TITLE State Norms for the North Carolina Testing Program. 1998 Edition.

INSTITUTION North Carolina State Dept. of Public Instruction, Raleigh. Div. of Accountability/Testing.

PUB DATE 1998-00-00

NOTE 100p.

PUB TYPE Numerical/Quantitative Data (110) -- Reports - Descriptive (141)

EDRS PRICE MF01/PC04 Plus Postage.

DESCRIPTORS *Academic Achievement; Comparative Analysis; *Elementary Secondary Education; Public Schools; *State Norms; State Programs; Tables (Data); Test Construction; Test Results; *Test Use; *Testing Programs

IDENTIFIERS North Carolina; North Carolina End of Course Testing Program; North Carolina End of Grade Testing Program

ABSTRACT

This publication provides a reference for educators and others interested in conducting comparative studies relative to North Carolina tests. It includes norms, tables, and other statistical information for all state-developed tests (state-mandated and local-option tests for which baseline data are available) that were administered during the current accountability cycle. The North Carolina ABCs Accountability Model requires extensive use of statistics from the state-mandated tests to monitor the progress of the state's public schools. Student improvement is monitored at the elementary and middle school levels through end-of-grade tests and at the high school level through end-of-course tests in the core subjects for which tests have been developed: English I and II; Algebra I and II; Geometry; U.S. History; Economic, Legal, and Political Systems; Physical Science; Biology; Physics; and Chemistry. Users of this publication are reminded that state-level frequency distributions and other descriptive statistics are prepared each year, but the normative statistics for baseline purposes are established the first year a test is used. Test interpretation material is provided in the following areas: (1) "Using Test Scores for Student Decisions"; (2) "End-of-Grade Tests--Achievement Levels by Subject and Grade"; (3) "End-of-Course Tests--Achievement Levels and Scale Scores; and (4) "Glossary of Testing and Other Statistical Terms." Tables present data on the state-mandated end-of-grade tests in reading and mathematics, local option end-of-grade tests in social studies, science, French, and Spanish, and state-mandated end-of-course tests. (Contains 62 tables.) (SLD)

Introduction

The purpose of this publication is to provide a reference for educators and others interested in conducting comparative studies relative to North Carolina tests. This publication includes norms tables and other statistical information for all state-developed tests (state-mandated and local option tests where baseline data are available) that were administered during the current accountability cycle. New tests and revisions of existing tests are made from time to time; therefore, subsequent editions of this publication will include norms and statistical information for new and revised tests as they are implemented.

The North Carolina ABCs Accountability Model requires extensive use of statistics from North Carolina state-mandated tests to monitor the progress of the state's public schools. Each school is measured against itself, and is accountable for having students make reasonable progress based on year-to-year comparisons of test performance. The model retains the core components of the previous testing program, focusing accountability on the basics. Student improvement is routinely measured by the State Board of Education in reading, writing, mathematics, and computer skills at the elementary and middle school levels. Schools are held accountable in the core subjects required for graduation where state tests have been developed: English I and II; Algebra I and II; Geometry; U.S. History; Economic, Legal, and Political Systems; Physical Science; Biology; Physics; and Chemistry. Statistical information, including norms, for other

state-developed tests is included in this document as a reference when using those tests.

Users of this publication are reminded that state-level frequency distributions and other descriptive statistics are prepared each year a state-mandated test is administered; however, for baseline comparative purposes, normative statistics are established the first year a test is administered. The baseline norm year is shown for each test in the List of Contents (on page 3) and at the top of each table.

Several legitimate statistical methods exist whereby norms may be calculated for tests. Each method may produce slightly different (although educationally insignificant) normative scores. The statistics presented here represent the product of the method used by the Public Schools of North Carolina, North Carolina Department of Public Instruction (NCDPI), for the state's testing and accountability programs. This method computes percentile ranks that can be compared across two or more distributions (unlike percentiles). Accordingly, persons using these tables should be able to replicate statistics on file at NCDPI when calculating test averages and percentile rankings locally.

