ABSTRACT

This bibliography contains 323 entries related to the provision of health care services in rural areas. The entries were derived from the AGRICOLA database produced by the National Agricultural Library and include journal articles, government reports, conference papers, Congressional hearings, and books. Entries cover such topics as community health services, elderly health care, educational programs, hospitals, health education, medical education, medical services, nutrition education, physicians, program development and evaluation, rural communities, and rural health services. Each entry contains title, author, publisher, publication date, journal or conference information (where appropriate), language, descriptors, and the National Agricultural Library call number. Some entries contain an annotation. Also included are indexes by author and subject and information about interlibrary loan from the National Agricultural Library. (LP)

Bibliographies in the Quick Bibliography Series of the National Agricultural Library, are intended primarily for current awareness, and as the title of the series implies, are not indepth exhaustive bibliographies on any given subject. However, the citations are a substantial resource for recent investigations on a given topic. They also serve the purpose of bringing the literature of agriculture to the interested user who, in many cases, could not access it by any other means. The bibliographies are derived from computerized on-line searches of the AGRICOLA data base. Timeliness of topic and evidence of extensive interest are the selection criteria.

The author/searcher determines the purpose, length, and search strategy of the Quick Bibliography. Information regarding these is available upon request from the author/searcher.

Copies of this bibliography may be made or used for distribution without prior approval. The inclusion or omission of a particular publication or citation may not be construed as endorsement or disapproval.

To request a copy of a bibliography in this series, send the title, series number and self-addressed gummed label to:

---

The United States Department of Agriculture (USDA) prohibits discrimination in its programs on the basis of race, color, national origin, sex, religion, age, disability, political beliefs, and marital or familial status. (Not all prohibited bases apply to all programs). Persons with disabilities who require alternative means for communication of program information (braille, large print, audiotape, etc.) should contact the USDA Office of Communications at (202) 720-5881 (voice) or (202) 720-7808 (TDD).

To file a complaint, write the Secretary of Agriculture, U.S. Department of Agriculture, Washington, D.C. 20250, or call (202) 720-7327 (voice) or (202) 720-1127 (TDD). USDA is an equal employment opportunity employer.

# Rural Information Center

National Agricultural Library  
U.S. Department of Agriculture  
Beltsville, Maryland 20705

The Rural Information Center (RIC) is a joint project of the Extension Service and the National Agricultural Library (NAL). RIC provides information and referral services to local government officials, community organizations, health professionals and organizations, cooperatives, libraries, businesses, and rural citizens working to maintain the vitality of America's rural areas. The Center combines the technical, subject-matter expertise of Extension's nationwide educational network with the information specialists and resources of the world's foremost agricultural library.

The Office of Rural Health Policy in the Department of Health and Human Services (DHHS) and the NAL jointly created a Rural Information Center Health Service (RICHS) as part of the RIC. RICHS collects and disseminates information on rural health issues, research findings related to rural health, and innovative approaches to the delivery of rural health care services.

## SERVICES:

Provide customized information products to specific inquiries including assistance in economic revitalization issues; local government planning projects; rural health issues; funding sources; and other related issues for the purpose of monitoring the quality of rural life.

Process a broad array of general and funding information requests on such topics as:

- Successful strategies, models, and case studies of community development projects
- Small business attraction, retention, and expansion
- Tourism promotion and development
- Recycling programs
- Community water quality
- Technology transfer to rural areas
- Closures, restructuring and diversification of rural hospital and clinics
- Agricultural health and safety
- Health programs, services, personnel issues
- State initiatives concerning rural health delivery issues

Refer users to organizations or experts in the field who can provide additional information.

Perform brief database searches of requested topics on a complimentary basis.

Furnish bibliographies and Rural Information Center Publication Series titles.

Identify current USDA and DHHS research and Cooperative Extension Systems programs.

## ACCESS:

\*Telephone 1-800-633-7701 (nationwide) or 1-301-504-5547  
\*Mail Rural Information Center  
National Agricultural Library, Room 304

## Document Delivery Services to Individuals

The National Agricultural Library (NAL) supplies agricultural materials not found elsewhere to other libraries.

Filling requests for materials readily available from other sources diverts NAL's resources and diminishes its ability to serve as a national source for agricultural and agriculturally related materials. Therefore, NAL is viewed as a library of last resort. Submit requests first to local or state library sources prior to sending to NAL. In the United States, possible sources are public libraries, land-grant university or other large research libraries within a state. In other countries submit requests through major university, national, or provincial institutions.

If the needed publications are not available from these sources, submit requests to NAL with a statement indicating their non-availability. Submit one request per page following the instructions for libraries below.

### NAL's Document Delivery Service Information for the Library

The following information is provided to assist your librarian in obtaining the required materials.

**Loan Service** — Materials in NAL's collection are loaned only to other U.S. libraries. Requests for loans are made through local public, academic, or special libraries.

The following materials are not available for loan: serials (except USDA serials); rare, reference, and reserve books; microforms; and proceedings of conferences or symposia. Photocopy or microform of non-circulating publications may be purchased as described below.

**Document Delivery Service** — Photocopies of articles are available for a fee. Make requests through local public, academic, or special libraries. The library will submit a separate interlibrary loan form for each article or item requested. If the citation is from an NAL database (CAIN/AGRICOLA, *Bibliography of Agriculture*, or the NAL Catalog) and the call number is given, put that call number in the proper block on the request form. Willingness to pay charges must be indicated on the form. Include compliance with copyright law or a statement that the article is for "research purposes only" on the interlibrary loan form or letter. Requests cannot be processed without these statements.

#### Charges:

- Photocopy, hard copy of microfilm and microfiche — \$5.00 for the first 10 pages or fraction copied from a single article or publication. \$3.00 for each additional 10 pages or fraction.
- Duplication of NAL-owned microfilm — \$10.00 per reel.
- Duplication of NAL-owned microfiche — \$ 5.00 for the first fiche and \$ .50 for each additional fiche per title.

**Billing** — Charges include postage and handling, and are subject to change. Invoices are issued quarterly by the National Technical Information Service (NTIS), 5285 Port Royal Road, Springfield, VA 22161. Establishing a deposit account with NTIS is encouraged. **DO NOT SEND PREPAYMENT.**

#### Send Requests to:

USDA, National Agricultural Library  
Document Delivery Services Branch, PhotoLab  
10301 Baltimore Blvd., NAL Bldg.  
Beltsville, Maryland 20705-2351

Contact the Head, Document Delivery Services Branch in writing or by calling (301) 504-5755 with questions or comments about this policy.

National Agricultural Library

## ELECTRONIC MAIL ACCESS FOR INTERLIBRARY LOAN (ILL) REQUESTS

The National Agricultural Library (NAL), Document Delivery Services Branch accepts ILL requests from libraries via several electronic services. All requests must comply with established routing and referral policies and procedures. The transmitting library will pay all fees incurred during the creation of requests and communication with NAL. A sample format for ILL requests is printed below along with a list of the required data/format elements.

### ELECTRONIC MAIL - (Sample form below)

<u>SYSTEM</u>	<u>ADDRESS CODE</u>
INTERNET.....	LENDING@NALUSDA.GOV
EASYLINK.....	62031265

TELEFACSIMILE - Telephone number is 301-504-5675. NAL accepts ILL requests via telefacsimile. Requests should be created on standard ILL forms and then faxed to NAL. NAL does not fill requests via Fax at this time.

### REQUIRED DATA ELEMENTS/FORMAT

1. Borrower's address must be in block format with at least two blank lines above and below so form may be used in window envelopes.
2. Provide complete citation including verification, etc.
3. Provide authorizing official's name (request will be rejected if not included).
4. Include statement of copyright compliance if applicable.
5. Indicate willingness to pay applicable charges.
6. Include NAL call number if available.

Contact the Document Delivery Services Branch at (301) 504-6503 if additional information is required.

## Health Care in Rural America

1 NAL Call No: RA771.A1J68  
**The 1990s and beyond: determining the need for community health and primary care nurses for rural populations.**

Hanson, C.M.

Kansas City, Mo. : National Rural Health Association.

The Journal of rural health v. 7 (4,suppl.): p. 413-426; 1991. In the series analytic: Issues and Trends in Availability of Health Care Personnel in Rural America / edited by D.A. Kindig and T.C. Ricketts. Includes references.

*Language:* English

*Descriptors:* U.S.A.; Health care; Health services; Rural communities; Nurses; Needs assessment; Medical education; Roles; Technology; Telecommunications; Self management; Schools; Pediatrics; Elderly; Mental health; Migrants; Anesthetics; Midwives; Health care costs

*Abstract:* Increased numbers of primary care and advanced practice nurses with unique generalist skills will be required to meet the accelerating physiologic and sociocultural health care needs of rural population. Several factors have been identified that will influence the demands and position of community-based nurses in rural practice settings during the next decade. A back-to-basics type of health care offered out of a growing elderly population; technological breakthroughs that make it possible for more chronically ill patients to live at home; serious substance abuse and other adolescent problems; AIDS; and high infant morbidity and mortality statistics are only some of the concerns that will demand nursing intervention. These changes speak to the need for improved nursing coordination, stronger collegial relationships, and better communication between physicians and nurses. Health care is moving in new directions to offer more efficient and technologically sophisticated care. These changes enhance the need for clinically expert educators who teach and jointly practice in programs with a rural focus. Telecommunications, and heightened computer literacy, will play a major role both in nursing education and clinical practice. The goals of kindergarten through 12th grades health promotion and disease prevention strategies in school health will be the norm and will require better prepared, and positions for, school nurses. More midwives and public health nurses will be needed to care for the growing population of sexually active adolescents who are in need of family planning and prenatal care. Underinsured and indigent populations will

continue to fall within the purview of midlevel practitioners, as will providing anesthesia services in small rural hospitals. The transition of some rural hospitals into expanded primary care units (e.g., EACHs and RPCHs), and new models of case management will greatly influence nursing demands.

**Access to obstetric care in rural areas: effect on birth outcomes.**

Nesbitt, T.S.; Connell, F.A.; Hart, L.G.; Rosenblatt, R.A.

Washington, D.C. : American Public Health Association.

