#### ABSTRACT

This study sought to identify the areas of most critical concern for curriculum emphasis for a department of wildlife science. The questionnaire was developed from existing documents and modified by a committee. Included in the sample were college seniors, graiuates, employers, and faculty members. An overall rate of return of 65% (141 usable questionnaires) was achieved. There was considerable agreement among the various groups. The single item ranked as most critical was knowledge of political obstacles to the implementation of sound resource programs. The second was ability to deal with cost considerations (economics) of wildlife problems. Thinking and problem solving skills also received high priority. These items indicate a need for new social and thinking skills, rather than a continuation of a traditional wildlife education program. (RE)

#### ABSTRACT

This study seeks to identify the areas of most critical concern for curriculum emphasis for the Department of Wildlife Science. It does not purport to provide specific solutions or final answers; rather, it should serve as a basis for analysis and planning.....

The questionnaire was developed from existing documents, and after being revised by a committee of five department members, was pilot tested and sent out to Wildlife Professionals. Four groups were included--graduates of the department since 1970, seniors who graduated in June 1975, employers and faculty members. An overall rate of return of 65 percent(141 usable questionnaires) was achieved......

Most conclusions were made by subtracting the "Present Performance" scale score from the "Future Importance" scale score to obtain a "Difference Score". (see sample questionnaire in Appendix A.) The larger the difference, the more critical the need.....

Thinking skills such as (1) critical thinking and the use of judgment, (2) planning and forecasting future trends, (3) independent thinking for creative solutions; and (4) systematic problem solving from an environmental perspective were cited as critical by virtually all groups. A final area of agreement involved energy and its impact on the environment.....

There was consensus on low criticality for skill in managing populations for sport hunting and sport fishing, the more traditional gims in Wildlife Science.....

A second analysis using rankings on performance and importance only - and not Difference - found similar results for the most critical items, with the exception of the economics concern and two of the thinking skills......

• These items of concensus appear to be interrelated and to indicate that rapid changes in the field require new social and thinking skills, rather than a continuation . of a traditional wildlife education.....

FOREWORD

The use of survey techniques to gather data on the educational needs of students, while not new, is fairly rare in higher education settings. This study aims at identifying needs for undergraduate students in the Department of Wildlife Science at Utah State University. It is similar in intent to an assessment conducted and published for the U.S.U. Department of Civil and Environmental Engineering. The aim is the . same in both studies: to identify those needs which are most critical, and thereby to provide guidance for the design of programs. The aim is not to specify immediate solutions to these problems, something which can come only after careful analysis and planning have taken place; but ito specify thich problems.are most deserving of resolution.

The study has been made possible by funding under a grant from the fund for the Improvement of Post-Secondary Education (OEG-0-74-8677) to conduct instructional development at the university department level. Particular thanks are due to the members of the Wildlife Science Department for their quality assurance role, specifically Drs. Bill Helm, George Innis, John Kadlec (Dept. Head), Allen Stokes, and Fred Wagner. In addition, appreciation is expressed to Drs. John Hunt, Jim Kennedy, and Richard Schreyer of the Department of Forestry for assistance in locating previously conducted research for the College.

While the conclusions expressed herein are necessarily those of the researcher, it is hoped that others will examine the data and draw additional conclusions. This document is presented as a springboard for discussion. It will succeed to the extent that planning to meet the future needs of the Wildlife Science Department takes place.

#### I. INTRODUCTION

"Tomorrow's resource graduate can no longer be taught to " seek the one best solution based on traditional assumptions. Tomorrow's resource manager will be playing chess, not checkers. Each decision will affect other decisions. There will not be one best move to discover, but a range of moves whose implica- 1 tion will only be understood in terms of future possible moves."

Education in the field of Wildlife Science is currently approaching a crossroads. In view of widespread environmental concern from all sectors of society, the traditional training for a role in fish and game management is seen by many as inadequate for the demands of jobs which most graduates in the field will take. New skills, attitudes and redirected training will be required to deal with conflicting demands of various interest groups. The most conservative view of the future would suggest that more such competencies will be required for tomorrow's graduate.