Educators and others interested in using these tables may contact the Regional Accountability Coordinator (RAC), local testing coordinators, or the Division of Accountability Services for additional information on the appropriate uses of these tables.

Acknowledgments

The development of a document that contains a variety of statistical information requires the skill and efforts of many individuals. We thank George Stubblefield and Tara Francis for compiling the statistical information; Kristopher Kaase for compiling the graphics and developing the end-of-grade interpolation tables; Mildred Bazemore for organization, writing, editing and contributions to the text; and Karen Davis, Tara Francis, LaShon Ormond, Eleanor Sanford, and George Stubblefield for their contributions to the text of this document.

End-of-Grade Tests

Historical Information. North Carolina end-of-grade tests were initiated in response to legislation passed in 1989 by the North Carolina General Assembly. North Carolina end-of-grade tests were developed by the North Carolina Department of Public Instruction with technical support from the L.L. Thurstone Psychometric Laboratory at The University of North Carolina at Chapel Hill and the North Carolina Technical Advisory Group. The tests were developed for use as achievement tests to measure the acquisition of specific subject-area content and skills associated with a particular grade in school.

Based on the 1989 legislation, North Carolina end-of-grade tests were developed for two purposes:

- To provide accurate measurement of individual student skills and knowledge specified in the North Carolina *Standard Course of Study*, and
- To provide accurate measurement of the knowledge and skills attained by groups of students for school, school system, and state accountability.

End-of-grade tests are based on the assessment of higher level skills. When properly administered and interpreted, these test results provide an independent, uniform source of reliable and valid information that enables:

- Students to know the extent to which they have mastered expected knowledge and skills and how they compare to others;
- Parents to know if their children are acquiring the knowledge and skills needed to succeed in a highly competitive job market;
- Teachers to know if their students have mastered grade-level knowledge and skills in the curriculum and, if not, what weaknesses need to be addressed;
- Community leaders and lawmakers to know if students in North Carolina schools are improving their performance over time and how the students compare with students from other states or the nation; and
- Citizens to objectively assess their return on investment in the public schools.

Scores on the end-of-grade tests are only one of many indicators of the achievement of students. The value of these tests lies primarily in the fact that the scores provide a common standard that is not influenced by local differences in achievement and expectations. The tests provide yardsticks, which can be used to compare the achievement of students, schools, school systems, and the state. The assessment yardstick can be used to measure gains (or losses) in performance across time to see if education improvement efforts at the state and local level are working.

Scale Scores. Raw scores are converted to scale scores on the end-of-grade tests. Scale scores allow the different forms of the test to be equated, so that a scale score of 150 in Reading on Form A represents the same level of achievement as a scale score of 150 on Form B, even though the raw scores may be slightly different.

The reading, mathematics, and science tests are reported on developmental scales, which yield rulers to measure growth in these subject areas across time. Just like height in inches, on average, student scores are expected to go up every year. Also like height, the rate of growth is somewhat faster in the earlier grades than in later grades.

Developmental scale scores on end-of-grade tests can be used to chart the average educational growth of students as they progress through the grades. Given the way the scales were developed, the differences in mathematics scores between grades in 1992-93 can provide a standard for comparing average growth across grade levels for the future, e.g., between where students were at the end of the third grade versus where they are at the end of the fourth grade. This *anticipated growth* varies from grade level to grade level and from subject to subject. Each year test results can be used to chart the *actual growth* of students from grade level to grade level within a subject. Schools and school systems may use the developmental scale scores to compare their own mean scale scores to the state average to evaluate the performance of

their students. Social studies scores are not on a developmental scale because the specific content covered at each grade is different. Scale scores can be averaged and relative comparisons made within each subject and across groups, schools, and school systems.

It is not appropriate to compare developmental scale scores across subjects (i.e., mathematics vs. reading) because the typical growth across grades for each subject is different. It is appropriate to compare scale scores within subjects and types of tests (i.e., open-ended and multiple-choice) across years.

