## ABSTRACT

This report, based on the results of the fifth biennial survey of humanities doctorate recipients, describes the demographic and employment characteristics of humanities Ph.D.s who received their degrees between January 1942 and June 1984 and were residing in the United States in February 1985. The number of humanities Ph.D.s in 1985 was estimated to be $90,600,6.3$ percent above the 85,200 estimated for 1983. Of these, 83,300 were in the lajor force, 6.9 percent above the 77,900 estimated for 1983. The survey variables include the field of the doctorate, year of Ph.D., gender, racial/ethnic group, and citizenship. The report covers: (i) doctoral population by field; (2) employment; (3) median annual salary; and (4) academic employment. The appendices include a survey of the questionnaires; sampling frame, sampling error, and response rates; weighting procedure; and fields of employment. Among the findings were that of those who achieved the rank of full professor, the percentage for men was approximately twice that for women (45.3 percent versus 23.8 percent respectively). (NL)

1986

NOTICE: The project that is the subject of this report was approved by the Governi: g Board of the National Research Council, whose members are drawn from the councils of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine.

This report has been reviewed by a group other than the authors according to procedures approved by a Report Review Committee consisting of members of the National Academy of Sciences, the National Academy of Engineering, and the Institute of Medicine.

The National Research Council was established by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy's purposes of furthering knowledge and of advising the federal government. The Council operates in accordance with general policies determined by the Academy under the authority of iis congressional charter of 1863, which establishes the Academy as a private, nonprofit, self-governing membership corporation. The Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in the conduct of their services to the government, the public, and the scientific and engineering communities. It is administered jointly by both Academies and the Institute of Medicine. The National Academy of Engineering and the Institute of Medicine were established in 1964 and 1970, respectively, under the charter of the National Academy of Sciences.

This study was supported by Contract No. SRS-8215829 between the National Academy of Sciences and the National Endowment for the Humanities (via an interagency agreement with the National Science Foundation).

## ACKNOWLEDGMENTS

The 1985 Profile was prepared under the auspices of the Office of Scientific and Engineering Personnel (OSEP) of the National Research Council. Support for the project was provided by the National Endowment for the Humanities.

The Survey of Doctorate Recipients (SDR) project, under the administrative supervision of Betty D. Maxfield, received assistance from OSEP's Data Processing Section: Eileen Milner and Mary Wanyoike supervised the coding of the returned questionnaires, and George Boyce updated and generated the data files for the survey project. Prudence Brown, research associate with the SDR Office, was responsible for all summary statistics and graphics in the report.

Jeffey Thomas served as the responsible staff officer at the National Endowment for the Humanities and assisted the program staff in developing the draft outiine for the report. Along with members of the Humanities Advisory Panel, he provided helpful advice about revisions to the draft report.

Prior to publication, the report was reviewed by James H. Mulligan, Jr., chairman of the OSEP Advisory Committee; Cora Marrett, a member of that Advisory Committee; John O'Connor and O. B. Hardison, members of the Humanities Advisory Panel, Alan Fechter, OSEP's executive director, and Linda S. Dix, OSEP's reports officer/editor. Their helpful suggestions and comments were incorporated into the final document.

Finally, the humanitnes Ph.D.s who responded to the 1985 Survey made this report possible. Their continual cooperation and ass.stance with this longitudinal survey is greatly appreciated.

## FOR FURTHER INFORMATION

Further analyses of the 1985 survey data will be done in 1986, and additional reports will be forthcoming. Meanwhile, questions may be directed to:

## SUMMARY OF FINDINGS

This report, based on the results of the fifth biennial survey of humanities doctorate recipients, describes the demographic and employment characteristics of humanities Ph.D.s who received their degrees between January 1942 and June 1984 and were residing in the United States in February 1985. In addition, results from the 1985 Survey are frequently compared to results from previous Surveys of Doctorate Recipients.

## Population Level and Trends

- The number of humanities Ph.D.s in 1985 was estimated to be $90,600,6.3$ percent above the 85,200 estimated for 1983 . Of these, 83,300 were in the labor force, 6.9 percent above the 77,900 estimated for 1983.

Figure I Humanities Ph.D. population, by field of doctorate, 1985 ( $\mathrm{N}=90, \mathrm{~F} 00$ ).

- Among the numanities disciplines, the greatest increases in numbers since 1981 wore noted for the fields of English/American languages and literature, nodern languages and literature, and music.

NOTE: For comparison purposes with earlıer reports, American history and "other history" have been combined in this figure. The decrease noted for Ph.D.s in speech/theater between 1977 and 1981 was more a result of changes in definition for this field than an actual decrease in Ph.D. prorluction. The field designated "other humanities" is not shown because the rields included in this category have changed over the years.

Figure II Distribution of the humanities doctoral population, by field, 1977, 1981, 1985.

Field Mobility
"Field mobility" is defined as "being employed in a field that differs from the field in which an individual earned his or her Ph.D."; thus, it is synonomous with "lack of retention" by a field

- Overall, the fields of music (86.1 percent) and art history (84.8 percent) had the highest rates of retention, or the lowest occurrences of field mobility. The fields of "other humanities" ( 42.9 percent) and "other history" ( 56.8 percent) had the lowest rates of retention, or the highest occurrences of fied mobility.
- Although there is variation by field, 22.0 percent of the humanities doctorates reported that they were employed in nonhumanities fields in 1985 ( 5.4 percent of these were employed in education).

## Labor Force Utilization

In general, the percentages of humanities doctorates who were in the labor force (i.e., those employrd full-time or part-time, those on a postdoctoral appointment, and those unemployed but seeking employment) during February of the survey year have remained frirly stable.

- In 1985, 83. U percent of the humanities doctorate- were employed on a full-time basis, 7.1 percent were employed part-time, 0.3 percent held postdoctoral appointments, and 1.5 percent were not employed but were seekirg employment -a total of 91.9 percent. The percentages of humanities Ph.D.s in the labor force for 1981 and 1077 were 91.7 percent and 92.4 percent, respectively.

## Trends in Jeb Oppo:tunities

Academe continued to be the prircipal empioyer of humanities Ph.D.s in 1985 ( 82 percent were working in educational institutions). This reflects a steady decline since 1977, when 88 percent of the humanities Ph.D.s were so employed.

- Business/industry not only continued to be the second most frequent employer of humanities Ph.D.s, but the percentage of humanities Ph.D.s employed in this segment has increased steadily since 1977. By field, approximately 10 percent of the Ph.D.s in the fields of music, speech/theater, philosophy, and "other humanities" reported being employed by business/industry in 1985.

Figure III Distribution of employed humanists, by selected types of employers, 1977, 1981, 1985.

- Recent Ph.D.s were far less likely than the total Ph.D. humanities population to be working in 4-year colleges/universities and more likely to be employed by 2 -year colleges and elementary and stcondary schools.

Teaching continued to be the most frequently reposted primary work activity for humanities Ph.D.s. Since 1981, however, there has been a steady decline in the percentage of Ph.D.s engaged primarily in teaching (from 69.7 percent in 1981 to 63.5 percent in 1985) and a slight increase in the percentage of those engaged in management/ administration, the secon ' must frequently reported primary work activity (from 11 percent in 1981 to 12.9 percent in 1985).

- There were variations across fields. In modern languages and literature, 68.4 percent were primarily engaged in teaching. However, only 60.8 percent of American history Ph.D.s and 57.8 percent of "other history" Ph.D.s we-c similariy engaged. Managementiadministration wa. the primary activity $r f$ over 16 percent of history doctorates.
- Compared to the total humanities population, those Ph.D.s who earned their doctorates in the humanities between 1979 and 1984 had slightly lower percentages primarily engaged in teaching ( 62.2 percent) and management'administration ( 8.8 percent), but a higleer percentage primarily engaged in research and developinent ( 7.0 percent compared to 4.9 percent for the total group).

Figure IV Distribution of employed humanists, by selected primary work activities, 1977, 1981, 1985.

## Salary Trends and Patternc

The median annual salary of humanities Ph.D.s employed full-time in 1985 was $\$ 34,600$, a 12.7 percent increase from the 1983 median salary of $\$ 30,790$. This in.crease reversis a trend noted in earlier survevs in which each subsequent survey showed a higher percentage increase in median annual salaries reported by humanities Ph.D.s.

- Median salaries ranged from a high of $\$ 37,300$ for Ph.D.s in American history to a low of $\$ 31,500$ for Ph.D.s in the general category, "other huinanities."
- Men had median annual salaries of $\$ 35,800$; women, $\$ 30700$.
- In general, the median annual salaries of men and women became more disparate with the increase in the number of years since the Ph.D. was awarded.
- The highest median annual salaries were earned by those employed in 4-year colleges/universities/medical schools and in 2-year colleges (\$35,100 and \$35,000, respectively). The lowest median annual salaries were earned by those in elementary/secondary schools and in business/industry (\$30,000 and \$30,800, respectively). Salaries of those employed in government increased from $\$ 28,000$ in 1983 to $\$ 33,500$ in 1985, an increase of more than 17 percent.

## Academic Employment

In general, the percentage of men who had achieved the rank of full professor was approximately twice that of women ( 45.3 percent vs. 23.8 percent, respectively), but the situation was reversed for the rank of assistant professor (25.1 percent for women vs. 12.9 percent for men).

The percentage of both men and women in nontenured jobs has increased since 1983.

## Demographic Characteristics

Results from the survey showed that the percentage of women in the humanities Ph.D. population continued to increase slowly. Of the total Ph.D. humanists in the United States in February 1985, 29.7 percent were women, compared to 28.5 percent in 1983 and 27.2 percent in 1981.

- Members of racial/ethnic minority groups constituted 6.6 percent of the humanities Ph.D. population in 1985, compared to 6.2 percent in 1983. Arulber Prowisad by Enc

# INTRODUCTION AND OVERVIEW OF SURVEY METHODOLOGY 

The Survey of Doctorate Recipients (SDR), developed in 1973 to respond to the needs of the federal government for information on Ph.D. scientists and engineers in the Unite, States, has been conducted on a biennial basis since its inception. Humanities doctorates werc added to the sumple in 1976 and were surveyed for the first time in 1977.