This research aims at documenting the most critical needs for graduates in the field. For the purposes of this study, "need" is defined as the discrepency between "what is" and "what should be". The focus was deliberately extended to deal with the future, as seen by 141 persons associated with the U.S.U. Wildlife Science Department, i.e. graduates, employers, senior students and faculty. The study is meant to serve as a basis for discussion and planning, not as the final word.

Predictions for the future are notorious for their inability to deal with unforeseen contingencies. For example, a number of predictions made as recently as five years ago made no provision for the energy shortage, casting doubt upon the accuracy of their far ranging conclusions.

1. Carl H. Reidel, "Education for Integrated Resource Management", paper presented to the Forest Curriculum Development Project, Estes Park, Colorado, November 15, 1972, p. 11.

2. David R. Francis, "Tomorrow's Bright Future Turns to Gloom," The Christian Science Monitor, June 9, 1975, p. 21.

While the present research was conducted with an eye toward the future, no delusions are held about respondent's predictions as being anything more than projections based upon present trends. To some extent, the use of a future-oriented questionnaire serves as a means to an end, a technique to stretch the imaginations of participants to take an, expanded, long-range view of wildlife problems.

2

#### II. PROCEDURES

Preliminary steps in the conducting of the needs assessment study began with the formation of a Quality Assurance Committee in May, 1975. The immediate task for this group was to develop a survey plan and to provide a sounding board for development of a questionnaire. Some preliminary decisions made by this group were: (1) the questionnaire' should attempt to probe the views of the future held by respondents; (2) the focus should be on undergraduate, rather than graduate education; and, (3) in formatting the questionnaire, the two responses for each question, "actual performance" and "future importance" should be separated. (see sample Questionnaire in Appendix A).

#### Developing the Questionnaire

A list of likely concerns was identified from existing documents in the department particularly the statements on graduate and undergraduate education (April 1975) by the department and from previous needs assessments conducted at U.S.U. as well as other institutions. In addition, the Committee helped to generate some additional concerns specific to the Wildlife field. An item pool of over 80 items was developed, and from these a selection for the pilot instrument was made.

Pilot Testing and Use

After several revisions in format as well as content, a pilot test instrument consisting of 54 questions was sent to 33 persons. Telephone interviews with respondents to the questionnaire suggested several alterations' which reduced the number of questions to 45 and brought the length down to five pages.

The four groups for sampling and the number of questionnaires sent . out were as follows:

- (1) all sentor students from the previous year (graduated
  - June, 1975) -- 78
  - 2) graduates (since 1970) who had responded to a short "employment questionnaire from the College of Natural
    - Resources. -- 51
- (3) employers of U.S.U. graduates, identified by job title throughout the U.S. -- 75
- (4) faculty members attending the departmental retreat. --14

To some extent, a built-in source of bias existed for graduates, since current addresses were available only for those responding to the previous questionnaire. The revised questionnaires were mailed in mid-July to all groups but faculty, with a follow-up letter on August 6th. Polling of faculty opinion took place at the departmental retreat, September 4th and 5th, where faculty members completed 14 questionnaires. Following the tabulation of results, there was considerable discussion of the preliminary results from all groups.

Considerations of Reliability

The questionnaire, shown in Appendix A, is essentially a selfreport instrument. Techniques for assessing reliability using an internal consistency method (e.g. split-halves or Kuder-Richardson formula) are clearly inappropriaté, since each item must be dealt with separately. In order to assess the reliability of the instrument, three persons involved in the pilot sample were asked to fill out a second questionnaire. Correlating their responses for both times of taking the questionnaire,

### **\ TABLE. 1**:

Reliabilities for Three Persons on Present Performance" and "Future Importance" Scales of the Questionnaire

	P	resent Perf	ormance	Future Importance	Difference (I-P)
Subject #1		.67	• • • •	- 53	75
Subject #2	•	.27	۰ ۱	71	.46 .
Subject #3		.61	:	.66	<u>.64</u>
Average (Mea	n) Reliabilit	у <b>.</b> .52	r	.64 🐒	.61