Achievement Levels. Achievement levels allow the comparison of student and group performance to standards based on what is expected in each subject at each grade level. Achievement levels were determined by relating the judgments of thousands of North Carolina teachers concerning the performance of each of their students to each student's performance on the end-of-grade multiple-choice tests. The four levels are:

Level I: Students performing at this level do not have sufficient mastery of knowledge and skills in this subject area to be successful at the next grade level.

Level II: Students performing at this level demonstrate inconsistent mastery of knowledge and skills in this subject area and are minimally prepared to be successful at the next grade level.

Level III: Students performing at this level consistently demonstrate mastery of grade level subject matter and skills and are well prepared for the next grade level.

Level IV: Students performing at this level consistently perform in a superior

manner clearly beyond that required to be proficient at grade level work.

Each achievement level corresponds to a range of scale scores for each subject and grade level. The scale score ranges for each subject and grade is presented below.

Ranges for Achievement Levels by Subject and Grade End-of-Grade Tests

Reading and Mathematics Scale Scores (1998)

Subject/Grade		Level I	Level II	Level III	Level IV
Reading	PT3	119-127	128-132	133-144	145-162
	3	115-130	131-140	141-150	151-172
	4	119-134	135-144	145-155	156-174
	5	124-138	139-148	149-158	159-178
	6	128-140	141-151	152-161	162-180
	7	130-144	145-154	155-163	164-183
	8	132-144	145-155	156-165	166-184
	Mathematics	PT3	105-117	118-125	126-134
3		98-124	125-137	138-149	150-173
4		111-131	132-142	143-155	156-182
5		117-140	141-149	150-160	161-188
6		130-145	146-154	155-167	168-196
7		134-151	152-160	161-172	173-203
8		137-154	155-164	165-177	178-208

Science Scale Scores (1997)

Grade	Level I	Level II	Level III	Level IV
3	119-132	133-143	144-155	156-180
4	122-136	137-147	148-159	160-182
5	128-141	142-150	151-161	162-187
6	130-141	142-151	152-161	162-188
7	134-145	146-153	154-164	165-189
8	134-145	146-154	155-166	167-190

Social Studies Scale Scores (1994)

Grade	Level I	Level II	Level III	Level IV
3	25-40	41-50	51-60	61-79
4	26-41	42-50	51-61	62-85
5	25-41	42-51	52-62	63-85
6	29-39	40-49	50-59	60-85
7	26-40	41-49	50-60	61-85
8	28-39	40-48	49-58	59-86

North Carolina Writing Assessment at Grades 4 and 7

Writing	Level I	Level II	Level III	Level IV
4 & 7	0.0 - 1.0	1.5 - 2.0	2.5 - 3.0	3.5 - 4.0

End-of-Course Tests

Historical Information. The North Carolina end-of-course tests were initiated in response to legislation passed by the North Carolina General Assembly — the North Carolina Elementary and Secondary Reform Act of 1984. This act called for the implementation of the Basic Education Program through the establishment of a core curriculum for all students for each content area and the development of tests to assess the implementation of each curriculum across the state. Based on this legislation, the North Carolina end-of-course tests were developed for two purposes:

- To provide accurate measurement of individual student skills and knowledge specified in the North Carolina *Standard Course of Study*, and
- To provide accurate measurement of the knowledge and skills attained by groups of students for school, school system, and state accountability.

End-of-course tests are based on the assessment of higher level skills within the context of specific subject-area content. When properly administered and interpreted, these test results provide an independent, uniform source of reliable and valid information, which enables

- Students to know the extent to which they have mastered expected knowledge and skills and how they compare to others;
- Parents to know if their children are acquiring the knowledge and skills needed to succeed in a highly competitive job market;

- Teachers to know if their students have mastered grade-level knowledge and skills in the curriculum and, if not, what weaknesses need to be addressed;
- Community leaders and lawmakers to know if students in North Carolina schools are improving their performance over time and how the students compare with students from other states or the nation; and
- Citizens to objectively assess their return on investment in the public schools.