## Quick Bibliography Series

American journal of public health v. 80 (7): p. 814-818; 1990 Jul. Includes references.

*Language:* English

*Descriptors:* Health services; Health care; Rural areas; Obstetrics; Hospitals; Community health services; Childbirth; Rural women

*Abstract:* Hospital discharge data from 33 rural hospital service areas in Washington State were categorized by the extent to which patients left their local communities for obstetrical services. Women from communities with relatively few obstetrical providers in proportion to number of births were less likely to deliver in their local community hospital than women in rural communities with greater numbers of physicians practicing obstetrics in proportion to number of births. Women from these high-outflow communities had a greater proportion of complicated deliveries, higher rates of prematurity, and higher costs of neonatal care than women from communities where most patients delivered in the local hospital.

5 NAL Call No: RA771.5.L36 1989  
Access to obstetrical services in rural communities a response to the liability crisis in North Carolina.

Langholz, Richard; Ricketts, Thomas C.  
United States, Health Resources and Services Administration, Office of Rural Health Policy, University of North Carolina at Chapel Hill, Health Services Research Center  
Chapel Hill, NC : Health Services Research Center, University of North Carolina at Chapel Hill, 40 leaves ; 28 cm. November 1989. The University of North Carolina Rural Health Research program. ... supported by the Office of Rural Health Policy, Health Resources and Services Administration, Public Health Service, U.S. Department of Health and Human Services, grant number HA-R-000016-02. Includes bibliographical references: (leaves 36-40).

*Language:* English

*Descriptors:* Rural health services; Obstetricians; Insurance, Physicians' liability

*Abstract:* This paper analyzes the current medical malpractice crisis by focusing on a policy initiative by the State of North Carolina designed to alleviate the problem. Particular emphasis is given to its effects on family physicians and the delivery of obstetrical services. Rising malpractice premiums are causing many family physicians and

obstetricians to find it financially impossible to provide obstetrical care. This is especially evident in rural areas, where family physicians are often the only source of obstetrical care, and where obstetricians tend to practice solo or in small groups without the technical backup provided by large, metropolitan medical centers. In response to this growing trend, the North Carolina General Assembly in 1988 passed the Rural Obstetrical Care Incentive Bill (ROCI), designed to encourage practitioners to provide obstetrical care in underserved areas. In return for these services, the state compensates physicians for the difference between the costs of malpractice with and without obstetrical practice, or \$6,500, whichever is less. This paper outlines the context of that program in North Carolina and suggests approaches for its evaluation and application in other states.

7 NAL Call No: 151.65 P96  
Addressing barriers to perinatal care: a case study of the Access to Maternity Care Committee in Washington State.

Schleuning, D.; Rice, G.; Rosenblatt, R.A.  
Washington, D.C. : Public Health Service.  
Public health reports v. 106 (1): p. 47-52; 1991 Jan. Includes references.

*Language:* English

*Descriptors:* Washington; Maternity services; Puerperium; Obstetrics; Rural communities; Health programs; Program development; Committees; Case studies

*Abstract:* Access to obstetrical services has deteriorated in recent years, as large numbers of physicians have discontinued or restricted obstetrical practice. In Washington State, one response to this access crisis has been the establishment of the Access to Maternity Care Committee (AMCC), an ad hoc group composed primarily of private sector obstetrical providers and representatives of State

## Health Care in Rural America

government responsible for the delivery of health care to women and children. The major objective of the AMCC is to improve access to obstetrical services for socially vulnerable women, both rural inhabitants and the medically indigent. The committee has been successful in serving as a forum in which to resolve many of the administrative problems that have arisen between private sector obstetrical providers and the State's Medicaid Program, the major source of payment for the one-third of pregnant women who are medically indigent. Building upon the trust that the committee members developed in working together, the AMCC served as a major force in persuading the State legislature to expand substantially its investment in perinatal care by increasing Medicaid eligibility, raising provider reimbursement, and improving social services for pregnant women. Such ad hoc coalitions between the private and public sector may be quite effective in addressing obstetrical access problems in other States.

*Language:* English

*Descriptors:* Nevada; Health care; Health services; Models; Rural communities; Case studies; Groups; Rural population

*Abstract:* This is a case study illustrating the wide variety of models for rural health care delivery found in a western "frontier" state. In response to a legislative mandate, the University of Nevada School of Medicine created the Office of Rural Health in 1977. Utilizing a cooperative, community development approach, this office served as a resource, as well as a catalyst, in the development and expansion of a variety of alternative practice models for health care delivery to small, underserved rural communities. These models included small, single, and multispecialty group practices; self-supporting and subsidized solo practices; contract physicians; midlevel practitioners; and National Health Service Corps personnel. The rural health care system that was created featured regional and consortial arrangements, urban and medical school outreach programs, and a "flying doctor" service.

**Are rural family physicians less likely to stop  
practicing obstetrics than their urban counter-  
parts the impact of malpractice claims.**

Rosenblatt, Roger A.  
Seattle, Wash. : WAMI Rural Health Research  
Center, Dept. of Family Medicine, Research Sec-  
tion, University of Washington,  
22 leaves ; 28 cm. (Rural health working paper se-  
ries ;). "April, 1990", Cover. Includes bibliographi-  
cal references (leaves 16-17).

*Language:* English

*Abstract:* We studied all family physicians who pur-  
chased obstetrical malpractice insurance from the  
Washington State Physicians Insurance Exchange  
and Association (WSPIEA) between January 1,  
1982, and June 30, 1988. Of the 470 family  
physicians in the sample, 149 (32 percent) discon-  
tinued obstetrics but remained in practice.  
Physicians who discontinued obstetrical practice  
were older, more likely to practice in an urban  
area, and more likely to be in solo practice. Family  
physicians in the state's 12 most rural counties  
were much less likely to quit practicing obstetrics  
than their urban peers. Family physicians leaving  
obstetrics had a lower rate of new obstetrical  
malpractice claims than their peers who did not  
quit, though the difference was not statistically sig-  
nificant. We conclude that rural family physicians  
are less likely to quit practicing obstetrics than  
their urban colleagues. Obstetrically related med-  
ical malpractice claims against family physicians  
are relatively infrequent, and being involved in a  
medical malpractice claim is not a factor in the de-  
cision of most family physicians who stop practic-  
ing obstetrics.

*Abstract:* The availability of nursing resources is one of the most critical issues facing health care organizations in the country. The study investigated the potential factors that relate to the desire of registered nurses (RNs) and licensed practical nurses (LPNs) to continue practicing in rural hospitals of North Dakota. All RNs and LPNs who

worked in North Dakota hospitals with fewer than 100 beds (490 hospitals) were mailed survey questionnaires. Approximately eight weeks later, responses were received from 291 respondents for an overall return rate of 59 percent. Correlational analyses were used to examine the subjects' responses. A moderate relationship was found among the work-related variables. Overall job satisfaction and performance constraints were the only variables to make significant contributions to the prediction of turnover intention for both RNs and LPNs. Overall job satisfaction accounted for the largest percentage of the variance ( $R^2=0.42$  and  $R^2=0.44$ ) for RNs and LPNs, respectively. Satisfaction with promotion was the only work-related variable to make a significant contribution to the prediction of turnover intention for RNs ( $R^2=0.23$ ). Performance constraints, role ambiguity, and shift worked were the only work-related variables contributing to the prediction of turnover for LPNs. These results are discussed in terms of their implications for the management of RNs and LPNs in rural hospitals. Clinical ladders for promotions, the identification of potential performance constraints, and supervisory training are suggested as target areas in which rural hospitals might focus attention for managing turnover in RNs and LPNs.

*Language:* English

*Descriptors:* Cancer; Rural health services; Urban  
health

*Abstract:* Rural and urban cancer mortality, when  
adjusted for age, race, and sex, show urban areas  
with higher rates. This appears to contradict other  
evidence that reveals rural populations at a disad-  
vantage in access to health services, especially  
specialty services including cancer care. This article  
reviews published research that compares urban

and rural cancer rates, measures of access, and  
prevention activities. Published studies show that  
there are differences in access between urban and  
rural populations when measured by stage at which  
cancer is diagnosed. Mortality rates, however, with  
a few exceptions, are lower in rural areas. There  
are a number of reasons why these results may not  
reflect the actual risk from cancer morbidity and  
mortality in rural areas when compared to urban  
areas. Research is necessary to explore the under-  
lying rates of outcomes for cancer patients in rural  
versus urban areas in light of the improvement of  
cancer treatments and their concentration in urban  
places.

*Abstract:* Mayors of rural towns whose small gen-  
eral hospitals closed between 1980 and 1988 were  
surveyed. Only hospitals that were the sole hospi-  
tals in their towns and that had not reopened were  
included in the survey. Of the 132 hospitals  
meeting these criteria, 130 (98.5%) of the mayors  
of their communities responded to the survey. The  
typical study hospital had 31 beds, with an average  
daily census of 12. Three fourths of the hospital  
closures were in the North-central and South

## Quick Bibliography Series

census regions. Half of the hospital closures were for hospitals that were 20 miles or more from another hospital. Mayors attributed the closure of their hospitals primarily to governmental reimbursement policies, poor hospital management and lack of physicians. To a lesser extent, they also implicated competition from other hospitals, reputation for poor quality care, lack of provider teamwork, and inadequate hospital board leadership. Respondents reported they had little warning that their hospitals were in imminent danger of closing. Warnings of six months or less were reported by 49 percent of the mayors; only 33 percent of mayors of towns with for-profit hospitals reported having more than six months warning. Of the 132 hospital buildings that closed, only 38 percent were not in use in some capacity in the summer of 1989. Most were being utilized as some form of health care facility such as an ambulatory clinic, nursing home, or emergency room. More than three fourths of the mayors felt access to medical care had deteriorated in their communities after hospital closure, with a disproportionate impact on the elderly and poor. Nearly three fourths of the mayors also perceived that the health status of the community was worse because of the hospital closure, and more than 90 percent felt it had substantially impaired the community's economy.

