded in 20 Fields of Study to Foreign Students and Resident Students by the University of California and the California State University, 1981-82 to 1985-86	106

56.	Percentage Change in Doctoral Degrees Awarded in Selected Disciplines to Foreign Students and Resident Students by the University of California and the California State University, 1981-82 to 1985-86	108

Introduction

IN June 1983, the Commission published a report, *Major Gains and Losses: Recent Shifts in Popularity of Academic Disciplines as Fields of Concentration*, which analyzed trends between 1976-77 and 1980-81 in the number and percentage of bachelor's, master's, and doctoral degrees conferred by California's colleges and universities in 24 major fields of study. This present document constitutes an update of that report for the ten years between 1976-77 and 1985-86 at the University of California and the California State University.

Highlights of the report

Trends among disciplines

- From 1976-77 to 1985-86, the number of bachelor's and doctoral degrees awarded by the University of California and the California State University increased by 3.5 percent and 4.7 percent, respectively, while the number of master's degrees declined by 5.7 percent. During those ten years, more disciplines experienced decreases than increases in the number of their bachelor's and master's degrees.
- Over the ten years, University and State University enrollments, like enrollments nationally, shifted away from programs in the humanities, letters, and social sciences and into business, computer science, and engineering. Between 1983-84 and 1985-86, however, they experienced a slight resurgence of student interest in selected majors in the social sciences and the humanities.
- The greatest percentage gains at the bachelor's level occurred in computer science (up 447.8 percent), engineering (113.3 percent), communications (87.5 percent), mathematics (63.7 percent), and business administration (56.0 percent). Within the engineering discipline, the number of bachelor's degrees almost quadrupled in electrical/electronic engineering.
- Among the disciplinary categories, the greatest losses at the bachelor's level occurred in the public affairs discipline (down 45.6 percent), foreign languages (31.6 percent), and fine arts (28.0 percent); but greater losses occurred in such specific majors as Afro-American studies (67.9 percent), anthropology (60.6 percent), and sociology (51.0 percent).
- At the graduate level, the number of engineering degrees conferred by the University and State University has remained relatively constant, while graduate degrees in the computer and information sciences, although few in number, grew by more than 160 percent.
- In 1985-86, 27 percent of the bachelor's degrees awarded by the California State University in 1985-86 were in business and management compared to only 4.7 percent at the University of California.
- California's two public universities now award almost as many master's degrees in business and management as in education, with the two fields combined accounting for 58.4 percent of all master's degrees.

Trends among men and women

- The number of women receiving bachelor's, master's and doctoral degrees from California's two public universities increased by 18.3 percent, 4.1 percent, and 59.2 percent, respectively, between 1976-77 and 1985-86.
- Women increased their share of total degrees awarded from 46 percent to 52 percent at the bachelor's level, from 46 to 53 percent at the master's level, from 29 to 42 percent at the first professional level, and from 21 to 34 percent at the doctoral level.
- The percentage of bachelor's degrees earned by women in business and management rose from 26 to 49 percent; in computer sciences, from 22 to 34

percent; and in biological sciences, from 36 to 57 percent.

- Women increased their share of doctorates in education from 46 percent to 64 percent.
- The percentage of women entering the high-demand disciplines of computer science, business and management, engineering and communications is increasing more rapidly than that of men.
- In 1985-86, women received 42 percent of the University's degrees in law, 41 percent of those in medicine, 52 percent of those in veterinary medicine, and 62 percent of those in pharmacy.

Trends among minority students

- Underrepresented minority students (Black, Hispanic, and American Indian) are increasing their participation in many disciplines in which they have traditionally been underrepresented, such as the biological sciences, mathematics, and the physical sciences.
- In 1985-86, business and management, engineering, and the social sciences were the three most popular undergraduate fields for underrepresented minority students -- accounting for 41 percent of all bachelor's degrees awarded to them.
- In 1985-86, the highest proportion of underrepresented minority students -- one out of every five -- earned bachelor's degrees in area studies, foreign languages, or public affairs programs.
- Minority students (both including and excluding Asian students) registered larger percentage increases in bachelor's degrees among the high-growth fields of business, engineering, and computer science than did non-minority students.
- Underrepresented minority students increased their number of master's degrees by 29.6 percent, while all minority students (including Asian) increased their number by 54.0 percent; in contrast to the 5.7 percent decline in master's degrees awarded to all students.
- The number of doctorates awarded to all minority students increased by 38.4 percent, compared to 4.1 percent for all students; but the number

awarded to underrepresented minorities (excluding Asian students) dropped by 10.6 percent.

Trends among foreign students

- The number of bachelor's degrees awarded to non-resident aliens by the University and State University increased over the ten years by 44.5 percent, although it decreased by 31.5 percent over the five-year period from 1981-82 to 1985-86.
- The number of master's degrees earned by foreign students increased by 35.5 percent over the decade, and their number of doctorates increased by 25.3 percent; but while their number of master's degrees decreased by 23.2 percent over the latter half of the decade, their number of doctorates increased by 37.0 percent during those five years.
- In 1985-86, California's two public universities awarded 3 percent of their bachelor's degrees, 12 percent of their master's degrees, and 20 percent of their doctorates to foreign students.
- In 1985-86, foreign students in engineering at the University and State University received approximately one out of every seven bachelor's degrees, one out of every three master's degrees, and almost half of all doctorates awarded in this field.

Differences between the 1983 report and this 1987 update

This report differs from the Commission's 1983 report, *Major Gains and Losses*, in two noteworthy ways:

- It covers only the University of California and the California State University, whereas the 1983 report included data on all of California's accredited four-year colleges and universities -- both public and independent; and
- Its classification of disciplines differs from that used in 1983.

The reason for concentrating on the University and State University is that data on them are more complete and considerably more accurate than in the independent sector. Commission staff is working with

representatives of the independent colleges and universities to improve data about those institutions, and the staff expects that future reports will cover them as well.

The difference in disciplinary classifications requires further explanation. In its 1983 report, the Commission employed the 2-category taxonomy used until then by the National Center for Education Statistics of the U.S. Department of Education in its Higher Education General Information Survey (HEGIS). Since then, however, the National Center for Education Statistics has replaced that taxonomy with a 50-category Classification of Instructional Programs (CIP), on which this present report is based. Several reasons prompted the change from the HEGIS taxonomy to the Classification of Instructional Programs -- among them, the fact that the HEGIS taxonomy contained no program definitions or descriptors, which limited the reliability and validity of the resulting data, since program titles alone often do not convey enough information about programs to indicate what degrees should be reported under which heading. Furthermore, the HEGIS taxonomy separated technological from academic degrees but did not define either category. Finally, it either lumped together as "other programs" majors such as laser fusion, particle physics, and energy conservation that today are distinct programs, or else reported them as interdisciplinary majors.