The North Carolina end-of-course tests were developed by the North Carolina Department of Public Instruction with technical support from the L.L. Thurstone Psychometric Laboratory at The University of North Carolina at Chapel Hill and the North Carolina Technical Advisory Group. The tests were developed for use as achievement tests to measure the acquisition of specific subject-area content and skills.

Scores on the end-of-course tests are only one of many indicators of the achievement of students. The value of these tests lies primarily in the fact that the scores provide a common standard that is not influenced by local differences in achievement and expectations. The tests provide yardsticks, which can be used to compare the achievement of students, schools, school systems, and the state. The assessment yardstick can be used to measure gains (or losses) in performance across time to see if educational improvement efforts at the state and local level are working.

High School Subjects Tests (EOC) Scale Scores

- The end-of-course tests are reported in terms of scale scores. Unlike end-of-grade tests, developmental scale scores are inappropriate for end-of-course tests because the content taught in each of the courses is discrete.
- Scale scores allow the different forms of the test to be equated, so that a scale score of 50 in Algebra I on Form A represents the same level of achievement as a scale score of 50 on Form B, even though the raw scores may be slightly different.
- The scale scores for all tests have a mean of 50 and a standard deviation of 10. The range of scale scores is approximately 20 to 90.
- Beginning with 1993-94, scores for Algebra I were reported as scale scores rather than raw scores. In 1994-95, Biology, English I, and U.S. History were reported as scale scores rather than raw scores. In 1995-96 Economic, Legal, and Political Systems (ELP) used scale scores rather than raw scores to report student performance. These scores are not comparable to scores from earlier years when raw scores were used.

Achievement Levels. Achievement levels allow the comparison of student and group performance to standards based on what is expected in each subject at each grade level. Achievement levels were determined by relating the judgments of thousands of North Carolina teachers concerning the performance of each of their students to each student's performance on the end-of-course tests. The four levels are:

Level I: Students performing at this level do not have sufficient mastery of knowledge and skills of the course to be successful at a more advanced level in the content area.

Level II: Students performing at this level demonstrate inconsistent mastery of knowledge and skills of the course and are minimally prepared to be successful at a more advanced level in the content area.

Level III: Students performing at this level consistently demonstrate mastery of the course subject matter and skills and are well prepared for a more advanced level in the content area.

Level IV: Students performing at this level consistently perform in a superior manner clearly beyond that required to be proficient in the course subject matter and skills and are very well prepared for a more advanced level in the content area.

Each achievement level corresponds to a range of scale scores for each subject.

**Achievement Level Ranges for
North Carolina End-of-Course Tests**

Test/Year Normed	Level I	Level II	Level III	Level IV
Algebra I*/1994	23-44	45-54	55-56	66-87
Algebra II/1997	23-45	46-57	58-68	69-88
Biology*/1995	25-46	47-54	55-64	65-88
Chemistry/1997	23-47	48-55	56-64	65-88
ELP*/1997	21-42	43-51	52-60	61-87
English I*/1995	22-42	43-51	52-60	61-85
English II**	0.0-1.5	2.0-2.5	3.0-3.5	4.0-6.0
Geometry/1997	23-45	46-56	57-66	67-87
Physics/1997	23-42	43-51	52-62	63-87
Physical Science/1997	23-43	44-53	54-63	64-87
US History*/1997	27-47	48-56	57-64	65-88

* These achievement level ranges have been approved by the State Board of Education.

** English II benchmarks were set in the summer of 1997.

Using Test Scores for Student Decisions

There is a natural desire to want to use numbers as if they were absolutely precise when making decisions. However, common experiences teach that most measurements vary a little in their precision. A carpenter's ruler may not be as accurate as a scientist's, bathroom scales may not be as accurate as those in a doctor's office, and speedometers in cars may show speeds that vary from those captured on a radar gun. Decisions can be and are made from both levels of precision.