The survey sample is longitudinal--i.e., individual members of the sample are resurveyed every two years. With each cycle, Ph.D s from the two earliest years are deleted, and Ph.D.s fiom the two most recent years art added, resulting in the maintenance of a 42-year span of coverage of doctorates.

This report is based on the fifth biennial survey of humanities doctorates, ${ }^{1}$ who obtained their degrees between January 1942 and June 1984 and were residing in the United States in February 1985. This introductory section is followed by an examination of geographic differences, field-switching tendencies, and demographic ciaracteristics. The next section presents an employment profile of the humanities doctorates and includes data on employment status, type of employer, and primary work activity. Because changes in the characieristics of a field are often first observed among the most recent graduates, statistics on Ph.D.s who graduated between 1979 and 1984 are reported separately from and compared to those for the total population of humanities Ph.D.s for several variables in this section. The employment section is followed by special analyses of median annual salaries of humanities Ph.D.s by gender, years since doctorate, and type of employer. In addition, data on those Ph.D.s who reported being academically employed in 1985 are presented in the closing section of the report.

The reader should note that the report is limited to the presentation of a statistical profile of these doctorates; the causal factors that underlie the statistical data are purposely not analyzer.

## The 1985 Sample

The 1985 SDR humanities file contains data on 95,787 individiuals who earned doctorates between January 1942 and June 1984. Foreign citizers who, at the time they received their degrees, indicated that they intended to leave the United States were excluded from the file.

The sampling frame ${ }^{2}$ was stratified to assure coverage of all significant subpopulations. The stratification variables were f.eld of doctorate, year of Ph.D., gender, racial'ethnic group, and citizenship. Each stratum had a sampling rate that varied from 3 to 100 percent, so as to provide a sufficiently large sample for small subgroups of the population. Within each stratum, a simple random sample was selected. The sample sizes

[^1]for the stratification categories are given in Appendix D. The overall sampling rate, from the roster of $95,787 \mathrm{Ph} . \mathrm{D} . \mathrm{s}$, was 16.2 percent.

## Survey Methodology

The survey sample included 15,504 humanities doctorates, of whom 587 were not surveyed in 1985 because information from previous surveys indicated that they were deceased or out-of-scope. ${ }^{3}$ The active sample, therefore, consisted of 14,917 individuals.

The first mailing of the 1985 survey was conducted in April 1985, and the followup mailing to those who had not yet responded took place in May 1985. An abbreviated questionnaire (see Appendix A) was mailed to the remaining nonrespondents in September 1985. The special form coniained preprinted information that had been provided by the sample members in previous National Research Council surveys. The respondent was asked to verify this information as well as to provide responses to a few questionnaire items.

## Weighting of Responses

Responses are defined as the total number of (1) completed questionnaires returned by sample members and (2) questionnaires returned with an indication that the sample member was deceased. Information was collected on 9,047 of the 14,917 individuals in the survey sample, yif ${ }^{\text {ing }}$ a response rate of 60.6 percent. ${ }^{4}$ The response rate, when calculated on the bas* 'those in the sample who were actually contacted $(13,560)$, was 66.7 percent.

Population essimates were made by weighting the responses received. Individuals known to be deceased or out-of-scope prior to the survey were excluded from the survey and weighted by sample weights (i.e., the ratio of a stratum's population size to its sample size). The responses received from the survey sample $(14,917)$ were weighted by the product of the weight for nonresponse and the sample weight. The weight for nonresponse is the ratio of the number of survey sample cases in the stratum to the number of responses in the stratum. The weighting procedure is explained further in Appendix E. The estimated population size using all responses $(95,787)$ is higher than the sum of the population estimates in the report $(90,600)$, since it includes those known to be deceased and individuals residing in foreign countries.

[^2]
## DOC'INRAL POPULATION BY FIELD

An estimated 90,600 individuals earned doctoral degrees in the humanities 5 between January 1942 and June 1984 and were residing in the United States in February 1985. This number represents a 6.3 percent increase from 1983, slightly higher than the 5.9 percent increase from 1981 to 1983 but lower than the 6.7 percent increase from 1979 to 1981.6

The humanities fields with the largest numbers of Ph.D.s continue to be English/ American languages and literature ( 23,700 , or 26.3 percent of all humanists), modern languages and literature ( 16,000 , or 17.6 percent of humanists), and history, which has been divided into two separate fields for analytical purposes--American history $(8,800$. or 9.7 percent) and "other history" ( 12,500 , or 13.8 percent).

Of the total 90,600 humanities doctorates, approximately 18,000 were employed in nonhumanities fields ( 4,400 in education ${ }^{7}$ ), and another $8,700^{8}$ were not employed. These two groups represent approximately 30 percent of all humanities doctorates.

Table 1 gives the distribution of $194 \_-1984$ humanities doctorates in the United States by field of datorate and field of employment as of February 1985. For all fields except the general category of "unspecified other humanities," the number of Ph.D.s with degrees in specific fields equals or exceeds the number employed in those fields. The greatest disparities were noted for the fields of English/American languages and literature (23,700 degrees earned compared to 15,800 individuals employed, a difference of 7,900 ), "other hisiory" ( 12,500 degrees eamed compared to 7,500 individuals working in the field, a difference of 5,000 ), and modern languages and literature ( 16,000 degrees earned and 11,000 individuals employed, again a difference of 5,000 ). As noted earlier, these three fields were also the largest humanities fields in terms of Ph.D. production. The reader is cautioned in the interpretation of these figures, however, because the field of employment numbers include Ph.D.s from a variety of humanities fields, not just those who remain in the same field (i.e., not all of the 15,800 Ph.D.s employed in English and American

[^3]TABLE 1 Distribution of Humanities Ph.D.s in the United States (1942-1984 Graduates), by Field of Doctorate and Field of Employment, 1985

| No Report on Employment Field |  |  | 1,500 | 1.6 |
| Not Employed |  |  | 8,700 | 9.5 |

[^4]languages and literature have degrees in those fields). The magnitude of this field switching is explained more fully in the section on field mobility. ${ }^{9}$

## Geographic Differences

The regional distribution of humanities Ph.D.s in the United States in 1985 (see Figure 1) was close to that of the total population except in New England, which had 10.2 percent of the humanities Ph .D.s but only 5.3 percent of the total population. The Middle Atlantic and South Atlantic regions had the most humanities doctorates--16,300 ( 18.5 percent) and 15,500 ( 17.1 percent), respectively. The regions with the fewest humanities Ph.D.s were the East South Central region (4,000, or 4.4 percent) and the Mountain region ( 4,300 , or 4.8 percent).

"Includes Alaska and Hawail.
NOTE: By region, Census Bureau estimates for the total U.S. population in 1985 are broken down as follows: New England, 5.3 percent; Middle Atlantic, 15.6 percent; East North Central, 17.4 percent; West North Central, 7.4 percent; South Atlantic, 16.8 percent; East South Central, 6.3 percent; West South Central, 11.1 percent; Mountain, 5.4 percent; and Pacific, 14.7 percent.

Figure 1 Regional distribution of the U.S. population of humanities doctorates and percentage distribution of the total Ph.D. population, 1985 (estimated population of 1942-1984 humanities Ph.D.s in the U.S. $=90,300$ excluding 300 in U.S. possessions).

Field Mobility of Employed Ph.D.s
In February 1985, the number of employed humanities Ph.D.s was 81,900 , or 90.4 percent of the total population of humanities doctorates in the United States. This

*Includes postdoctoral appointees as well as Ph.D.s employed full-time and part-time.
percentage has remained relatively constant ever the past several years ( 90.3 percent in 1981 and 89.9 percent in 1983).

As shown in Table 2, these humanities Ph.D.s are distributed acress a variety of employment fields. The percentage of Ph.D.s from a given field who remain in the same field when employed is defined as the retention rate of the field. On the other hand, a humanicies Ph.D. who is employed either in a nonhumanities field or in a broadly defined humanities field ${ }^{10}$ that is different from his/her degree field is defined as "field mobile." The largest percentage of fielc-mobile Ph.D.s tended to secure employment in nonhumanities fields (primarily in education). Figure 2 shows the distribution of the Ph.D.s who were employed in nonhumanities fields.

Figure 2 Distribution of humanities Ph.D.s employed in nonhumanities fields in 1985.

The disciplines with the highest retention rates were music ( 86.1 nercent of the 6,100 employed music Ph.D.s) and art history ( 84.8 percent of the $2,4 \mathrm{C}$, employed art history Ph.D.s). The lowest retention rate occurred for those Ph.D.s categorized in ' other humanities" (which includes linguistics, archeology, American studies, religious studies, and unspecified other humanities). This tendency for high mobility may, however, be related to the fact that this is such a diversified group that the individuals therein do not behave like a group in which the individuals had similar training and Ph.D. experiences. Of the $6,800 \mathrm{Ph}$. . s in the "other humanities" group, 30.5 percent were employed in nonhumanities fields such as education or social sciences. About the same amount of oufflow to nonhumanities occurred for those Ph.D.s with degrees in "other history," where alr.0st one-third of the $11,400 \mathrm{Ph}$.D.s indicated that they were employed in nonhumanities areas in 1985.

*Excludes Ph.D.s awarded July-December 1984.
**In view of the lack of a comprehensive sampling frame for foreign-eamed Ph.D.s in the United States, the number of humanities Ph.D.s who are foreign ciazens may be somewhat underestimated.

With the exception of "other history" and "other humanities," the retention rates for humanities fields were 60 percent or higher. There was relatively greater field mobility between history fields: American history and "other history" ( 9.1 percent and 8.7 percent, respectively); between languages and literature: classical to modern ( 4.6 percent) and modern to English/American ( 3.8 percent); and from speech/theater to English/American languages and l'.cerature ( 5.2 percent). Because these fields have similarities in content area, the transfer from one to the other is relatively easy.