The new Classification of Instructional Programs attempts to alleviate these problems by providing definitions and a more detailed list of student majors and programs. In doing so, of the 50 discipline categories developed, some 30 apply to four-year degree granting institutions.

This conversion from HEGIS to CIP posed one substantial problem for updating the Commission's 1983 report. In order to make meaningful comparisons between data in that document and subsequent data, the Commission staff had to develop a crossover taxonomy that combined several of CIP's 50 categories into classifications comparable to those of the HEGIS taxonomy which was used in the 1983 report. Display 1 at the top of page 4 shows how several CIP categories were combined to reach that end.

The only major inconsistency in this crossover appears in the discipline category of Interdisciplinary Studies. The CIP redistributed several majors in this category to major discipline headings such as engi-

neering or business and management. However, the staff estimates that these transfers alter the total number of degrees conferred in those disciplines by less than 2 percent. Thus the pre- and post-1980-81 data is believed to be at least 98 percent comparable.

Scope and organization of the report

This report depicts degree trends in various fields at the statewide level, but because changes in enrollments and degrees conferred are unique to each campus, these statewide trends should not be perceived as applicable to all campuses.

Chapter One describes changes in the number of degrees awarded by California's two public universities from 1976-77 through 1985-86. Using information provided by the universities via student-specific data tapes, it documents changes in student interest as reflected in percentage increases or decreases in the number of degrees granted in specific disciplines over the course of the decade as well as the percent each of those disciplines represents as a percent of the total number of degrees awarded.

Chapter Two examines the numbers of degrees awarded and percentage changes in specific majors within the University and the State University.

Chapter Three discusses changes in men's and women's interests and highlights the dramatic increase of women in historically male-dominated specialties.

Chapters Four and Five report similar data for ethnic minority and foreign students, respectively.

Finally, the tables in Appendices A and B -- the primary source of information used throughout the report -- provide detailed descriptions of changes in student degree patterns for 1976-77 and 1980-81, and for 1981-82 and 1985-86, by discipline, sex, ethnicity, and resident status, for both the University of California and the California State University.

In addition, the appendices include several detailed graphic displays for both of the five-year periods indicated above, and depicts various gains and losses for each discipline for men and women, minority and majority students, and resident and foreign students.

Implications of the data

The Commission's data collection and analysis system allows it to document shifts in enrollments and degrees by field of study since 1976-77. Assembled in this manner, the information can be an invaluable tool for programmatic decisions and curriculum and faculty resource planning. During periods of dramatic shifts and fiscal stringency, it becomes an essential instrument for program planning and review. Moreover, beyond its implications for academic planning, it provides an excellent clue regarding the values and goals in society as a whole. It suggests the kinds of careers to which students aspire, the knowledge and skills most in demand, and the varieties of specialized training that colleges and universities are being urged to provide.

As noted above, student interest in high technology and business has continued to increase over the past decade, but the decline in the humanities and social sciences seems to be bottoming out, since slight

increases have recently appeared in several of those disciplines that had shown precipitous declines throughout at least the first seven years of the decade. In addition, enrollments became more diversified in terms of ethnicity and foreign students, and more equal in terms of the representation of men and women. Both the number and percent of total baccalaureate degrees earned by minorities and women have increased in the high-demand disciplines of business and management, computer science, engineering, and mathematics, while foreign students lost ground in those same disciplines. At the graduate level, however, foreign students represented significant and growing numbers in these high-demand disciplines -- probably for at least two reasons:

- Many American students perceive that a baccalaureate is sufficient to ensure their employability, especially in engineering, and thus they do not continue into graduate study; and

- Many foreign students have difficulty finding work in high-technology firms, since most of these firms are involved in defense-related work and require their employees to obtain security clearances; and thus these students may seek the doctorate in hope of securing an academic appointment, particularly if they are interested in establishing permanent residency in the United States.

These several enrollment trends present a number of noteworthy implications for public policy regarding degree programs, financial aid, and program review.

Implications for faculty diversity

Currently, the University of California and the California State University estimate a need for some 14,000 new faculty members between now and the end of the century to replace faculty who retire or leave for other reasons, and to hire additional faculty to serve an increasing number of students. Such a large number of openings clearly presents the two universities with an almost unique opportunity to hire greater numbers of women and minorities. Unfortunately, the number of these potential new hires in the high-demand disciplines is limited, since very few American women and minorities are pursuing the doctoral degrees that will qualify them for academic appointments in these disciplines. At the same time, increases in foreign student graduate enrollments in these fields lead to the likelihood that a greater proportion of future faculty will be foreign born. The State has an important need, in cooperation with its two public universities, to design mechanisms that will increase both the number and diversity of native students enrolled in graduate programs and to be assured that foreign-born faculty have adequate facility in English.

In its final report, *The Master Plan Renewed* (July 1987), the Commission for the Review of the Master Plan for Higher Education also identifies these issues. It advocates a statewide program for the "early identification, recruitment, and training of minority and women undergraduate, graduate, and postgraduate students for faculty and academic administrative positions" (p. 23). It also recommends that both the University of California and the California State University "ensure that all faculty and teaching assistants have the necessary instructional skills prior to entering a classroom" by emphasizing "the development of teaching skills for those candidates about to enter the professoriate" (p. 32).

Implications related to student selection of majors

Students choose majors because of many reasons, including their special talents and interests in a given field; but their choices are influenced by economic conditions, job prospects, and students' perception that a degree in a particular discipline will increase their employability. This latter factor is particularly significant for students who rely on loans to complete their undergraduate programs, in that their indebtedness may dissuade them from graduate study and persuade them to enter high-paying fields such as engineering and business in order to pay off their debts.

Some ways to reduce this problem would be to expand grants and part-time employment as alternatives to loans for undergraduates, develop opportunities for graduates to repay their loans through teaching, and increase State financial aid support for women and underrepresented minority graduate students who plan to become college and university teachers.

Implications for reviewing degree programs

The increase of degrees awarded in high-demand disciplines as a percent of total degrees raises questions about the number of degree offerings in less popular disciplines on small campuses. These campuses clearly need to continue to offer courses in those fields, if only as service and support courses for other majors; but their lack of students in some degree programs calls for careful review of these degree offerings in order to determine the possibility of consolidating some programs and retraining and reassigning some of their faculty.

With regard to this issue, the Master Plan Review Commission calls for "rigorous and systematic review of the quality of graduate programs" and the determination of "whether there is a continuing need and adequate resources for both existing and new programs." It directs that programs for which continuing need and adequate resources do not exist "shall be phased out," and it instructs the Postsecondary Education Commission to "advise the segments, the Governor, and the Legislature on segmental compliance with this policy" as well as to "seek private foundation or state support for a blue ribbon commission to study the master's degrees in the California State University, the University of California, and the independent institutions" (p. 35).