Individuals often use their knowledge of accuracy when making the final decision. For example, the carpenter may use lumber that has been cut just a bit short but reject other cuts because of the intended use of the wood. The doctor may not make a decision about a patient using just one precise measurement but may prefer to use a pattern of weight measurements from two scales before suggesting a course of treatment. The police officer may not ticket a speeding offender driving within a few miles per hour of the posted speed limit because he or she recognizes the potential for a difference in precision.

Making decisions about students has similar problems, with the additional complexity of the measurement of human characteristics such as school achievement or aptitude. Clearly, it is easier to measure speed, weight, or length than intelligence or achievement. Teachers who work with students approximately 180 days each year can only assign grades into perhaps five broad categories of achievement (such as A, B, C, D, or F). They also know that achievement may vary from day to day for a given student. One day a student

may respond in a consistent "well above average" fashion while the very next day he or she may give average or just above average responses. When it comes to a decision that has more important consequences than reporting to parents about progress in school, such as failure in a grade or admission to a special program, teachers are often uncomfortable depending on their own judgment alone. Most prefer to use additional independent judgments or results from standardized tests to confirm these major decisions.

Multiple-choice tests are more reliable than any single teacher's test, but they are not perfect instruments. Just as speedometers, scales, and rulers have variation in their measurement accuracy, test scores vary due to characteristics of the specific test items and the differences in student performance that occur on a daily basis. In order to help ensure that all students meet a standard of performance, citizens and educators sometimes feel a need to use a single objective score from a standardized test to make important decisions about students. It is inappropriate to place so much weight on a single administration of a single instrument, which takes such a short time to administer. The *Testing Code of Ethics*, guidelines adopted by the State Board of Education, has helped many educators make more appropriate interpretations of test scores. Two items under Reporting are illustrative:

- Individual test scores are best presented as approximations and not as absolutes. It is preferable to report results as a limited score range rather than distinct points.

- Test scores are to be presented as one source of information about a student or group of students and should not be used alone for placement, referral, and other consequential decisions on the education of a student.

These guidelines are consistent with Standards for Educational and Psychological Testing developed nationally by the American Psychological Association, the American Educational Research Association, and the National Council on Measurement in Education.

For more information on the psychometric characteristics (e.g., standard error of measurement) of tests developed by The NCDPI, refer to the following documents:

- North Carolina End-of-Grade Tests, Technical Report #1 (NCDPI, 1996), and
- North Carolina End-of-Course Tests, Technical Report #1 (NCDPI, 1996).

Examples of Appropriate Uses

The process for identifying students for special programs in North Carolina follows guidelines in the Testing Code of Ethics by using a combination of teacher recommendations, standardized tests, and past performance.

- The state standard for a **Competency Test** in a given area, which was also set using a combination of information, is currently based on one test. However, the student has repeated opportunities to take the test before the decision to withhold graduation with a diploma is made.
- Similarly, **Grade-Level Proficiency Guidelines** identify students on a standard set by teachers and translated to a test score. Under these guidelines, local policy and discretion determine promotion and retention decisions which take into account the student's test score and other information which may indicate a student's level of achievement in a grade.

Conclusion

When making decisions that impact students, the best plan is one which incorporates a combination of information about the student. The plan should ask for repeated demonstrations of the weaknesses or excellence of the student in the particular area. This conservative approach more nearly matches that used by the carpenter, doctor, or police officer. It takes into account variation in measurement and checks for patterns that provide keys for any important decision.

Glossary of Testing and Other Statistical Terms

Achievement Levels. Predetermined levels of achievement that relate the judgment of North Carolina teachers to the actual student performance on North Carolina tests. The achievement levels allow for the comparison of student and group performance to establish standards based on what is expected in a subject area at each grade level.

Achievement Test. A test that measures the extent to which a person has “achieved” something, acquired certain information, or mastered certain standardized sets of skills - usually as a result of planned instruction or training.