With the exception of one person (Subject #2) on the Present Performance scale and consequently the Difference statistic, the reliabilities are consistently above, 50, which would generally be acceptable for an attitudinal instrument. Conclusions about one scale being more reliable than the others would be presumptious using these data, due to the small sample size. (3 people) It is of interest to note that the Difference statistic appears to be at least as reliable as either of the other two scales,

13. -

#### PÓSSIBLE BIAS FROM NON-RESPONDENTS

In any study of a survey nature, some portion of ersons will not respond; for one reason or another. The researcher its then left with the problem of determining to what extent the sample obtained is representative. At least three strategies are employed by researchers to handle this question:

(1) The researcher can continue to send letters and make telephone
calls until virtually all questionnaires have been obtained.
(2) if the proportion of nonrespondents is considerable, (Borg and Gall suggest 20% or more), it may be advisable to conduct interviews of a sample of non-respondents, to establish a similar response pattern; and
(3) on the basis of significant demographic characteristics available, the researcher may obtain an estimate of the representativeness of the sample.

For this study, the third approach has been taken, i.e., using . demographic characteristics to establish representativeness. Two separate analyses were conducted, one for all three groups based upon geographic status and a second one for graduates only, based upon their employment or non-employment in the Wildlife field. In both cases, a Chi Square test was used, and in neither instance was the group of non-respondents shown to be significantly different from those responding to the questionnaire. From this evidence as well as the fairly substantial overall response rate to the questionnaire (65%) one can conclude that major bigs from inon-respondents is unlikely.

#### III. RESULTS

"The professional wildlife manager frequently finds himself in the center of new, sometimes explosive issues and debates... As his professional career expands, he must deal increasingly with social forces and therefore must be aware of new public stitudes, community interests and political pressures. "1

Before dealing extensively with the questionnaire results, it is useful to examine certain demographic characteristics of respondents.

Rate of Response

returned.

The overall rate of response to the questionnaire was 65 percent. Table 2 below summarizes the numbers of questionnaires sent out and

TABLE 2:

Number of Responses Received From Questionnaires Mailed

Group .	· ·	Sent Out	Number Returned	Percent
Graduates (Since 1970)		<b>X</b> 8	<b>5</b> 6	76%
Seniors (Graduates June 1975)		51	25	49%
Employers		75	un 146 .	61%
Faculty	•	<u>14</u>	<u> </u>	" <u>100</u> "
Total		218	141	65%

Highest response came from graduates (72%) and employers (61%). Last year's seniors were somewhat lower, with a return rate of 40 percent.

John L. George, Samuel S. Dubin, and Benjamin M. Nead, "Continuing Education Needs of Wildlife and Fisheries Managers," <u>Wildlife</u> Society Bulletin, Yol. 2, No. 2, Summer, 1974

15

ERIC.

To some extent, the contrasting return rate for other graduates and seniors may be a function of the accuracy of the current address available.

## Geographic Distribution of Respondents

The geographical distribution of returns for the mailed questionnaire is shown in Table 3. The largest percentages of respondents are located in the seven Mountain States (25%), Utah (19) and the three West Coast States (15%). An analysis was done to see if the response rate to the questionnaire varied significantly by region. While the results did not reach statistical significance, there was an unexpectedly larger portion of non-respondents from Utah than from areas outside Utah.

#### Future Orientation

Respondents' projections of the future are of interest, but are probably of peripheral importance for development of curriculum. This item served as a means to an end, namely getting respondents to consider the future in their deliberations of what skills, attitudes and competencies would be important for students.

Table 4 displays the distribution of responses by group. Scenario A is meant to be a somewhat pessimistic view of the future; Scenario B is meant to be fairly neutral; and Scenario C fairly optimistic. Two positions midway between the three scenarios, items D and E, were inserted

#### TABLE 4: FUTURE ORIENTATION

A. Large numbers of people inhabit all nations in situations ranging from moderate oyercrowding to chaotic overpopulation. Industrial producation has declined due to lack of resources, and hunger is the common denominator of mankind. Pollution has made many environments extremely unhealthy.

D. Position between A and B

Population growth Β. strains the resources of many, underdeveloped countries, while developed countries grow richer. Some forms of pollution have been eradicated, but environmental strain continues. International efforts at cooperation have had some success, although many forms of wildlife are extinct or endangered.