Possible future analyses

A summary report based on hundreds of pages of quantitative information can call attention to only some of the broader trends and developments reflected in the data. It cannot hope to identify those patterns that result from changes in institutional policy rather than student choice, and it cannot account for all the shifts within the same general field — such as the increase of 355.5 percent in bachelor's degrees in applied mathematics over the past five years, compared to only 58.6 percent in general mathematics.

With the information currently available in computer files, these and a variety of other topics can be investigated in detail. It is possible, for example, to assess program vitality, examine enrollment patterns in relation to the size and location of campuses, and analyze thoroughly shifts in degrees conferred by age, sex, and ethnicity. Thus while this update describes several interesting recent curricular developments, subsequent reports can be expected to analyze additional enrollment and degree trends of significance, and they will include data on trends in accredited independent colleges and universities as well as public institutions.

OVER the ten-year period from 1976-77 through 1985-86, the nine campuses of the University of California and the 19 campuses of the California State University awarded nearly 640,000 baccalaureate degrees and over 150,000 master's and 20,000 doctoral degrees. During that time, their number of bachelor's and doctoral degrees increased by 3.5 percent and 4.7 percent, respectively. In contrast, their number of master's degrees decreased by 5.7 percent.

By themselves, these ten-year totals do not suggest extensive changes in student enrollment and degree patterns, but a closer look at the number of degrees awarded by level and subject area discloses a number of significant shifts.

Bachelor's degrees

Display 2 below, based on data from Appendix A, shows the changing nature of undergraduate interests by depicting the percentage change in the number of bachelor's degrees awarded by the University of California and the California State University in 20 subject areas over this past decade. It demonstrates that a substantial shift toward computer science, engineering, and business administration occurred, accomplished in a large measure at the expense of the humanities, social sciences, and other liberal arts programs. As it indicates, nearly twice as many fields experienced decreases in the number of bachelor's degrees as enjoyed increases. Within the seven programs showing increases, the high-

Source: California Postsecondary Education Commission.

technology programs of computer science and engineering clearly predominated, and of the other five, all but area studies are increasingly technological in orientation. In contrast, the fields experiencing the greatest losses were public affairs, education, foreign languages, and fine arts.

Although the high-technology and business disciplines showed marked increases throughout the past decade, there have been several marginal shifts in those disciplines that experienced losses during the first half of the decade as compared to the latter half, as the displays in Appendix A show. Between 1976-77 and 1980-81, the most noteworthy decreases were in area studies, biological sciences, social sciences, foreign languages, and public affairs. Between 1981-82 and 1985-86, however, public affairs, area studies, agriculture, education, and architecture experienced the greatest declines.

Master's degrees

At the master's level, Display 3 shows that gains were distributed over a wider range of fields -- eight rather than six -- but these were still outnumbered by the other 12 that absorbed losses. Notably, mathematics, which registered a strong increase at the baccalaureate level, declined slightly at the master's level. The total number of master's degrees decreased slightly and appeared to do so at the expense of those fields that increased.

In comparing the gains and losses in master's degrees by subject area between the 1976-77 to 1980-81 period and the 1981-82 to 1985-86 period, several notable shifts are evident from the displays in Appendix A. During the first five years of the decade, eight of the 20 fields experienced increases, compared to only five during the second half. Architecture, physical science, home economics, business and management, and public affairs all experienced in-

Source: California Postsecondary Education Commission.

creases during the first half-decade but decreased during the second half. Conversely, communications and mathematics, which experienced declines during the first five years, noted increases during the latter five years.

First professional degrees

The number of first professional degrees awarded by the University of California has increased the past ten years in five professions but declined in law, as Display 4 below shows. The most significant change has been the increased representation of women in all fields -- altogether, a 13 percentage-point increase from 29 to 42 percent. (Display 5 at the top of page 10 shows that women's only declines occurred in optometry between 1976-77 and 1980-81, and in dentistry and veterinary medicine between 1980-81 and 1981-82.) By 1985-86, 41.5 percent of all law degrees awarded by the University (including those from Hastings College of the Law) went to women; as did 41.0 percent in medicine, 52.0 percent in veterinary medicine, and 62.4 percent in pharmacy.

Doctorates

Display 6 on page 10, based on the displays in Appendix B, provides information about doctorates similar to that in Displays 2 through 4 for bachelor's, master's, and first professional degrees. Like bachelor's degrees, the number of doctorates awarded by the University increased over the ten-year period. Furthermore, ten disciplines showed net gains in the number of doctorates, while only seven experienced losses. Yet like the bachelor's and master's degree changes, the discipline experiencing the largest percentage increase -- albeit with a modest base -- was computer science. With this exception and apart from the notable gains in health, the relative increases in the number of doctoral degrees conferred were rather evenly distributed among the other eight disciplines that increased, while losses tended to be concentrated in business and management, letters, and fine arts.

Despite these overall trends, several disciplines experienced marked shifts between the first half and latter half of the decade. For example, from 1976-77 through 1980-81, public affairs experienced the second greatest increase in doctoral production of all disciplines, but between 1981-82 and 1985-86 it underwent the greatest decrease. Likewise, education showed a slight increase in the first half of the decade but experienced about a 10 percent decline over the past five years, suggesting a lessening demand for such a degree from public institutions. (The Commission's recent report, *The Doctorate in Education: Issues of Supply and Demand in California* (1987), provides a detailed discussion of this issue.)

Changes in the proportional distribution of degrees conferred

Display 7 on pages 11-12 illustrates these trends somewhat differently by listing for each of the five years and for all three degree levels the number of degrees awarded in each field, together with each field's percent of total degrees conferred. The final column of this display shows that while some areas of study experienced dramatic changes, over the 1976-77 to 1985-86 period, most areas' share of degrees remained relatively stable. Among the more notable, the social sciences declined at all three degree levels and, in doing so, posted the greatest

overall loss of all. However, during the past five years, the number of bachelor's and doctorates in this area increased slightly.

Education experienced the greatest loss in total degrees awarded at the master's level of any single field, declining from 25.4 percent of total degrees awarded in 1976-77 to 20.3 percent in 1985-86, a 5.1 percentage point loss; and like the social sciences, it suffered losses in its share of degrees awarded at all three levels. Losses in fine arts, letters, and psychology were less severe but were also general across all levels.

On the positive side, business and management clearly established the best record for growth in total share of degrees awarded at the bachelor's and master's levels. Its percentage of all degrees jumped by

6.5 percentage points at the bachelor's and 3.5 points at the master's, but declined by 1.0 point at the doctoral level. Likewise, engineering, physical sciences, and computer science recorded substantial percentage increases in the number of degrees at all levels, but unlike business and management and engineering, the fields of computer science and the physical sciences still represent a relatively small share of all degrees conferred, although the number of total degrees conferred in computer science has increased markedly.

Finally, some disciplines -- among them, communications, health, and mathematics -- increased their percentage at one degree level while declining at others.