## Demographic Characteristics by Field of Doctorate

The composition of the various fields with regard to sex, racial/ethnic identification, age, and citizenship is given in Table 3. Results from the 1985 survey show that women continued to slowly increase their share of the humanities Ph.D. population: of the total Ph.D. humanists in the United States in February 1985, 29.7 percent were women, compared to 27.2 percer in 1981 and 21.9 percent in in 1977. Figure 3 shows the percentage of women in each field for survey years 1977, 1981, and 1985.

Figure 3 Percentage of women in the humanities doctoral population, 1977, 1981, 1985.

Findings from previous SDR surveys showed that men consistently outnumbered women in all humanities fields. This was not true in 1985, where analyses show that wome., outnumbered men in the field of art history ( 50.8 percent of the 1942-1984 Ph.D.s were women). The reader should keep in mind, however, that art history is one of the smallest fields in the humanities, having 2,700 Ph.D.s. Therefore, an increase in the percentage of women in this field does not constitute a significant increase for women in humanities overall.

As was true in 1983, the representation of women ir most fields increased by 1-2 percent, except in classical languages and literature, where women have shown a steady decline of about 1 percent since the 1981 survey. Other fields where relatively high percentages of women were represented were modern languages and literature (43.6 percent of the 16,000 Ph.D.s), English/American languages and literature ( 35.1 percent of the $23,700 \mathrm{Ph} . \mathrm{D} . \mathrm{s}$ ), and "other humanities" ( 32.5 percent of the 7,500 doctorates). While the percentages of women in history and philosophy are increasing (from 14.3 percent in 1977 to 17.4 percent in 1985 in history and from 13.5 percent in 1977 to 15.4 percent in 1985 in philosophy), these fields continue to have the lowest percentages of women.

Members of racial/ethnic minority groups (i.e., Blacis.s, American Indians, Asians, and Hispanics) constituted 6.6 percent of the humanities Ph.D. population in 1985, increasing from 6.2 percent in 1983. As seen in Figure 4, this small increase in the percentage of minorities has been consistently observed since 1977, when minorities represented 4.7 percent of the population. The field that had the highest representation of minorities was modern languages and literature, in which 10.5 percent of the $\mathrm{Ph} . \mathrm{D} . \mathrm{s}$ were Hispanic and 3.4 percent were Black, Asian, or American Indian. Representation of Blacks, Asians, American Indians, and Hispanics was small across the remaining humanities fields, ranging from 3.2 percent for Blacks in music to less than 0.1 percent for American Indians in English/American languages and literature. Although all humanities fields have a small representation of minorities, only the American Indian group has shown a decline since 1979 ( 0.4 percent to 0.2 nercent). For the same period, Blacks have increased their representation from 1.5 percent to 1.8 percent, and Asian representation has increased from 1.1 percent to 1.6 percent.

Figure 4 Percentage of minorities in the humanities doctoral population, 1977-1985.

The median age of Ph.D. humanists increased in 1985. It had been a steady 45 years during the 1981 and 1983 surveys; however, the median age of Ph.D. humanists in 1985 was 47 years. This age increase is related to the fact that Ph.D. production has
decreased slightly and graduates are slightly older when .eceiving their doctorates. ${ }^{11}$ Overall, only one-fifth of the Ph.D. humanists were younger than 40 years of age. The fields of "other humanities," music, and art history had the highest percentage of Ph.D.s under 40 years of age: 30.9 percent, 30.3 percent, and 28.3 percent, respectivel;: As was true in past surveys, Ph.D.s in speech/theater were oldest, with almost 50 percent falling into the " 50 years and older" category.

A review by field of the calendar year in which Ph.D.s were awarded provides an indication of the relative growth and the attractiveness of the fields over time. For example, the fields of art history, music, and "other humanities" have produced apnroximately twothirds of their doctorates since 1970. Fields such as classical languages and literature, speech/theater, and "other historv" have produced only 53.4 percent, 55.5 percent, and 57.1 percent, respectively, durins, the 1970-1984 period.

In 1985, 3.2 percent of the humanities Ph.D.s in the United States were forcign citizens, a slight incrcase from 1983 and 1981 figures ( 3.0 and 2.7 percent, respectively). The degree fields with the highest percentage of foreign citizens have remained the same over the years: modern languages and literature ( 7.9 percent), art history ( 5.6 percent), and "other humanities" ( 5.4 percent). The field of American history had the lowest percentage of foreign citizens, 0.5 percent. However, as the SDR does not have a comprehensive sampling frame for foreign-earned Ph.D.s, these percentages are most likely an underestimation of the representation of foreign citizens in the Ph.D. population in the United States.

[^7]
## EMPLOYMENT

## Employment Status by Field of Doctorate

Approximately 83 percent of the 90,600 humanities doctorates who earned their degrees during 1942-1984 were employed in full-time positions in February 1985 (Table 4). As can be seen in Figure 5, this percentage has declined slightly sinr: 1977, when approximately 84 percent were employed full-tine. The percentage holdug parttime positions, on the other hand, has beer increasing over this time period--from 4.6 percent in 1977 to 7.1 percent in 1985. ine small percentage who reported that they were on postdoctoral appointments ${ }^{12}$ declined even further, from 1.0 percent in 1977 to 0.3 percent in 1985.

The percentage of doctorates $\sqrt{ }$. oo were not employed has decreased slightly over the years: 9.6 percent in 1977, 9.2 percent in 1981, and 9.0 percent in 1985. The reader is cautioned, however, that the 9.6 percent classified as "not employed" is NOT an unemployme.t rate. This rate is calculated on the total population of 1942-1984 humanities doctorates and therefore includes those who were retired ( 6.2 percent), those who were not seeking employment ( 1.6 percent), and those not reporting employment status ( 0.3 percent)--none of whom are considered part of the labor force in this report.

For purposes of this report, the 1985 humanities doctoral labor force consists of those Ph.D.s who were either on postdoctoral appointments, employed in full-time or parttime jobs, or unemployed but seeking employment during February 1985. The percentage of humanities doctorates in the labor force during February of the survey years has remained relatively constant: 92.3 percent in 1977; 91.1 percent in 1979; 91.7 percent in 1981; 91.4 percent in 1983; and 91.6 percent in 1985. Characteristics of the humanities labor force will be discussed in the following section.

Philosophy continued to have the highest percentage of Ph.D.s in full-time employment, 88.1 percent. However. the only field with a notable increase since 1983 in the percentage employed full-time was modern languages and literature ( 81.7 percent in 1985 compared to 78.2 percent in 1983) In the other humanities fields, the percentage employed full-time was stable or increased only slightly. Ih.D.s in art histor:' were an exception, with 77.0 percent reporting full-time employment in 1985 compared to 78.4 percent in 1983. Along with having thc lowest percentage of those employed fulltime, art history continued to show the highest percentage employed in part-time jobs ( 10.5 percent) and on postdoctoral appointments ( 1.6 percent). In fact, this was the only field with greater than 1.0 percent on postdoctoral appointments; all other humanities fields had 0.5 percent or less.

The fields of classical languages and literature and modern languages and literature had the highest percentages of Ph.D.s who were not employed in February 1985 ( 11.2 percent and 11.1 percent, respectively). However, over half of these Ph.D.s were retired ( 6.0 percent and 6.3 percent, respectively), and an additional 2 percent in eacii

[^8]TABLE 4 Employment Status of Humanities Ph.D.s (1942-1984 Graduates), by Field of Doctorate, 1985 (in percent)

*The percentages sf postdoctoral appointees may be underestimated because information about foreign Ph .D.S who came to the U.S.for postdoctoral research or study is incomplete.
**Percentages are not unemployment rates because they are calculated on the total population, which includes those retired, those not seeking employment, and those not reporting status, none of whom arr considered part of the labor force in this repon.

Figure 5 Percentage of the humanities doctoral population employed full-time or part-time, 1977, 1981, 1985.
field were not seeking employment. Overall, though, the fields of speech/theater and English/American languages and literature had the highest percentages of Ph.D.s who were retired in 1985: 7.8 percent and 7.6 percent, respectively. The field of philosophy had the lowest percentage of retired Ph.D.s, only 3.0 percent of its 7,000 members.

## Emr yment Status of Recent Ph.D.s

As shown in Table 5, the percentages of 1979-1984 Ph.D.s in full-time jobs was similar to percentages for the total cohort across fields, except in modern languages and literature, where only 76.7 percent of the recent graduates reported being in full-time jobs, compared to 81.7 percent of the total Ph.D.s in the field. For all humanities Ph.D.s, the most notable difference between the recent Ph.D. graduates and the total cohort was the higher percentage of recent Ph.D.s who were in part-time jobs--11.3 percent, compared to 7.1 percent of the total cohort. This difference between the recent graduates ard the total cohort can be seen within each humanities field as well.

Postdoctoral appointments are most frequently held by recent graduates, but for humanities Ph.D.s the percentages in this category are small even for the recent cohort--less than 1.0 percent for all fields except art tistory, which had 3.3 percent of its 700 recent graduates on postdoctoral appointments in February 1985.
'rABLE 5 Employment Status of Humanities Ph.D.s (1979-1984 Graduates), by Field of Doctorate, 1985 (in percent)

*The percentages of postdoctoral appointecs may be underesumated because information about foreign Ph.D.s who cari.e to the IJ.S.for postdoctoral research or study is incomplete.
**Percentages are not unemployment rates because they are calculated on the total population, which includes those retired, those not seeking employment, and those not reporting status, none of whom are considered part of the labor force in this repon.

Recent graduates in modern languages and literature had the higrest percentage (9.4) who were not employed in 1985. A further breakdown of this group shows that 5.2 percent were seeking employment, but another 4.1 percent were either retired or unemployed and not seeking employment. The latter statistic is surprising in view of the fact that it applies to recent graduates. The same kind of finding is noted in the field of English/American languages and literature, where 4.9 percent of the 4,200 Ph.D.s in the recent cohort indicated that they were either retired or not employed and not seeking employment. Various possible explanations for these figures include lack of suitable job opportunities in one's field, no financial requirement to work, dependent children limiting one's flexibility in the job market, earning the doctorate at an advanced age, or discouragement with the job market.