E. Position between B and C

C. New technology has allowed production worldwide to more than keep pace with population expansion. A rapidly rising standard of living, a strong concern for environmentally-sound solutions to problems, and a cooperation among nations characterize the world situation.

None of the above (or no response)

Total

ERIC

to lessen the discomfort of being forced to take an extreme position, but still allow respondents to indicate a direction of their view.

All groups tended to respond more toward the "pessimistic", rather than the "optimistic" end of the scale. Graduates and professors responded most frequently in the mildly pessimistic category (D), while seniors and employers tended to favor the more neutral position (B). It is of interest to note how few (overall, 8 percent) responded in the strong pessimistic or strong optimistic positions (A or C). As expected, there seems to be a cautious "wait and see" attitude, rather than much certainty about the future. Evidence from telephone interviews with the pilot sample respondents indicated that respondents kept these predictions in mind while completing the rest of the questionnaire.

# Interpreting the Difference Statistic.

As stated earlier, a need has been defined as the discrepancy between "what is" and "what should be." To measure this difference on items in the questionnaire, a difference score was computed between the "Future Importance (I)" of an item and the "Present Performance (P)" as rated by the respondent. The size of this difference indicated the "criticality" of the need. If the respondent left either "Present Performance", or "Future Importance" blank, or marked "Don't Know," his rating of the item was not included in the calculation of Difference (I-P). In some cases, particularly with employers, there was reluctance to rate the department's present performance, and the "Don't Know" column was marked extensively. In cases where the number of usable responses

was less than 50 percent of the total group, that item has arbitrarily been marked with a dash following the number.

For the interpretation of this Difference or "Criticality Index", consider three examples. The first and most frequently encountered is the case where the "Future Importance" is perceived as <u>greater than</u> the "Present Performance". The size of the difference could be seen as an indication of the need: the larger the difference, the more critical the need. Another example results when the "Present Performance" is roughly <u>equivalent</u> to the "Future Importance". This could occur where both Present Performance and Future Importance are either high or low, and would indicate minimal attention to this need is warranted now. A final example, somewhat rare, occurs when the rating for "Present Performance" exceeds that for "Future Importance." In this case, the Difference is negative and would be interpreted as saying that too much emphasis is being placed on that area in the curriculum at present, that a student's time could probably be spent more profitably in other

#### Items Cited as Most Critical By All Groups

wavs.

A number of items were viewed as critical by all, or almost all groups. All items will be discussed in more detail in the following sections, by category, but this section examines the ones with considerable agreement in ranking high or low.

Table 5 allows a quick look at the items cited as most and least critical by the four groups polled. The total, cited last, is a numerical averaging of all responses, regardless of group.

for sport hunting

<sup>15</sup> 23

Figures 1 and 2 show these same findings (for higher ranked items) in graphic form, for each of the groups polled.

Clearly, the most critical need as identified by all respondent groups is "Knowledge of political obstacles to the implementation of sound resource programs." It is ranked either first or second in criticality by all groups.

The second item seen as most critical is "Ability to deal with cost considerations (economics) of wildlife problems." It is canked first by seniors, second by graduates, sixth by employers, and twelfth by faculty. In some ways the concern with economic considerations is a parallel to the political concern discussed above.

Next in criticality are a series of four thinking skills which are ranked as high in criticality by all groups. These concerns are as follows: (1) Skill in critical thinking and use of judgment; (2) Skill in planning and forecasting future trends; (3) The ability to think independently and to arrive at creative solutions to problems; and (4) Ability to solve problems systematically from a broad environmental perspective. While the exact ranking of these four concerns varies by group, it is noteworthy that of the top ten items ranked by each group,

faculty and employers include all four of these skills. graduates and seniors include three. There is a reasonable concensus on the discrepancy between present performance and future importance of these thinking skills.

Essentially, respondents seem to be saying that these thinking skills are vitally important ant that present educational programs are not providing these crucial skills.

24

A concern with energy and its impact on the environment is demonstrated by three of the four groups ranking this item in the top ten in criticality.