TO indicate the general direction of student program choices, the description of broad disciplinary categories contained in Chapter One is sufficient. Within some of these categories, however, the extent of shifts in student choices becomes fully apparent only when the specific degree programs of individual academic departments or disciplines are compared. This chapter examines those disciplines at California's two public universities that gained or lost the most graduates between 1976-77 and 1985-86.

Engineering specialties

The number of bachelor's degrees in all fields of engineering increased markedly between 1976-77 and 1985-86, almost quadrupling in electrical/electronic engineering and nearly doubling or tripling in all other fields except civil engineering, where the number of bachelor's degrees conferred remained unchanged (Display 8, pages 16-17).

At the same time, the number of graduate degrees in most engineering specialties grew little if at all. The total number of master's degrees increased slightly, primarily because of an increasing number of degrees awarded to women; but the number of doctoral degrees remained virtually unchanged and became a matter of some concern, since it could affect the future supply of faculty and the vitality of research in engineering.

A number of engineering programs at both the University and the State University have been declared "impacted," meaning that enrollments are near capacity and that students must meet special conditions before they can be admitted. Such impaction creates a number of complications for curricular planning. Not only is it necessary, as in any field, to predict the extent and duration of student and societal demand for each of the specialized areas of study, but the limited availability of faculty and the need for state-of-the-art equipment make engineering a difficult field to plan for at the present time. There are growing indications of interest on the part of industrial management in involving itself more

directly in the process of engineering education. Such involvement, properly regulated, may ease some of the pressures many campuses are currently experiencing in their efforts to determine and serve the public interest in this curricular area.

Letters

The category of letters includes several traditional mainstays of the humanities curriculum, and Display 9 on pages 18-19 depicts trends in four of them -- classics, comparative literature, English, and philosophy. Comparative literature suffered one of the largest losses among all letters disciplines at the bachelor's level -- 73.1 percent in bachelor's degrees over the past ten years.

Classics has the distinction of being the discipline most often cited as an example of a field of study that must be maintained to preserve the wholeness of the curriculum, no matter what the enrollment. Certainly, if student demand at all three degree levels were the only criterion, one campus would be more than able to accommodate all classics majors in the State, since only 16 baccalaureates were awarded in this major in 1985-86.

For decades, the most popular major among all letters subjects was English -- the undergraduate program on most campuses consisting of a combination of courses in English and American language and literature. The English major was never a direct route to employment, except perhaps for students interested in teaching in secondary schools, but served instead to provide a liberal education for those preparing for careers in law, advertising, journalism, public relations, and a range of other occupations.

The 1,989 bachelor's degrees in English awarded in 1985-86 by the University and the State University might still be impressive were it not for the 7.2 percent decrease over ten years that Display 9 indicates. That the number of graduate degrees in English is also declining is not surprising in view of the publicity given to the oversupply of Ph.D.s in the field. In the past three years, however, public inter-

es. in improving writing skills may have contributed to an increase in the number of degrees conferred in English. During this time, bachelor's degrees in English have increased from 1,717 in 1982-83 to 1,989 in 1985-86 -- a 15.8 percent increase.

Philosophy served a dwindling number of undergraduate majors during the ten years, experiencing a 29.1 percent decline in baccalaureates. While the relatively small number of doctorates in philosophy has increased slightly, the number of master's degrees declined by 64.5 percent the last ten years. With few opportunities for teaching philosophy in the secondary schools, the occupational utility of the master's degree in philosophy is perhaps even more limited than master's degrees in other humanities disciplines.

Social science disciplines

During the last ten years, several social science disciplines suffered large losses in the number of baccalaureate degrees awarded. Display 10 on pages 21-26 shows changes in 12 area studies and social science specialties. As can be seen, between 1976-77 and 1985-86, bachelor's degrees in Afro-American studies declined by 67.9 percent, in anthropology by 60.6 percent; in history, by 36.2 percent; and in sociology, by 51.0 percent. In recent years, however, most of these disciplines appear to have bottomed out, and in some instances the number of bachelor's degrees conferred in these majors has increased slightly. Moreover, the number of master's degrees recently conferred in selected social sciences also suggest that the movement of students out of the social sciences may be abating. In the past two years, several campuses have experienced slight increases in the number of students enrolling in what have been low-demand disciplines.

As can be seen from Display 10, the two social science disciplines that have enjoyed overall increases over the past decade are economics and international relations. Bachelor's degrees in international relations increased from 73 in 1976-77 to 211 in 1985-86, or 189 percent, while those in economics rose from 1,513 to 1,949, or nearly 29 percent. Baccalaureates in economics awarded by the University increased slightly during the ten-year period, while those at the State University dropped in the first five years and then increased during the second five.

In general, the percentage drop in baccalaureates among all social science disciplines has been more severe in the State University than in the University. The pattern is much the same at the graduate level, where the decline in social science master's degrees at the State University is particularly striking. There, only criminology and sociology showed modest increases over the past ten years, while general social science, political science, and history posted declines. Even in economics -- a field in which the number of master's degrees awarded by the University of California increased -- the number of master's degrees awarded by the State University declined.

Other disciplines undergoing major changes

In addition to the specific programs discussed in the preceding pages, other disciplines have also experienced major changes in the numbers of degrees awarded during the last ten years. For example, in the past five years alone, baccalaureates in computer science have increased by 105.3 percent, while master's and doctorates have increased by 22.2 percent and 57.7 percent, respectively. This high-demand major, however, may soon experience a topping-out as current market conditions suggest a consolidation of computer firms and a reduced demand for management information systems personnel.

Every field of study will show some fluctuation in the number of students earning degrees, but the magnitude of the changes in the individual degree programs listed in Displays 11 and 12 on pages 27-29 suggest an unusual volatility and further demonstrate the difficulties of curriculum management. These two displays show those fields with increases or decreases of at least 20 percent in the number of degrees awarded during the years 1976-77 to 1980-81 and between 1981-82 and 1985-86. (As the displays note, they include only those programs that awarded at least 100 degrees at the bachelor's level, 50 at the master's level, or 25 at the doctoral level in either 1976-77, 1980-81, 1981-82, or 1985-86.)

At the baccalaureate level, between 1976-77 and 1980-81 agricultural business, landscape architecture, and general architecture experienced the greatest increases, while bacteriology, cinematography, and city planning noted the greatest declines. In contrast, during the five years between 1981-82 and 1985-86, applied mathematics, human and animal genetics, and general mathematics ex-

perienced the greatest gains, while speech pathology/audiology, music performance, and general renewable natural resources had the greatest losses.

Similar shifts occurred at the master's level. During the first five years of the decade, speech pathology/audiology, physics, and geology were the three majors with the largest percentage gains, while medical laboratory technology, French, and parks and recreation management were the three with the greatest declines. By the second half of the decade, however, the three majors noting the greatest increases had

shifted to special education, geology, and linguistics, while those with the largest declines were general agricultural sciences, home economics, and anthropology.