## Labor Force

As mentioned earlier, the labor force is defined as those Ph.D.s who are employed full-time or part-time, on rostdoctoral appointments, or unemployed but seeking employment. Of the total humanities Ph.D. labor force in 1985 (approximately 83,300), 90.2 percent were employed in full-time positions, and 1.7 percent were unemployed but seeking employment (Table 6). The remaining 8.1 percent of the labor force held part-time jobs or postdoctoral appointments. Of the 7.7 percent who were employed in part-time jobs, less than one-third ( 2.5 percent) were seeking full-time employment. The unemployment rate ( 1.7 percent) has remained unchanged since 1983.

By field, the unemployment rates varied slightly, with modern languages and literature and classical languages and literature having the highest rates ( 2.7 percent and 2.6 percent, respectively) and American history and philosophy the lowest (1.1 and 1.0 percent, respectively). More than half of the Ph.D.s in "other humanities" who were employed part-time were seeking full-time employment. In all other fields, only 20 35 percent of the part-time employed were seeking full-time employment.

The unemployment rate for the recent graduates (Table 7) was higher than for the total group of hum ${ }^{n}$ nities Ph.D.s ( 2.8 percent compared to 1.7 percent). By field, recent Ph.D.s in moderal languages and literature and American history had the highest percentages unemployed ( 5.4 percent and 5.3 percent, respectively). Also, of the 11.7 percent recent graduates who were employed part-time, mure than half ( 6.2 percent) were seeking full-tine employment (compared to less than one-third for the total group). Thus, it may be concluded that the recent graduates in the humanities have a somewhat more difficult time securing jobs than the group as a whole.

## Geographic Distribution

By region, the number of Ph.D.s in the labor force varied greatly (Table 8). The smallest number of humanities Ph.D.s in the labor force were in the East South Central $(3,700)$ and Mountain $(3,900)$ regions. On the other hand, the Middle, Atlantic region and the South Atlantic region had the greatest number of humanists in the labor force ( 15,700 and 14,300 . respectively).

With reference to employment status across the regions, the West North Central region (Iowa, Kansas, Minnesota, Missouri, North Dakota, Nebraska, and Soutn Dakota) had the highest percentage of humanists who were employed full-time ( 93.2 percent of the 6,500 Ph.D.s in the labor force in the region). All the other regions, except the Pacific region, had full-time employment rates of approximately 90 percent.

As was true in previous years, the Ph.D.s in the Pacific region (Alaska, Califomia, Hawaii, Oregon, and Washington) had the lowest rate of full-time employment

| 1985 Location (Region) | Total Ph.D. Labor Force (N)* | 1985 Labor Force Status |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Employed Full-time | Employed <br> Part-time | Postdoctoral Appointment | Unemployed \& Seeking Employment |
| All Regions | 83,300 | 90.2 | 7.7 | 0.4 | 1.7 |
| New England | 8,500 | 89.6 | 8.4 | 0.1 | 1.9 |
| Middle Atlantic | 15,700 | 89.7 | 8.0 | 0.4 | 1.9 |
| East North Central | 13,100 | 91.0 | 7.5 | 0.1 | 1.4 |
| West North Central | 6,500 | 93.2 | 5.5 | 0.2 | 1.1 |
| South Atlantic | 14,300 | 90.8 | 7.1 | 0.8 | 1.3 |
| East South Central | 3,700 | 90.0 | 7.0 | 1.0 | 1.9 |
| West South Central | 6,600 | 92.1 | 6.6 | 0.1 | 1.1 |
| Mountain | 3,900 | 91.7 | 6.9 | 0.2 | 1.3 |
| Pacific | 10,800 | 86.4 | 10.4 | 0.4 | 2.8 |
| U.S. Possessions | 200 | 91.2 | 8.8 | 0.0 | 0.0 |

*Includes those employed full-time or part-lime, postdoctoral appointees, and those seeking employment.
NOTE: Regions by state are as follows: New England (Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont); Middle Alantic (New Jersey, New York, Pennsylvania); East North Central (Illinois, Indiana, Michigan, Ohio, Wisconsin); West North Central (Iowa, Kansas, Minnesota, Missouri, North Dakota, Nebraska, South Dakota); South Atlantic (Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, West Virginia); East South Central (Kentucky, Alabama, Mississippi, Tennessee); West South ('sntral (Arkansas, Louisiana, Oklahoma, Texas); Mountain (Arizona, Colorado, Idaho, Montana, New Mexico, Nevada, Utah, Wyoming); and Pacific (Alaska, Califomia, Hawaii, Oregon, Washington).
( 86.4 percent), the highest rate of part-time employment ( 10.4 percent), and the highest unemployment rate ( 2.8 percent). In view of this rather somber employment picture, it is surprising to note that the size of the Ph.D. labor force in the Pacific region has increased by 600 since 1983, or 11 percent of the total increase for all regions. In the West North Central region, which had the highest percentage employed full-time and the lowest percentage seeking employment, the labor force increased by only 100 , or 1.9 percent of the :otal increase.

## Type of Employer by Field of Doctorate

In 1985, approximately 81,600 of the 90,600 humanities Ph.D.s in the United States were employed in either full-time or part-time jobs. Table 9 shows that overall, 82.3 percent of these employed Ph.D.s were working in educational institutions ( 4 -year college, university, or medical school; 2-year college; elementary/secondary school). This percentage has been declining steadily since 1979 , when 86.6 percent of the humanities Ph.Ds indicated that they were employed by educational institutions. This decline is evident not only for the total group, but also within the various humanities fields.

Conversely, the percentage of Ph.D. humanists workıng in business/industry (the second most frequent employer of humanities Ph.D.s overall) has increased steadily from 5.6 percent in 1979 to 8.7 percent in 1985 . For most humanities fields, the percentage of Ph.D.s employed in business/industry has increased over the years, with the fields of speech/theater, mus: 2 , philosophy, and "other humanities" reporting approximately 10 percent of their Ph.D.s so employed in 1985.

While only 2.4 percent of all humanities doctorates reported that they were employed by the federal government in 1985, the percentage is more than twice as high for history Ph.D.s ( 5.9 percent for "other history" and 5.5 percent for American history). In fact, government employment on all levels (federal, state, and local) attracted 8.7 percent of the American history Ph.D.s and 8.3 percent of the "other history" Ph.D.s, thus making "government" the second most frequent employer for historians.

Art history Ph.D.s and humanists in the "other humanities" category frequently accepted employment with nonprofit organizations other than educational institutions ( 9.9 percent and 8.8 percent, respectively). In fact, nonprofit organizations were the second most frequently reported employer for art historians.

## Employers of Recent Ph.D.S

In 1985, 76.2 percent of the 1979-1984 Ph.D.s were employed in ed cational institutions (Table 10). In comparison with all humanities Ph.D.s, the recent doctorates were far less likely to be working in 4-year colleges/universi'ıes/medical schools ( 65.7 percent versus 74.3 percent for the total group) and more likely to be employed either by 2 -year colleges and elementary and secondary schools ( 10.5 percent compared to 8.0 percent for the total group) or by business/industry (ll. 6 percent compared to 8.7 percent for the total group).

As was true for the 1942-1984 Ph.D. cohorts, government (federal, state, and local) employed large percentages of recent Ph.D. historians ( 16.0 percent of American history Ph.D.s and 14.5 percent of "other history" Ph.D.s), and other nonprofit organizations were agcin the second most frequent employer of recent graduates with art history degrees ( 14.1 percent).

## Primary Work Activity by Field of Doctorate

As seen in Table 11, teaching and management/administration were most frequently reported as the primary work activity of humanities Ph.D.s. Teaching and management' administuation were also tie most frequently reported primary work activities of humanities Ph.D.s in previous survey years; however, since 1981 there has been a decline in the percentage of Ph.D.s engaged primarily in teaching ( 69.7 percent in 1981 to 66.3 percent in 1983 to 63.5 percent in 1985) and an increase in the percent of humanists engaged primarily in management/administrative work ( 11.0 percent in 1981 to 11.4 percent in 1983 to 12.9 percent in 1985).

By field, variations in the type of work were reported by the humanities Ph.D.s. Teaching was reported as the primary work activity by 68.4 percent of the $14,100 \mathrm{Ph} . \mathrm{D} . \mathrm{s}$ with degrees in modern languages and literature, but by only 57.8 percent of the Ph.D.s with degrees in "other history." As pointed out earlier, the relatively high percentage of history doctorates emploved in government positions may help to explain the more than 16 percent reporting management/administration as their primary activity. It is also worth noting the trend, for the past several surveys, for history Ph.D.s to have teaching as their primary activity less frequently. Whether this is the result of fewer hist,ry teaching jobs or of an ever-increasing demand for history Ph.D.s in managerial jobs is difficult to say. Nonetheless, less than 60 percent of the history Ph.D.s (American and "other history" combined) reported that they were engaged primarily in teaching in 1985, a decline from 1983 and 1981 ( 61.6 percent ard 64.5 percent, respectively).

As was true in previous surveys, several work activities are peculiar to specific fields. Curatorial work was reported as the primary work activity by 7.0 percent of art history Ph.D.s (compared to 0.3 percent of all humanities Ph.D.s), and performing arts was reported by 9.2 percent of music Ph.D.s (compared to 1.0 percent of the total). Tt.e percentage of philosophy Ph.D.s reporting researich and development as their primary activity was almost twice the percentage for all humanities Ph.D.s combined ( 8.6 percent compared to 4.9 percent).

