ABSTRACT

As a means of evaluating its nursing curriculum, the Los Angeles Community College District conducted a follow-up survey of 111 nursing graduates: 33 White graduates of Los Angeles Pierce College; 17 Black graduates of Los Angeles Southwest College; 27 Hispanic graduates of East Los Angeles College; 19 Asian/Pacific Islander graduates of Los Angeles City Colleges; and a multi-ethnic group of 15 graduates from Los Angeles Valley College. The survey instrument solicited information concerning: (1) the usefulness and students' use of tutoring, the value of repetition of course content, and the adequacy of instruction in each specialized area of nursing; (2) the value of various educational experiences in preparing students to take the State Board examinations; (3) the perceived strengths or weaknesses of the college program with respect to a variety of clinical experiences, hospital training, and review courses; and (4) personal information, such as age, year of graduation, continuing education activities, and number of hours working while in school. Selected findings reveal that 65% of the respondents worked while in college and that approximately 20% had used college tutoring services. The graduates felt that more clinical experience should have been provided and that they were least prepared for the psychiatric nursing component of the board examination. The study report tabulates findings by college. (JP)

### PURPOSE OF THE STUDY

In conjunction with a project, "Health Occupations In-Service Education", directed by Linda Friedrich of the LACC Nursing Faculty, the Research Office was asked to assist in the development and analysis of a questionnaire to be sent to recent Nursing graduates of five District colleges, each college sample to consist of a specific ethnic group. The purpose of the project was "to examine the relevance of current educational curriculum and practices to industry demands". This study analyzes the responses to the questionnaire sent to the graduates.

### PROCEDURE OF THE STUDY

The questionnaire was designed to provide information concerning:

- (1) Current specialty practices in each field of expertise
- (2) The relevancy of the educational preparation as it relates to on-the-job demands.
- (3) Perceived strengths and weaknesses of the specific college educational program.

The instrument was to be mailed by each of the five colleges to thirty recent graduates. Completed questionnaires were furnished to the LACC Research Office and analyzed as indicated in the following section.

### FINDINGS

The following Table 1 shows the participating colleges, the ethnic group targeted, and the number of completed questionnaires received.

TABLE 1 - Distribution of Responses

<u>College</u>	<u>Ethnic Group</u>	<u>No. Responding</u>
(P) Pierce	Anglo	33
(S) Southwest	Black	17
(V) Valley	Multi-ethnic	15
(E) East L.A.	Hispanic	27
(C) LACC	Asian/Pacific	19
	(T) Total	111

The following tables summarize responses of each of these five groups (and the total) to the questions asked.

TABLE 2 - Number of hours per week worked for pay while a student

<u>No. of hours</u>	<u>P</u>	<u>S</u>	<u>V</u>	<u>E</u>	<u>C</u>	<u>Total</u>

#### SUMMARY AND CONCLUSIONS

This study summarizes responses to a survey of recent Nursing graduates in five district colleges, each college group to represent a specific ethnic background (with one exception, Valley College, where it was decided to have a multi-ethnic group). Responses were received from 111 students, as follows: Pierce (Anglo) - 33, Southwest (Black) - 17, Valley (Multi-ethnic) - 15, East L.A. (Hispanic) - 27, and L.A.C.C. (Asian/Pacific) - 19.

Following are some observations on the findings:

- (1) 65% of the students indicated they worked while attending college. Highest % working were LACC and East L.A.; lowest Southwest.
- (2) Median age of respondents (presumably at time of responding) was 31; lowest median age was at East L.A. and LACC, highest at Pierce.
- (3) One third of the respondents graduated in 1980 (100% at Vall. ); Pierce and Southwest respondents' graduation dates went as far back as 1972, East L.A. and LACC to 1976.
- (4) About one in five students (most at Valley, none at Pierce) used tutoring services. Most of those tutored felt that they were helped, especially in mathematics.
- (5) Students from all five colleges agreed that repetition of topics in more than one class is necessary in all the Nursing areas, especially in Medical-Surgical Nursing.

- (6) When asked to evaluate types of learning experiences, students rated study of textbooks, classroom lecture and discussion, clinical experiences, and review of classroom notes as most useful. Least useful were field trips, general education courses and contacts with hospital personnel.
- (7) When asked concerning their feelings about sections of the State Boards, students indicated they felt strongest in Medical-Surgical Nursing, weakest in Psychiatric Nursing, although response differences were not great.
- (8) Students felt strongly (especially at East L.A. and LACC) that more clinical time at the hospital was needed.
- (9) When asked to offer written comments or suggestions for program improvement, slightly over half did so. Nine of ten LACC students responded to this invitation, only one in eight from Southwest. In their comments, students reaffirmed the need for more clinical time and offered some recommendations for classroom instruction improvement. These recommendations generally called for more lectures, less audio-visual, more on team leading, and improvement of presentations on Psychiatric Nursing.
- (10) Slightly less than half the respondents are now pursuing higher education. Most "continuing education" was "inservice" training, mainly in the areas of medical and surgical nursing.