At the doctoral level, from 1976-77 to 1980-81 microbiology experienced the greatest percentage increase, while oceanography noted the greatest decrease. In comparison, from 1981-82 to 1985-86 entomology had the largest gain, while other multidisciplinary or interdisciplinary studies had the largest decline.

THE total number of bachelor's and master's degrees awarded by California's two public universities remained virtually constant over the 1976-77 to 1985-86 period, but substantial changes took place in the number of men and women receiving degrees and, in some instances, the disciplines in which they were obtained.

(In reviewing these changes, the reader should be aware that the University of California did not report the sex of approximately 8 percent of its degree recipients in 1980-81 and of smaller percentages in subsequent years. As a result, Commission staff developed the trend analyses in this chapter using only those degree recipients whose sex was known.)

Bachelor's degrees

At the baccalaureate level, the number of degrees awarded to women by the University of California and the California State University over the past decade increased by 18.3 percent, while the number awarded to men declined by 8.9 percent (Display 13, page 32). The ratio of bachelor's degrees awarded to men and women was 54:46 in 1976-77, but by 1985-86 this ratio had become 48:52 (Display 14, page 33).

In 1976-77, the four most popular fields for men, in order of their popularity, were the social sciences, business and management, the biological/life sciences, and engineering. In 1985-86, these same four fields retained their top positions for men, but their order of preference changed to business and management, engineering, the social sciences, and the biological/life sciences. Whereas these four fields accounted for 53.4 percent of the bachelor's degrees awarded to men in 1976-77, they represented 58.1 of men's degrees in 1985-86.

In 1976-77, women at the University and State University selected the social sciences, interdisciplinary studies, psychology, and fine arts as their four most preferred fields of study. These four fields accounted for 45.2 percent of the total number of bachelor's degrees awarded to women in that year. By 1985-86, the top four fields had shifted to business

and management, the social sciences, interdisciplinary studies, and psychology.

In 1985-86, these four disciplines accounted for 48.6 percent of the total number of bachelor's degrees awarded -- a 3.4 percentage-point increase over the 45.2 percent ten years earlier.

The movement of women into business and management programs has been dramatic during the past ten years, with bachelor's degrees awarded to women in that field increasing by 56.0 percent. Display 14 on page 33 depicts graphically the percentage change in bachelor's degrees awarded to men, women, and all students of California's two public universities in 20 general fields of study between 1976-77 and 1985-86. (The displays in Appendix C show these changes for the two half-decades of 1976-77 to 1980-81 and 1981-82 to 1985-86.) As Display 15 illustrates, women generally recorded greater percentage increases than men in the "growth" fields and, conversely, lesser decreases in those fields experiencing losses over the ten years. In some measure, these changes are due to the increase in the total number of bachelor's degrees awarded to women; however, the overriding trend that emerges from these data is that women are moving into the high-demand disciplines more rapidly (on a percentage basis) than men and are leaving the low-demand fields such as social sciences and public affairs more slowly than their male counterparts.

The two disciplines experiencing the most rapid expansion for men, as measured by the percentage increase in degrees awarded, were computer science and engineering. For women, disciplines more than doubling their degree productivity between 1976-77 and 1985-86 included computer science, engineering, business and management, and communications. A fourth discipline, mathematics, nearly doubled as well. These percentage gains are impressive for women receiving their degree in business and management and communications. However, Display 14 on page 33 shows that the ratio of degrees awarded to women versus men in engineering and computer science increased only modestly between 1976-77 and 1985-86. The field with the lowest

Source: California Postsecondary Education Commission.

percentage of bachelor's degrees awarded to women in 1985-86 was engineering (approximately 15 percent), while the highest was home economics (97 percent).

Master's degrees

A number of trends are notable regarding the number of master's degrees awarded by the University and the State University between 1976-77 and 1985-86:

First, the number of master's degrees awarded to women increased by 295 or 4.1 percent, while that for men decreased by 1,952 or 22.6 percent. This increase for women reversed the ratio of degrees awarded to men and women from 54:46 in 1976-77 to 47:53 in 1985-86 -- almost exactly the same ratio shifts as those at the baccalaureate level (Display 14).

The four most popular disciplines for women (education, health, public affairs, and business and management) were identical in both 1976-77 and 1985-86. The same phenomenon held for men, with the greatest number of degrees being in business and management, engineering, education, and the social sciences.

The increased concentration of degrees awarded in fewer fields of study described earlier for men at the baccalaureate level took place for men and women at the master's level. In 1985-86, the four most popular disciplines for men at the master's level accounted for approximately 56.5 percent of the total number of degrees awarded, while the four disciplines favored most by women during the same year accounted for 61.0 percent of their total.

The largest percentage increase over the past decade in the number of master's degrees awarded to both men and women occurred in computer science -- 135.7 percent and 296.4 percent, respectively (Displays 16 and 17, pages 36 and 37). Although the total number of master's conferred in this discipline are rather small as a percent of the total number of

master's degrees conferred, this overall increase is still noteworthy, in that the discipline continues to attract more and more graduate students each year.

Finally, the three disciplines with the largest proportion of women in 1985-86 were home economics, health, and library science, at 91, 88, and 77 percent, respectively. Those with the smallest representation were engineering, physical sciences, and computer science, at 12, 27, and 29 percent, respectively.

Doctorates

The displays in Appendix B indicate that between 1976-77 and 1985-86, the number of doctorate degrees awarded to men decreased by 12.4 percent. Among the larger disciplines, men experienced their greatest declines in the social sciences (down 57.5 percent), while the greatest percentage gain was in the physical sciences (up 9.7 percent). The four most popular fields among men in 1976-77 and 1985-86 were the biological sciences, the physical sciences, engineering, and the social sciences, although the percent of total doctorates awarded in the social sciences decreased sharply. These four fields produced approximately 54 percent of the doctorates awarded to men in 1976-77 and roughly 47.2 percent in 1985-86.

Across almost all disciplines, women increased both their number and percentage of doctoral degrees. Overall, their number of doctoral degrees increased by 61.7 percent. Among the larger disciplines, women noted marked increases in the biological/life sciences and the social sciences.

The overall ratio of doctoral degrees awarded to men and women changed from 79:21 percent in 1976-77 to 66:34 percent in 1985-86 (Display 14). The three fields with the largest proportion of men to women in 1985-86 were engineering (93 percent), mathematics (86 percent), and physical science (84 percent). The fields with the highest percentage representation of women were public affairs (91 percent), education (55 percent), and foreign languages and psychology (both with 56 percent).

THE laws and regulations governing the collection of ethnicity data make it difficult to accurately report changes in degree awards to minority students. (Appendix D explains the difficulties involved in the collection and use of these ethnic data.) The information that can be obtained from student ethnicity data must be developed by employing assumptions about student characteristics and reporting the data accordingly. Unfortunately, many of the assumptions used in this report are largely untested, and the conclusions reported in this chapter must therefore be considered tentative.

