ABSTRACT

The purchase and preparation of data from the March 1973 Current Population Survey for New York City has been in the nature of an experiment. The U.S. Bureau of the Census in conducting its Current Population Surveys (CPS) includes a sample of approximately 2,100 households in New York City, chosen in such a way as to be representative of the city as a whole though not necessarily of the individual boroughs. It covers a wide range of data including age, sex, ethnicity, family size, income, earnings, occupation, education, etc., and these can be cross-tabulated in a variety of ways. A sample of 2,100 households is a respectably sized sample. Nevertheless, it has its limitations, especially when it is more and more finely broken down, for example, first by income groups, then by ethnic groups, and then by family size. The degrees of variance of the standard errors are shown in the appendix. We have done a great deal of "collapsing" of the data as they were obtained from the Census Bureau printouts. In preparing the tables, we tried to strike a balance between reasonable reliability, on the one hand, and flexibility for the users of the data on the other hand. Whenever the Census Bureau presented medians, eg., income, years of schooling, for categories that did not require additional calculation by us, our tables show the CPS figures. (Author/JM)

FOREWORD

The Current Population Survey conducted by the U.S. Bureau of the Census is a source of monthly and annual data on various social and economic characteristics of the population of the United States and some of its major subdivisions such as standard metropolitan areas. It is widely used as a gauge of economic and social trends.

The Bureau does not, however, publish these data by cities. As a result, apart from the decennial census, most cities lack a reliable source of information on many significant trends. The decennial census, however, is always out of date long before the decade is over, and when change is rapid, as it has been in recent years, it may be out of date even sooner. Major cities critically need current data on social and economic trends to provide a basis for monitoring and assessing changes in the status of the population and as a basis for consideration of policies to deal with emerging problems.

The Ford Foundation recognized the need for testing the potentialities of the CPS data for major cities in the country and agreed that New York City provided a good laboratory for conducting the test. We are grateful to the Ford Foundation for a grant which made it possible for the Center for New York City Affairs to purchase the basic data from the Bureau of the Census and to work them up into a set of tables for dissemination to the many public and voluntary agencies and citizens groups concerned about the various aspects of the city. Though the data have some limitations, which are explained in the section describing the nature of the data, they reveal a great deal about what has been happening in New York City in the last three years. We hope to be able to continue to publish these data annually; whether our hope is realized depends on financing.

Dr. Blanche Bernstein, Director of Research, Urban Social Problems, and Arley Bondarin, Research Associate, prepared this material, ably assisted by Janice Bowen, statistical assistant, and Allison Williams who typed, retyped, and stenciled the tables.

social trends.

The Bureau does not, however, publish these data by cities. As a result, apart from the decennial census, most cities lack a reliable source of information on many significant trends. The decennial census, however, is always out of date long before the decade is over, and when change is rapid, as it has been in recent years, it may be out of date even sooner. Major cities critically need current data on social and economic trends to provide a basis for monitoring and assessing changes in the status of the population and as a basis for consideration of policies to deal with emerging problems.

The Ford Foundation recognized the need for testing the potentialities of the CPS data for major cities in the country and agreed that New York City provided a good laboratory for conducting the test. We are grateful to the Ford Foundation for a grant which made it possible for the Center for New York City Affairs to purchase the basic data from the Bureau of the Census and to work them up into a set of tables for dissemination to the many public and voluntary agencies and citizens groups concerned about the various aspects of the city. THE NATURE OF THE DATA

The U.S. Bureau of the Census in conducting its Current Population Surveys (CPS) includes a sample of approximately 2,100 households in New York City, chosen in such a way as to be representative of the city as a whole though not necessarily of the individual boroughs. It covers a wide range of data including age, sex, ethnicity, family size, income, earnings, occupation, education, etc., and these can be cross-tabulated in a variety of ways.

Special reference needs to be made to the ethnic breakdown. Beginning with the 1971 Current Population Survey, the data for Hispanics, i.e., those of Spanish origin, can be obtained separately from those for whites including Hispanics. The data for Hispanics, of course, are particularly useful in analyzing trends in New York City. Therefore, in all tables showing an ethnic breakdown, we have presented the data for whites excluding Hispanics, non-whites including Blacks and other non-whites, and Hispanics including Puerto Ricans and other Hispanics. We should note, however, one exception. The Census printouts presented the data for (1) whites including white Hispanics, (2) non-whites including non-white Hispanics, (3) white Hispanics, and (4) non-white Hispanics. We subtracted the data for white Hispanics from the data for whites including Hispanics. We did not, however, subtract the non-white Hispanics from the non-whites; the reason was that the numbers were small. Non-white Hispanics are only 3.6 percent of all non-whites and only 5.4 percent of all Hispanics. The labor involved in doing all the additional arithmetic was too great and would not have significantly altered the results of the cross-tabulations. Thus, the data shown in the tables for Hispanics relate to white Hispanics.