*Abstract:* Rural America is dynamic and challenging, and it is vastly different from what it was midway through the century. Unfortunately, many people, including policymakers, have a very outmoded picture of what today's rural America is really like. This paper begins by exploding seven common myths about rural America. Next, three characteristics of the rural environment, diversity, sparse population, and interdependency with broader social and economic forces, are examined in relation to health care delivery and medical education. The contribution of health care to the economic needs of rural America is also explored. The paper closes by noting both altruistic and self-serving motives for the medical education establishment to become more concerned and involved in rural health issues.

*Language:* English

*Descriptors:* Arizona; Community health services; Rural communities; Community development; Case studies

*Abstract:* The concept of a health service district, as a variation of the special tax district, is described and discussed. Tax districts have traditionally been used to support both capital construction (revenue bonds) and operational expenses of single-purpose governmental entities. The health service district, where authorized by state laws, may be used by local areas to subsidize the delivery of ambulatory health care. A particular case, the Ajo-Lukeville Health Service District in Arizona, illustrates what can be accomplished by this mechanism with the cooperation of local residents and outside agencies. Both the process of establishing such a district and the outcome of the Ajo-Lukeville experience is described. Reasons why health service districts may prove potentially attractive at this time are reviewed. Impediments to the development of more health service districts are also explored, including the lack of technical assistance, an inadequate awareness of the potential of health service districts, and the absence of a widespread orientation toward community financed and controlled health care. Movement in this direction should facilitate the development of additional health service districts.

*Abstract:* Despite efforts to deinstitutionalize long-term care, it is estimated that 43 percent of the elderly will use a nursing facility at some point. Whether sufficient nursing facility services will be available to rural elderly is debatable due to cut-backs in governmental expenditures and recent financial losses among nursing facilities. This paper explores the challenges confronting rural nursing facilities in maintaining their viability and strategies that might be considered to improve their longevity. A comparative analysis of 18 urban and 34 rural nursing facilities in New Mexico is used in identifying promising strategic adaptations available to rural facilities. Among other considerations, rural facilities should strive to enhance

*Descriptors:* Pennsylvania; Health promotion; Rural areas; Elderly; Community health services; Recruitment; Methodology; Disease prevalence; Participation; Costs; Diseases; Risk; Characteristics

*Abstract:* Background. Although interest in health promotion for the elderly is increasing, the issues of recruitment into such programs and self-selection have not been well explored. While clinical studies require high participation levels and expensive recruitment, community efforts are satisfied with recruiting small numbers of volunteers from poorly defined populations. These small samples may not be representative of the populations at risk. Methods. As part of the Rural Health Promotion Project, a Medicare demonstration, community-based recruitment methods were evaluated and participant characteristics were compared. A total of 3,884 individuals ages 65-79 were recruited in northwestern Pennsylvania, using four sequential recruitment strategies, varying in aggressiveness. The methods were: (A) mail only, (B) mail with phone recruitment follow-up, (C) mail with phone recruitment and scheduling, and (D) mail with aggressive phone recruitment and scheduling. Results. Recruitment yields were Method A, 13.5%; B, 21.1%; and C, 31.6%. The most aggressive Method (D) yielded 77.0% participation. More aggressive methods (C and D) recruited more educated individuals. No other demographic or health status differences were noted. Conclusion. These data show that large numbers of the elderly can be recruited into a health promotion program using aggressive methods and professional interviewers.

*Language:* English

*Descriptors:* Pennsylvania; Children; Adolescents; Mental health; Health services; Hospitals; Rural areas; Rural urban relations; Medical treatment; Programs

*Abstract:* Eighteen child and adolescent partial hospital (PH) programs in a single geographic region were surveyed through site visits. Nine of the programs with 670 clients were located in two urban areas, and nine programs with 126 clients were located in seven rural to semirural counties. Administrative and client characteristics of the urban and rural facilities were compared. Compared to urban programs, those in rural areas were much smaller, more exclusively served adolescents and not children, and had stronger financial and administrative links to local community mental health centers and special education authorities. Educational facilities at many rural programs seemed deficient. About half of the rural and urban clients received Medicaid, and there was an overrepresentation of minorities in both groups; although older, rural clients had lower rates of inpatient and residential psychiatric treatment. Similar proportions of rural and urban clients (45% and 33%, respectively) were discharged from PH services due to the achievement of some or all of their treatment goals. The implications of these findings for the design and operation of rural PH programs are discussed.

*Language:* English

*Descriptors:* Rural health services; Medical care; Competition

*Abstract:* Rural primary care programs were established in areas where there was thought to be no competition for patients; however, evidence from site visits and surveys of a national sample of subsidized programs revealed a pattern of competitive responses by the clinics. In this study of 193 rural primary care programs, mail and telephone surveys produced uniform data on the organization, operation, finances, and utilization of a representative sample of clinics. The programs were found to compete in terms of: (1) price, (2) service mix, (3) staff availability, (4) structural accessibility, (5) outreach, and (6) targeting a segment of the market. The competitive strategies employed by the clinics had consequences that affected their productivity and financial stability. The strategies were related to the perceived missions of the programs, and depended heavily upon the degree of isolation of the program and the targeting of the services. The competitive strategy chosen by a particular program could not be predicted based on service area population and apparent competitors in the service area. The goals and objectives of the pro-

grams have more to do with their competitive responses than market characteristics. The chosen strategies may not meet the demands of those markets.

*Abstract:* An ethnographic analysis of elders' health beliefs and practices is presented in the context of economic and social traditions that blend the values of independence and connection in a small town. Rural mental health workers are provided with recommendations that are consistent with and reinforce these traditional mechanisms of individual and community health maintenance.

## Health Care in Rural America

bution; Population distribution; Ethnicity; Blacks

**Abstract:** In 1991, members of the rural caucus proposed numerous bills designed to attenuate the rural-urban differences in health care delivery and health status. Implicit in the legislative process is the assumption that "rural America" differs systematically from "urban America." However, research has consistently demonstrated that there is not a single rural America but rather, those areas outside of the major metropolitan areas represent a complex mosaic of varying social and environmental settings. Rural communities differ in meaningful ways along a number of socioenvironmental parameters, and accordingly, health status indicators also differ across rural communities. Thus, health outcome statistics averaged across rural communities will often mask important health disparities experienced by certain population groups. Policies based on these aggregate indicators may overlook the needs of the most disadvantaged. While a number of measures of rurality have emerged in the last decade, much of the information presented to policy-makers is either too aggregated (i.e., metropolitan-nonmetropolitan) to identify important differences across the range of communities, or it is gathered in agency-specific categories that are not comparable. The central question under examination in the current context is the possibility of distorting the picture of infant health status by aggregating the diverse rural locales of the United States. Empirical results indicate that when considering infant mortality, any rural disadvantage is contingent upon how 'rural' and 'urban' have been defined. Further, the results indicate that conclusions must be conditioned on other important sociodemographic parameters such as region of the country and race.

**Abstract:** The 1947 report by Haven Emerson envisioned the widespread delivery of local public health services through organizational patterns

that substituted multi-county or regional agencies for locally controlled departments. The 1971 study by Vlado Getting supported the Emerson report and suggested alternative methods to provide public health services via multi-county area health service agencies for rural areas of Illinois. The number of local agencies in the State has doubled since the mid-1960s, yet a majority of rural counties have maintained a single-county health agency rather forming multi-county arrangements. In effect, potential economics of scale have been forfeited. In northwest Illinois, however, eight local health departments, covering both rural and urban areas, have formed a multi-county consortium to identify and meet several overlapping program needs. This Region I consortium, with a population base of 590,000, was created as a result of the 1981 Omnibus Budget Reduction Act. Through the block grants created by the act, funds became available for preventive health and health promotion activities in fiscal year 1982. Once in place, the consortium provided a cost effective means to manage the Women, Infants, and Children Supplemental Feeding Program (WIC) and some elements of family planning programs in Region I. The consortium approach offers numerous opportunities for future growth and regionalization of services.

*Descriptors:* New Mexico; Hospitals; Physicians; Relationships; Rural areas; Utilization; Personnel management

*Abstract:* Rural hospitals are searching for new strategies to enhance utilization in view of constraints introduced by prospective payment and other environmental pressures. Developing physician relations is an approach that is reportedly leading to better hospital-physician collaboration and subsequently to improved utilization. This paper examines rural hospital-physician relations and the association with utilization. The findings suggest that rural hospitals emphasize quality care as well as diagnostic and treatment equipment procurement as methods for building relationships with physicians. These strategies are correlated with efforts to build a larger medical staff. Higher rural hospital utilization, in terms of occupancy, discharges and patient days provided, is associated with a larger medical staff. The results suggest that rural hospitals' attempts to cultivate physician relations have the potential for making significant differences in utilization outcomes. However, the linkages between utilization and physician relations

are complex and require further research.

*Abstract:* This paper reports the findings of a study of health insurance coverage and access to health services among farm families in Minnesota. The study included 1,482 families actively engaged in farming during 1989. While less than 10 percent of the population were uninsured during this period, the majority had limited coverage with high deductible and coinsurance provisions. Moreover, they were paying an estimated 15 to 20 percent more for their plans than a similar plan would have cost in the Minneapolis-St. Paul, MN, area. With the exception of cost, satisfaction with health services was found to be very high, and there were few indications of access problems.

*Language:* English

*Descriptors:* U.S.A.; Health care; Health services; Rural communities; Medical auxiliaries; Supply; Demand; Geographical distribution

*Abstract:* The use of nonphysician providers, such as nurse practitioners, physician assistants, and certified nurse midwives, in rural areas is critically important due to the continued primary care access problems. This study examines the major factors influencing the use of nonphysician providers in rural community and migrant health centers based on a 1991 national survey of the centers. This study demonstrates that the employment of nonphysician providers in rural community and migrant health centers is significantly influenced by both supply and demand factors. Among supply factors, there is a significant and positive relationship between the number of total staff and the number of nonphysician providers employed. There is a significant but inverse relationship between the number of physicians and the number of nonphysician providers employed, indicating nonphysician providers primarily serve as substitutes for physicians in rural community and migrant health centers. The supply of nonphysician providers, as measured by the number of affiliated training programs, is significantly related to the employment of nonphysician providers. The demand variable, geographic location, and the centers' staffing policies are also significant determinants of the use of nonphysician providers.