Three terms are used throughout this chapter to describe different portions of the student population. The first, "Students Who Declared Their Ethnicity" (SWDTE), is a five-element subset of the eight categories used by colleges and universities to report student ethnicity. Under federal and state statutes, student ethnicity declarations have been collected for the following categories:

1. Black Non-Hispanic
2. Hispanic
3. Asian (including Pacific Islander and Filipino)
4. Native American
5. White
6. Other (not covered under categories 1-5)
7. Students Who Declined to State Their Ethnicity
8. Non-Resident Alien

All of these categories (and particularly the non-resident alien category) are mutually exclusive; students reported in one category may *not* appear in another. The SWDTE population is defined as those U.S. residents *who specifically declared their ethnic origin*. To develop SWDTE data from the eight categories described above, the "non-resident alien," "other" and "declined to state" categories are discarded and only those students in ethnic categories 1-5 above are used in computations of ethnic representation. Such a methodology assumes that the distribution of students by ethnicity in the "declined to state" and "other" categories is the same (or approximately the same) as for those U.S. resident students who specifically declare their ethnic origin.

Further, SWDTE data acknowledges that the ethnic distribution of non-resident aliens is not known and assumes, for the purposes of this report, that their ethnicity declarations are of little interest in terms of reporting degrees awarded to California's student population.

Two other phrases -- *all minorities* and *underrepresented minorities* -- are used throughout this chapter; both are subsets of the SWDTE population.

- *All minorities* is defined as that group of SWDTE students who declared their ethnicity in categories 1-4 (all non-white students).
- *Underrepresented minorities* -- a subset of *all minorities* -- includes only those students who reported their ethnicity as Black, Hispanic, or Native American.

The latter phrase is useful in this chapter in describing changes in student demand that have taken place within that subset of the student population that has traditionally been underserved in California's postsecondary education. It is used for comparing differences in student enrollment and degree award patterns between these students and those who are more adequately represented -- generally, white and Asian students. The phenomenon of differential enrollment patterns for different ethnic groupings is particularly significant in computer science, engineering, mathematics, and the physical sciences, where white and Asian students have historically exhibited similar enrollment and degree award rates.

Bachelor's Degrees

The top three disciplines in terms of numbers of baccalaureate degrees awarded by the University of California and the California State University to graduates in the "all minorities" category in both the 1976-77 and 1985-86 academic years were the social sciences, business and management, and biological sciences. These three disciplines accounted for slightly more than 42 percent of the total number of

baccalaureate degrees awarded in 1976-77, and accounted for about 40 percent in 1985-86.

As Display 18 indicates, the disciplines in which bachelor's degree recipients in the "all minorities" category represented the greatest proportion of the 1976-77 graduating class in that discipline were foreign languages (25.7 percent), public affairs (22.3 percent), and health (21.9 percent). In 1985-86 the three disciplines with the greatest proportion of graduates in this category were area studies (45.2 percent), engineering (35.5 percent), and mathematics (34.3 percent).

Overall, students in the "all minorities" category recorded a 54.2 percent increase in the number of bachelor's degrees awarded over the 1976-77 to 1985-86 period. The three disciplines recording the largest percentage gain in the number of bachelor's degrees (Displays 19 and 20, pages 40 and 41) were computer science (1,344.4 percent), engineering (302.2 percent), and mathematics (188.4 percent). Only five disciplines showed decreases: education (-34.0 percent), public affairs (-19.1 percent), foreign languages (-13.6 percent), social sciences (-8.7 percent), and home economics (-7.4 percent). (Appendix E contains displays similar to Display 20 for each of the two five-year periods in the decade.)

Considering only those students classified in the "underrepresented minorities" category (Black, Hispanic, and Native American), bachelor's degrees awarded over the 1976-77 through 1985-86 period increased 29.6 percent. For these graduates in 1976-77, the top three fields in the *number* of bachelor's degrees awarded were the social sciences, interdisciplinary studies, and business and management, respectively. In 1985-86, these three fields remained the most popular, but business and management replaced social sciences in the top position. In 1976-77, these three disciplines accounted for approximately 48 percent of the total number of bachelor's degrees awarded to underrepresented minorities, compared to about 41 percent in 1985-86. The fields with the highest *percentage* representation of these selected minorities in 1976-77 were foreign languages (20.7 percent), public affairs (17.4 percent), and social sciences (14.1 percent). By 1985-86 the disciplines with the greatest representation had shifted to area studies (39.2 percent), public affairs (24.8 percent), and foreign languages (21.7 percent). Disciplines with the lowest representation by 1985-86 were computer

science (6.2 percent), the physical sciences (6.3 percent), and agriculture (6.5 percent).

One of the most interesting trends at the baccalaureate level for both "all minority" and "underrepresented minority" categories was the rate of change of degree awards by discipline. As Display 19 notes, degree recipients in both of these categories recorded larger *percentage* increases in the "growth" fields of computer science, engineering, business and management, mathematics, and communications than did the overall SWDTE population. This condition proved particularly noteworthy in communications, where underrepresented minority graduates recorded higher *percentage* increases in baccalaureate awards than did either the "all minorities" category (that is, underrepresented minorities plus Asians), or the total graduating class. Some of the spectacular increases in these percentages are clearly attributable to small numbers (for example, underrepresented minority graduates in computer science increased from 16 to 121 over the 1976-77 to 1985-86 period -- a 656.3 percent increase), but the consistency of the increases in bachelor's degrees awarded to "all minorities" and "underrepresented minorities" in the growth disciplines suggests that other factors such as improved secondary school counseling, expanded collegiate level outreach programs, support programs such as the Minority Engineering Program, and increased awareness among minority students of the linkage between the growth fields and job opportunities may have influenced their selection of majors.

Master's degrees

"All minorities" (including Asian students) and "underrepresented minorities" at the University and State University recorded impressive increases in both the number and percentage of master's degrees awarded over the 1976-77 to 1985-86 period (Displays 21 and 22, pages 42 and 43). Master's degree recipients in the "all minorities" category posted a 17.4 percent increase (318 degrees), while those in the "underrepresented minorities" category noted a 9.6 percent (102 degrees) rise. These percentage gains did not, however, translate into substantial increases in the overall representation of "all minorities" and "underrepresented minorities" in the graduating class. Between the 1976-77 and 1985-86 academic years, the percentage of master's degrees

awarded to "all minorities" increased from 16.7 to 19.4 percent of the statewide SWDTE total, while underrepresented minority degree recipients rose only from 10.1 to 10.6 percent.

Among both "total minorities" and "underrepresented minorities" at the master's level, the most popular fields in both the 1976-77 and 1985-86 academic years were education, business and management, and public affairs (Display 23, page 44). While business and management and public affairs experi-

enced an overall 17.6 percent and 14.4 percent jump, respectively, in the number of master's degrees awarded to "underrepresented minorities" over this ten-year period, education experienced a 9.1 percent decline.