The "other Hispanics" is a somewhat mixed group; it includes many from South America and the Caribbean areas, who are mainly fairly recent immigrants to New York City, and some originating from Spain or Portugal who are long-time residents of the city. The income and educational levels, as well as other characteristics of the older Hispanic residents, are undoubtedly very different from the characteristics of the Puerto Ricans and other Hispanics who are recent migrants.

This tends to blur some of the ethnic differences but the number of long-term

Special reference needs to be made to the ethnic breakdown. Beginning with the 1971 Current Population Survey, the data for Hispanics, i.e., those of Spanish origin, can be obtained separately from those for whites including Hispanics. The data for Hispanics, of course, are particularly useful in analyzing trends in New York City. Therefore, in all tables showing an ethnic breakdown, we have presented the data for whites excluding Hispanics, non-whites including Blacks and other non-whites, and Hispanics including Puerto Ricans and other Hispanics. We should note, however, one exception. The Census printouts presented the data for (1) whites including white Hispanics, (2) non-whites including non-white Hispanics, (3) white Hispanics, and (4) non-white Hispanics. We subtracted the data for white Hispanics from the data for whites including Hispanics. We did not, however, subtract the non-white Hispanics from the non-whites; the reason was that the numbers were small. Non-white Hispanics are only 3.6 percent of all non-whites and only 5.4 percent of all Hispanics. The labor involved in doing all the additional arithmetic was too great and would not have significantly altered the results of the cross-tabulations. Thus, the data shown in the tables for Hispanics relate to white Hispanics.

The "other Hispanics" is a somewhat mixed group; it includes many from South America and the Caribbean areas, who are mainly fairly recent immigrants to New York City, and some originating from Spain or Portugal who are long-time residents of the city. The income and educational levels, as well as other characteristics of the older Hispanic residents, are undoubtedly very different from the characteristics of the Puerto Ricans and other Hispanics who are recent migrants. This tends to blur some of the ethnic differences but the number of long-term Hispanic residents is not so large as to make a great difference.

A sample of 2,100 households is a respectably sized sample. Nevertheless, it has its limitations, especially when it is more and more finely broken down, for example, first by income groups, then by ethnic groups and then by family size. The degrees of variance or the standard errors are shown in the Appendix.

We have done a great deal of "collapsing" of the data as they were obtained from the Census Bureau printouts. For example, the income data up to the \$4,000 level are available in \$500 intervals; in no case, however, do our tables use anything narrower than a \$1,000 interval and sometimes it is \$2,000. In preparing the tables, we tried to strike a balance between reasonable reliability, on the one hand, and flexibility for the users of the data on the other hand; the users may want other combinations than the sub-groups shown in the tables. It is probable that, in our effort to preserve flexibility for the users we have, in some of the detailed tables, pierced the barrier of reasonable reliability. In some cases, however, we have omitted separate tables for non-whites or Hispanics, because the data were so clearly unreliable as to be misleading and subject to misinterpretation. In any event, we urge the users to consult the Appendix, especially when making use of the finer breakdowns.

The CPS data which the Center purchased from the Bureau of the Census came from the March 1973 survey. In March, the respondents were asked questions about their income and earnings during the preceding calendar year. Thus, the income data reflect the situation in 1972; the data on other characteristics, such as age, family size, reflect the situation in March 1973.

We should note also that whenever the Census Bureau presented medians, e.g., income, years of schooling, for categories that did not require additional calculation by us -- the "collapsing" of categories or the subtraction of white Hispanics from all whites -- our tables show the CPS figures. The CPS figures are derived, of course, from the more detailed intervals shown on the printouts and may differ slightly from the medians that one would calculate from the data shown on our tables. In all cases involving whites, excluding Hispanics, we calculated medians from the finer breakdowns in the CPS printouts rather than those we decided to reproduce in the final versions of the tables. Further, in many instances, due to rounding, the total in a CPS printout does not equal precisely the sum of the categories. We have derived the totals in our tables from adding the data in each category; consequently, comparable totals in different tables may differ slightly.

may want other combinations than the sub-groups shown in the tables. It is probable that, in our effort to preserve flexibility for the users we have, in some of the detailed tables, pierced the barrier of reasonable reliability. In some cases, however, we have omitted separate tables for non-whites or Hispanics, because the data were so clearly unreliable as to be misleading and subject to misinterpretation. In any event, we urge the users to consult the Appendix, especially when making use of the finer breakdowns.