*Abstract:* Of the 1.25 million heart attacks reported each year in the United States, two thirds occur in men. Health and government organizations have attempted to promote dietary behaviors that may reduce heart disease risk. However, national dietary surveys indicate that most American men fail to follow many of these dietary recommendations, including reduction of dietary fat. Moreover, studies suggest that men are less likely than women to believe in the efficacy of dietary recommendations. The purpose of our research was to determine the communication sources most likely to be used by men who have adopted dietary behaviors to reduce dietary fat.

*Descriptors:* Maryland; Rural youth; Adolescents; Substance abuse; Counties; Tobacco smoking; Alcoholic beverages; Health

*Abstract:* We examined the relationship between the drug use by young adolescents and two indicators of illness, frequency of illness and numbers of days absent from school owing to illness. Data were from a general health survey of all eighth grade students enrolled in public schools in two rural Maryland counties. A total of 745 students completed a self-administered questionnaire during school hours in January 1984. Information was obtained on a variety of sociodemographic characteristics and on the students' use of tobacco, alcohol, and marijuana. Correlational analyses were used to examine the relationships among cigarette smoking, beer or wine drinking, whiskey or hard liquor drinking, and marijuana use. Logistic regression was used to model the effects of drug use behaviors on the likelihood of being absent from school 3 or more days, adjusting for the student's age, sex, race, parents' education, illness frequency, and concerns about learning problems in school. We found substantial covariation among the use of cigarettes, alcohol, and marijuana. After adjusting for the background variables of illness, frequency, and learning problems, we found that students who are frequent cigarette smokers experienced a 2.6 risk of school absenteeism. Other drug use behaviors were not associated significantly with increased risk of missing school. Findings are discussed within the context of health-related consequences of drug use.

*Language:* English

*Descriptors:* Saskatchewan; Medical education; Medical schools; Students; Recruitment; Rural areas

*Abstract:* The Canadian Province of Saskatchewan, like its American counterparts, is experiencing a steady urbanization of its population particularly by young adults. This has been accompanied by progressive decrease in the availability of health services to an aging rural population. Physicians, and, in particular, Saskatchewan graduates, find rural practice unattractive. Unlike the American experience, level of income is not the issue. Not only is rural practice unattractive to Saskatchewan graduates, but medicine as a career is not attracting students from rural areas. The need for a comprehensive overall strategy ranging from recruitment to reorganization of rural health care is proposed.

*Descriptors:* North Dakota; Nurses; Nutrition knowledge; Nutrition information; Nutrition education; Nutritional intervention; Health promotion; Rural areas; Academic achievement; Age differences; Continuing education

*Abstract:* With the increase in wellness programs, earlier hospital discharges, higher health care costs, and more home health care, rural nurses are required to generalize their practices and draw from a more extensive knowledge base. The purpose of this study was to examine nursing interventions, specifically nutrition education practices, based on nutrition knowledge that is used in health promotion. A stratified random sample of rural nurses from hospitals, nursing homes, and community health agencies in North Dakota was invited to participate in this study. Data were obtained via questionnaires. The questionnaire consisted of two parts: the first analyzing demographic data and the second analyzing nutrition knowledge. Nutrition information requests were received by 90.9 percent of the practicing registered nurses. The community/public health nurses had the highest nutrition knowledge scores while medical-surgical hospital nurses had the lowest nutrition knowledge scores. With nutrition information and education being a frequently sought intervention by the rural health client, it would seem that registered nurses should be highly prepared and knowledgeable to meet these clients' needs.

*Abstract:* Certified registered nurse anesthetists (CRNAs) provide the majority of anesthesia services in rural hospitals. Some services provided by CRNAs are routine, while others are for emergency conditions. The effect of the current nurse shortage on the potential pool of nurse anesthetists becomes a critical concern when considering the

## Quick Bibliography Series

nature of CPNA services in rural areas. This study investigated the potential factors that relate to the desire of CRNAs to continue practicing in rural hospitals of North Dakota. All CFNAs licensed in North Dakota ( $n = 125$ ) were mailed survey questionnaires. Approximately five weeks later responses were received from 54 respondents for an overall return rate of 43 percent. Correlational analyses were used to examine responses of the subjects. A moderate degree of relationship was found among the work-related variables. The average interscale correlation, calculated using an  $r$  to  $z$  transformation, for the seven work-related variables was 0.47. Overall, pay and promotion satisfaction exhibited strong ( $r > 0.60$ ) correlations with turnover intentions. Supervisory satisfaction was only moderately ( $r = -0.33$ ) related to intention to quit. These results are discussed in terms of their implications for the management of CRNAs in rural hospitals. Revised salary schedules, clinical ladders for promotions, supervisory training, and the identification of potential performance constraints are suggested as areas in which rural hospitals should focus attention in an attempt to manage turnover in CRNAs.

*Abstract:* This study of 167 nurses in 10 rural Georgia agencies examines the relationships among personal characteristics, factors of job satisfaction, autonomy, and job retention. The findings indicate that, contrary to expectations, personal characteristics (e.g., age, education, salary, marital status, and number of dependents) are not strong predictors of job retention in this sample. Some of the factors of job satisfaction do correlate negatively with indicators of impending job change, but the strongest relationships were those related to nursing autonomy. The study concludes that, of the variables studied, autonomy was the most effective predictor of job satisfaction and intention to remain in the current position.

*Language:* English

*Descriptors:* Health maintenance organizations; Rural health services

*Abstract:* The decline in federal financial support for rural health care may lead rural health care consumers to turn to a once-prevalent private sector model for health care services: health care cooperatives. This study examines the feasibility of health care cooperatives in rural America and whether the corporate structure of a cooperative is a feasible option for rural residents in communities that lack access to primary health care services. The paper will familiarize readers with the

concept of cooperatives and will provide a background for anyone thinking about establishing a rural health care cooperative. The history of health care cooperatives and similar health care systems is reviewed, as are current and past examples of health care cooperatives. As an example of one state's history of cooperatives, experiences in North Carolina will be briefly discussed. Also discussed are several issues that must be considered before developing a health care cooperative: whether the practice will be prepaid or fee-for-service; the importance of professional legal, financial, and organizational assistance; and the personnel practices of the cooperative. Rural health care providers and consumers may find cooperatives a suitable and efficient option for securing health care services for their communities. In establishing a cooperative, organizers must consider whether the corporate structure of a cooperative fits the needs of their communities and of the patients who would join and be served by the cooperative. The views and recommendations expressed in this report do not necessarily reflect the views of the Department of Health and Human Services and the Administration.

*Abstract:* There are approximately 600 Community and Migrant Health Centers (C/MHCs) providing preventive and primary health care services principally to medically underserved rural and urban areas across the United States. The need to develop geriatric programs within C/MHCs is clear. Less clear is how and under what circumstances a comprehensive geriatric program can be adequately financed. The Health Resources and Services Administration of the Public Health Service contracted with La Jolla Management Corporation and Duke University Center on Aging to identify successful techniques for obtaining funding by examining 10 "good practice" C/MHC geriatric programs. The results from this study indicated that effective techniques included using a variety of funding sources, maintaining accurate cost-per-user information, developing a marketing strategy and user incentives, collaborating with the area agency on aging and other community organizations, and developing special services for the elderly. Developing cost-per-user information allowed for identifying appropriate "drawing card" services, negotiating sound reimbursement rates and contracts with other providers, and assessing the financial impact of changing service mixes. A marketing strategy was used to enhance the ability of the centers to provide a comprehensive package of services. Collaboration with the area agency on aging and other community organizations and volunteers in the aging network was found to help establish referral networks and subsequently increase the number of elderly patients served. Finally, development of special services for the elderly, such as adult day care, case management, and health education, was found to increase program visibility, opportunities to work with the network of services for the aging, and clinical utilization.

*Descriptors:* U.S.A.; Health care; Medical education; Graduate study; Rural areas; Recruitment; Rural communities

*Abstract:* Currently, residency training is neither detrimental nor helpful to the problems of rural health. Based on four generally accepted "truths" about rural health, medical schools should recruit students from rural areas, have them choose family practice as a career, and train them in rural settings. Given no substantial changes in residency training, the following recommendations are made. Develop a consensus definition of "rural." Educate rural communities to the purpose of residency training. Residency review committees should support rural rotations of at least six months; consider the number of residencies at a site irrelevant for accreditation; judge the quality of the product as the standard of accreditation; and define teaching competency by other than specialty label. All medical school departments should be involved in seeking solutions to the problems of rural health. New opportunities for funding of rural residency training should be sought. If major changes in residency training are possible, internal medicine, family practice, and pediatrics should merge as a single primary care specialty and for residency training. Only this residency should be considered primary care for residency reimbursement purposes, and only its graduates should be reimbursed for primary care services.

*Abstract:* This paper concerns black midwives who practiced traditional medicine in six central Texas counties, mostly located on the Brazos River. During the years of hospital segregation following the Civil War, the black midwife performed two major functions. Through formal connections with white physicians who taught them the basics of obstetrical care, black midwives were able to pro-

## Health Care in Rural America

vide a better level of health care for black women than otherwise would have been available. The same ties enabled the black midwife to secure assistance from whites for the rural black community. These arrangements improved the health and productivity of rural black families and lessened the severity of the caste system. A sharp decline in the use of black midwives occurred when desegregation reduced training opportunities and the market for their services.

*Descriptors:* Canada; U.S.A.; Health care; Access; Hospitals; Rural areas; Physicians

*Abstract:* This paper considers various aspects of the Canadian health care system and the implications for the improved delivery of rural health care in the United States. The major aspects examined are access to care, rural hospitals, and rural physicians. A search of the pertinent literature revealed a large amount of information concerning rural physicians in Canada, but less that dealt directly with rural hospitals and access to health care in rural areas. Universal access is the cornerstone of the Canadian health care system, which is operated by each province under certain mandates of the federal government, with both providing funding for the system. The diffusion of medical technology has been slower in Canada than in the United States, which is perceived by some as a major success of the system. Little distinction is made between rural and urban hospitals in Canada, with all hospitals funded by annual global budgets from the province, rather than by direct payment for each service provided. Funding for capital items must be requested separately. This method of reimbursement allows better planning in meeting the needs of each community. Physicians in Canada are mostly private practitioners who are reimbursed by fee for service. As in the United States, there has been difficulty in attracting physicians to rural areas. However, all but one province have incentive programs to encourage physicians to practice in underserved rural areas, with some having disincentives for those locating in overserved areas. Overall, the Canadian health care system has chosen to control costs by focusing on the provider rather than the consumer and appears to be more successful in providing access to health care in rural areas of the country.