A final note of consensus should be made for the extremely low rankings in criticality given to the two questions involving skill in managing populations for sport hunting and sport fishing. The item for - sport hunting was ranked lowest by graduates, employers, and seniors and next to lowest by faculty. The item involving sport fishing was ranked slightly higher for each of the groups. For each of the groups, these items were ranked in the lowest three. All groups polled seemed to be saying that training for the traditional fish and game roles involving sport hunting and sport fishing receive too much emphasis. There is remarkable consensus on this point.

#### An Alternative Ranking Interpretation

The foregoing analysis represents one method of analyzing the needs assessment questionnaire. An alternative approach, based on performance and importance ranking only--and not the difference (I-P)-offers additional explanatory power.

The procedures for analyzing the data were fairly straightforward. First, ranking for each of the forty-five items was done separately using group (and total) means on "Actual Performance" and "Future Importance". Then, arbitrarily, a cutoff point of the highest ten and the lowest six items was chosen. Each item which fell into these highest and lowest item categories for any of the four groups was tabulated, and the results are shown in the following three tables.

± |

Table 6 shows those items ranked by any of the four groups (or in , the "Total" ranking) in the top ten or bottom six. The first column gives the question number; the next column gives the number of times this concern appeared for the four groups plus the total group.

Table 7 is handled in similar fashion, in this case with "Actual 'Performance".

Table 8 combines the results of the two previous tables by showing those items which appeared in two or more of the categories.

Of particular interest are the items which appear high in importance but which are ranked low in performance. By inference, these four items point directly to portions of the undergraduate Wildlife curriculum which ought to be improved. Another set of items which suggest program changes are those six items ranked high in performance but low in. importance. The inference is that too much emphasis is being placed on these concerns relative to their importance.

#### Comparison of the Two Approaches

The results of the two separate analyses are quite similar. The six items identified in the second ranking procedure as being high in performance but low in importance are all found in the top ten items for the total ranking by the difference. Similarly, the two concerns dealing with managing fish and game populations for sport fishing and sport hunting show up high in performance but low in importance. Many other similarities are notable. Perhaps of more concern would be an explanation of the discrepancies between the two analyses.

For example, why does the concern about cost considerations (economics) not show up in the second ranking analysis? The answer is simply that

no group cited this concern as extremely high in importance, while virtually all are extremely low in performance. Rather, the rankings in importance range from eighteen to thirty, considerably outside the range for inclusion in Importance (top ten). It is included in the very bottom rankings on Performance, from forty-second to forty-fifth place. A similar rational could be cited for the inclusion or exclusion of each of the other items where disparities in the analyses are apparent. Each form of analysis has its advantages as well as its drawbacks. The ranking by Difference (I-P) emphasizes the numerical discrepancy between Importance and Performance ratings, regardless of relative standing on the Importance or Performance scales. The alternative ranking procedure deals only with extreme rankings for the groups (high and low) and may be strongly affected if differences across groups are major ones. The reader is invited to examine the varying lists of priority items and to note the findings of both approaches. Each analysis offers a form of simplifying the complexity of the data and highlights certain items of priority. The aim, besides promoting discussion, is to find areas where the analyses compliment each other. As noted above, these areas are many.

#### An Item Analysis by Groups

The reader is invited to examine each item's ranking in the following sections. Items are grouped in the same logical category as were used in the questionnaire, as follows:

Section 1: Technical knowledge and skills.(Items 1-16)Section 2: Thinking Skills(Items 17-23)Section 3: Communication Skills.(Items 24-29)Section 4: Attitude and Motivation(Items 30-40)Section 5: Background and Breadth.(Items 41-45)

For each item, rankings are given for "Present Performance," "Future Importance", and "Difference (I-P)". As described above, the "Difference" ranking has been used most extensively in drawing conclusions. In each section, items are presented in order of their criticality (Difference) ranking, with most critical items listed first, etc.

Because a difference score was computed only when both "Present Performance" and "Future Importance" were marked, the number of difference scores indicates all who responded to both scales for a particular question. When fewer than 50% answered, the number is followed by a dash:(-).