Criterion-Referenced Test. A test that is designed to provide information on the specific knowledge or skills possessed by a student. Such tests usually cover relatively small units and are related to instruction. Performance is measured in reference to mastery of particular skills. Scores from these tests have meaning in terms of *what* the student knows or can do, rather than in their relation to the scores made by some external reference or norm group.

Curriculum-Based Test. A test that is designed to measure student performance in reference to goals and competencies specifically defined in a curriculum.

Developmental Scale Scores. Developmental scales are similar to rulers that allow growth in a subject to be measured across time. Developmental scale scores are intended to be interpreted much like height in inches. As is the case for growth in

height, we expect an annual increase in scale scores, but not the same increase for each year. The rate of growth is a bit faster in the earlier grades than in the later grades. A developmental scale score in end-of-grade reading should not be compared to a developmental scale score in end-of-grade mathematics.

Diagnostic Test. A test that is used to diagnose, analyze or locate an individual’s specific areas of weakness and/or strength to determine the nature of the weaknesses or deficiencies and, where possible, to suggest the cause. Diagnostic tests are most commonly prepared for the skill subjects.

End-of-Course Tests. Curriculum-based accountability assessments used to measure student achievement in specific high school courses.

End-of-Grade Tests. Achievement tests that provide information about the overall proficiency of students in specific content areas at the end of a grade. They measure how much a student has grown educationally in a year and whether or not groups of students are performing according to grade level expectations. These tests are curriculum-based accountability tests and scores are presented as developmental scale scores. The tests provide limited information about the strengths and weaknesses of individual students in specific skill areas.

Focused Holistic Score. Used in assessments, which evaluate the writing skills of students in grades 4, 7, and English II (grade 10). Student

compositions are assigned a score that reflects a trained reader's general impression of each composition's quality. The reader focuses on the set of prescribed composition characteristics (main idea, supporting details, coherence, and organization) and assigns a score based on the level of facility that the writer demonstrates.

Frequency. The number of objects, individuals, or events in a category. For example, the number of students enrolled in an elementary school or in an Algebra I course; the number of students in each grade level; and the number of students in third grade who scored 150 on their reading test.

Frequency Distribution. The number of objects, individuals, or events in each category of a variable. For example, the number of third-grade students in Xavier Elementary School scoring at each score point on the reading EOG test.

Gain. Gain is computed as the difference between the average student test scores in the grade, group or subject in Year 1 and the average test scores of the same grade, group or subject in Year 2. For example, the difference between grade 3 reading scores in 1993 and grade 3 reading scores in 1994; or the difference between Algebra I test scores in 1994 and Algebra I test scores in 1995.

Growth. The cohort difference in test score achievement across grades/years. Growth is computed as the difference between the test scores (developmental scale scores) of a group in Year 1 and the test scores of the same group in Year 2. For example, grade 3 mathematics

test scores in 1993 and grade 4 mathematics test scores in 1994.

Mean, Median, Mode. Measures of central tendency. The mean (or average) is the sum of the scores divided by the total number of scores. The median is the middle score in an ordered distribution of scores. The mode is the most frequently occurring score in the distribution. The mean is generally the best measure of central tendency when scores are normally distributed.

Mean Percent Correct. The average of the percentage of test questions students answered correctly.

N or Number. The number of students with valid test scores on a specific test, which may also be referred to as "N-counts."

Normal Curve Equivalents (NCEs). The normal curve equivalent (NCE) scale ranges from 1 to 99. NCEs have many of the same characteristics as percentile ranks but have the additional advantage of being based on an equal-interval scale. That is, the difference between two successive scores on the scale has the same meaning throughout the scale.

Norm-Referenced Test. A test that measures performance in relation to a comparison group.

Norming Year. The first year a test is administered; used for baseline comparative purposes. Percentile scores are computed based on the state distribution of scores from the norming year.

Percentiles. A percentile indicates the percentage of scores that fall below a given score. A commonly used percentile is the median, which is the 50th percentile. For example, a score at the 55th percentile means that the score is higher than the score achieved by 55 percent of all students taking the test in the year the test was normed. A score at the 55th percentile *does not* mean 55% of the questions were answered correctly.