*Abstract:* This section of The Journal of Rural Health is intended to assist readers in their efforts to keep current in the research literature with a relevance to rural health. In monitoring the journals from neighboring disciplines, we attempt to alert readers to new research and scholarly debate. The scope of this section is, for the most part, limited to publications from the United States. Inclusion of a publication does not represent an endorsement of the research or the validity of the conclusions reported. As research reviews editor, I invite comments on this section. I am particularly interested in innovative ways the section might be used to ensure that the journal's readers are the most erudite professionals involved in rural health.

*Descriptors:* Mountain states of U.S.A.; Health care; Health services; Human immunodeficiency virus; Rural areas; Hospitals; Personnel; Knowledge; Education; Training; Policy; Surveys

*Abstract:* A Survey of 108 hospital administrators in the eight states of the Mountain Census Region was conducted to identify frontier rural hospitals' experiences (fewer than 50 beds) in the provision of care and services to patients with HIV infection; to assess the availability of HIV care and services in these small, remote rural hospitals; and to assess the status of education and policy development related to HIV infection. Of the 62 hospitals that responded, 16 (26%) had provided care and services to HIV-infected patients. Acute inpatient and emergency room care were the services most commonly utilized. An additional 11 hospitals reported the presence of HIV-positive individuals in their medical service areas. Thus, nearly 44 percent of the hospitals were aware of the importance of addressing HIV infection as a local concern. Employees in the hospitals that had experienced caring for HIV-positive persons expressed more concern about acquiring HIV infection than those in hospitals that had not. Four nursing assistants, two registered nurses, and one dietary worker had refused to provide care. HIV education consisted primarily of video programs, presentations by in-house staff, and sending employees away to workshops. Despite this HIV education, most staff remain fearful of caring for HIV infected patients. Major concerns expressed by the hospital admin-

## Quick Bibliography Series

istrators were related to enforcing universal precautions, confidentiality, staff response, community acceptance, and cost of care. Only 30 hospitals (48%) had AIDS policies in effect, and these focused primarily on infection control and universal precautions. The results of the study indicate that frontier rural hospital administrators are aware that increasing numbers of individuals with HIV infection will seek care and services from frontier hospitals.

*Abstract:* American health care is changing dramatically. Health maintenance organizations (HMOs) and other managed care plans are central to this change. Today, the majority of Americans living in metropolitan areas receive their care from these types of plans. The goal of this article is twofold. First, it will discuss the potential implications of HMOs and managed care for physician needs and supply in rural regions. Second, it will derive insight into alternative approaches for meeting rural health manpower needs by analyzing HMO staffing patterns. As HMOs and other managed care plans expand, rural physicians, their practices, and their patients will almost certainly be affected. As described in this paper, most of these effects are likely to be positive. The staffing patterns used by HMOs provide an interesting point of comparison for those responsible for rural health manpower planning and resource development. HMOs appear to meet the needs of their enrollees with significantly fewer providers than are available nationally or suggested by the federal standards. Moreover, HMOs make greater use of non-physician providers such as a nurse practitioners and physician assistants.

*Abstract:* The health status of Indian teenagers in the United States is below that of the general population. The usual barriers to the use of health care services that young people, including young Indians, encounter are compounded in rural areas by distance, isolation, and lack of appropriate services. To overcome these barriers in rural New Mexico, a public health demonstration project (a) established a single location where adolescents can receive multiple, integrated health care services free of charge; (b) set up the initial program of

services at a rural school; (c) established links with existing agencies; and (d) incorporated community action toward creating change. The project began as a joint effort of three communities, the University of New Mexico (UNM), and the Albuquerque Area Indian Health Service (IHS) of the Public Health Service; a secondary level public school soon became a participant. The project is being replicated in two other communities that have formed separate partnerships with UNM and the area IHS; also the New Mexico Health and Environment Department has joined the effort in one community. Preliminary data suggest that the services are being used by a majority of the target population, with the proportions of boys and girls about equal.

*Language:* English

*Descriptors:* North Carolina; Preventive medicine; Children; Medicaid; Physicians; Participation; Rural areas; Medical services; Costs; Program effectiveness

*Abstract:* This study evaluated a method to increase physicians' participation in Early and Periodic Screening, Diagnosis and Treatment (EPSDT), a preventive health care program for Medicaid eligible children. Use of EPSDT can improve children's health status and reduce health care costs. Although the potential benefits of EPSDT are clear, the program is underused; low rates of participation by private physicians contribute to underuse. This study targeted a population of 73 primary care physicians in six rural counties in North Carolina where the physician supply, their participation in EPSDT, and use of EPSDT were low. A mailed intervention packet attempted to address barriers to participation perceived by private providers. The packet consisted of a carefully constructed letter, an informative journal article, and an educational pamphlet. Participation in EPSDT screening increased from 15 to 25 private physicians (67 percent), at a cost, on average, of less than \$30 per recruited provider. Suggestions are presented for adapting the intervention packet to other settings.

*Descriptors:* Michigan; Wisconsin; Substance abuse; Rural youth; Age differences; Sex differences; Religion; Health beliefs; Peer influences; Alcoholic beverages; Tobacco smoking; Cocaine

*Abstract:* The relationships between personal substance use, health beliefs, peer use, sex, and religion were examined using data collected from 265 middle school students in rural northern Michigan and northeastern Wisconsin in January and February 1984. A positive correlation between peer and personal drug use was established. A relationship was also found between health beliefs and personal substance use. In addition, a regression model was able to account for a statistically significant amount of the variance of alcohol, marijuana, and cigarette use in the target population. Recommendations are made concerning future research, methods of improving health education program development, and possible target areas for psychotherapy.

*Language:* English

*Descriptors:* Hospitals, Rural; Rural health services; Rural health services

*Abstract:* Rural hospitals represent almost half of all short-stay nonfederal general hospitals in the United States but have been more severely affected than their urban counterparts by changes in reimbursement, regulation, and technology. One hundred sixty rural hospitals closed during the first eight years of the decade, and the rate of closure is accelerating. This paper uses secondary data sources to examine the structure, role, and content of rural hospitals, both in relationship to the needs of the populations they serve and in comparison with nonrural hospitals. Rural hospitals differ systematically from other hospitals in the United States, with smaller daily censuses, lower occupation rates, shorter lengths of stay, and disproportionately high shares of Medicare patients. They are dominated by very small institutions, with over 1,000 rural hospitals having fewer than 50 beds and an average daily census of 12.1 hospital patients. Nearly half of the smallest rural hospitals—those with fewer than 25 beds—incorporate nursing homes, and in these situations the nursing component has more beds and more patients than the hospital portion of the facility. Small rural hospitals offer a core of basic services to the populations they serve. Emergency, obstetric, and newborn services are virtually ubiquitous in rural hospitals of all sizes, and they are also more likely to offer long-term nursing and home care services than urban hospitals of similar size. The inpatient diagnostic and procedural mix of these institutions demonstrates that they provide care for common medical and surgical conditions of low complexity. Rural hospitals are also relatively inexpensive, representing only six percent of total expenditures for hospital care. Given their central role in supporting the provision of health services to rural

## Health Care in Rural America

areas, the apparent appropriateness of the conditions they treat, and their relatively modest cost, it would seem reasonable to use federal policy to stabilize our previous investment in these institutions.

*Abstract:* The cost and quality of health care is an ever-increasing concern. Responsible people are looking for logical solutions. One solution is the increased involvement of nurse practitioners and certified nurse midwives in the delivery of health care services to patients. This paper reviews the supply, education, and responsibilities of nurse practitioners and certified nurse midwives, government studies of the need for nonphysician providers, the cost-effectiveness of health care delivered by nurse practitioners and certified nurse midwives, and impediments to practice.

*Abstract:* According to the Bureau of Labor Statistics (cf. Crispell, 1990), the medical clerical field is one of the faster growing areas of employment. This paper reports on long-term employment of trainees involved in nontraditional medical clerical programs. These programs were funded by the Job Training Partnership Act (JTPA) and filled both the needs of the local rural health care facilities and the employment needs of unskilled youths and adults. These nontraditional students of low socioeconomic background and poor work history were successfully mainstreamed into university courses and consequently obtained productive employment. A follow-up study was conducted of 64 individuals who completed three different, one-year JTPA programs. The study investigated the following questions: Was the trainee currently employed? If so, was employment related to the training program, and were the quarterly salaries higher than minimum wage and previous salaries? How many different jobs were reported since training? Did the individual retain employment in a rural setting? The JTPA programs at Southern Illinois University included some innovative yet practical components that resulted in very high program completion rates, high initial placement, and a continuing pattern of long-term employment. These components included: emphasis on training for the most needed positions/jobs that matched university capabilities; the pursuit of higher starting salaries; informing participants of support services; training in job hunting and work readiness; using some individualized, competency-based instruction; establishing internship arrangements with prospective employers; and careful matching of the trainee to initial placement site with consideration of personality as well as skills.

*Descriptors:* Florida; Nurses; Work satisfaction; Hospitals; Size; Rural areas; Urban areas; Sociology of work; Individual characteristics; Demography; Salaries; Professional recognition

*Abstract:* Despite recent declines in turnover and vacancy rates, maintaining a stable nursing staff continues to be critical to the effective operation of American hospitals. Job satisfaction is a pivotal element in nurse retention, and organizational theory suggests that some of the factors that influence job satisfaction vary by facility size. This is a study of job satisfaction among a sample of 731 nurses providing direct patient care in 22 hospitals. The sample includes approximately equal numbers of nurses employed in very small rural hospitals (1-49 beds), medium sized facilities located in small towns (50-99 beds), and larger metropolitan institutions (> 100 beds). Differences by hospital size were observed in overall job satisfaction and in five sub-dimensions of that concept (i.e., professional status, task requirements, pay, organizational policies, and autonomy). With the exception of pay, the results indicated that nurses employed in the very small rural hospitals were more satisfied with their jobs. Differences by hospital size were also observed in the personal characteristics of the nurses, several specific aspects of their job, and in their perceptions of job mobility. A set of four hierarchically nested ordinary least squares regression models indicated that job-specific characteristics were the most powerful predictors of job satisfaction.