Furthermore, there was little shifting of graduates among these three most popular disciplines. These three popular disciplines represented 52.2 percent of the total number of master's degrees awarded to graduates in the "minorities" category in 1976-77,

and 51.2 percent in 1985-86. The highest concentration of "total minority" degree recipients (measured in terms of their proportions of their graduating classes in each discipline) occurred in the fields of public affairs, engineering, and architecture during the 1976-77 academic year. By 1985-86, a noticeable shift had taken place. In that year, area studies,

computer science, and engineering enrolled the highest concentration of "all minorities."

In 1976-77, underrepresented minority students accounted for 17.1 percent of the total number of master's degrees awarded in public affairs. In 1985-86 public affairs claimed 20.2 percent, but was replaced

as the discipline with the largest proportion of underrepresented minorities by area studies with 36.1 percent.

The disciplines with the lowest representation of master's degree recipients classified as all minorities in 1985-86 included agriculture (7.5 percent), letters (9.5 percent), and the physical sciences (12.5 percent). For underrepresented minorities, computer science (1.2 percent), agriculture (3.8 percent), letters (5.1 percent), and engineering (5.2 percent) posted the lowest proportions of master's recipients.

Doctorates

Doctoral degree recipients classified as "all minorities" and "underrepresented minorities" fared differently over the ten-year period. While the percentage of all doctorates awarded by the public segments increased by 4.1 percent, degrees awarded to "all mi-

norities," with a smaller base, rose 51.9 percent (69 degrees). Doctorates awarded to underrepresented minorities, however, dropped by 10.6 percent (10 degrees). Graduates in the "all minorities" category rose from 6.7 percent to 9.8 percent of the total graduating class at the University over the 1976-77 to 1985-86 period while underrepresented minorities held steady at about 4 percent of the total number of doctorates granted in both years.

The relatively small number of degree recipients at the doctorate level precluded the development of detailed figures describing the distribution of total minority and underrepresented minority graduates by discipline. The data do reveal, however, that graduates in the total minorities category are generally concentrated in education, health, social science, and the liberal/multidisciplinary studies (Display 24, page 46), and that the number of doctoral recipients in engineering increased from seven to thirty-three between 1976-77 and 1985-86.

THE same eight categories of data that California's colleges and universities have used to ask students about their ethnicity (listed on page 37 above) are used to distinguish foreign students from other students, as follows:

- Only students who report themselves to be "non-resident aliens" are classified as "foreign" students."
- Students who declared their ethnicity in one of the five ethnic categories are assumed to be U.S. residents -- that is, either U.S. citizens or non-citizens residing in the U.S. as permanent residents.
- Similarly, students reported in the "other" or "declined to state" categories are, for the purpose of this chapter's discussion, assumed to be U.S. residents.

Clearly, these three assumptions are somewhat arbitrary. To the extent that they are inaccurate, this chapter probably underestimates the number of foreign students who graduated between 1976-77 and 1985-86. However, as the discussion of student ethnicity data in Appendix D indicates, the self-reported nature of ethnicity data offer a strong potential for unreliability. Students who report their status as "non-resident aliens" may or may not be foreign students, just as those who report their ethnicity as "white" or "Hispanic" may or may not be U.S. residents. Under these circumstances, the three assumptions seem to the Commission staff the best for reporting trends in foreign student degrees, but their accuracy is unknown.

Bachelor's degrees

Foreign graduates at the baccalaureate level in both the University of California and the California State University increased substantially in both number and percentage over the past decade. However, in recent years, both their number and percentage have begun to decrease. Several factors have contributed to this recent decline, including political instability or policy changes in their own countries,

such as Iran; the increase of domestic students, who receive first choice for admittance in high demand, impacted programs; and cost factors that may render attendance at public four-year institutions prohibitively expensive for foreign students.

Statewide, although the number of bachelor's degrees awarded to foreign students increased by 106.8 percent between 1976-77 and 1980-81, since 1981-82 this percentage decreased by 31.5 percent for a total ten-year gain of 44.5 percent (Display 25, page 48). When considered in relation to the State's overall baccalaureate degree production, foreign students increased their share of the total from 2.1 percent in 1976-77 to 4.5 percent in 1980-81 (Display 26, page 49), but decreased their share of such degrees from 4.4 percent in 1981-82 to 3.0 percent in 1985-86. During the first five-year period of the decade, the number of foreign student graduates declined in only one discipline category, foreign languages. During the latter half, however, foreign student graduates, as a percent of total graduates, declined in each discipline, except computer science -- a discipline in which their numbers increased steadily over the past decade.

In 1985-86, the proportion of foreign students receiving bachelor's degrees ranged from a low of 0.2 percent in public affairs to a high of 9.7 percent in computer science. The number of foreign graduates receiving bachelor's degrees more than doubled in three of the 19 disciplines examined over the ten-year period -- computer science, mathematics, and the physical sciences (Display 27, page 50). (The displays in Appendix F provide similar information for each of the two five-year periods in the decade.)

The pattern of foreign student baccalaureates differed somewhat from U.S. residents throughout the past decade, but like that of U.S. residents, it tended toward high technology and business-related fields. In 1976-77, engineering and business and management (the two most popular disciplines) accounted for 25.2 percent of the total number of foreign students' bachelor's degrees, but by 1985-86, these two disciplines accounted for 34.4 percent of the total -- despite the fact that their bachelor's degrees in

engineering declined by 51.6 percent between 1981-82 and 1985-86. Like U.S. residents, foreign graduates exhibited a strong interest in computer science. Over the ten years studied, their bachelor's degrees in this discipline jumped from 19 to 228 -- an 1100.0 percent increase. Foreign students also differed from U.S. residents in their affinity for three fields that suffered overall declines: agriculture (up

43.3 percent); the fine arts (up 27.8 percent); and interdisciplinary studies (up 16.1 percent).

Computer science proved to be the baccalaureate program in which foreign students represented their greatest percentage of the statewide graduating class in 1985-86. However, throughout most of the decade, engineering was the frontrunner in foreign

student participation. In 1976-77, foreign students accounted for 10.5 percent of the bachelor's degrees awarded in engineering. By 1981-82, this percent had increased to 16.0 percent -- nearly one out of

every six bachelor's degrees awarded in engineering. Since then, the number has decreased to only 6.8 percent -- an amount less than that ten years ago

Master's degrees

Foreign students earning master's degrees exhibited similar choices as resident students, in that they increased their concentration in computer science and mathematics, as did U.S. residents. However, like their baccalaureate counterparts, they decreased their number and percentage in engineering -- despite the fact that engineering was the discipline in which they recorded their highest percentage of master's degrees -- 31.2 percent, or nearly one out of every three, in 1985-86, compared to only 28.0 percent in 1976-77 (Display 26).