<sup>23</sup> 31

#### An Item Analysis by Groups

The reader is invited to examine each item's ranking in the following a sections. Items are grouped in the same logical category as were used in the questionnaire, as follows:

Section 1: Technical knowledge and skills.(Items 1-16)Section 2: Thinking Skills(Items 17-23)Section 3: Communication Skills.(Items 24-29)Section 4: Attitude and Motivation(Items 30-40)Section 5: Background and Breadth.(Items 41-45)

For each item, rankings are given for "Present Performance," "Future Importance", and "Difference (I+P)". As described above, the "Difference" ranking has been used most extensively in drawing conclusions. In each section, items are presented in order of their criticality (Difference) ranking, with most critical items listed first, etc.

Because a difference score was computed only when both "Present Performance" and "Future Importance" were marked, the number of difference scores indicates all who responded to both scales for a particular question. When fewer than 50% answered, the number is followed by a dash:(-).

# Areas of Agreement and Controversy

As would be expected when sampling opinion on any question, some areas of agreement are readily apparent while others are not. By examining the size of the standard deviation for a particular item, a relative measure of the dispersion of responses — or degree of agreement or disagreement may be obtained. A complete listing of items and their standard deviations is given in Appendix C. Also included are two columns showing items with • highest and lowest levels of agreement on Performance, Importance and Difference (I-P).

One cautionary note should be added, however, in interpreting the standard deviation or the variance statistic. That is the question of whether the disagreement occurs between groups, say between seniors and employers, or across all respondents, on a generally controversial item. This analysis of standard deviations does not make that distinction and thus contains elements of both sources of variation.

Certain items from previous analyses stand out as showing fairly high agreement. Item #1, "knowledge of total ecosystem planning" shows high agreement on Importance, Performance, and Difference. Substantial agreement exists upon the importance of item #8, "Knowledge of political obstacles to the implementation of sound resource programs, "although there is somewhat less agreement as to the present performance of the department. Items 18, 19, and 20 -- dealing with systematic problem solving, creative and critical thinking -- show considerable agreement on importance, but less in the rating of present performance. Substantial agreement occurs for item 24, "ability to communicate with those in other disciplines".

<sup>38</sup> 46

Certain items show considerable disagreement, most of which appear to be controversial current topics. For example, respondents disagree on the importance of "skill in managing game populations for food production" and "a commitment to retaining public ownership of wildlife found on private lands." Where there was considerable agreement as to a "knowledge of political obstacles," there is considerable disagreement as to the need for "attitudes of political activism,"..."personal convictions to implement change." But the concern for a " social conscience," working for society's improvement, shows high agreement in the difference statistic. What this may reflect is a fairly widespread suspicion of politics and activism, but a recognition of the need for political awareness and socially oriented motives IV. CONCLUSIONS

This report summarizes the results of a survey of 141 persons for the Wildlife Science Department at Utah State University. These people, sampled from four groups, returned questionnaires as follows: Graduates of the department since 1970 - 56 Seniors-graduating June 1975 - 25 Employers of Wild life graduates - 46 Faculty, Department of Wildlife Science - 14

The overall return rate of 65 percent of questionnaires, after six weeks and one follow-up letter, would seem to indicate considerable interest on the part of those completing the questionnaire. In their written comments (included in Appendix B), a number of persons state that this type of study was important at this time.

The returned questionnaires give a profile of geographic location of graduates and others involved in Wildlife work, as well as some insight into prevailing attitudes toward the future. Based upon a comparison of demographic characteristics of respondents and non-respondents, the bias from non-respondents was felt to be minimal. Most respondents took a slightly pessimistic view of future trends in population, resources, levels of pollution. These findings of demographic characteristics and future the bias from are of interest, but are not of central importance to this study.

What is important from this survey, in view of the undergraduate curriculum in the Department of Wildlife Science, is the pattern of similar responses across groups on a number of concerns. All groups gave "knowledge of political obstacles to the implementation of sound resource programs" as

a most critical concern. The "ability to deal with cost considerations (economics) of wildlife problems" was listed as a close second in order of criticality, although in a second analysis based upon top and bottom rankings, this concern did not emerge. Aside from these two concerns, four items involving thinking skills were ranked as critical by the various groups. These skills include critical thinking and the use of judgment, independent thinking and creative solutions to problems, planning and forecasting future trends, and systematic problem solving from an environmental perspective. The last two of these thinking skills were confirmed in the second analysis, while the other two were omitted. The concern with energy and its impact upon the ecosystem was found critical in both analyses. Two items which were <u>not</u> viewed as critical at this time in either analysis were skill's in managing fish and game populations for sport fishing and sport hunting.

