DEVELOPMENTAL PURPOSES OF COMMERCIAL GAMES

Fun, it is generally agreed, is the primary purpose of most recreational games found in toy and department stores today. What many buyers, particularly those working in recreation/therapeutic recreation settings with ill or handicapped individuals, do not realize, however, are the secondary benefits that can be derived from commercial games.

Commercial games can contribute to various aspects of the user's growth and development, including perceptual motor development, development of strength and agility, and enhancement of academic skills. Specific areas in which games have been known to have a positive effect are:

Associative Learning--the establishment of functional relationships between ideas, objects, or experiences. Matching games, such as lotto, encourage associative learning.

Auditory Memory--the ability to recall auditory stimuli correctly. Games that make a sound or come with a record may enhance auditory memory, if they require the player to remember a command or sound.

Eye-Hand Coordination--involves coordinating the functions of the eyes and hands in carrying out activities that use the hands. Target games, placement of playing pieces in precise locations, and even games involving bouncing, throwing, and catching balls require and can help develop eye hand coordination.

Fine and Gross Motor Control--developing ability to regulate actions of the small and large muscle groups. Games requiring precise movements and accuracy help to develop control of the fine and gross motor abilities. These include pick-up sticks (fine motor) and hula hoops (gross motor).

* Definitions of these terms were taken from Instructional Materials Thesaurus for Special Education, Third edition. Columbus, Ohio: National Center on Educational Media and Materials for the Handicapped, The Ohio State University (43210), 1976.

EC 110 248

Fine and Gross Motor Skills--the use of small and large muscle groups. Many games can contribute to development of fine and gross motor skills, such as badminton and pitch back games (gross motor) and jacks and erector games (fine motor).

Laterality--developing the internal awareness of sidedness (right and left). Simon Says-type games and any game that directs users to use a specific hand or side of the body can help develop awareness of laterality.

Tactile Discrimination--the skill to identify various shapes, textures, or forms when presented tactually. Most games designed for blind persons rely on shapes or textures to convey information, and these games can also help sighted users to better develop their sense of touch.

Visual Motor Integration--ability to associate, organize, and sequence visual input with eye, hand, and finger movements. As with eye hand coordination, precision games tend to enhance this ability.

Visual Discrimination--skill to identify and choose between shapes, forms, and patterns when presented visually. Jig saw puzzles and shape puzzles can help individuals develop visual discrimination skills.

Visual Imagery--process of evoking a visual image of an object. This is generally developed by games that require the player to think ahead to the consequences of his/her actions, or mentally picture the finished product (as in puzzles) to choose the right course of action.

Visual Tracking--the process of fixating on and following a visual pattern or the movement of an object through space. Catching and hitting games, such as lacrosse and ping pong typically develop this ability, as do drawing and tracing games.

Mathematics skills, social skills, expressive skills, and specific sports skills may also be enhanced by choice of appropriate games. Many times, when games are presented to individuals and groups in a fun context, the players do not even realize that they are developing new skills and abilities.

CHOOSING COMMERCIAL GAMES

There are no strict rules to follow in selecting commercial games that can enhance intellectual, social, physical, emotional, or perceptual development. Three general guidelines should always be considered when shopping for the right games for your program, however:

- .. The price is within your budget. \$3.95 might be too much for some; others have hundreds of dollars to work with.

The condition of the game is in accordance with its projected use. If lots of people, especially small children, will be using it, durability is a must; if elderly or visually impaired persons will be using it, print should be large and easy to read; when tots or motorically impaired individuals are in the program, large graspable pieces are necessary.

Purpose of the game is meaningful to and appropriate for individuals who will use it. Chronological age of users, not their mental age, should be the prime consideration in choosing games. It is not appropriate for mentally retarded adults to play children's games, when there are numerous adult games with simple rules and instruction. Skills of users must also be considered, so that games are chosen to help users develop or enhance needed abilities.

The table, target, manipulative, active, and creative games listed on the following pages represent only a very few commercial games with a purpose. These and similar items are available from local toy and department stores or, when a local supplier is not available, from the national manufacturer or distributor listed. In using this practical guide to commercial games with a purpose, realize that all prices quoted are approximate and may have changed since research was initially done. And--take a trip to your local toy store for many, many more excellent ideas.

TABLE GAMES

<u>ITEM</u>	<u>DISTRIBUTOR</u>	<u>DESCRIPTION</u>	<u>DEVELOPMENTAL PURPOSE</u>
Dutch ^o Shuffleboard	U. S. Games 1393 Cypress Ave. Melbourne, FL 32935 \$63.00	Table-top shuffleboard game for 2-4. players.	Eye hand coordination; addition; visual motor integration; (can be placed on floor and played with feet, if player has no use of hands).