## Primary Work Activity of Recent Ph.D.s

The humanities Ph.D.s who graduated between 1979 and 1984 had a pattern of work activities similar to that of the total (Table 12), with 62.2 percent engaged primarily in teaching and 8.8 percent in management/administration. There was, however, a tremendous variation across fields. For example, 71.0 percent of the recent music Ph.D.s and 70.7 percent of the recent modern languinges and literature Ph.D.s reported that they were engaged primaiily in teaching in 1985, while the percentage for the recent "wher history" Ph.D.s was only 48.0.

Several "ork activities within fields show a heavy concentration of a cent graduates. Over 14 percent of the recent "other history" Ph.D.s were $e_{\mu_{1}}$ aged primarily in research and development. This represents approximately one-third of the total of "other history" Ph.D.s with research and development as their primary activity. Of the 1979-1984 American history Ph.D.s, 17.4 fercent reported that they were engaged primarily in writing/editing work. This represents almost 40 percent of the total of American i.istory Ph.D.s engaged primarily in this area of work. Finally, 14.0 percent of the recent graduates in art history were engaged primarily in curatorial work, which represents over 60 percent of the total of Ph.D.s in art history who work primarily in this area.

[^9]
# MEDIAN ANNUAL SALARY 

By Field of Doctorate, Gender, and Years Since Doctorate

The median annual salary of full-time employed humaniti s Ph.D.s in 1985 was $\$ 34,600$ (as shown in Table 13), a 12.7 percent increase fium the 1983 median salary of $\$ 30,700$. This latest percentage represents a downtum in the growth rate of humanities salaries: prior to 1985 , the percentage increase had been getting larger every two years ( 8.5 percent from 1977 to $1979,14.8$ percent from 1979 to 1981 , and 16.3 percent from 1981 to 1983).

By field, Ph.D.s with degrees in American history had the highest median salary, $\$ 37,300$. On the other hand, Ph.D.s in the "other humanities" field had the lowest median salary, $\$ 31,500$, followed closely by Ph.D.s in music ( $\$ 32,400$ ) and Ph.D.s in classical languages and literature $(\$ 32,600)$. Ph.D.s in speech/theater, who had been holding the highest median salaries for the previous four survey years, dropped behind Ph.D.s both in American history and "other history" and in philosophy.

For all fields combined, men had a median salary of $\$ 35,800$ compared to $\$ 30,700$ for women, a differential of over $\$ 5,000$. Across all humanities fields, the median salaries of the men were consistently higher than those of the women in the same fields (Figure 6). Although both women and men in the field of American histery earned the highest median salaries, the salaries of female Ph.D.s were substantially lower than those of the male Ph.D.s ( $\$ 32,900$ for females compared to $\$ 38,100$ for males, a $\$ 5,200$ difference). The largest difference across the humanities fields by sex occurred in philosophy, in which male Ph.D.s earned a median salary of $\$ 36,500$ compared to $\$ 30,800$ for women, a $\$ 5,700 \mathrm{gap}$. The smallest salary differences occurred in the fields of "other humanities" ( $\$ 2,700$ difference) and classical languages and literature ( $\$ 2,900$ difference).

In general, the median annual salaries of men and women became more disparate with the increase in the number of years since the Ph.D. was awarced. For all fields combined, the salary differential between men and women within five years of receipt of Ph.D. was only $\$ 700$, and in two fields the median salary for women was higher than that for men ("other history": $\$ 26,500$ for women and $\$ 25,700$ for men; and English and American languages and literature: $\$ 25,800$ for women and $\$ 25,300$ for men). In art history and speech/theater, on the other hand, men within five years of receipt of Ph.D. made considerably more than their female counterparts (approximately $\$ 28,000$ for men and approximately $\$ 24,000$ for women).

As the number of years since receipt of the doctorate increases, so does the gap between salaries of men and women: a differential of $\$ 1,300$ for Ph.D.s receiving their doctorates 11-15 years earlier and $\$ 4,600$ for those having their degrees for 21-30 years. The greatest difference in median salaries was for those Ph.D.s whose degrees were earned over 30 years ago. However, because of the relatively small number in this cohort, merian salaries could be reported by field and sex only for modern languages and literature, where men received the highest median salaries of all humanities fields, $\$ 52,500$.

TABLE 13 Median Annual Salaries of Humanities Ph.D.s Employed Full-Time, by Gender, Years Since Ph.D., and Field of Ph.D., 198.5 (in thousands of dollars)

NOTE: Median salaries were computed only for Ph.D.s employed full-ume, excluding those in the U.S. military. Academic salaries were multiplied by $11 / 9$ to adjust for a full-time scale. Medians were not provided for cells with less than 20 cases reporting salary.

Figure 6 Median annual salaries of humanities Ph.D.s employed fuil-time, by field of doctorate and gender, 1985.

## By Field of Doctorate, Gender, and Type of Employer

The median annual salaries of humanities Ph.D.s by type of employer varied considerably. Overall, 4-year colleges/universities/medical schools and 2-year colleges provided the highest salaries for humanities doctorates, $\$ 35,100$ and $\$ 35,000$, respectively (Table 14). The lowest median salaries were earned by humanities Ph.D.s employed by elementary/secondary schools ( $\$ 30,000$ ) and business/industry, ircluding self-employed individuals $(\$ 30,800)$. A comparison of salaries reported in 1983 and in 1985 shows that government-employed humanists experienced the greatest increase (from $\$ 28,600$ to $\$ 33,500$, a $\$ 4,900$ increase). Increases since 1983 for those employed by educational institutions and by business/industry were $\$ 3,900$ and $\$ 3,000$, respectively.

By field, music and American history Ph.D.s working at 2-year colleges had the highest median salaries ( $\$ 40,300$ and $\$ 39,500$, respectively). Music Ph.D.s working in business/industry reported the lowest median salary $(\$ 25,500)$.

As reported earlier, men consistently earned higher median salaries than women across all the humanities fields. Analysis of the salary data by type of employer shows some even greater disparities between the salaries for men and women in certain fields. For example. men with degrees in modern languages and literature and employed in government earned $\$ 9,300$ more than their female counterparts, and men with degrees in music and employed by educational institutions earned $\$ 6,100$ more than the women. On the other ha.i. , females with degrees in "other humanities" and employed in business/ industry earned $\$ 9,600$ mure than their male counterparts. The lowest median salaries for both women and men were for music Ph.D.s employed by business/industry (\$19,600 for women and $\$ 25,700$ for men).

## ACADEMIC EMPLOYMENT

As noted earlier, academe continues to be the most frequent employer of individuals with doctoral degrees in the humanities. Table 15 provides a time-series view of academically employed Ph.D. humanists since 1977. Although the numbers of Ph.D. humanists who were academically employed has increased since 1977, the percentage holding the academic ranks of professor or associate professor declined for the first time in 1985, by 2.2 and 2.0 percent, respectively. However, before this can be referred to as a downward trend, it is necessary to examine additional data for subsequent years.

The most noteworthy increase occurred for the faculty position labeled "other." However, because of the differences in definition of what constitutes "other" faculty over the years, the reader is urged to compare 1981 data to 1985 data, when "other" faculty (administrator and other faculty) were similarly defined. When this is done, the reader will note an increase from 5.1 percent to 7.8 percent in the "other" faculty grouping.

TABLE 15 Academic Pusition of Humanities Ph.D.s, 1977-1985

| Academic Position | 1977 | 1979 | 1981 | 1983 | 1985 |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Total Reporting Position (N) | 49,700 | 53,200 | 58,100 | 59,000 | 64,300 |

[^10]
## Academic Position by Cohort, Field of Ph.D., and Gender

Table 16 presents data on the percentage distribution of Ph.D.s who were working in U.S. colleges and universities in 1985 , both for the total group and for the more recent Ph.D.s (1979-1984), by field of Ph.D., sex, and academic position. ${ }^{13}$

Overall, 45.3 percent of the men nad achieved the rank of full professor compared to 23.8 percent of the women. By field of Ph.D. groupings, mer were consistently more likely to be full professors than were women in the same field grouping. For assistant professor rank and instructor positions, the reverse was true. For all fields combined, an estimated 12.9 percent of the men held the rank of assistant professor compared to 25.1 percent of the women, and 2.8 percent of the men were instructors compared to 6.3 percent of the women. Similarly, for all field groupings except English/American languages and literature, higher percentages of 1979-1984 female Ph.D.s held assistant professor positions than did their male counterparts. Within the ranks of associate and full professor, however, the female share was consistently loi.er than the male share, both for the more recent Ph.D.s (again, except for those in English/American languages and literature) and for the total group.

Over half ( 52.5 percent) of the 12,600 male history Ph.D.s employed in academe held the rank of full professor; only 29.5 percent of the 2,200 females in the ficld held a similar rank. In 'pite of this large gender gap, it should also be noted that no other field had such a high representation of women in the full professor rank.

While for the total group women were more likely than $m=n$ to hold nonfaculty positions and postdoctoral appointments, this did not hold true for the more recent graduates, of whom 6.5 percent of the men and 5.7 percent of the women were in nonfaculty jobs. However, there were differences in this particular male-female comparison across fields. For example, 14.7 percent of the male history Ph.D.s were employed in nonfaculty jobs in 1985 compared to $\$ 1.8$ percent of the females.

## Tenurs Status

The number of Ph.D. humanists with tenure has increased since 1983 for both men (by approximately 280) and women (by approximately 1,055 ) due to an increase in the total number academically employed. The percentage with tenure, however, has declined since 1983. On the other ha.d, both the numbers and the percentages of male and female humanities Ph.D.s ir nontenured academic jobs have increased since 1983 (21.4 percent for men in 1985 compared to 17.9 percent in 1983, and 44.9 percent for women in 1985 compared to 39.4 percent in 1983). As can be seen in Figure 7, women continued to be both in nontenured jobs and in nontenure track jobs more frequently than men (24.1 percent for women compared to 9.5 percent for men).

Table 17 gives information on the tenure status of academically employed humanities Ph.D.s by age and broad field groupings. For all but one field gro'ping, male humanists continued to de more likely to have tenure than women in the same $a_{0}$ e categcing. The exception was in history: in the "age 35 and under" category, 9.6 percent of the 200 female history Ph .D.s reported that they were in tenured jobs compared to 4.2 percent of their 600 male counterparts.