*Language:* English

*Descriptors:* North Dakota; Nurses; Work satisfaction; Health care; Rural communities; Size; Age differences; Marriage; Family structure; Employment

*Abstract:* A correlation between job satisfaction and employment longevity has been demonstrated by a number of researchers. However, the measurable aspects of job satisfaction only partially explain an individual's tenure at a particular job. Information about the relationship between job satisfaction and retention of community health nurses in a rural state was provided by 258 community health nurses in North Dakota who responded to a mailed questionnaire. Job satisfaction assessment included measures of autonomy, task requirements, salary, benefits, rewards, professional status, organizational climate, and interpersonal interactions. Job satisfaction was analyzed by taking into account the individual importance of each component. While the majority (61%) of the responding nurses indicated that they expected to stay in their current jobs for a period of five years or more, they were dissatisfied with various aspects of their jobs. The greatest factor influencing the nurses' choice of current position was job availability, followed by preferences for the particular health care agencies or communities. These findings indicate that retention of rural nurses should focus on strategies that go beyond improving job satisfaction.

*Abstract:* Responding to health care needs of the elderly has presented great challenges for health care professionals. These problems are compounded in rural communities by physical and social isolation, increased poverty, and lack of transportation. An innovative approach to meeting health needs of rural elderly is through nursing centers. Through an emphasis on health promotion and maintenance of optimal level of functioning, these primary health care facilities can foster independence and self-care for this targeted population. In addition, nursing centers serve as clinical sites for student learning experiences and settings for nursing research. This article focuses on a nursing center established at Edinboro University of Pennsylvania (EUP), which tailors its services to the elderly living in Edinboro. Results of a client satisfaction survey, based on the Risser Patient Satisfaction Instrument, are described in addition to patterns of nursing center usage, general categories of care, teaching interventions, referrals, counseling, and frequency of visits. Findings from the survey indicated a general high client satisfaction level with nursing care received at the center. Discussion also includes plans to expand services to elderly in the community through home visits.

*Abstract:* Archival and follow-up questionnaire data were collected from patients treated in a small rural multidisciplinary chronic pain treatment program in Pocatello, Idaho. Pre- and posttreatment improvement ratings were collected from service providers and patients; post hoc ratings of pain, improvement, activity level, and return to work were collected by questionnaire. A questionnaire return rate of 47% was seen. Findings suggest that the 10-day inpatient treatment program appeared to significantly reduce patients' pain complaints and a 69% return-to-work rate was reported.

*Descriptors:* Florida; Infant mortality; Mothers; Households; Urban areas; Rural areas; Risk; Health; Ethnicity; Age differences; Academic achievement; Marriage; Pregnancy; Health care; Low birth weight infants; Communities

*Abstract:* This research examines the relationship between residence and infant mortality. The purpose of the study was to identify the effects of maternal residence on infant mortality, using a multivariate model which included both individual and county-level variables known to be associated with sub-optimal birth outcome. Data on all births in Florida during 1987 were drawn from birth and infant death certificates. In addition, information concerning county sociodemographic structure and medical resources were gathered and linked to the individual records. After examining the distributions of selected risk variables across a five-category measure of residence (from most urban to most rural), a logit model was estimated to predict the odds of an infant death associated with maternal residence. At the bivariate level, rural residents were found to have increased odds of an infant death compared to residents of all other residence categories. Second, a logit model was estimated that controlled for the influence of important maternal, infant, and county risk characteristics. The results of this second, more fully specified model indicate that residence did not have an independent direct effect on infant mortality when the influence of the other risk factors was controlled. We conclude that although residence does not influence infant mortality directly, it does influence mortality indirectly through its association with key risk factors. In particular, because population characteristics and medical resources are differentially distributed across rural and urban areas, residence remains an important factor to be considered when predicting health outcomes. The implications of these findings for policy-makers and health planners, as well as for health services researchers are also discussed.

*Abstract:* This study examines the supply and selected characteristics of nurses working in non-metropolitan areas of the United States using the most recent data reported in the third national sample survey of registered nurses in 1988. Nursing supply is analyzed in terms of the ratio of registered nurses per 100,000 people for three standard nonmetropolitan census county size classifications and nine regional groupings of states. Seven dimensions relating to the educational background and current professional characteristics of registered nurses are studied. Findings indicate a notable difference in the ratio of nurses per population across county size and regions of the country. In terms of characteristics selected for this study, the educational background, salary gap, and time spent in various activities differentiate nurses in rural areas from those working in urban counties. Results of this study should be particularly relevant because a variety of educational, financial, and other incentives are being considered to address what is perceived to be a crisis in rural nursing availability.

*Descriptors:* California; Nutritional state; Health; Pesticide residues; Food safety; Rural areas; Poverty; Growth retardation; Cholinesterase; Ddt; Nutrient intake; Children

*Abstract:* The nutritional status of 191 rural, low-income subjects from the Porterville-Woodville area of Tulare County, California, was surveyed in 1969 at the request of, and in collaboration with, the medical staff of Salud Medical Clinic, Woodville, California. For comparative purposes, 28 middle-income children from the city of Visalia were also studied. The results indicate that dietary intake was adequate for most nutrients, with the exception of iron. However, a high incidence of microcytosis and low or deficient serum folate levels was observed along with a high prevalence of short stature. Evidence suggestive of organophosphate pesticide exposure was found in the low plasma cholinesterase activity of a number of children. The levels of DDT and DDE in serum were also found to be respectively twice and three times the mean values reported for non-exposed adult males.

*Language:* English

*Descriptors:* U.S.A.; Rural women; Elderly; Woman's status; Mental health; Role perception; Literature reviews

*Abstract:* Older rural women have built upon a rich heritage of courage, optimism, perseverance, and social action. They have acted upon and reacted to economic and social crises that threatened rural institutions and values. Despite these attributes and contributions, they remain largely mythical, uncelebrated, and among the most economically disadvantaged groups. Current economic and social crises occurring in rural areas have important implications for the well-being of older women. This article, drawing upon the historical and empirical literature, suggests that many of the mental health needs of older rural women can best be met by enhancing their proclivity to act upon their environment. Furthermore, it proposes that their history specifies the mechanisms through which their needs can best be met.

*Language:* English

*Descriptors:* North Carolina; Pregnancy; Preventive medicine; Medical services; Insurance; Rural areas; Program effectiveness

*Abstract:* In the period 1985-89, there was a severe drop in obstetrical services in rural areas of North Carolina, partly because of rising malpractice insurance rates. The State government responded

with the Rural Obstetrical Care Incentive (ROCI) Program that provides a malpractice insurance subsidy of up to \$6,500 per participating physician per year. Enacted into law in 1988, the ROCI Program was expanded in 1991, making certified nurse midwives eligible to receive subsidies of up to \$3,000 per year. To participate, practitioners must provide obstetrical care to all women, regardless of their ability to pay for services. Total funding for the program has increased from \$240,000 to \$840,000, in spite of extreme budgetary constraints faced by the State. The program and how its implementation has maintained or increased access to obstetrical care in participating counties are described on the basis of site visits to local health departments in participating counties and data from the North Carolina Division of Maternal and Child Health. The program is of significance to policy makers nationwide as both a response to rising malpractice insurance rates and reduced access to obstetrical care in rural areas, and as an innovative, nontraditional State program in which the locus of decision making is at the county level.

*Abstract:* In the next few years, Our Community Hospital, located in the small town of Scotland

Neck, NC, will undergo a conversion through which it may serve as an appropriate model for similar small hospitals in distressed rural communities. With technical and grant assistance from the Office of Rural Health and Resource Development of the North Carolina Department of Human Resources, the hospital has begun to phase out almost all acute care services and will expand and strengthen its focus on primary care, emergency medical services, and services for elderly persons. This paper addresses four issues of greatest concern to hospital administrators, rural health professionals, academics, and rural residents interested in hospital conversions: (1) community involvement during the planning process; (2) the evolution of the program's structure; (3) financing for the project; and (4) the development of cooperation between state and federal governments, foundations, and private groups. This case study describes one possible course in addressing an acute health care problem facing rural America—the viability of rural hospitals.

*Abstract:* This paper summarizes the responses of rural elderly people to a variety of symptoms experienced during a three-week period. Responses to symptoms included causal attributions, consultation patterns, and intervention strategies. Data recorded in diaries during a three-week period highlight the importance of lay care in the illnesses of older people. Most symptoms were managed by older respondents themselves. When symptoms were discussed with someone else, the consultant was most likely a family member or friend rather

than a health care professional. Only one third of the respondents contacted any formal provider about any of their symptoms. The majority of respondents combined medical and nonmedical explanations in interpreting their symptoms. The most frequent response to a symptom was doing nothing. The next two most commonly reported interventions were over-the-counter medications and activity limitation. Analyses revealed few differences among residential categories in patterns of illness behavior. Rural-urban differences often disappeared when controlling for demographic and socioeconomic background which covary with residence.

19 leaves ; 28 cm. (Rural health working paper series ;). "September 1991", Cover. Includes bibliographical references (leaves 14-16).

*Language:* English

*Abstract:* We surveyed all 37 rural Washington State hospitals with less than 100 beds to determine how rural emergency departments (EDs) are staffed by physicians and to estimate rural hospital payments for ED physician services. Only five hospital EDs (14%) were still covered by the traditional rotation of local physicians, billing fee-for-service. Ten hospitals (27%) paid local private practitioners to provide ED coverage. Twelve other hospitals (32%) hired visiting ED physicians to cover weekends and/or evenings. The remaining ten rural EDs (27%) were staffed entirely by external contract physicians. Thus, 86 percent of rural hospitals contracted for ED coverage and 59 percent obtained some or all of this service from nonlocal physicians. Most of the 32 hospitals with some form of contracted services have changed to this ED coverage in the last few years. The cost of these services is high, particularly for the smallest hospitals which have fewer than eight ED visits per day and pay physician wages of nearly \$100 per visit. Emergency staffing responsibility has shifted from local practitioners to the hospital administrators because of rural physician scarcity and a desire to improve quality and convenience. The cost of these changes may further undermine the economic viability of the smaller rural hospitals.