What these groups seem to be saying quite clearly is that the field of Wildlife Science has been changing rapidly. The traditional emphasis upon fish and game training for sport fishing and sport hunting are no longer adequate for the work by most professionals in the field.-With the increasing environmental concern on the part of numerous organizations, the ability to deal realistically with political pressures and cost considerations are crucial for tomorrow's wildlife graduate. Skills in planning and analysis, independent thinking, creativity and use of judgment in decision-making are critical for undergraduate education. These findings of the most critical concerns appear to be interrelated and to provide some definite directions for undergraduate curriculum revision. The implementation of change will require imagination and, ironically, a number of the same social and thinking skills identified in the survey. Clearly, a degree of agreement exists across groups which can open the way for curriculum redirection at this time.

Department Wildlife Science 752-4100 EXT. 7928

The Department of Wildlife Science needs your help. We live in a rapidly changing world and our Department must change to keep pace. We need your input to determine the kinds of changes which should be made.

The undergraduate curriculum is of particular concern. Most of you are familiar with at least the broad outlines of the course sequence. At present, undergraduates take courses designed to provide a background in basic science as well as an understanding of ecology, biology, and communications. A terrestrial or an aquatic course sequence option rounds out the curriculum.

Two questions are important to our deliberations: 1) Is the curriculum adequate for today's world?, and 2) How important will various skills and knowledge be for graduates of the future? For this, we'd like to draw on your experience and perspective for guidance.

Please fill out the questionnaire today and mail it in the enclosed envelope. To be included, we need to receive your response by <u>August 15</u>. Your response is important, and a prompt reply will be most helpful to us.

Sincerely,

1 Lacloc Ann A. Kadlec

Professor and Department Head

#### DEPARTMENT OF WILDLIFE SCIENCE UTAH STATE UNIVERSITY

# Future Oriented Questionnaire: An Exercise In Alternative Futures

The following statements describe alternative future views (1985-2000) of the world in which we live. As you read these, check the one with which you identify most closely.

A.- Large numbers of people inhabit all nations in situations ranging from moderate overcrowding to chaotic overpopulation. Industrial production has declined due to lack of resources, and hunger is the common denominator of mankind. Pollution has made many environments. extremely unhealthy.

B. Population growth strains the resources of many underdeveloped countries, while developed countries grow richer. Some forms of pollution have been eradicated, but environmental strain continues. International efforts at cooperation have had some success, although many forms of wildlife are extinct or endangered.

C. New technology has allowed production worldwide to more than keep pace with population expression. A rapidly rising standard of living, a strong concern for environmentally-sound solutions to problems, and a cooperation among nations characterize the world situation.

D. A position between A and B above.

E. A position between Boand C above.

<u>Directions</u>: In light of your projections for the future, respond to each of the concerns listed below by following the directions for the left and the right columns.

Example: Question No. 1 should read, starting in the left column:

"Rate the <u>present performance</u> of the Department of Wildlife Science in providing students with . . . knowledge of total ecosystem planning" (on the scale of "successful" to "unsuccessful").

Then, reading in the right column:

"Evaluate the <u>importance</u> of this concern for future resource management' (on the scale of "important" to "unimportant").

Your careful consideration of each item is appreciated.

Department Wildlife Science 752-4100 EXT. 7928

Dear Sir:

JAK:cg

A short time ago we sent you a questionnaire which was designed to help us do a better job of establishing the goals and priorities for our curriculum. Your input to this survey is very important if the survey is to be really valid.

This letter is to thank you for the time and interest you have already invested if your return has been sent; and if it hasn't yet, to encourage you to do so as soon as possible. If for some reason the questionnaire did not reach you, we will mail another upon request.

Again we express our appreciation for your willingness to participate in this study.

Sincerely,

A-8

a Kadler

John A. Kadlec Professor and Department Head