As did their baccalaureate counterparts, foreign students at the master's level generally increased their percentage of degrees over the ten years. In a number of disciplines (including area studies, communications, computer sciences, the physical sciences, and interdisciplinary studies) the number of master's degrees awarded to foreign students more than doubled (Displays 28 and 29, pages 52 and 53). Only two disciplines awarded fewer degrees -- agriculture and foreign languages. Engineering posted a moderate increase in the number of master's degrees awarded to foreign students -- 20.2 percent, but in

comparison, master's degrees awarded to U.S. residents increased by only 3.4 percent.

Doctorates

University of California doctorates awarded to foreign students increased by over 25 percent during the 1976-77 to 1985-86 period. In considering discipline percentage changes, however, the "smallness" of the numbers is significant, and, therefore, the magnitude of the trends could be misinterpreted. Nonetheless, foreign students increased their degree production in the numerically largest disciplines, with the greatest increases noted in education, the physical sciences, and mathematics (Displays 30 and 31, pages 53 and 54).

In addition, 45.3 percent of all of the Ph.D.s in engineering awarded by the University in 1985-86 went to foreign students -- a number comparable to the 43.2 percent awarded in 1976-77. More surprising, however, is the fact that foreign students received half of the University's 28 doctorates in business and management -- a considerable increase from their 27.7 percent in 1976-77.

Appendix D

Problems Attendant to Reporting Student Ethnicity

OF all of the information developed, collected, and reported by a campus in the course of an academic year, student ethnicity data undoubtedly present the most difficult challenges. Problems in collecting student ethnicity fall into five basic areas:

1. Errors inherent in the self-reporting process

By law, student ethnicity must be self-reported; that is, students must voluntarily indicate the ethnic group with which they identify. While both federal and State law give administrators limited authority to intervene in the ethnicity declaration process, campus officials are, for the most part, precluded from influencing students' choice of their ethnic category.

2. Errors induced by failure to report

Although the federal government exhorts educational institutions to report the ethnicity of their students, campus officials have few mechanisms by which to campus officials to force recalcitrant students to declare their ethnicity. Many students, through intent or neglect, take advantage of this condition and fail to declare their ethnicity when the opportunity is afforded them.

3. Inability to verify the accuracy of the information collected

While self-reporting has clear and obvious benefits in terms of ensuring the confidentiality of personal information, it impedes an institution's ability to verify the accuracy or appropriateness of such information. In general, student declarations of ethnicity are private matters maintained

in confidential files. As such, ethnicity declarations are rarely subject to review to ensure their accuracy.

4. Changes in reporting categories

Reporting categories have been modified by the federal government a number of times over the past few years and some student ethnicity designations submitted in prior years and not recollected in the interim are no longer valid. Further, some of the changes introduced by the federal government have proven difficult to interpret by both administrators and students -- a condition further complicating the problems involved in the collection of student ethnicity data.

5. Administrative error

Finally, many institutions solicit student ethnicity declarations as part of their first-time admission or first day of registration procedures. From both the students' and the institution's standpoint such efforts could probably not come at a more untimely moment. At this time, many students and administrators are concerned with ensuring that students have, enrolled in the proper classes, paid the appropriate fees, received proper student financial assistance, and familiarized themselves with the local campus geography. Amidst such obvious turmoil, administrative procedures often fail, and student ethnicity declarations are either unsolicited or lost.

Nonetheless, while it is clear that collecting and reporting accurate student ethnicity is a difficult task, most campuses do a good job of informing students of the need to know their ethnicity and accurately recording their responses.

CALIFORNIA POSTSECONDARY EDUCATION COMMISSION

THE California Postsecondary Education Commission is a citizen board established in 1974 by the Legislature and Governor to coordinate the efforts of California's colleges and universities and provide independent, non-partisan policy analysis and recommendations to the Governor and Legislature.

Members of the Commission

The Commission consists of 15 members. Nine represent the general public, with three each appointed for six-year terms by the Governor, the Senate Rules Committee, and the Speaker of the Assembly. The other six represent the major segments of postsecondary education in California.

As of March 1987, the Commissioners representing the general public are:

Seth P. Brunner, Sacramento
C. Thomas Dean, Long Beach, *Chairperson*
Seymour M. Farber, M.D., San Francisco
Cruz Reynoso, Los Angeles
Lowell J. Paige, El Macero
Roger C. Pettitt, Los Angeles
Sharon N. Skog, Mountain View, *Vice Chairperson*
Thomas E. Stang, Los Angeles
Stephen P. Teale, M.D., Mokelumne Hill

Representatives of the segments are:

Yori Wada, San Francisco; representing the Regents of the University of California

Claudia H. Hampton, Los Angeles; representing the Trustees of the California State University

Arthur H. Margosian, Fresno, representing the Board of Governors of the California Community Colleges

Donald A. Henriksen, San Marino; representing California's independent colleges and universities

Harry Wugalter, Thousand Oaks; representing the Council for Private Postsecondary Educational Institutions

Angie Papadakis, Palos Verdes; representing the California State Board of Education

Functions of the Commission

The Commission is charged by the Legislature and Governor to "assure the effective utilization of public postsecondary education resources, thereby eliminating waste and unnecessary duplication, and to promote diversity, innovation, and responsiveness to student and societal needs."

To this end, the Commission conducts independent reviews of matters affecting the 2,600 institutions of postsecondary education in California, including Community Colleges, four-year colleges, universities, and professional and occupational schools.

As an advisory planning and coordinating body, the Commission does not administer or govern any institutions, nor does it approve, authorize, or accredit any of them. Instead, it cooperates with other state agencies and non-governmental groups that perform these functions, while operating as an independent board with its own staff and its own specific duties of evaluation, coordination, and planning.

Operation of the Commission

The Commission holds regular meetings throughout the year at which it debates and takes action on staff studies and takes positions on proposed legislation affecting education beyond the high school in California. By law, the Commission's meetings are open to the public. Requests to address the Commission may be made by writing the Commission in advance or by submitting a request prior to the start of a meeting.

The Commission's day-to-day work is carried out by its staff in Sacramento, under the guidance of its executive director, William H. Pickens, who is appointed by the Commission.

The Commission issues some 30 to 40 reports each year on major issues confronting California postsecondary education. Recent reports are listed on the back cover.

Further information about the Commission, its meetings, its staff, and its publications may be obtained from the Commission offices at 1020 Twelfth Street, Third Floor, Sacramento, CA 95814-3985; telephone (916) 445-7933.

MAJOR GAINS AND LOSSES: PART TWO

California Postsecondary Education Commission Report 87-26

ONE of a series of reports published by the Commission as part of its planning and coordinating responsibilities. Additional copies may be obtained without charge from the Publications Office, California Postsecondary Education Commission, Third Floor, 1020 Twelfth Street, Sacramento, California 95814-3985.