[^11]TABLE 16 Academic Position of Humanities Ph.D.s, by Year of Doctorate, Field of Doctorate, and Gender, 1985 (in percent)

SAMPLING FRAME

## Sample Selection

Data from the Survey of Doctorate Recipients (SDR) are collected biennially from a stratified random sample of Ph.D. humanists. A longitudinal data base has been constructed from the five surveys conducted since i977. For each surviy, adjustments have been made to both the sampling frame (population) and the sample. These revisions have significant implications when comparing the results of one survey to the results of another.

## 1977

In 1977, a stratified sample of 15,014 individuals was . indomly selected from the population of 74,032 who earned their Ph.D.s in the humanities between January 1, 1930, and June 30, 1976. The oversll sampling rate was 20.3 percent (see page 65 , Table I)-5). The sample was stratified by $火 火$ of doctorate, field of doctorate, sex, and race/ethnic gioup.

The sample was selected from the Doctorate Records File (DFF), which contains information about virtually all Ph.D.s awarded by U.S. universities between 1920 and the present. These data are collected from the annual Survey of Earned Doctorates (iED), another survey conducted by the National Rescarch Council.

Individuals who indicated in the SED that they were foreign citizens and planned to depart the United State following receipi of their doctorate were not included in the 1977 sampling frame. This exclusion was based on the high probability that these individuals would not return to the U.S. labor force.

## 1979

The 1979 sampling frame was adjusied to include only Ph.D. recipients who had earned their degrees between Jantary 1, 1936, and June 30, 1978, a 42-year time span.

In a study of response bias, it was discovered that the survey nonrespordents consisted of higher percentages of foreign citizens and foreign residents. To adjust for this bias, citizenship was added as a stratification variable. The 1979 sample consisted of approximately 9,948 humani ${ }^{+}$es doctorates, an over $i l l$ sampling rate of 12.6 percent (see page 64, Table D-4).

For the 1981 Survey, the cohort adjustments were again made to maintain a 42-year time span (January 1, 1938, to June 30, 1980). In addition, the overall sampling rate for FY1973-1976 Ph.D.s was increased from 11.8 percent to 15 percent in 1981 because of special interest in studying, in detail, the employment characteristics of recent doctorate recipients.

On a one-time basis, the 1981 sampling frame included individuals who earned their doctoral degrees between July 1980 and February 1981. This 8 -month extension was made in response to a study that required data on the most rucent Ph.D. recipients. The 1981 sampie was $13,676 \mathrm{Ph} . D . s$, yielding an overall sampling rate of 16.1 percent (see page 63 , - Cable D-3).

## 1983

For the 1983 survey, $\therefore$ sample of 14,979 Ph.D.s was drawn from a sampling frame of 91,790 doctorate ${ }_{1} e c ı p i e n t s$, yielding an overall sampiing rate of 16.3 percent (see page 62, Table D-2). In keeping with previous surveys, the cohort population was adjusted to maintain a 42 -year time span and included only those Ph .D. recipients who earned their degrees between January 1, 1940, and June 30, 1982. Religious stadies
doctorates were added to the 1983 sampling frame, and a stratified random sample of these cases was added to the survey sample.

1985
For the 1985 survey, the 1983 and 1984 Ph.D. humanists were added to the sampling frame and the 1940 and 1941 Ph.D.s were deleted, leaving the 42 -year time-span coverage. Maintaining the longitudinal sample, additional Ph.D.s were selected from the new cohort, leaving a 16.2 percent sample, or $15,504 \mathrm{Ph}$.D.s, from the population sampling frame of 95,787 humanities doctorates (see page 61, Table D-1).

## Sampling Rates

For the 1977 survey, the sampling rate was approximately 20 percent. In 1979, the longitudinal sample was reduced in size because of budgetary constraints. The rev sed simple, using a rate of 12.6 percent, was reviewed to assure that it was large enough to p:ovide reliable estimates of the Ph.D. population.

## Effect on Sampling Errors

Obviously, any . 'ange in the sample size has an effect on the sampling errors of population estimates. If the prcportion of the $f$ pulation possessing a particular characteristic, $R$, is being estimated by the statistic $p$, the standard error of $p$ can be computed by

$$
\text { S.E. }(\mathrm{p})=[\operatorname{VAR}(\underline{\mathrm{P}}) / \mathrm{n}]^{1 / 2}
$$

where VAR( P ) is estimated by $[\mathrm{p}(1-\mathrm{p})]$, p equals the sample proportion, and n equals the sample size.

This formula is equivalent to

$$
\text { S.E. }(\mathrm{p})=[\operatorname{VAR}(\underline{\mathrm{P}}) / \mathrm{n}]^{1 / 2} \text { or }[\operatorname{VAR}(\underline{\mathrm{P}})]^{1 / 2} /(\mathrm{n})^{1 / 2}=[\text { S.D. }(\underline{\mathrm{P}})] /(\mathrm{n})^{1 / 2},
$$

where S.D.(P) is the standard deviation of $P$. Holding S.D.(P) fixed, the sampling error, S.E.(p), rill vary as $n$ is adjusted by a factor k :

$$
\text { S.E. }\left({ }_{1}\right)=\left[\text { S.D. }(\underline{P}] /(\mathbf{k n})^{1 / 2} \text { or S.E. }(\mathrm{p})=\left[\text { S.D. }(\underline{\mathrm{P}})^{1} / /(\mathrm{k})^{1 / 2}(\mathrm{n})^{1 / 2}\right. \text {. }\right.
$$

If the sample size is increased to $\bar{n}$, then $k=(\bar{n} / n)>1$. In this case the sampling error is reduced by a factor of $l /(k)^{1 / 2}$. For example, if the sample $p$ quals 0.2 , the estimated

$$
\text { S.D. }(\mathrm{P})=[0.2(1-0.2)]^{1 / 2}=0.4
$$

If $n$ is 100 , then

$$
\text { S.E. }(p)=\left[0.4 /(: 0 .)^{1 / 2}\right]=0.04 .
$$

If n is increased to 1600 ,

$$
\text { S.E. }(\mathrm{p})=\left[0.4 ;(1600)^{1 / 2}\right]=0.01
$$

Here $\mathrm{k}=16$ and the sampling error is $\mathrm{l} /(\mathrm{k})^{1 / 2}$ of its original value.

However, if the sample size is decreased to $\bar{n}$, then $k=(\bar{n} i n)<1$. In this case, the sampling error is increased by a factor of $1 /(k)^{1 / 2}$. In the previous example, if the initial sample size equalled $1600 ; i=(100 / 1600)=1 / 6$. The sampling error increased from 0.01 to 0.04 , a factor of 4.

For the 1985 SDR, the sampling frame is 95,787 , and the sample is 15,504 . If the earlier 20 percent sampling rate had been applied, the 1985 sample would have been 19,157 . The expected effect of the sample size reduction on the sampling errors surrounding the estimates of the total population can be approximated by computing

$$
k=(15,504 / 19,157)=.809 \text { and } 1 /(k)^{1 / 2}=1.11 .
$$

This, for a fixed standard deviation, the sampling error shoיld be approximately 11 percent greater under the 1985 sampling scheme.

In these computations, the effects of the finite population correction factor ( fpc ) have been ignored. The fpc has little effect on sampling error estimates for large populations and low sampling rates. However, although the overall sampling rate for the 1985 SDR sample is 16.2 percent, sampling rates for the strata range from roughly 2 percent to 100 percent. Thus, computation of sampling errors that takes into account sample stratification will result in lower sampling error estimates than computations that disregard the sample design.

Finally, this discussion applies Ouly to the total sample $\boldsymbol{n}$ and does not address the issue of less than complete survey response, which will of course effectively reduce the sample and thus increase the sampling error.

## APPENDIY C

SAMPLING ERROR

## Sampling Error Estimates for Ratios

Most of the statistics preseried in this report are ratios of two weighted sums of observation, i.e., ratios o' random variabies. Thus, for example, we are concerned with a ratio, $r=y / x$, where

$$
\begin{aligned}
& y=\sum_{h=1}^{n}\left[\frac{N_{h}}{n_{h}}\right] \sum_{i=1}^{n} y_{h i} \\
& x=\sum_{h=1}^{n}\left[\frac{N_{h}}{n_{h}}\right] \sum_{i=1}^{n} x_{h i}
\end{aligned}
$$

and where $y_{h i}$ and $x_{h i}$ are sservations made on the $i^{\text {th }}$ response of stratum $h, N_{h}$ is the number of individuals in the active population of stratum $h$, and $n_{h}$ is the number of responses for stratum in.

The estimates of sampling error for most statistics in this report are computed based on a stratified random sampling scheme (whereby the responses obtained for each stratum are a random sample from that stratum). Strata were combined whenever the number of responses in a stratum was less than two.