Percentile Ranks. The percentile rank of a score is the percentage of scores less than or equal to that score. For example, the percentile rank of 63 is the percentage of scores in the distribution that falls at or below a score of 63. In Algebra I, the percentile rank of a score of 63 is 80. The percentile rank is a point on the percentile scale, whereas a percentile is a score, a point on the original measurement scale. Percentile ranks of scores can be compared across two or more distributions; percentiles cannot be used to determine differences in relative rank due to the fact that the interval between adjacent percentiles do not necessarily represent equal raw or scale score intervals.

Range. A measure of variability. The range is the difference between the highest and lowest scores in the distribution.

Raw Score. The number of test questions a student answers correctly.

Scale Scores. Scores that express how far a given *raw* score (number correct) is from a reference point, usually the mean score. Scale scores are units of an equal-interval scale. The difference between two successive scores on the scale has the same meaning throughout the scale.

The advantage of scale scores is that they allow an individual's performance to be compared on several different tests, regardless of the raw score scales.

Standard Deviation. A measure of variability; an indication of how much variation there is in the scores, i.e., how close together or how spread out the scores are. The standard deviation measures the extent to which scores or events in a distribution, on the average, deviate from the mean. The standard deviation is the square root of the variance.

For example: SAT Verbal Scores are reported as scale scores. The scores range from 200 to 800. The mean is 500. To determine the standard deviation of normally distributed scores, divide the range of scores by 6 ($600/6=100$).

Statistical significance = $1/4$ of a standard deviation ($100/4=25$). Using the SAT example, a score of 485 is within 25 points of the mean. In a statistical context, this score is not significantly different from the mean.

Educational significance = $1/3$ of a standard deviation ($100/3=33.3$). Using the SAT example, a score of 465 is not within 33 points of the mean. In an educational context, this score is not significantly different from the mean score.

Reliability. The extent to which a test is consistent in measuring whatever it purports to measure; an indication of dependability, stability, trustworthiness, and relative freedom from errors of measurement. Reliability is usually expressed as a *reliability coefficient* or

by the standard error of measurement derived from it.

Standard Error of Measurement. As applied to a single obtained score, the amount by which the score may differ from the hypothetical true score due to errors of measurement. The larger the standard error of measurement, the less reliable the score. In about two-thirds of the scores in a group, the obtained score will not differ by more than one standard error measurement from the true score.

Standardized Test. A test designed to provide a systematic sample of individual performance, administered according to prescribed directions, scored in conformance with definite rules, and interpreted in reference to certain normative information.

Test Item Banks and Testlets. Item banks are pools of items available electronically and from which teachers can select items for use in the classroom. Test item banks are designed to match the curriculum goals and objectives which allows the teacher to assess achievement/mastery immediately after instruction. Item banks can be used to generate tests to diagnose student strengths and weaknesses.

Testlets are a resource developed by NCDPI for teachers and administrators to operationalize and implement the revised North Carolina *Standard Course of Study*. Testlets are mini-tests that measure specific areas of the curriculum. The same items are found in test item banks developed by NCDPI and found in the testlets.

Validity. The extent to which a test measures that which it purports to measure. All procedures for determining test validity are concerned with the relationships between performance on the test and other independently observable facts. There is content-related validity, criterion-related validity, construct-related validity, and predictive validity.

Variance. A measure of variability derived by subtracting the mean test score from each student's test score, squaring the difference, summing the squares, and dividing by the number of students. If the variance is small, the scores are close together; if the variance is large, the scores are more spread out.

NOTICE

REPRODUCTION BASIS

This document is covered by a signed “Reproduction Release (Blanket) form (on file within the ERIC system), encompassing all or classes of documents from its source organization and, therefore, does not require a “Specific Document” Release form.

This document is Federally-funded, or carries its own permission to reproduce, or is otherwise in the public domain and, therefore, may be reproduced by ERIC without a signed Reproduction Release form (either “Specific Document” or “Blanket”).
