IDENTIFIERS Inventory of Classroom Management Styles

ABSTRACT

This study represents a continuation of research efforts to further refine the Attitudes & Beliefs on Classroom Control (ABCC) Inventory. Formerly titled the Inventory of Classroom Management Style, the ABCC is an instrument designed to measure teachers' perceptions of their classroom management beliefs and practices. It is based on a continuum originally suggested by C. Wolfgang and C. Glickman (1980, 1986). Objectives were to: (1) investigate the impact of classroom management training on classroom management style; (2) study the relationship between class size and classroom management style; (3) investigate differences between the perceived classroom management style of teachers who had and had not enrolled in a graduate course within the preceding 6 months; and (4) further substantiate the construct validity of the ABCC. Data were collected from 281 certified teachers, who were primarily urban, and female. Most of the teachers were Caucasian (69.9%) and they had an overall average of 14.35 years of teaching experience. Results show significant differences on the Instructional Management subscale of the ABCC regarding classroom management training as well as significant positive correlations between average class enrollment and teachers' scores on the People Management and Behavior Management subscales of the ABCC. A one-way analysis of variance did not yield significant differences between the teachers who had enrolled in graduate courses in the last 6 months and those who did not. Results seem to be in keeping with the construct. (Contains 3 tables and 26 references.) (SLD)

Paper presented at the Annual Conference of the American Educational Research Association, San Diego, CA., April, 1998.

ABSTRACT

This study represents a continuation of research efforts to further refine the Attitudes & Beliefs on Classroom Control (ABCC) Inventory. Formerly titled the Inventory of Classroom Management Style, the ABCC Inventory is an instrument designed to measure teachers' perceptions of their classroom management beliefs and practices. The objectives of this study were four-fold: 1. to investigate the impact of classroom management training on classroom management style, 2. to investigate the relationship between class size and classroom management style, 3. to investigate differences between the perceived classroom management style of those teachers who have and those who have not enrolled in a graduate course within the last 6 months, and 4. to further substantiate the construct validity of the Attitudes and Beliefs on Classroom Control (ABCC) Inventory.

Data were collected utilizing the ABCC and demographics. The subject pool was composed of 281 certified teachers. Subjects were primarily urban (73%) and female (58%). Participants ranged in age from 23 to 63 with the average age of 41.7 years. Teachers reported an overall average of 14.35 years teaching experience. Ethnic composition of the subject pool was as follows: 2.1% African-American, 0.7% Asian, 69.9% Caucasian, 21.9% Hispanic; 2.7% were of other ethnic origin.

Results revealed significant differences on the Instructional Management sub-scale of the ABCC regarding classroom management training as well as significant, positive correlations between average class enrollment and teachers' scores on the People Management and Behavior Management sub-scales of the ABCC. A 1-way ANOVA failed to yield significant differences between those teachers who have enrolled in graduate courses in the last 6 months and those who have not. Results seem to be in keeping with the construct.

Classroom Management Training, Class Size and Graduate Study: Do These Variables Impact Teachers' Beliefs Regarding Classroom Management Style?

Although often used interchangeably, the terms *classroom management* and *discipline* are not synonymous. *Discipline* typically refers to the structures and rules for student behavior and efforts to ensure that students comply with those rules. *Classroom management*, on the other hand, is a broader, umbrella term describing teacher efforts to oversee a multitude of activities in the classroom including learning, social interaction, and student behavior.

Within this study, classroom management style is defined as a multi-faceted construct that includes three broad, independent dimensions -- instructional management, people management, and behavior management. It is operationalized as behavioral tendencies that teachers utilize to conduct daily instructional activities. These tendencies reflect the teacher's discipline, communication, and instructional styles, as well as the classroom spatial management. All of these manifest in the teacher's preferences and efforts to attain desirable educational goals.