*Abstract:* We surveyed all 37 rural Washington state hospitals with fewer than 100 beds to determine how rural emergency departments are staffed by physicians and to estimate rural hospital payments for emergency department physician services. Only five hospital emergency departments (14%) were still covered by the traditional rotation of local practitioners and billed on a fee-for-service basis. Ten hospitals (27%) paid local private practitioners to provide emergency department coverage. Twelve other hospitals (32%) hired visiting emergency department physicians to cover only weekends or evenings. The remaining 10 rural emergency departments (27%) were staffed entirely by external contract physicians. Thus, 86 percent of rural hospitals contracted for emergency department coverage, and 59 percent obtained some or all of this service from nonlocal physicians. Most of the 32 hospitals with some form of contracted services have changed to this emergency department coverage in the last few years. The cost of these services high, particularly for the smallest hospitals that have fewer than eight emergency department visits per day and pay physician wages of nearly \$100 per patient visit. Emergency staffing responsibility has shifted from local practitioners to the hospital administrators because of rural physician scarcity and a desire to improve quality and convenience. The cost of these changes may further undermine the economic viability of the smaller rural hospitals.

*Abstract:* Academic health centers in the United States are in danger of becoming more and more irrelevant to the non-tertiary, primary health care needs of modern society. This paper explores options to respond to one segment that repeatedly has been demonstrated to be in distress: rural health care. Recommendations are made about selective recruitment into medical and other health schools to address the issue, early professional socialization, curricular reform and the types of technical assistance that academic centers might well provide to rural practitioners and caregiver institutions.

*Abstract:* The failure to provide adequate prenatal care for low-income pregnant women in the United States and the effects of this failure on infant mortality are well known. Many studies have identified institutional barriers against access to care as a major cause. To overcome these barriers, Public Health District V, South Central Idaho, has created a comprehensive prenatal health care model that has almost tripled participation in its program during the first year of implementation and increased it again significantly during the second year. This decentralized pregnancy program has succeeded in getting all of the physicians offering obstetrical care in the district to serve low-income pregnant clients on a rotating basis. The new program provides pregnancy testing as well as financial screening services. Also, it has combined support services into one-stop-shopping clinics that include an innovative expansion of the Women, Infants and Children (WIC) Program of the U. S. Department of Agriculture. WIC food vouchers help attract clients into the prenatal care system and keep them coming. Enrichment of the duties of the public health nurse provides case coordination that pulls together the patchwork of medical

and support services for the pregnant client.

*Language:* English

*Descriptors:* Rural health services; Medically underserved areas; Health promotion

*Abstract:* This paper describes the experience of operating a mobile primary care clinic. The clinic serves low-income, medically underserved communities in Pima County, Arizona. Over a period of ten years, the Rural Health Office of the University of Arizona has operated two mobile units. The unit presently in use began operation in mid-1987. The program philosophy and history are recounted. Each of the services, Primary Care, Health Promotion and Disease Prevention, Health Professional Education, and Community Involvement, are outlined, as well as utilization patterns and client demographics. The effectiveness of a mobile unit in the provision of primary care, including client acceptance and potential for meaningful community involvement, is addressed.

*Abstract:* Debates about the accessibility, costs, and coverages of health care for the population at large have recently accelerated. This paper addresses some of the demographic, health, and fiscal ramifications of creating a preventive health care bridge to children in uninsured and underinsured families in two rural Wisconsin counties. The study findings revealed that the initial health status of children making a preventive health visit under a minimal copayment plan was noticeably worse than the status of those who had the free Early and Periodic Screening, Diagnosis, and Treatment (EPSDT) program available to them on a more or less continual basis. Upon their first visit, the children who did not have access to a free EPSDT program had a greater number of medical and dental health problems and fewer preventive dental care visits than their EPSDT contemporaries. Beyond a greater number of problems, however, we found no noticeable differences between the two groups in the types of health problems present (i.e. the clinical distribution of the problems was similar across the two groups). This paper also contrasts referral completion rates and rates of diagnostic confirmation of identified problems between the two groups. Finally, we provide estimates of the cost of coverage for each unprotected child.

**Readmission following surgery in Washington State rural hospitals.**

Welch, H. Gilbert

Seattle, Wash. : WAMI Rural Health Research Center, Dept. of Family Medicine, Research Section, University of Washington.

23 leaves : ill. ; 28 cm. (Rural health working paper series ;). January 1991. Includes bibliographical references (leaves 14-15).

*Language:* English

*Abstract:* Because of concern about the quality of care in rural hospitals, we examined readmission following four surgical procedures commonly performed in Washington state rural hospitals: appendectomy, cesarean section, cholecystectomy and transurethral prostatectomy. Readmissions to any hospital in the state within 7 and 30 days of discharge were identified and compared to corresponding data for urban hospitals. During the two-year period examined, there were no significant differences in readmission rates for surgeries performed in rural and urban hospitals. Readmission rates for all four procedures were nominally

## Quick Bibliography Series

lower in rural hospitals. Analyses which either restricted age or excluded Medicaid, self-pay, charity, and rural patients receiving care at urban facilities did not change these results. Investigating readmission rates following common surgeries, we found no evidence of low quality care in Washington state rural hospitals. Early readmission is an imperfect marker for poor surgical outcome, however, and other proxies for quality remain to be examined.

*Language:* English

*Descriptors:* Arizona; Nurses; Nursing; Rural areas; Medical education; Clinical experience; Educational programs

*Abstract:* An objective of exposing health profession students to rural clinical experiences was to overcome problems of geographic maldistribution of health personnel. Nevertheless, little can be said about the impact of rural training rotations on the supply of health personnel in rural areas or on students' decisions about where to practice. To assess the relationship between rural clinical rotations and practice locale, surveys were administered to all applicants taking registered nurse exams in Arizona in July 1990, February 1991, and July 1991. The students most likely to be working in rural locations were rural high school graduates with rural clinical experience during nursing school. Students who were urban high school graduates with rural clinical experience were only slightly less likely to locate in rural areas. Rural and urban high school graduates with no rural clinical experience were far less likely to choose rural practice. Rural rotations were associated with rural job selection only if students attended rural educational programs.

*Language:* English

*Descriptors:* U.S.A.; Nursing; Medical education; Health care; Rural areas; Program evaluation; Regional surveys

*Abstract:* This paper discusses research on the role of nursing education in preparing students for rural practice. The purpose of the research was to learn how education programs respond to unique features of rural nursing. Results from a two-phase nationwide survey of 275 baccalaureate nursing programs are presented. The first phase identified programs offering a rural track, the second phase was a follow-up survey to the deans and faculty of rural-oriented programs. These findings indicate educators recognize that rural nursing differs from urban nursing because of cultural and demographic features, as well as technical and economic characteristics. Most educators believe their role should include developing student interest in rural practice. Recommendations from the findings are presented.

*Descriptors:* Florida; Physicians; Personnel management; Rural communities; Attitudes; Perception; Health services; Surveys

*Abstract:* This study was undertaken to investigate issues affecting recruitment and retention of physicians in a rural north Florida community. As part of this investigation, the authors examined the relevant context of medical care and physician practice for this community. The results identify a number of problems not uncommon in rural communities and supported by previous literature. Physicians felt isolated, dissatisfied with job security and professional autonomy, and frustrated by a lack of cooperation among the major providers of health care. More importantly, upon closer scrutiny, some of the most appealing characteristics of this community for incoming physicians become its weaknesses. Access to a regional medical center nearby and nearness to a metropolitan area were both cited as positive attributes to their choice of practice location. In this community, however, these appear to have resulted in a highly divided medical system. Many of the employed and insured patients in the country prefer to get their medical care in the nearby city. At the same time three separate entities within the community, a federally funded community health center, a county public health unit, and a community hospital, are expected to provide services for the poor and uninsured. The resulting lack of a comprehensive approach to provision of services contributes significantly to the dissatisfaction among providers and to their ultimate retention.

*Abstract:* The issue of rural hospital closings in the United States in recent years has become of increasing concern to health care policy analysts.

## Health Care in Rural America

Rural communities face unique health needs, necessitating access to local health care. Much has been written about the social, economic, legislative, and technological changes that have increased the stress on rural hospitals in the 1980s. However, quantifiable models have been lacking with which to examine in detail factors associated with rural hospitals and to correlate such factors with individual hospitals' risks of closing. In this study, we identify variables correlated with rural community hospital closures in the period 1980-87. Using epidemiologic case-control methods, 161 closed rural hospitals were matched 1 to 3 with a control group of 483 rural hospitals which remained open during the same period. A series of hospital performance indicators and demographic, economic, and social community variables were entered into a multiple logistic regression model. Four variables were found to be positively correlated with risk of closure. They are for-profit ownership; nongovernment, not-for-profit ownership; presence of a skilled nursing or other longterm care unit; and the number of other hospitals in the county. Variables negatively correlated with risk of closure were accreditation by the Joint Commission on the Accreditation of Healthcare Organizations, the number of facilities and services, and membership in a multihospital system. Policy and research implications at the Federal, State, and local levels are discussed.

1990 Dec. Paper presented at the 1990 Invitational Symposium "Rural Health: A Challenge for Medical Education," February 1-3, 1990, San Antonio, Texas. Includes references.

*Language:* English

*Descriptors:* U.S.A.; Health care; Rural areas; Medical education

*Abstract:* The many changes that have affected the health care system over the last decade have had a substantial impact on the rural areas of the nation. These changes include implementation of the prospective payment system, the resource-based reimbursement system for physician services, and a host of other state- and federal-level initiatives in health care. Rural America is also experiencing dynamic changes as part of the globalization of the nations economy. Themes from the symposium include the issue of differences between urban and rural primary care, selection of medical students, continuity of care, funding of graduate medical education, and effective methods of rural physician education, including new uses for technology. The summary analysis recommends that the Association of American Medical Colleges form a task force on rural health and medical education to begin an active dialogue on how medical education can effectively respond to the challenges of rural health during the coming decade.