The CPS data which the Center purchased from the Bureau of the Census came from the March 1973 survey. In March, the respondents were asked questions about their income and earnings during the preceding calendar year. Thus, the income data reflect the situation in 1972; the data on other characteristics, such as age, family size, reflect the situation in March 1973.

We should note also that whenever the Census Bureau presented medians, e.g., income, years of schooling, for categories that did not require additional calculation by us -- the "collapsing" of categories or the subtraction of white Hispanics from all whites -- our tables show the CPS figures. The CPS figures are derived, of course, from the more detailed intervals shown on the printouts and may differ slightly from the medians that one would calculate from the data shown on our tables. In all cases involving whites, excluding Hispanics, we calculated medians from the finer breakdowns in the CPS printouts rather than those we decided to reproduce in the final versions of the tables. Further, in many instances, due to rounding, the total in a CPS printout does not equal precisely the sum of the categories. We have derived the totals in our tables from adding the data in each category; consequently, comparable totals in different tables may differ slightly.

Finally, we should explain that the population covered in Tables 1 to 23 is the non-institutional population of New York City, numbering 7,648,000 persons. The tables exclude the city's institutional population estimated to number 69,000 persons.

The purchase and the preparation of data from the March 1973 Current Population Survey for New York City has been, as indicated in the Foreword, in the nature of an experiment. We think the data will prove of great value to a wide variety of policy-makers, program analysts, civic groups, etc., who need current information about the characteristics of the city's population. We would like the users of these data to tell us whether they agree, how they have used the data, whether and what additional data from the CPS they need and whether some other format would be more helpful. With such guidance, we hope to increase the usefulness of the series in future years.

Clearly, the data presented in the series of tables in this volume are only the raw material for analysis. They must be compared with data for past periods and the trends analyzed for their implications.

The Center plans to analyze the trends in income and occupational distribution and to publish monographs on these subjects in the coming months. We hope others will use the data for additional analytical studies and send us copies of what they do.

In the following section we present only a few highlights of trends which emerge from comparing data from the April 1970 decennial census and the March 1973 CPS for New York City.

A FEW HIGHLIGHTS OF TRENDS

APRIL 1970 -- MARCH 1973

Age Distribution

While the total population declined by 2.3 percent,

--the number of children under 14 years of age dropped by 6.6 percent;

--the "working age" population, those 20-65 years old, decreased by 2.6 percent;

--the aged 65 and over increased by four percent.

NEW YORK CITY POPULATION BY AGE, 1970 AND 1973

	<u>April 1970</u>		<u>March 1973*</u>		<u>Pct. Change 1970-73</u>
	<u>No.</u>	<u>Pct.</u>	<u>No.</u>	<u>Pct.</u>	
Under 14	1,747,667	22.1	1,632,000	21.2	-6.6
14-20	726,405	9.2	743,000	9.6	+2.3
20-65	4,472,912	56.7	4,356,000	56.4	-2.6
65 and over	947,878	12.0	986,000	12.8	+4.0
Total	7,894,862	100.0	7,717,000	100.0	-2.3

*The age distribution of the institutional population is not available from CPS data. To make the age distribution for 1973 as nearly comparable to 1970 as possible, the 69,000 persons were distributed among the age groups from 6 to 65 and over in accordance with their distribution in the non-institutional population.

Family Size

Comparison of data on family size for April 1970 and March 1973 reveals that the total population declined by 2.3 percent, but

--the number of unrelated individuals rose by 4.0 percent;

--the total number of family units fell by 1.6 percent.

These changes reflect a continuation of trends in the 1960s when the number of unrelated individuals increased by over 157,000 and the number of families dropped by about 20,000. In part, the shift in the relationship between the number of unrelated individuals and families reflects the rising rates of divorce, separation, desertion, and non-formation of families during the sixties and continuing into the seventies. In part, it indicates the out-migration of families from the city to the suburbs.