Dimension one, instructional management, includes aspects such as monitoring seatwork, structuring daily routines, and allocating materials. The manner in which these tasks are managed contributes to the general classroom atmosphere and classroom management style (Burden, 1995; Kounin, 1970; McNeely & Mertz, 1990; Weinstein & Mignano, 1993). Nowhere is this better documented than in Kounin's classic (1970) study of orderly and disorderly classrooms. Concepts such as smoothness and momentum of instruction were consistently found to be characteristics of well-planned lessons that prevented off-task behaviors. More recent research has revealed similar findings. For example, McNeely and Mertz's (1990) study revealed that student teachers began their field experience by focusing on quality lesson planning. By the end of their experience, however, they had begun to see students as the "enemy" and shifted the focus of lesson planning from activities designed to encourage learning to those likely to discourage disruption.

The people management dimension pertains to what teachers believe about students as persons and what teachers do to develop the teacher-student relationship. A large body of literature

indicates that academic achievement and productive behavior are influenced by the quality of the teacher-student relationship (Burden, 1995; Glasser, 1986; Ginott, 1972; Gordon, 1974; Evertson, Emmer, Clements, & Worsham, 1997; Weinstein, 1996). As Weinstein (1996) explains, ". . . teachers are good when they take the time to learn who their students are and what they are like, . . . when they laugh with their students, . . . and when they are both a friend and a responsible adult" (p. 76).

The third dimension, behavior management, is similar to, but different than, discipline in that it focuses on pre-planned means of preventing misbehavior rather than the teacher's reaction to it. Specifically, this facet includes setting rules, establishing a reward structure, and providing opportunities for student input. Emmer, Evertson, and Anderson's classic (1980) study documented one of the primary differences between effective and ineffective classroom managers was the manner in which they formulated and implemented classroom rules. Still, classroom rules are of little assistance if students are not motivated to follow them. As Weinstein and Mignano (1993) explain, ". . . classroom order is like conversation: It can only be achieved if both parties agree to participate" (p. 88). Establishing an effective reward structure and encouraging student input can be useful tools in the prevention of misbehavior and the maintenance of order in the classroom environment.

Glickman and Tamashiro (1980) and Wolfgang (1995) conceptualized a framework to explain teacher beliefs regarding child development. Based on a combination of psychological interpretations, the underlying continuum of control illustrates three approaches to classroom interaction: non-interventionist, interventionist, and interactionist. The non-interventionist presupposes the child has an inner drive that needs to find its expression in the real world. At the opposite end of the continuum are interventionists--those who emphasize what the outer environment does to the human organism to cause it to develop in its particular way. The non-interventionist is the least directive and controlling, while the interventionist is most controlling. Traditional behavior modification provides the theoretical foundation for the interventionist's school of thought. Models of classroom management such as those developed by Lee Canter

(1992), Fredric Jones (1987), or James Dobson (1992) are examples of the interventionist approach. Proponents of Eric Berne (1964), Thomas Harris (1967) (transactional analysis), Haim Ginott (1972) (congruent communication), or Thomas Gordon (1974) (teacher effectiveness training) are considered non-interventionists.

Midway between these two extremes, interactionalists focus on what the individual does to modify the external environment, as well as what the environment does to shape the individual. Interactionalists strive to find solutions satisfactory to both teacher and students, employing some of the same techniques as non-interventionists and interventionists. Theories developed by Alfred Adler, Rudolph Dreikurs, and William Glasser provide the framework for interactionalist ideology (Wolfgang, 1995). Cooperative Discipline (Albert, 1989) and Judicious Discipline (Gathercoal, 1990) are both examples of classroom management models that exemplify interactionalist ideology.

The assumption is that teachers believe and act according to all three models of discipline, but one usually predominates in beliefs and actions (Wolfgang, 1995; Wolfgang & Glickman, 1980; 1986). Therefore, the application of these various theories emphasizes teacher behaviors that reflect the corresponding degrees of power possessed by student and teacher.

One of the most widely used interventionist classroom management paradigms is Lee Canter's Assertive Discipline (1992). More than 750,000 teachers have been trained in the use of this model which consists of a set of rules and a hierarchy of predetermined rewards and consequences (Hill, 1990). Canter defines the assertive teacher as, "One who clearly and firmly communicates her expectations to her students, and is prepared to reinforce her words with appropriate actions. She responds in a manner which maximizes her potential to get her needs to teach met, but in no way violates the best interest of the students" (1992, p. 14). When the child misbehaves, he or she is allowed one warning before the predetermined consequence is automatically administered.