*Abstract:* Although patient education has always been recognized as an essential function of a hospital, it was not until the health concerns of the nation focused on prevention that hospitals began to develop activities aimed at primarily healthy individuals. Hospital health promotion evolved from patient education about specific diseases to programs focused on modifying of lifestyle practices to prevent future debilitating conditions. Studies conducted in the early 1980s show hospital-based health promotion programs increasing in number and including such target populations as senior citizens, children, business people, and hospital employees. However, the extent of involvement of the rural hospital in offering health promotion programs has not been clearly established. The current study was conducted to determine the status of health promotion programs in rural North Carolina hospitals. Elements considered were types of programs, target audiences, methods of financing, staff use, and availability of specialized facilities for health promotion programs. The results indicate rural hospitals do offer health promotion programs, but their primary focus is on hospital employees. Most programs are offered at low or no cost, making those offered for the community readily accessible. If input from the community is used and programming is aimed at specific health needs of rural populations, the rural hospital could make a significant contribution to an overall primary prevention strategy, lowering community health care costs.

## Quick Bibliography Series

*Abstract:* Hospital closures in general, and rural hospitals closures in particular, have received widespread attention from policymakers and the media. Between 1980 and 1987, 364 U.S. community hospitals closed or stopped providing inpatient chronic or acute medical care. There is no single strategy to keep rural hospitals open in the many rural communities which are in danger of losing what is often their only source of medical care and an important component of their local economy. These hospitals do have some problems in common, such as an unfavorable differential in Medicare reimbursement rates between urban and rural areas, small size which often means higher costs and an inability to benefit from economies of large-scale purchasing, and slimmer margins and reserves which make them less able to absorb financial pressures. For example, when presented with a Medicare patient whose cost of care exceeds the amount allowed by Medicare, a small hospital will feel this deficit more keenly, as it has fewer patients over which to spread out and recoup the loss. The following case study of the decisions made by a small, rural hospital in eastern North Carolina illustrates how these institutions must stretch their resources in order to survive.

*Abstract:* This research examines the impact of prospective payment (PPS) on the financial performance of Kansas hospitals, which are predominantly rural. Financial ratios are presented and regressed on bed size and year. The data suggest that bed size has the strongest effect on financial viability. There are indications of a delayed effect of PPS on the rural, smallest hospitals (fewer than 25 beds), suggesting that non-operating sources of revenue (local property tax mill levies) are being used to subsidize them in the short term. Small hospitals appear to be delaying all capital and long-term costs to survive. The research suggests that the effect of PPS may be long term.

*Abstract:* Solo practice is the dominant mode of rural medical care delivery. At the same time, it is the most likely not to succeed, because the solo physician is choosing to leave the rural community. Group family practice is the most stable form of rural practice, is acceptable, and is sought by the majority of family practice residents seeking to establish new practices. Characteristics of successful rural practices include group practice, retention of the same health care providers for more than three years, a community-oriented focus, integration of

*Abstract:* It is often assumed that poor birth outcomes are more common among rural women than urban women, but there is little substantive evidence to that effect. While the effectiveness of rural provider and hospitals has been evaluated in previous studies, this study focuses on poor birth outcome in a population of rural residents, including those who leave rural areas for obstetrical care. Rural arid urban differences in rates of inadequate prenatal care, neonatal death, and low birth weight were examined in the general population and in subpopulations stratified by risk and race using data from five years (1984-88) of birth and infant death certificates from Washington state. Also examined were care and outcome differences between rural women delivering in rural hospitals and those delivering in urban facilities. Bivariate analyses were confirmed with logistic regression. Results indicate that rural residents in the general population and in various subpopulations had similar or lower rates of poor outcome than did urban residents but experienced higher rates of inadequate prenatal care than did urban residents. Rural residents delivering in urban hospitals had higher rates of poor outcomes than those delivering in rural hospitals. We conclude that rural residence is not associated with greater risk of poor

birth outcome. White and nonwhite differences appear to exceed any rural and urban resident differences in rates of poor birth outcome.

*Language:* English

*Descriptors:* Pennsylvania; Prescriptions; Drugs; Elderly; Rural areas; Urban areas; Health care; Health services; Demography; Geographical distribution; Health insurance; Longitudinal studies

*Abstract:* Despite documentation that rural elderly have reduced access to both primary care and specialist physician services there have been very few studies comparing rural and urban patterns of prescription drug use. This is unfortunate, because prescription drugs are the most commonly used type of health care by the elderly. This research merged claims data for a random sample of 18,641 enrolled elderly in the Pennsylvania Pharmaceutical Assistance Contract for the Elderly (PACE) for the years 1984 through 1988 with Medicare inpatient and outpatient health services records and with county-level demographic and health services resources data bases to test several models of factors associated with prescription drug use. The Human Resources Profile County Code from 1980 census data (HRPCC80) in the Area Resource File provided a very detailed (10 levels) definition of rurality. Consistent with our hypotheses based on preliminary studies, neither rurality designations nor county-level health care resource indices, nor interaction terms of health services resources with rurality were powerful predictors of prescription drug use. Use of health services (from Medicare data) and variables of longevity and continuity in the PACE program were consistently robust predictors of prescription drug use. Personal demographic characteristics were also strong predictors: white widowed women under age 85 with relatively higher incomes used more prescription drugs.

*Language:* English

*Descriptors:* U.S.A.; Depression; Mental health;

Health care; Psychotherapy; Rural population; Urban population; Perception; Attitudes

*Abstract:* Stigma may be a particularly important barrier to mental health care in rural communities where lack of anonymity increases the probability that someone who seeks care will be labeled "crazy." This study examined rural-urban differences in the stigma associated with depressive symptoms and the stigma associated with seeking treatment for depressive disorders. In addition, the study compared how the stigma associated with seeking treatment predicted use of care in rural and urban residents with a history of depressive symptoms. Two hundred subjects from metropolitan and adjacent non-metropolitan counties rated one of four randomly selected vignettes using 14-point semantic differential scales. The findings indicated that rural residents with a history of depressive symptoms labeled people who sought professional help for the disorder somewhat more negatively than their urban counterparts. Logistic models controlling for sociodemographic characteristics demonstrated that the more negative the labeling, the less likely depressed rural residents were to have sought professional help. Labeling was not associated with use of care among urban people with depressive symptoms. We concluded that prospective studies are warranted to inform the development of interventions to decrease the stigma associated with seeking treatment for depressive disorders in rural communities.

*Language:* English

*Descriptors:* Idaho; Self care; Adults; Health; Illness; Wellness; Medicine; Physicians; Health services; Rural areas; Attitudes; Age differences; Sex differences; Academic achievement; Family size; Marriage; Household income; Geographical distribution

*Abstract:* Self-care and illness response to a recent medical event were examined based on a mailed questionnaire to a random sample of 416 adults in a frontier area in north-central Idaho. A total of 494 questionnaires were returned (45% response rate), and 78 were eliminated. Self-care behaviors were classified as: (1) waiting to see what would happen, (2) purchasing or taking a nonprescription medication, (3) taking a prescription medication that was on hand, (4) taking both a prescription and a nonprescription medication, (5) contacting a physician, and (6) going to a hospital. These six variables were classified into three intervention constructs of no intervention (waiting), informal intervention (self-medicating), and formal intervention (contacting a health care professional). Fifty-six percent of the respondents reported self-medicating behaviors. Correlation analysis indicated that initial self-care and illness response behaviors in this frontier area were generally appropriate. Three multiple discriminant models were tested to differentiate those people who waited, self-medicated, and contacted formal providers from those who did not. A significant model could not discriminate between those who waited and those who did not. Models for self-medicating and contracting formal providers correctly classified cases 60 to 70 percent of the time.

The analyses indicate that self-medicating was more likely to be reported by younger individuals, by those who lived further from the hospital, who perceived their health status to be better, who reported less satisfaction with community health care services, and that the self-medicating was appropriate.

*Abstract:* To meet the needs of a large indigent rural population, a rural regional referral hospital in northeastern Kentucky developed a maternity program that utilizes nurse midwives and family physicians as the primary medical providers with support from obstetricians. After five years, the number of deliveries at the hospital has increased almost 30 percent, and the maternity center is now responsible for more than 70 percent of all deliveries at the medical center. Accounting for the large increase in the number of deliveries is an increasing number of women from surrounding areas who now utilize the maternity center and the hospital for their obstetric care. During the same

## Health Care in Rural America

time, there has been a corresponding decrease in deliveries to women with no prior prenatal care and a shift toward obtaining earlier prenatal care in the hospital service population. Results of the study suggest that combining the skills of nurse midwives and family physicians with surgical backup provided by a consulting obstetrician is an effective means of meeting the health care needs of an indigent, underserved rural population.

*Abstract:* Over the past decade national policymakers have grappled with the increasingly difficult issue of implementing programs which sustain the viability of the rural health care system.

The set of problems that are of major concern to these decisionmakers include: (1) the shifts in the utilization patterns away from the rural health care delivery system; (2) the impact of modification in the health care reimbursement system which disproportionately favors urban health systems; and, (3) the continuing difficulty in affecting the disproportionate supply of health providers in urban areas compared to rural settings. The complex nature of health services research demands a multidisciplinary approach especially on sociocultural problems such as rural health delivery. Effective analysis in health care crosses many disciplinary boundaries such as medicine, nutrition, economics, sociology, and public health among others disciplines. A major concern to many of these rural health research analysts is the ad hoc treatment of the rural populace in federal and state health policy decisionmaking. The key to understanding the variance in treatment of rural health can be appreciated by reviewing the accuracy of rural definitions. In the present study, a refined rural definition is proposed which will assist research analysts in providing greater information on the distribution of rural health care services. A preliminary analysis of the proposed definitions indicates that a more precise measurement of rural provides greater accuracy in determining the medical needs of rural areas. Adaptation of the concept will benefit the decisionmaking process through improvements in the methodological approach to rural health research. State legislators, regional and state planning agencies, federal funding agencies, foundations, and other programs involved in support of rural life program will be better able to assess the impact of programs through use of the new definition.