NEW YORK CITY TOTAL POPULATION,
UNRELATED INDIVIDUALS AND FAMILIES BY FAMILY SIZE,
1970 AND 1973

	<u>1970*</u>	<u>1973</u>	<u>Pct. Change</u> <u>1970-73</u>
Total Population	7,894,862	7,717,000	- 2.3
<u>Unrelated Individuals</u>	<u>986,566</u>	<u>1, 26,000</u>	<u>+ 4.0</u>
<u>Total Families</u>	<u>2,059,281</u>	<u>2,027,000</u>	<u>- 1.6</u>
2 Persons	806,337	832,000	+ 3.2
3 Persons	467,573	429,000	- 8.2
4 Persons	385,367	421,000	+ 9.2
5-6 Persons	312,228	279,000	-10.6
7 or More Persons	87,776	66,000	-24.8
5 or More Persons	400,004	345,000	-13.8

*These data, which are available in the U.S. Census Bureau's Subject Report PC2-93, "Low Income Areas in Large Cities," are based on a smaller sample than the data appearing in General Social and Economic Characteristics - New York, PC(1)C34NY. Therefore, the totals for unrelated individuals and families differ slightly; in this tabulation, we have used the figure of 986,566 unrelated individuals from the General Social and Economic Characteristics volume instead of the figure of 968,736 in PC2-93. The two sources have approximately the same figure for the number of families; the difference is only 338.

by about 20,000. In part, the shift in the relationship between the number of unrelated individuals and families reflects the rising rates of divorce, separation, desertion, and non-formation of families during the sixties and continuing into the seventies. In part, it indicates the out-migration of families from the city to the suburbs.

*These data, which are available in the U.S. Census Bureau's Subject Report PC2-93, "Low Income Areas in Large Cities," are based on a smaller sample than the data appearing in General Social and Economic Characteristics - New York, PC(1)C34NY. Therefore, the totals for unrelated individuals and families differ slightly; in this tabulation, we have used the figure of 986,566 unrelated individuals from the General Social and Economic Characteristics volume instead of the figure of 968,736 in PC2-93. The two sources have approximately the same figure for the number of families; the difference is only 338.

The number of unrelated individuals rose an average of about 15,000 per year during the sixties and by about 13,500 per year from 1970 to 1973, but this difference may not be significant. The recent decline in the number of families has been sharper; it averaged about 2,100 per year during the sixties and about 10,500 per year from 1970 to 1973.

The data on family size indicate some mixed trends in the period 1970-73. The increase in the number of two-person families continued the sixties' trend at an accelerated rate, and the decline in the number of three-person families also continued the sixties' trend and at a sharper rate. The number of four-person families, however, appears to have dropped by almost nine percent between 1960 and 1970 and risen again in 1973 to almost the 1960 level. In contrast, the number of five or more person families rose between 1960 and 1970 but dropped sharply thereafter. For the period 1960-1973 the percentage changes are as follows:

	<u>Percent Change</u> <u>1960-1973</u>
Total Population	- 0.8
<u>Unrelated Individuals</u>	<u>+23.7</u>
<u>Total Families</u>	<u>- 2.5</u>
2 Persons	+ 7.0
3 Persons	-15.3
4 Persons	- 0.4
5 Persons	- 1.5
6 or More Persons	-15.1

Ethnic Characteristics

The change in the ethnic distribution of the city's population evident during the 1950s and 1960s has continued into the 1970s:

- The number of whites excluding Hispanics has declined by 8.3 percent from 4.9 to 4.5 million persons. Comparable data are not available from the 1960 census, but it may be roughly estimated that during the sixties the city's population of whites excluding Hispanics dropped by about 900,000. The drop of 400,000 during the three years since the April 1970 census indicates some acceleration of the rate of loss.
- The number of Blacks and other non-whites increased by 5.6 percent, or by 104,000 persons.
- The number of Hispanics increased by 11.5 percent, or 128,000 persons. Within the Hispanic group of 1,241,200, roughly 73 percent are Puerto Ricans and 27 percent are other Hispanics. The "other Hispanics" are one of the most rapidly increasing groups in the city.

NEW YORK CITY POPULATION BY ETHNIC GROUP, 1970 AND 1973

	<u>April 1970</u>		<u>March 1973*</u>		<u>Pct. Change 1970-73</u>
	<u>No.</u>	<u>Pct.</u>	<u>No.</u>	<u>Pct.</u>	
White (excluding Hispanic)	4,935,973	62.5	4,525,600	56.8	- 8.3
Non-White	1,846,021	23.4	1,950,200	25.3	+ 5.6
Hispanic	1,112,868	14.1	1,241,200	16.1	+11.5
Total	7,894,862	100.0	7,717,000	100.0	- 2.3

*The ethnic distribution of the institutional population of 69,000 persons is not available from the CPS data. In this tabulation, it was assumed that the ethnic distribution of the institutional population was the same as it was in the 1970 decennial census.