Another classroom management "package" in which teachers across the nation have received training is Cooperative Discipline (Albert, 1989). A very different approach from Assertive Discipline, Cooperative Discipline is drawn from a combination of theories posited by

Alfred Adler, Rudolph Dreikurs, William Glasser, Albert Ellis, and Eric Berne. Belonging is the considered the primary goal of all behavior and, when appropriate behavior doesn't yield this objective, the child will engage in inappropriate behaviors. It is believed that students engage in misbehavior in an effort to attain one of four mistaken goals of misbehavior: attention, power, revenge, or avoidance-of-failure. All teacher interventions are tailored to the specific situation and the individual student's goal. Teachers are also trained in other, preventive, measures to foster the sense of belonging for all students within the classroom (Albert, 1989). Considering these two widely different perspectives toward classroom management, it seems reasonable to assume that teachers trained in one of these two models would approach their classrooms from different places on the teacher control continuum put forth by Woolfgang (1995).

The facets of classroom management may vary as a function of class size. No where is this more clearly delineated than by Tennessee's Project STAR (Student Teacher Achievement Ratio) (Achilles, 1996; Pate-Bain & Achilles, et al., 1992). In summary, the longitudinal studies of K through grade 3 discerned that "... compared to larger classes,

- small classes ameliorate the effects of large schools
- fewer students are held back a grade
- while small classes benefit all students, minority students benefit the most
- students receive more individual attention
- smaller classes are friendlier and more intimate
- there are fewer discipline problems in smaller classes;

students are more likely to participate in activities. (1996, p. 77)

Considering the class as the unit of measurement rather than individual students, the studies also revealed higher achievement over those students who had attended regular sized classes.

While there are student benefits to be obtained from smaller class sizes, the Project STAR line of research also highlights the importance of teacher characteristics and instructional styles. Teachers whose classes scored in the top 15% of scaled-score average gains in reading and math were observed and interviewed thus revealing they consistently "... engaged their [first graders]

through the use of creative writing, hands-on experiences, learning centers, and math manipulatives. They practiced Lee Canter's assertive discipline or some variation of it and made it clear that they had high expectations for their students. They maintained good communication with parents" (Pate-Bain & Achilles et al., 1992, p. 255). Considering these instructional techniques, it is not surprising that 84% of these outstanding teachers taught small classes or regular size classes with a full-time instructional aide.

Although important, these findings focus on the effects/differences of smaller class size in grades K - 3 and not in the upper grades. Despite obvious budgetary concerns, Shanker (1985) believes secondary level teachers of academic subjects should have instructional responsibility for no more than 90 to 100 students in the course of a school day. With the typical five teaching periods a day (at 25 to 40 students per class period), even a small homework assignment "yields 150 to 200 papers that must be examined and analyzed" (Shanker, 1985, p. 313). Clearly, class size is likely to directly impact the nature of instruction as well as teacher-student interaction.

The nature of the subject pool is always an important factor in the research process. Often, researchers tap graduate (or undergraduate) students for research projects because we have easy access to them. However, this study questions whether teachers who continue their education are somehow different from the population of educators at large. Unlike subjects previously tapped in this line of research, these participants were drawn directly from the public schools and not from university graduate level courses.

Research efforts to explore the effects of classroom management on instructional effectiveness and the educational environment are limited by the quality of instruments presently available to measure the construct. Although there are two scales that measure teachers' approaches to discipline (Pupil Control Ideology, Willower, Eidell, & Hoy, 1967; Beliefs on Discipline Inventory, Wolfgang & Glickman, 1980, 1986), there is no instrument that addresses the broader concept of classroom management. Therefore, little empirical research has been done regarding the broader concept of classroom management.