The variance of the ratio $y / x$ is estimated by the expression

$$
s_{r}^{2}=\left(\frac{y}{x}\right)^{2}\left(\frac{s_{y}^{2}}{}+\frac{s_{x}^{2}}{x^{2}}-\frac{2 s_{x y}}{x y}\right)
$$

where

$$
s_{x y}=\sum_{h=1}^{n} \frac{N_{h}^{2}}{n_{h}} \frac{N_{h}-n_{h}}{N_{h}-1} \frac{1}{n_{h}-1}\left(\sum_{i=1}^{n}\left[x_{h 1}-\bar{x}_{h}\right]\left[y_{h i}-\bar{y}_{h}\right]\right),
$$

$x_{h}$ and $y_{h}$ being the means $c_{i}^{-}$the $x$ and $\because$ values observed in stratum $h$, respectively. Similarly, $s_{x}^{2}$ and $s_{y}^{2}$ are defined using

$$
\sum_{i=1}^{n}\left[x_{h i}-\bar{x}_{h}\right]^{2} \text { and } \sum_{i=1}^{n}\left[y_{h i}-\bar{y}_{h}\right]^{2} .
$$

(I nese are combined in parentheses in the $\mathrm{s}_{\mathrm{xy}}$ formula above.)
Compa-isons can be made between sampling crrors computed on the basis of a simple random sample (srs) and those that take into account stratification. Table C-1 presents sampling errors associated with selected statistics from the report. Bases of various sample sizes and a range of statist: $\sim$ values have been chosen th provide representative comparisgis. Sampling erro ; in the column $s_{p}$ were computed with the expression $[p(1-p) / n]$ where " $n$ " refers to the number of respondents, while those under $\mathrm{s}_{\mathrm{r}}$ were calculated with the formula described on the previous page, which takes into account the sample design. The statistics are in percertage form and are the estimated proportion of a variable category with a given characteristic

$$
\frac{1}{n} \sum_{i=1}^{n} y_{1}
$$

(for the purposes of $\mathrm{s}_{\mathrm{p}}$ ), or the ratin of two random variables, $\mathrm{y} / \mathrm{x}$ (for the purposes of $\mathrm{s}_{\mathrm{f}}$ ).

TABLE C-1 Comparison of Sampling Errors for Selected Statistics

| Variable Base and Subcategory | Sample Size of Variable Base | Statistic (\%) | $\begin{aligned} & \mathrm{s}_{\mathrm{p}}(\%) \\ & (\mathrm{srs}) \end{aligned}$ | $\mathrm{S}_{\mathrm{T}}$ (\%) Stratified |
| :---: | :---: | :---: | :---: | :---: |
| Field of Ph.D.--Total | 8,804 |  |  |  |
| Eng/Amer Lang. \& Lit. Ph.D. (Table 1) |  | 26.3 | 0.5 | 0.2 |
| Field of Employment--Total Employed Employed in Music (Table 2) | 7,949 | 6.5 | 0.3 | 0.1 |
| Speech/Theater Ph.D.--Total Employed Employed in Eng/Amer Lang. \& Lit. (Table 2) | 456 | 5.2 | 1.0 | 1.1 |
| Philosophy Ph.D.--Total Female (Table 3) | 881 | 1.5 .4 | 1.2 | 0.4 |
| P Iodern Language Ph.D.--Total Employed Full-Time (Table 4) | 2,116 | 81.7 | 9.8 | 1.0 |
| Ant History Ph.D.--Total Full-Time or Part-Time Employed Employed in 4-Y:. College/Univ. (1 able 9) | 507 | 77.1 | 1.9 | 1.8 |
| Speech/Theater Ph.D.--FY79-84 Graduates Full-Time or Part-Time Employed Employed in Management/Administration (Table 12) | 119 | 13.2 | 3.1 | 3.3 |
| Total Males--Academically Employed Hold Rank of Professor (́Table 16) | 3,165 | 45.3 | 0.9 | 1.1 |

Whenever possible, the subgroups examined are the same as those in the 1977 Profile* in order to facilitate comparisons of the effects on sampling errors of sample size reductions.

For the most part, differences between the two error estimates are small. Calculations based on srs ar for many statistics, the same as or slightly higher than those that take into azcount the stratification. For statistics that are ratios of two stratifying variables (e.g., the iatio of women philosophy Ph.D.s to total philosophy Ph.D.s), the estimate of sampling error is much higher using the formula for $\mathrm{s}_{\mathrm{p}}$. In certaia cases (mainly those involving estimates of type of employer or primary work activity for small subgroups), the use of the formula for $s_{p}$ appears to underestimate the sampling error.

Taking these potential discrepancies into account, a useful appuximation of the sampling errors of those statistics presented in this report ir percentage furm can be

[^13]$7 i$
obrained from Table C-2. This table summarizer sampling errors associated with various proportion values at given sample sizes. Calculauons in this table assume a simple random sample.

Values for Table $\mathrm{C}-2$ were computed using the formula

$$
s_{p}=\left[\frac{p(1-p)}{n}\right]^{1 / 2}
$$

in which $\mathbf{p}$ is the proporion of a particular category (variable) possessing a certain characteristic.

$$
y\left(\text { i.e., } p=\frac{1}{n} \sum_{i}^{n} y_{i}\right),
$$

and n is the number of sample cases in the variable-specified catagory. The finite population correction factor,

$$
\mathrm{fpc}=\left(\frac{[\mathrm{n}-\mathrm{n}]}{[\mathrm{N}-1]}\right)^{1 / 2},
$$

has been omitted from the calculations, since the fpc has a negligible effect on most statistics in this report unless the estimate applies to a subgroup that has a high sampling rate. In any case, the omission of the fpc in the formula for $s_{p}$ yields a conservative estimate (i.e., a higher estimate) or the sampling urror.

TABLE C-2 Approximate Sampling Errors for Various Statistics and Sample Sizes

| Sample <br> Size | 0.01 or 0.99 | 0.05 or 0.95 | 0.10 or 0.90 | 0.25 or 0.75 | 0.50 |  |

| 200 | 0.00704 | 0.01541 | 0.02121 | 0.03062 | 0.03536 |  |
| 100 | 0.00995 | 0.02179 | 0.03000 | 0.04330 | 0.05000 |  |

The estimated populations for particular variables are provided in this report. The sample sizes can be estirnated by multiplying the pepulation by the weighting fraction, which is the sampling fraction corrected for nonresponse. The mean weighting fractions for selected groups are presented in Table C-3. For exampie, in Table 9 the population of speech/theater Ph.D s is 3,400 . Multiplying by 0.134 , the approximate sample size is 455 . The sampling error of a reported statistic (for instance, those employed in 4 -year college:
or universities, 75.6 percent--type of employer, Table 9 ) can be estimated either by using the formula for $\mathrm{s}_{\mathrm{p}}$ or by consulting Table $\mathrm{C}-2$ and using rough approximations of the sample size and percentage in proportion form. In this case,

$$
s_{\mathrm{p}}=\frac{0.756(1-0.756)^{1 / 2}}{455}=0.0201 \text {, or } 2.0 \text { percent } .
$$

Similarly, the value in the table opposite 400 for 0.75 is 0.02165 . The reader can construct the desired confidence interval by multiplying the standard error by the appropriate coefficient: - is $\mathrm{s}_{\mathrm{p}}$ will provide a 68 percent confidence interval; $\pm 2 \mathrm{~s}_{\mathrm{p}}$, approximately a 95 percent interval, etc.

## Sampling Error Estimates for Medians

Sampling errors for median salary estimates* presented in this report were computed not by strata but for all observations n, the number of sample cases in a particular subgroup reporting a salary. Comparisol.s of sampling errors for ratios and preportions (see previous page) indicate only minor differences between those calculated by strata and those that do not fully take into account samp'e design. The reader should interpret the confidence intervals as close approximations.

From the estimated population distribution, a statistic, $m$, is computed as an estimator of $M$, the position measure. When $m$ is a median $\left(\mathrm{p}_{\mathrm{m}}\right)$, the proportion of cases in

[^14]the derived distribution falling below the position measure equals 0.5 . The sampling error of $p_{m}$ is estimated by the formula
$$
s_{p_{m}}=\left(\frac{p_{m}\left[1-p_{m}\right]}{n}\right)^{1 / 2}
$$

Two additional proportions are then compured:

$$
\begin{aligned}
& \mathbf{p}_{1}=\mathrm{p}_{\mathrm{m}}-\mathrm{ks}_{\mathrm{pm}} \\
& \mathrm{p}_{\mathbf{2}}=\mathrm{p}_{\mathrm{m}}+\mathrm{ks}_{\mathrm{pm}}
\end{aligned}
$$

Table C-4 contains the 95 percent confidence intervais of median salary for selected categories. The confidence interval for the median is set by calcuating $m_{1}$ and $m_{2}$, the values below which $p_{1}$ and $p_{2}$ of the population distribution fall. The level of confidence is determined by $k$ and will be 68 percent when $k=1$, approximately 95 percent when $k=2$, etc. Because the vilues of $m_{1}$ and $m_{2}$ depend on the variability of the distribution, the

TABLE C-4 95 Percent Confidence Intervals of Median Sasdries for Selected Categories (in thousands of dollars)

| Category | Confidence Intervals | (Repo_ted Statistics) |
| :---: | :---: | :---: |
| Total, Full-Time Employed Ph.D.s | 34.4-34.9 | (34.6) |
| Gender |  |  |
| Men | 35.4-36.2 | (35.8) |
| Women | 30.3-31.2 | (30.7) |
| Employer |  |  |
| Educational Institutions | 34.7-35.1 | (34.9) |
| Business/Industry | 30.4-32.9 | (30.8) |
| Federal Government (excluding military) | 32.3-34.9 | (33.5) |
| Field |  |  |
| American History | 36.3-38.6 | (37.3) |
| Art History | 31.4-34.7 | (33.3) |
| "Other History" | 35.6-37.1 | (36.4) |
| Music | 31.1-33.8 | (32.4) |
| Speech | 34.6-36.4 | (35.6) |
| Philosophy | 35.1-36.8 | (36.1) |
| English/American Larguages \& Literature | 33.3-34.7 | (34.1) |
| Classical Languages \& Literature | 31.0-34.1 | (32.6) |
| Modern Languages \& Literature | 32.6-34.3 | (33.6) |
| "Other Humanities" | 30.6-3^. 0 | (31.5) |

reader is cautioned that corresponding values for 2 stardard errors are not necessarily twice those for 1 standard error.

For example, in Table 14 an estimated median annual salary of $\$ 36,100$ is reported for Ph.D. philosophers. This was computed on the basis of 723 sample observations. Therefore,

$$
\mathrm{s}_{\mathrm{p}}={\frac{0.5(1-0.5)^{1 / 2}}{723}=0.0186 . . . . . .}
$$

Te construct a 95 percent confidence interval, compute

$$
p=0.5-2[0.0186]=0.4628 \text { and } p=0.5+2[0.0186]=0.5372,
$$

which round to .016 and .054 . The values $m_{1}=\$ 35,100$ (the value at the 46 th percentile) and $m_{2}=\$ 36,800$ (the value at the 54!t percentile) are then determined and provide the bounds of this interval.