Median Income

Before discussing trends in the income of New Yorkers, it is necessary to point out that (1) all income data obtained from surveys tend to underestimate income, particularly at the lower and upper ends of the income scale; while the median is less affected than the extremes of the income distribution, it too reflects the tendency to underestimate, and (2) the estimate of median income of families of two or more persons in New York in 1969 obtained from the April 1970 decennial census was significantly higher than was obtained from the CPS data for the city for the same year; the figures were \$9,682 and \$8,917 respectively in 1969 dollars, about a seven percent difference. The reasons for the difference are not yet clearly understood, nor is the issue of which is the more accurate yet settled. In any event, for purposes of describing recent trends in median income in New York City, we rely on comparable data from the CPS for the three years for which it is available to us, that is, 1969, 1970, and 1972.

The impact of the 1970-71 recession, which in New York City lasted well into 1972, is clearly evident from the data presented below. Median income in current dollars rose by 11.1 percent between 1969 and 1970 but only by another 1.4 percentage points from 1970 to 1972. More significant is the comparison in constant dollars, in other words in real income. While real median income rose by 3.8 percent between 1969 and 1970, from 1969 to 1972 for all families combined, it declined by five percent; Blacks and other non-whites were particularly hard hit as their median income declined by 8.3 percent.*

White (including Hispanic)	\$11,267	\$11,592	\$10,932	+ 2.9	- 3.0
Non-White	\$ 8,137	\$ 8,950	\$ 7,464	+10.0	- 8.3
Total	\$10,567	\$10,965	\$10,039	+ 3.8	- 5.0

*It should be noted that the standard error of the median for all families is \$200; for whites, including Hispanics, it is \$270; and for non-whites it is \$350.

A decline in real income of Blacks between 1969 and 1972 occurred in all central cities with a population of a million or more, but the decline in New York City was slightly larger. For all central cities it amounted to 7.0 percent as compared with 8.3 percent in New York.

The contrast between New York and other central cities over one million population is even more marked for families in all ethnic groups combined -- in New York the decline in real median income was 5.0 percent and in all central cities it was 1.5 percent. This may be the result of a number of factors -- a more rapid increase in New York than in other central cities in the proportion of Black and Hispanic families whose incomes are below the average for whites, the relative increase in the proportion of two-person families which, on average, have lower incomes than larger families, and the relatively slower rate of recovery in New York from the 1970-1971 recession. In this connection, it may be noted that 1972 marked the peak in the welfare caseload in New York City; the numbers on welfare began to decline only in October 1972.

APPENDIX ON STANDARD ERRORS

The explanatory memorandum and tables on standard errors included in this Appendix were prepared by the Statistical Methods Division for the Demographic Surveys Division, Bureau of the Census, U.S. Department of Commerce.

The four tables on standard errors apply to the data presented in this volume for New York City as well as to CPS data published by the Census Bureau for the New York Standard Metropolitan Statistical Area.

ESTIMATED STANDARD ERRORS FOR SPECIAL TABULATIONS
FOR NEW YORK STANDARD METROPOLITAN STATISTICAL AREA

This memorandum provides information on the reliability of data from a CPS supplement, tabulated for New York.

The attached tables contain standard errors appropriate for estimates for the New York standard metropolitan statistical area based on tabulations for a single month's CPS data. For estimates pertaining to non-white characteristics, the standard errors contained in the attached tables should be multiplied by 1.5.

The standard errors as calculated partially measure the random response and enumeration errors as well as sampling variability, but they do not measure any systematic enumerator errors or systematic biases in the data. A number of approximations were required in arriving at the standard errors and the tables should be considered to provide a rough approximation rather than a precise standard error for any specific item.

Tables 1 and 2 of this attachment should be used for estimates of number of persons and of number of households, respectively. Tables 3 and 4 of this attachment should be for estimates of percent of persons and of percent of households, respectively.

Some characteristics, though involving numbers of persons rather than households, are such that no more than one person per household will generally have the characteristic (e.g., number of women who are heads of households). For these characteristics, Tables 2 and 4 should be used.

TABLE 1
 STANDARD ERRORS OF ESTIMATED NUMBERS OF PERSONS
 (Ratio-Estimated Data)
 (68 Chances out of 100)

<u>Size of Estimate</u>	<u>Standard Error</u>	<u>Size of Estimate</u>	<u>Standard Error</u>
1,000	1,400	100,000	14,100