In the minds of teachers, classroom management is considered one of the most enduring and widespread problems in education (Johns, MacNaughton, & Karabinus, 1989; Long & Frye, 1989; Willower, Eidell, & Hoy, 1967). Clearly, there is a need to investigate the consequences of classroom management beliefs and practices further. The objectives of this study were 1. to investigate the effect of classroom management training on teachers' attitudes and beliefs, 2. to investigate the relationship between class size and classroom management style, 3. to investigate differences between the perceived classroom management style of those teachers who have and those who have not enrolled in a graduate course within the last 6 months, and 4. to further substantiate the construct validity of the Attitudes and Beliefs on Classroom Control (ABCC) Inventory.

Methods & Procedures

Data were collected via a revised version of the Attitudes and Beliefs on Classroom Control (ABCC) Inventory and demographics. Within this study, classroom management was defined as a multi-faceted construct that includes three broad dimensions: Instructional Management, People Management, and Behavior Management. The ABCC Inventory, an instrument designed to measure teachers' perceptions of their classroom management beliefs and practices, consists of 26 Likert format statements. A four category response scale for each item was used. Beliefs were classified on a continuum originally suggested by Wolfgang and Glickman (1980, 1986) that reflects the degree of teacher power over students in each of the three dimensions. Cronbach's coefficient alphas for the three ABCC sub-scales ranged from .82 to .69.

Subjects

Data were collected from a total of 281 teachers using the Attitudes and Beliefs of Classroom Control (ABCC) Inventory and a demographic questionnaire. Subjects were drawn from two public school districts in the southwest. Unlike subject pools previously tapped in this line of research, these participants were drawn directly from the public schools and not from university graduate level courses.

The subject pool was primarily urban (73%) and female (58%). Participants ranged in age from 23 to 63 with the average age of 41.7 years. Teachers reported an overall average of 14.35 years teaching experience. Ethnic composition of the subject pool was as follows: 2.1% African-American, 0.7% Asian, 69.9% Caucasian, 21.9% Hispanic; 2.7% were of other ethnic origin.

Results

On the demographic questionnaire, subjects were asked to indicate the model of classroom management in which they had received their primary training. Teachers were divided into three groups: those indicating primary in Assertive Discipline (an interventionist model of classroom management) (Canter, 1992), those indicating primary training Cooperative Discipline (an interactionist model of classroom management) (Albert, 1989), and those indicating they had not received any training in a specific model of classroom management. Data were analyzed using a 1-Way ANOVA. Results from Scheffe post-hoc analysis revealed a significant difference on one of the three sub-scales. Subjects trained in Assertive Discipline scored significantly more interventionist on the ABCC Instructional Management sub-scale than those trained in Cooperative Discipline or those receiving no formal training in classroom management models. (See Table 1.) Neither People Management nor Behavior Management sub-scales yielded significance.

Table 1.
1-Way ANOVA: Classroom Management Training & ABCC Inventory Sub-scales

	Assertive Discipline	Cooperative Discipline	No Formal Training	F	p
Instructional Management	M = 43.22 SD = 5.91	M = 39.30 SD = 6.78	M = 41.55 SD = 7.04	5.461	p = .005
People Management	M = 17.74 SD = 4.28	M = 18.89 SD = 3.77	M = 17.39 SD = 3.99	1.97	p = .142
Behavior Management	M = 7.57 SD = 2.79	M = 8.58 SD = 2.82	M = 8.18 SD = 3.99	2.13	p = .121

Analyses determined a significant positive relationship between average enrollment of classes taught and scores on two of the three sub-scales of the ABCC. (See Table 2.) As class enrollment increases, teachers' score more controlling on the People Management and Behavior

Management sub-scales of the ABCC Inventory. No significant relationship was determined between class size and the Instructional Management sub-scale.

Table 2.
Pearson Product-Moment Correlations of the ABCC Inventory Sub-scales with Average Class Enrollment.

Instructional Management	People Management	Behavior Management
$r = .0171$	$r = .146$	$r = .181$
$p = .787$	$p = .022$	$p = .004$

On the demographic questionnaire, subjects were asked if they had enrolled in a university graduate level course within the last six months. Unlike subject pools previously tapped in this line of research, these participants were drawn directly from the public schools and not from university graduate level courses. The assumption was that those teachers enrolled in graduate courses may not be representative of the population at large. Data were analyzed via a one-way ANOVA; none of the three sub-scales of the ABCC yielded significance. (See Table 3.)