The ampling frame in tudes inose deceased and those residing in foreign countrier; hence, these numbers exceed the population estimates shown in the other tables of this report.
The survey semple is the semple sixe minus persons known to be deceased or out-of-scope prior to the survey. The out-of-scope rlassification is assigned to an individual who indicated on a previous survey tha he or she holds a Ph.D. from a forcign institution, is a foreign cirizen, and resides in a foreign country.
c The number assum i couscted equals the survey samole minus those andividuals for whom no valid addresses could be a arned.
${ }^{4}$ Responses include indiv. 4wale found to be deceased on residing in a foreign country at the time the recent survey was conducted.
e Response rase " A " is ti umber of survey responses divided by the number in the surve' ample. Response rate " $\mathrm{B}^{\prime}$ is the number of survey responses divided by the number assumed to have been consacted.
f Mersed field's cremor for certain mall subgroups when sample was reduced

- Menged or .orts cremed for certain small subgroupe when sample was reduced.
${ }^{\text {b }}$ Include only those individuals whose racial/ethnic grop was frown at the time the sampe was selected.

## APPENDIX E

WEIGHTING PROCEDJJRE

Estimates in this report are based on veighted responses. Th.2 507 individuals (in the total sample of 15,504 ) who were known to be deceased or out-of-scope pricr to the survey were excluded and weighted for sample weights. The responses $(9,047)$ received from the survey sample were assigned a response weight that is the product of the weight for nonresponse and the sample reight. Table E-1 shows the classification of the sample and the formulas used for calculating the weights.

Table E-1 Classification of Sample and Weighting for 1985 Survey of Doctorate Re :ipients

| Group | Number in Sample | Type of Estimation Weight* |
| :---: | :---: | :---: |
| TOTAL SAMPLE | 15,504 |  |
| EXCLUDED FROM SURVEY Known Deceased Prier to 1985 Survey** Out-of-Scope*** |  | Sample Sample |
|  | -587 |  |
| SURVEY SAMPLE | 14,917 |  |
| No Valid Address | -1.357 |  |
| CONTACTED SAMPLE | 13,560 |  |
| RESPONSES |  |  |
| Good Responses | 9,003 | Respmnse |
| Known Deceased [from feedback to the 1985 Survey (code 4)] | 44 | Response |
| TOTAL | 9,047 |  |

*The sample weights (Ws) and response weights (Wr) for each straium were zomputed as follows:

$$
W_{s_{h}}=\frac{N_{h}}{n_{h}}
$$

where $N_{h}$ and $n_{h}$ are the respective population and sample sizes of the stratum ( $h$ ) and

$$
W_{i_{h}}=\frac{N_{h}}{n_{h}} \cdot \frac{n_{h}}{r_{h}}
$$

wher: $n_{h}$ is the number of survey sample cases in the stratum and $r_{h}$ is the number of survey responses in that stratum.
** Based on information cbtained from the 1977-1983 survey responses or through address searches.
***Based on responses tha' inaicated individaals held Ph.D.s from foreign institutions, were foreign citizons, and resided in foreign coun ries.

Each stratum with fewer than two responses was $m$ rged with a similarly defined stratum in order to calculate sampling errors. Respondents in each stratum were assigned a weight equal to the integral part of the stratum's respense weight, or the integral part plus one. Allocation of weights within a stratum was made at random so as to represent the stratum population. This technique avoids the necessity of rounding fractional estimates of totals.

For example, consider a stratum that contains 60 ir dividuals, of whom 15 were selected for the sample. One of the 15 is known to be deceased prior to the survey. This individual receives a sample werght, $60 / 15$, or 4.0 , and thus represents 4 individuals in the population. The number of survey sample cases in the stratum is 14 . Of these 14 individuals, 10 responded. The average weight for the respondenss in this stratum would be $[60 / 15] \cdot[14 / 10]=5.6$. To obtain integer weights, 4 of the respondents (chosen at random) would each receive a weight of 5 , thus representing 20 individuals in the population. The 6 remaining respondents would each receive a weight of 6 , thus representing 36. Combined, the 10 respondents would represent 56 individuals in the stratum, who together with the 4 individuals estimated to be deceased represent the entire 60 individuals in the stratum.

## APDENDIX F

FINE FIELD OF EMPLOYMENT

TABLE F-1 Ph.D.s in the Humanities in the United States, 1985

| 1985 Fine Field of Employment | Est | 1985 Fine Field of Employmeni | Est. N |

The National Academy Press was created by the National $f$ demy of Sciences to publude the reports assued by the Academy anc / the Nacoomal Academy of Engineening, the Institute oi Medicine, and the National Rexearch Council, all operating under the charter granted to the National Acadeniny of Sciences by the Congress of the Unted States

[^0]:    

    * Reproductions supplied by EDRS are the best that can be made

[^1]:    ${ }^{1}$ Appendix A provides sample questionnaires from the 1985 survey.
    ${ }^{2}$ See Appendix B for further details on the sampling frame and Appendix C for sampling error information.

[^2]:    ${ }^{3}$ Out-of-scope is based on a response indicating that the individual satisfied the following three criteria: held a Ph.D. from a foreign institution; was a foreign citizen; and resided in a foreign country. The pre-survey deceased and the out-of-scope cases are inflated by their sample weights and then subtracted from the population that is used to calculate the population estimate weights.
    ${ }^{4}$ See Appendix D for detailed rates for the 1985 SDR.

[^3]:    ${ }^{5}$ The categories for the humanities include American history; "other history" (history and philosophy of science and all history except American history); art history; music; spesch/theater; philosophy; English/American languages and literature; classical languages and literature; motern languages and literature; and "other humanities" (linguisucs, archeology, American studies, relggious studies, and unspecified other humanities).
    ${ }^{6}$ See Science, Engineering, and Humanities Doctorates: 1983 Profile, Wast ngton, D.C.: National Academy Press, 1985, and Science, Engineering, and Humanities Doctorates: 1981 Profile, Washington, D.C.: National Academy خıcs:, 1982.
    ${ }^{7}$ For additional information on the estimated number of humanities Ph.D.s who were employed in each field category and on the 20.3 percent employed in the nonhumanities categories, see Appendix $F$.
    ${ }^{8}$ The reader should not use this figure to calculate an unemployment rate because it includes those individuals whe were ratired or unemployed but not seeking employment. For unemployment data, refer to Table 6, page $\mathbf{i 8}$.

[^4]:    *Includes postdoctoral appointees as weil as Ph.D.s employed full-time and part-time.
    **'Other His'ory" includes those subfields listed below that heading. Other History, which is one of the subfields, includes the history of all countries except America and those in Europe.
    ***"Unspecified history" was not in option on the employment specialties list.

[^5]:    ${ }^{9}$ The effects and implications of this relatively frequent incidence of humanists being employed in nonhumanities fields are examined i:. a special study based or the 1983 Survey of Doctorates Recipients: Mary Belisle and Betty D. Maxfield, Humanists on the Move: Employment Patterns for Ilumanities Ph.D.s, Washington D.C.: National Academy Press, 1985.

[^6]:    ${ }^{10}$ Broadly defined humanities fields are those listed in Table 2 under "field of doctorate."

[^7]:    ${ }^{11}$ The median age of the 3,745 humanities doctorates who graduated in FY1981 was 33.5 years. In FY1984, the number graduating dropped to 3,528 and their median age rose to 34.5 years. See Summary Report 1981: Dectorate Recipients from United States Universities, Washington, D.C.: Nationai Academy Press, and Summary Report 1984: Doctorate Recipients from United States Universities, Washington, D.C.: National Academy Press.

[^8]:    ${ }^{12}$ This category includes postdoctoral fellowships, traineeships, research associateships, and interiisinps.

[^9]:    *Includes those employed full-time or part-time.

[^10]:    *Not an option on the 1977 survey form. In the 197y and 1983 surveys this category included "other faculty," while in 1981 and 1985 it included "administrators" as well as "other faculty."

[^11]:    ${ }^{13}$ Ph.D.s who did not report their academic position were excluded from the percentage base for longitudinal comparison.

[^12]:    2a Thank you for completing this questionnaire. Plesse return the completed form in the enclosed envelope to the National Research Council. JH630, 2101 Constitution Avenue, Weshington, D.C. 20418.

[^13]:    *Science, Engineering, and Humanities Doctorate in the United States: 1977 Proftle, Washington, D.C.: National Academy of Sciences, 1978.

[^14]:    *The method for determiniug sampling errors of medians in this report was adapted from Morri; H. Hansen, William N. Hurwitz, and William G. Madow, Sample Survey Methods and Theory, vol. 1 (John Wiley \& Sons, Inc., New York, 1953), pp. 448-449.

[^15]:    - The sampling frame includes those deceased and those residing in foreign countries; hence, these numbers exceed the population estimates shown in the other tables of this report.
    ${ }^{\text {b }}$ The survey sample is the sample size minus persons known to be deceased or out-of-scope prior to the survey. The out-of-scope classification is assigned to an individual who indicated on a previous sut ey that he or she holds a Ph.D. from a foreign institution, is a foreign citizen, and resides in a foreign country.
    ${ }^{\text {c }}$ The number assumed contacted equals the survey sample minus those individuals for whom no valid addresses could be oblained.
    ${ }^{1}$ Responses include individuals found to be deceased or residing in a foreign country at the time the recent survey was conducted.
    - Response nate " A " is the number of survey responses divided by the number in the survey sample. Response rate " B " 18 the number of survey responses divided by the number assumed to have been contacted.
    ${ }^{f}$ Merged fields created for certain small subgroups when sample was reduced
    s Merged cohorts created for certain small subgroups when sample was reduced.
    ${ }^{\text {h }}$ Include only those individuals whose racinleahnic group was known at the turne the sample was selected.