Table 3.
1-Way ANOVA: Graduate Enrollment & ABCC Inventory Sub-scales

	Enrolled	Not Enrolled	F	p
Instructional Management	M = 40.41 SD = 6.78	M = 41.96 SD = 6.73	2.315	$p = .129$
People Management	M = 23.83 SD = 3.95	M = 24.06 SD = 3.70	.185	$p = .668$
Behavior Management	M = 18.27 SD = 2.86	M = 19.03 SD = 2.83	3.222	$p = .074$

Summary & Discussion

Within this study, classroom management was defined as a multi-faceted construct that includes three broad dimensions -- instructional management, people management, and behavior management. Beliefs regarding these facets can vary and play a role in the teacher's approach to classroom management style. Wolfgang and Glickman (1980, 1986) conceptualized a framework to explain teacher beliefs toward child development. Based on a combination of psychological

interpretations, their continuum illustrates three approaches to classroom interaction--non-interventionists, interventionists, and interactionalists.

Research results have revealed differences in achievement and classroom interaction as a result of class size (Achilles, 1996; Pate-Bain & Achilles et al., 1992). However, research efforts to explore the effects of classroom management on instructional effectiveness and the educational environment are limited by the quality of instruments presently available to measure the construct. Although there are scales that measure teachers' approaches to discipline, there is no instrument that addresses the broader concept of classroom management.

This study is a continuation of previous research regarding the nature of classroom management styles (i.e.: Baldwin & Martin, 1994; Martin & Baldwin, 1997, 1996, 1994, 1993; Martin, Baldwin, & Yin, 1995; Martin, Yin, & Baldwin, 1997, 1998). The objectives of this study were four-fold: 1. to investigate the effect of classroom management training on teachers' attitudes and beliefs, 2. to investigate the relationship between class size and classroom management style, 3. to investigate differences between the perceived classroom management style of those teachers who have and those who have not enrolled in a graduate course within the last 6 months, and 4. to further substantiate the construct validity of the Attitudes and Beliefs on Classroom Control (ABCC) Inventory.

Only one of the three sub-scales of the ABCC proved significant based on teachers' classroom management training. Those teachers who reported their primary classroom management training in Assertive Discipline scored significantly more interventionist on the Instructional Management sub-scale than those who were trained in Cooperative Discipline or those who reported no formal training in this area. None of the other two sub-scales (People Management nor Behavior Management) yielded significance.

Results yielded via the Instructional Management sub-scale are in keeping with the construct. It is of interest, however, that only one sub-scale, and not all three, performed the way they did. Because attitudes and beliefs tend to remain fairly stable, it appears that classroom management training is not likely to have much impact in teacher attitudes in either direction. The

Instructional Management sub-scale taps aspects such as monitoring seatwork, structuring daily routines, and allocating materials. The People Management dimension pertains to what teachers believe about students as persons and what teachers do to develop the teacher-student relationship. The third sub-scale, Behavior Management, focuses on pre-planned means of preventing misbehavior rather than the teacher's reaction to it. Regardless of training, teachers seem to have a consistent approach to these two facets of classroom management. It appears that teacher training models are more likely to directly impact the "nuts and bolts" aspects of classroom management addressed in dimension one perhaps because they are more objective than the other two areas.

Two of the three sub-scales of the ABCC Inventory and class size yielded significant (positive) correlations. (See Table 1.) As class size increased, so did scores on the People Management and Behavior Management sub-scales of the ABCC. The Instructional Management sub-scale failed to yield a statistically significant relationship with class size.

It stands to reason that larger class sizes provide fewer opportunities for teacher-student interactions and thus impede the development of meaningful instructor-pupil relationships (People Management). Similarly, as class size increases, so does the difficulty of monitoring student behavior (Behavior Management). As class enrollments increase, teachers are likely to become more controlling in these two components of classroom management.

Instructional Management, however, differs from People Management and Behavior Management. As research concludes, when it comes to managing the instructional environment, providing smaller classes is of little consequence without necessary training. As Pate-Bain, Achilles, et al. (1992) assert,

Providing teachers with an appropriate student load will make *possible* the individualized and personalized instruction that is the basis of sound education. However, if this reduction in student load is to be educationally effective, finances must be provided for all present and future teachers to be adequately trained in small-group instruction. (p. 256) (Emphasis added.)

Simply presenting teachers with smaller classes is not likely to result in different approaches to instruction. Teacher training is necessary for such adaptations to occur.

In order to ascertain differences between the perceived classroom management style of those teachers who have and those who have not enrolled in a graduate course within the last 6 months, a series of 1-way ANOVAs were performed. Results revealed no significant difference between these two groups of teachers regarding the Instructional, People, or Behavior Management sub-scales of the ABCC Inventory. (See Table 2.) Those subjects who have recently enrolled in graduate study either had not studied material related to the areas tapped in this study or the additional study had not influenced their ideology. Little is known regarding the nature of the subjects' graduate study, i.e.: coursework taken or the programs in which they were enrolled. Public schools are under increasing demands and obtaining permission to collect data in the schools can be a time consuming and cumbersome task. These results indicate that this interim step may not be necessary. Meaningful research results may be gleaned from those graduate students who are teachers. These results should be interpreted cautiously, however, as they may be sample specific.

Construct validity is a complex and on-going process. This study represents a step in the process of establishing the construct of classroom management. Many questions remain unasked and unanswered. Do ethnic and cultural differences exist? How do personality variables effect classroom management? What is the "best" style for managing the classroom? Do teacher perceptions of their classroom management style match their behavior in the classroom?

There can be little doubt that the teachers encounter a variety of new experiences in the classroom. Their beliefs regarding these experiences and the manner in which they approach them work together to create a unique and individual style of classroom management.

A clearer understanding of the facets of classroom management will hopefully facilitate the process of university level instruction of pre-service and experienced teachers. Because of the lack of an empirically derived body of information, a systematic means of measuring these factors

seems to be a fruitful one for future study. The Attitudes and Beliefs on Classroom Control (ABCC) Inventory appears to be a timely and useful tool for additional research in this area.

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic media, and sold through the ERIC Document Reproduction Service (EDRS). Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following three options and sign at the bottom of the page.

The sample sticker shown below will be affixed to all Level 1 documents

The sample sticker shown below will be affixed to all Level 2A documents

The sample sticker shown below will be affixed to all Level 2B documents

PERMISSION TO REPRODUCE AND DISSEMINATE THIS MATERIAL HAS BEEN GRANTED BY

Level 1

Level 2A

Level 2B

Check here for Level 1 release, permitting reproduction and dissemination in microfiche or other ERIC archival media (e.g., electronic) and paper copy.

Check here for Level 2A release, permitting reproduction and dissemination in microfiche and in electronic media for ERIC archival collection subscribers only

Check here for Level 2B release, permitting reproduction and dissemination in microfiche only

Documents will be processed as indicated provided reproduction quality permits.
If permission to reproduce is granted, but no box is checked, documents will be processed at Level 1.

I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries.

III. DOCUMENT AVAILABILITY INFORMATION (FROM NON-ERIC SOURCE):

If permission to reproduce is not granted to ERIC, or, if you wish ERIC to cite the availability of the document from another source, please provide the following information regarding the availability of the document. (ERIC will not announce a document unless it is publicly available, and a dependable source can be specified. Contributors should also be aware that ERIC selection criteria are significantly more stringent for documents that cannot be made available through EDRS.)

Publisher/Distributor:
Address:
Price:

IV. REFERRAL OF ERIC TO COPYRIGHT/REPRODUCTION RIGHTS HOLDER:

If the right to grant this reproduction release is held by someone other than the addressee, please provide the appropriate name and address:

Name:
Address:

V. WHERE TO SEND THIS FORM:
