A method for collecting and disseminating information on hearing handicapped children was developed, and the availability of recorded information on both the incidence and development of hearing impaired children was determined. Detailed information was collected on 4,300 of the estimated 6,755 hearing impaired students enrolled in schools, classes, and other special education programs in the states of Maryland, Pennsylvania, Virginia, West Virginia, and the District of Columbia. The information concerned hearing threshold levels, ability to communicate, intelligence levels, achievement levels, methods used to communicate, and selected demographic characteristics. Every state in the country was also surveyed to obtain descriptive information about hearing screening programs and educational services for the hearing impaired. The conclusion was that a nationwide system for collecting data on hearing impaired students is feasible. Recommendations were made that a permanent program for collection of data and procedures for a sequential and segmented approach to the major operational and coverage problems be established, that major policies be determined by representatives of the sources and users of the data, and that the program include resources for improving methodology and evaluating data. Twenty-one tables are given. (Author/SN)

## PREFACE

This document has been prepared to mark the completion of two years of activity directed toward developing procedures for collecting factual data on the characteristics of hearing impaired children. In the jargon of Federal grant procedures it is referred to as the "final report." Despite the jargon, it is not the intent here to write about the end of a program. The purpose here is to inspire a new program. A program that will provide a better means of meeting the needs of hearing handicapped children. For, despite the large growth in recent years of resources, human and financial, available for identifying and assisting the handicapped, the need is far greater than the supply. To make the most efficient use of these limited resources, we must have more knowledge about the population we are trying to help, and we must have the means of measuring the effectiveness of these efforts.

It is the intent of this document to show that factual information can be obtained on a systematic basis for a relatively small expenditure of resources.

The activities reported upon here have required the help and co-operation of many persons. To describe the contributions made by each would require an almost infinite amount of space. To single out some individuals is not just, for each has made an essential contribution. Therefore, to all the organizations and persons listed below, I extend my sincere and grateful thanks for the assistance they have given.

Augustine Gentile

## SUMMARY

Presented here is a description of activities pursued over a period of two years directed toward the development of a method of collecting and disseminating comprehensive national statistics on the characteristics of hearing impaired children.

The knowledge gained during the study leads to a recommendation for the establishment of an office to conduct a permanent program of data collection.<sup>/1</sup> Initially this office would collect data on students enrolled in schools and classes for the hearing impaired and eventually would collect information on children of all ages who have been identified as having a significant loss of hearing, whether or not they are in special education programs for the hearing impaired.

The report also contains detailed statistical information about 4,300 students enrolled in schools and classes for the hearing impaired in the states of Maryland, Pennsylvania, Virginia, West Virginia and the District of Columbia. The data were collected for the purposes of detecting problems of definition, terminology, availability of data and of developing solutions to these problems. Use of these data should be subject to the limitations and explanatory remarks presented in the text.

In order to determine the feasibility of collecting information about hearing impaired children on a national basis, it was necessary to conduct a survey of all the states in the country. The results of the survey are presented in tabular form in Appendix II of this report. These tables contain information on hearing screening programs, standards used, legal authorization for and administrative control of the programs. In addition, the tables show the number and type of educational programs provided, the number of students enrolled in each program and the type of administrative control for these programs.

---

/1

The Office of The Annual Census of Hearing Impaired Children was formally established as of May 1, 1968.

## INTRODUCTION

### General

In February 1966, the Division of Research, Bureau of Education for the Handicapped, Office of Education, in recognition of the need for factual information about handicapped children, awarded a grant to Gallaudet College to develop a method for collecting information on hearing handicapped children. This report describes activities related to the project, presents the results of these activities, and suggests procedures for the establishment of an annual nationwide census of hearing impaired children.

### Background Information

To date, the statistics available on the volume and characteristics of hearing impaired children have been derived from ad hoc studies usually covering small geographical areas. Attempts have been made to pool and project data from such studies to arrive at national estimates. However, in recent years, because of the expansion of programs for identifying and providing educational and health services for the hearing impaired, the need for reliable, current and useful national data has become increasingly important. Not only are data needed for better program planning and allocation of resources, but there is also a need to measure the efficacy of existing programs. It has been suggested that these needs can only be met by the establishment of an organization that will develop and operate a continuing program of data collection and dissemination.

The need for such an organization was recognized at a meeting sponsored by the National Institute of Neurological Diseases and Blindness, U.S. Public Health Service, held in March 1964. Leaders of various disciplines involved with the problems of the hearing impaired participated in the meeting. It was the unanimous conclusion of the participants that the National Institute of Neurological Diseases and Blindness should institute a program designed to provide the statistical information needed by all organizations in the field.<sup>/1</sup> In April 1964, the Conference of Executives of American Schools for the Deaf passed a resolution expressing its interest and support for the establishment of a program to collect uniform statistics about students in the schools for the deaf and other hearing impaired children.

/1

Proceedings, Conference on the Collection of Statistics of Severe Hearing Impairments and Deafness in the United States, 1964, Public Health Service Publication No. 1227, Washington, D.C.

The National Institute of Neurological Diseases and Blindness was unable to proceed with its plans because of administrative problems. Therefore, in 1965, the office which is now the Division of Research, Bureau of Education for the Handicapped, Office of Education, in recognition of the views expressed at the Conference and because of the need for data to better plan its own activities, took the initiative in seeking ways to solve the problem. This action, in part, took the form of a two-year grant to study the feasibility of and to develop methods and procedures for collecting nationwide information on hearing impaired children. This report is the result of the two-year grant.

## OBJECTIVES

As indicated above, the primary objectives of this study were to ascertain the problems, develop procedures and make recommendations for an optimum method of collecting useful and reliable nationwide data on the number and characteristics of hearing impaired school-age children. The word "useful" in the previous sentence must be emphasized and explained here. The success of any data collection system that may follow from this developmental project can neither be measured in terms of the volume of computer tabulations that may result, nor in terms of the number of times that statistics derived from the system are quoted in speeches or professional journals. The success of this project and the success of any ensuing data collecting activities can only be measured in terms of the utility of the data in improving the educational status and general welfare of hearing impaired children. To achieve this goal, it is essential that general policy for the conduct of the program be made by a group representative of all the data sources and data users. The importance of the foregoing is taken into consideration in the final recommendations in this report.

In this section we have stated the general and long-range objectives of the study. The detailed and immediate objectives of the study are reflected in the section that follows.

### The Problems

In order to achieve the general objectives stated above, it was determined, a priori, that answers to the following questions must be obtained.

1. What is the status of identification audiometry programs throughout the country?
  - (a) Who administers the program?
  - (b) To what extent do children with hearing losses have a chance of being identified?
  - (c) What kind of records are available on children who have been identified as having an impairment of hearing?
  - (d) Where are the records kept?
  - (e) Is there some efficient way of obtaining data from these records?

2. What kind of special educational services are available to hearing impaired children?
  - (a) What are the criteria for obtaining these services?
  - (b) Who administers the programs?
  - (c) What kind of summary and individual records are kept?
  - (d) Who keeps these records?
  - (e) Is there some efficient way of obtaining data from these records?
3. Do officials at the state and local level need national data on the hearing impaired?
  - (a) What kind of data do they need?
  - (b) What kind of data are they collecting at the state or local level?
4. Is the need and interest of state and local officials for data sufficiently great for them to be willing to participate in a data collection system?
  - (a) What are the practical barriers to participation?
  - (b) What are the legal and administrative barriers to participation?
5. What would be the best way to collect data on the large number of the more severely hearing impaired children enrolled in full-time schools for the deaf?
  - (a) What kind of records are kept?
  - (b) Can information on students in schools for the deaf be pooled with information on hearing impaired students receiving other types of special education?
  - (c) Would these schools be willing to participate in a data collection system?

## METHODS

### General

Prior to the time that this study began, it was decided to confine our activities to the states of Maryland, Pennsylvania, Virginia, West Virginia and the District of Columbia. These states were selected because they were close to the headquarters for the project, Gallaudet College, Washington, D.C. It was also believed that because of the difference among these states, in economic status, educational systems, population size and other characteristics, they might be generally representative of all the states in the country. Subsequent events proved this assumption was not correct and it became necessary to gather a substantial part of the desired information from all parts of the country.

At the outset of this project, the only preconceived notion the author had was that final recommendations concerning methods and procedures for collecting data on hearing impaired children would be based on the knowledge and advice of persons directly involved in identifying and providing services for these children. This philosophy was adhered to throughout the course of the study.

The sections that follow describe categorically the major activities pursued in carrying out the project.

#### 1. Informational Contacts.

By means of letters, phone calls and, subsequently, personal visits, superintendents of schools for the deaf and officials of the departments of education and health in the five-state area were informed about the purposes of the project. News about the project was received with a great deal of enthusiasm by all persons contacted and many made unsolicited promises to cooperate with the project in all ways possible. These visits also served to establish lines of communication for further contact and exchanges of information.

#### 2. Collecting Information.

During the initial visits with state and school officials, arrangements were made to obtain information about:

- a. The status of identification audiometry programs and the availability of educational and health services in each state.
- b. The kinds of individual records kept on students receiving special educational training.

These efforts produced extensive information about the operational details of programs for hearing impaired children. It was also learned that some states did not have any organized programs for these children.

Samples of records kept on individual children revealed the types of information that were on file. As might be expected, there was a wide variety in the kinds of information available for individual children but more important were the similarities in the kinds of data that were available. On the basis of the information obtained in conversations, written descriptive material and samples of the records kept on the children enrolled in special education programs for the hearing impaired, it was possible to formulate and carry out the next steps of the program.

### 3. Development of a Reporting Form.

One of the planned steps in the project design was to collect information on hearing impaired students in the five-state area. The procedures followed in the development of a form for this purpose are described in this section.

In the development of the form prime consideration was given to the following factors:

- a. The content should be limited to only a few basic topics, in order to reduce the burden of preparing the forms.
- b. The requested information should be available from most of the potential reporting sources.

A draft of the form was prepared and distributed, for comments, to persons in the five-state area. In addition, the forms were completed for a portion of the students enrolled at one of the schools for the deaf in the area.

On the basis of the comments received and the experience gained in completing the forms at the schools for the deaf, a revised version was prepared.

In January 1967, representatives of the department of education and health of the five-state area and the superintendents of five schools for the deaf in the area participated in a meeting to discuss the status of the project, the revised reporting form and further participation in the project. A final version of the reporting form (see Appendix III) was adopted and all the participants agreed to make arrangements for completing the individual form on students enrolled in their jurisdictions.

Three of the states represented could only provide information on students enrolled in the four schools for the deaf in their areas. Two of the states agreed to complete the forms for all hearing impaired students in schools for the deaf as well as those in classes or itinerant programs.<sup>/1</sup> The forms were completed for students enrolled during the 1966-67 school year.

#### 4. Collecting Data on the Characteristics of Students in the Five-State Area.

As noted previously, the primary purpose for collecting data on the individual students was for methodological analyses. The objectives were to determine the availability of information for selected topics and to evaluate the quality of the reported information. In addition, there was interest in developing standard terminology, definitions and instructional materials. Respondents were given only a few instructions for completing the forms and they were asked to report any difficulty they had in understanding the form or getting the required information.

---

/1

For the purpose of this report the following terms are defined as indicated:

Schools for the deaf - These consist of a building or a group of buildings used exclusively for the instruction of hearing handicapped children. In residential schools for the deaf a majority of the students remain overnight on weeknights during the school year. In day schools for the deaf a majority of the students go home at the end of the school day.

Classes for the deaf - These are special classrooms set aside for the instruction of hearing handicapped children. These special classes are usually held in a school for students with normal hearing. Hearing impaired students attend the special classes on either a full-time or part-time basis.

Itinerant programs - These are generally programs in which a teacher travels to two or more schools to provide special instruction to hearing handicapped children. Except for these periods of special instruction, the children attend regular classes.

Before the end of 1966-67 school year, records were received for 2,074 students enrolled in seven residential schools for the deaf,<sup>/1</sup> 371 students in the two day schools for the deaf in the five-state area, and 1,856 students in classes and itinerant programs in two of the areas (Pennsylvania and the District of Columbia).

In all, 4,301 records were received. All of the information on the records was classified, coded and prepared for computer input. The qualitative and quantitative results of this phase of the project are discussed in a later section.

##### 5. Nationwide Survey of Identification Audiometry and Educational Services for the Hearing Impaired.

From the initial information obtained from the five-state area, it was learned that only two of the five states had statewide identification audiometry programs and educational programs coordinated at the state level. Many areas in a third state had identification programs and provided educational services, but these were controlled at the local level. In the other two states there was very little activity related to these programs. Because of the wide differences found within the five-state area, both as to the scope of services provided and the methods and procedures used in hearing screening programs and educational programs for the hearing impaired, it became obvious that information from additional states would be necessary before recommendations could be made about the feasibility of a nationwide data collection program. Accordingly, the scope of the project was expanded and letters and questionnaires were sent to all of the states in April of 1967. The questionnaires requested descriptive information about the availability of services for hearing impaired children. Copies of the covering letter, questionnaires and related materials are shown in Appendix IV. Eventually replies were received from 47 states and the District of Columbia. The substantive results of the survey are presented later in the report.

/1

Records were not requested from two residential schools in the five-state area. These two schools have a total enrollment of 204 students.

## RESULTS OF THE STUDY

This section is divided into three parts. The first part deals with the general objectives of the study. That is, what was learned about the availability of information and the problems and feasibility of collecting information on hearing impaired children. The second part discusses the data collected on students from the five-state area, and the third part reviews the results of the nationwide survey of identification audiometry programs and educational and health services for the hearing impaired.

### Findings Related to the General Objectives of the Project.

#### 1. Types of Data Available.

As stated before, one of the general objectives of the study was to determine the type of information that is recorded for hearing impaired children and the quality and homogeneity of the data. Based on an examination of files, copies of forms and actual records received from the five-state area, it may be said that extensive information is kept on all children who are receiving special educational training because of an impairment of hearing. While there is a great deal of variation in format, terminology and definitions, almost always the following types of information are kept:

- Name
- Residence
- Date of Birth
- Sex
- Expressive and Receptive Communication Skills
- Results of Audiological Tests
- Years of School Attendance
- Achievement Levels
- Intelligence Levels
- Age at Onset of Loss
- Existence of Other Handicapping Conditions.

## 2. Means of Collecting Data.

In order to determine more specifically the best methods or channels for collecting data on hearing impaired students enrolled in special education programs, data was sought for students enrolled in these programs in the five-state area.

In one state, Pennsylvania, all the records were obtained through the Supervisor of Speech and Hearing Programs of the Department of Public Instruction. Records were obtained for all students in public schools and classes and for fifty percent (50%) of the students in itinerant programs. It was determined that records from the two private schools for the deaf in the state would have to be collected directly from the schools but because of time limitations, no effort was made to collect these records.

In three states, Maryland, Virginia and West Virginia, records were collected only from the schools for the deaf. Contact and communications were made directly with each school. It was found in these states that records on students in classes or in other programs were kept at the local level and that in order to collect these records officials at the local level would have to be contacted.

For the District of Columbia records were obtained directly from the school for the deaf which provides services for hearing impaired children who live in the District of Columbia and other nearby areas. In the District, children enrolled in special classes and children enrolled in itinerant programs come under the jurisdiction of separate program supervisors. Records for these children were provided by the supervisor of each program.

As indicated by the foregoing, the channels of communication and sources through which data might be collected varied a great deal in the five-state area. Therefore, it became necessary to obtain data on potential information sources from all the states, in order to determine the best methods of collecting data nationally on hearing impaired children.

### 3. Quality of the Data.

In order to obtain the best picture possible of the availability and quality of existing information, respondents were given very little instructional and definitional information. Further, they were asked to complete the forms on the basis of existing information without making any extraordinary efforts to fill in items on the form by conducting new tests or audiological examinations. Thus, we were able to obtain some measure of the proportion of times that usable data for important variables were available.

In all, records were obtained on 4,301 hearing impaired students in the five-state area. Table A shows the percentage of records for which data for the listed items were not reported or were not usable.

These percentages clearly indicate that the greatest problem areas in terms of non-reporting were the items on achievement testing and intelligence levels. It should be noted that in many cases information was given for these items, but because of lack of instructions it was not in usable form. Other items for which there was a high proportion of unusable responses or non-responses were:

Years of School Attendance  
Age at Onset of Loss.

It is believed that procedures can be developed to reduce the non-reporting for all items below the ten-percent level.

As indicated, achievement test scores and intelligence scores were frequently not reported or when reported lacked enough information to make them usable. In addition, a great variety of tests were administered to persons within the same age groups. While the scores for different achievement and intelligence tests had the same distribution patterns for a given age group, the frequencies were not large enough to determine if the same results would be obtained in a large sample. In an ongoing survey this problem could be largely resolved by having all respondents use a standard test and standard procedures for administering the tests.

TABLE A: PERCENTAGE OF RECORDS FOR WHICH DATA FOR SELECTED ITEMS WERE NOT REPORTED OR WERE NOT USABLE.

ITEM	All Students N = 4301	Students in Residential Schools N = 2074
	Percent	Percent
Age	0.0	0.0
Sex	0.0	0.0
Achievement Tests <sup>/1</sup>		
Battery Medians	30.6	17.4
Reading Levels	54.6	42.6
Hearing Threshold Levels	12.6	11.3
Intelligence Quotients <sup>/1</sup>	47.0	67.0
Age at Onset of Loss	34.7	25.0
Total Years Attended School	15.8	24.2
Lipreading Ability	6.3	2.4
Methods Used to Communicate to Others	4.5	2.1

<sup>/1</sup> Reporting for these items was only required for students eleven years of age and older.

#### 4. Summary.

In summary the records collected from the five-state area show that useful data is recorded for hearing impaired students enrolled in special education programs. It also has been demonstrated that the information is available for a data collection system. Finally, it is believed that the problems of underreporting and standardization can be readily resolved in an ongoing regular data collection system.

#### Findings From Records of Students in the Five-State Area.

##### 1. Sources and Limitations of the Data.

For methodological purposes, data were collected on 4,301 hearing impaired students receiving special educational training in a five-state area. Table B shows the proportion of the estimated total of hearing impaired students in the five-state area, for whom records were obtained, by type of educational program.

All of the records collected on students enrolled in classes and itinerant programs came from two areas, Pennsylvania and the District of Columbia. These records were collected through the efforts of personnel in the state department of education. At the time the data were collected it was not feasible for personnel at the state level in the other three states to attempt to collect the information from programs in their states. Therefore, no effort was made to collect data on students enrolled in classes and itinerant programs in these areas. However, records on the students in schools for the deaf in these three states were collected. On the basis of the foregoing, therefore, statistics cited here and in the detailed tables in Appendix I should be considered as highly representative of the schools in the entire five-state area, but only representative of classes and itinerant programs for Pennsylvania and the District of Columbia. The reader is further cautioned that because little is known about the distribution and characteristics of the hearing impaired school population in the United States, there is no way of determining how representative of the total universe the data from the five-state area might be.

**TABLE B: ESTIMATED NUMBER OF HEARING IMPAIRED STUDENTS IN THE FIVE-STATE AREA AND THE NUMBER AND PERCENT OF STUDENTS FOR WHOM RECORDS WERE OBTAINED, BY TYPE OF EDUCATIONAL PROGRAM.**

Type of Program	Estimated Total Number of Students in the Five-State Area	Records Received	
		Number	Percent of Estimated Total
Residential Schools	2,278	2,074	91.0
Day Schools	386	371	96.1
Classes	1,271	751	59.1
Itinerant Programs	2,800	1,105	39.5
All Programs	6,735	4,301	63.9

Therefore, projections of these data to prepare estimates for students in other states are not warranted. Other factors that limit the validity of these data are the high proportion of "unknowns" for some of the items and the pooling together of scores from a great variety of tests to produce the data on achievement and intelligence levels. In view of these limitations the validity of the statistics presented here are open to question. It is not possible to defend or describe the validity of the data. However, presentation of the data is justified in terms of the objectives of the study, i.e., to demonstrate the general availability of information and to determine the problems and develop the procedures necessary to collect useful data for presentation in a meaningful form. These data, then, are presented to show what is available and how they might be presented in analytical statistical tables. In an ongoing operational program of data collection the validity of the data can be improved by use of standard measures, terms and procedures. Further, the program would be expected to devote a substantial portion of its resources to evaluation studies. Thus, the reliability of any published statistics could be described in the usual statistical terms.

## 2. Some Highlights of the Data.

In the five-state area about forty percent (40%) of the estimated 6,735 hearing impaired students enrolled in special education programs are attending schools for the deaf. The others are enrolled in classes and itinerant programs. Slightly more than half (56%) of the students for whom records were obtained were males. Audiometrically, for those for whom information was received, eighty-nine percent (89%) of the students in schools for the deaf had hearing threshold levels of 60 dB(ASA) or higher, compared to eleven percent (11%) for students enrolled in other programs. At the other end of the audiometric scale, only one percent (1%) of the students in schools, compared to sixty-eight percent (68%) of the students in other programs has threshold levels below 40 dB(ASA).

Age at onset of hearing loss was reported for about seventy-five percent (75%) of the students from residential schools; hearing loss was reported as occurring at birth for seventy-six percent (76%) of these students and under three years of age for ninety-six percent (96%) of the students. Age at onset was reported for fifty-six percent (56%) of the students enrolled in other than residential schools; hearing loss was reported as occurring at birth for seventy-three percent (73%) of these students and as under three years of age for eighty-two percent (82%) of the group.

About thirty percent (30%) of the students in residential schools were described as having enough ability to express themselves orally so that most of their speech could be understood by others. Among the other students about seventy-seven percent (77%) were so described.

The distribution of reading levels, as determined by scores from a variety of tests, were computed for students 14-17 years of age with hearing thresholds at 50 dB(ASA) or higher. It was found that twenty-six percent (26%) had below third-grade reading levels, thirty-two percent (32%) had between third-and fourth-grade levels; twenty percent (20%) had between fourth-and fifth-grade levels and twenty-two percent (22%) read at the fifth-grade or higher level.

The tables in Appendix I contain additional details on these and other variables.

## Findings From the National Survey of Identification Audiometry Programs and Educational Services For the Hearing Impaired

In order to begin collecting useful data on hearing impaired children on a national basis, two basic factors are required. One is that the hearing impaired child has a chance of being identified and secondly, that a record containing descriptive information about his hearing loss and other pertinent characteristics must be available. To determine to what extent these factors were present, a survey of the fifty states and the District of Columbia was conducted. Replies were received from all but three states. Descriptive summaries of the data are presented in Tables 15 and 16 in Appendix II. Presented below are some highlights that were extracted from these tables.

### 1. Identification Audiometry Programs.

The extent to which hearing screening programs are conducted in the country is reflected in Table C. It may be inferred from the data in this table that, proportionately, a larger number of children are covered by hearing screening programs in state that have programs coordinated at the state level than in the other states. It should be noted that several additional states reported they are in the process of developing state coordinated programs.

For those states that reported this information, the number of children screened in a recent year is shown in Table D. Many states reported difficulty in obtaining this information. Since it was not a major purpose of the survey to collect numerical data on this item, no effort was made to obtain better reporting on the number of children screened. Therefore, the total number of children screened shown in the table is a minimum number and we have no information available from the study to indicate what proportion of the actual total number of children screened this represents.

Additional information regarding testing procedures, follow-up procedures, legislative authority and other program information is given in the tables in Appendix II.

TABLE C: NUMBER OF STATES WITH HEARING SCREENING PROGRAMS, BY EXTENT OF COVERAGE AND EXTENT OF STATE LEVEL OF INVOLVEMENT IN THE SCREENING PROGRAMS.				
Extent of Coverage of Screening Programs /1	Total States With Specified Coverage	EXTENT OF STATE LEVEL INVOLVEMENT		
		Coordinated at the State Level	Little or No Involvement at the State Level	Extent of Involvement at the State level Not reported
		Number of States		
<u>U.S. TOTAL</u>	<u>51</u>	<u>25</u>	<u>22</u>	<u>4</u>
Substantial	27	21	6	0
Moderate	7	2	5	0
Very Little	6	0	6	0
Not Reported	11	2	5	4

/1

The categories shown in this table are for many states based on a highly subjective interpretation of the information received. The terms may be very roughly considered to mean: "substantial" - 60% or more of the school-age population covered; "moderate" - 30%-59% covered; "very little" - less than 30% covered. It is believed that a majority of the states in the "not reported" category have "very little" coverage.

TABLE D: NUMBER OF STATES WITH HEARING SCREENING PROGRAMS, BY EXTENT OF COVERAGE AND NUMBER OF CHILDREN SCREENED IN A RECENT YEAR <sup>/1</sup> FOR REPORTING STATES.						
Extent of Coverage <sup>/2</sup>	Number of States With Specified Coverage	NUMBER OF CHILDREN TESTED IN A RECENT YEAR				
		Entire State Reported		Only Part of State Reported		Number Screened Not Reported
		Number Screened	Number States	Number Screened	Number States	Number States
U.S. Totals	51	4,100,202	12	2,858,257	15	24
Substantial	27	4,029,909	10	2,701,771	9	8
Moderate	7	79,293	2	135,048	4	1
Very Little	6	--	--	21,438	2	4
Not Reported	11	--	--	--	--	11

<sup>/1</sup> Year for which data was reported varies from state to state, but most reports were for the 1966-67 school year.

<sup>/2</sup> See footnote to Table C.

## 2. Educational Services.

For the 1966-67 school year, estimates of the number of students enrolled in special education programs for the hearing impaired, by type of programs and the number of states offering these programs are given in Table E. Because we did not attempt to cover private institutions in our survey, data for private institutions were obtained from the May 1968, issue of the American Annals of the Deaf.

The table shows that 22,084 students are enrolled in public and private residential and day schools for the deaf. An additional 15,688 students are enrolled in special classes for the hearing impaired. However, six states that have classes did not report enrollment figures for students attending these classes. Only 18 of 39 states that reported having itinerant programs submitted enrollment figures. The total number of children enrolled in itinerant programs in these states amounted to 16,370. Thus, the total reported number of children enrolled in all programs amounted to 54,142.

Of importance, in terms of the survey objectives, was information obtained about the kinds of records kept on students enrolled in special education programs and the accessibility of these records. Only nine states reported that individual records on students enrolled in classes and itinerant programs were kept at state level. All other states reported that individual records were kept at the local level only. Records on individuals in schools for the deaf are kept at the schools only.

The detailed tables in Appendix II contain additional types of information on educational services that have not been summarized here.

TABLE E: NUMBER AND TYPE OF SPECIAL EDUCATION PROGRAMS FOR HEARING IMPAIRED CHILDREN AND NUMBER ENROLLED IN THESE PROGRAMS: UNITED STATES, 1966-67 SCHOOL YEAR.

Type of Program	Number	Number of States With Programs	Number of Students	Number of States Reporting Enrollment
<u>Schools</u>				
Public	85	48	20,352	48
Private <sup>/1</sup>	26	17	1,732	17
<u>Classes</u>				
Public	470 <sup>/2</sup>	44	14,341	38
Private <sup>/1</sup>	53	25	1,347	25
<u>Itinerant Programs</u>	--	39	16,370	18

<sup>/1</sup> Data was obtained from the May 1967 issue of the American Annals of the Deaf.

<sup>/2</sup> One state did not report the number of classes.

## CONCLUSIONS

Evidence has been presented that much useful information is available on children enrolled in special education programs for the hearing impaired. It has also been demonstrated that this information can be collected and prepared to provide much needed statistical information. Further, the study has generated a great deal of interest among educators and other persons serving the hearing impaired. This interest has been expressed in the form of written offers to cooperate in a data collection program.

The problem areas that the study has uncovered may be classified into two groups, operational and coverage.

The major operational problems are the excessive number of sources from which data would have to be collected for a nationwide data gathering system and the lack of standard terminology and definitions to describe important characteristics of hearing impaired children. It is believed that these operational problems are amenable to solutions and suggested solutions are contained in the recommendations in a later section of this report.

The coverage problem is due to the fact that in some areas of the country hearing screening programs are non-existent. Thus, it may be presumed that some children with impaired hearing have not been identified. However, there is encouraging evidence that better identification programs are developing in these areas.

The study has developed some illustrative statistical information on 4,301 students enrolled in special education programs and has also produced a comprehensive description of the programs that are available in each state to identify and provide educational services for hearing impaired children.

## RECOMMENDATIONS

Based on the evidence developed from this study, it is recommended that a permanent program be established to collect, analyze and disseminate comprehensive statistical information about the number and characteristics of hearing impaired children in the United States. The paragraphs that follow suggest the procedures to be followed in establishing such a program.

The need for national information on hearing impairments has been cited here and by most organizations and individuals concerned with these problems. During this study records were obtained on almost one-hundred percent (100%) of the students for whom records were sought. This is ample evidence that useful data are available and that the data can be collected. This recommendation suggests procedures for establishing a nationwide data gathering system and offers solutions to the major problems involved in establishing such a system. Furthermore, it is believed that the procedures outlined here can serve as a model for programs to collect data on children with other handicapping conditions.

The major problems involved in establishing such a system and the suggested solutions may be summarized as follows:

1. The lack of national data can be attributed largely to the fact that heretofore there has been no central organization with a continuing responsibility for collecting data on handicapped children.

These recommendations propose the establishment of such an organization.

2. Records currently kept are not uniform in content or quality between and within states.

The continuing program envisioned by this proposal would permit the development of standard reporting forms with uniform definitions and standard tests, e.g., standard achievement and intelligence tests.

3. Since in many states records on students attending special classes or involved in itinerant programs are kept at the local level only, it might be too much of a burden to collect records directly from each school.

Information collected from all fifty states during the developmental phase of the project has indicated which states have central record-keeping systems. It has also been found that many of the states are in the process of organizing programs that will lead to central record-keeping systems.

The establishment of a permanent data gathering organization would in many cases provide the motivation and impetus for establishing central record-keeping systems. The program would offer encouragement and assistance to state officials seeking to develop such systems.

4. The willingness of school officials to cooperate with such a venture is of major importance.

In November 1967, the Executive Committee, Conference of Executives of American Schools for the Deaf reaffirmed a resolution passed by the membership in 1964 expressing its interest and support in the development of an annual census of the hearing impaired.

Evidence of the interest of state officials and their willingness to cooperate is shown in Appendix V.

In order to maintain their interest and cooperation, an advisory committee composed of representatives of the participating schools and school systems should be created. The advisory committee would provide the information and guidance necessary for the project staff to keep abreast of the current needs and problems of educators at the local level. With this guidance, the project staff would be able to collect and disseminate the kinds of information that are needed most by persons in the field. Thereby, interest in the project should be sustained at a high level.

The suggested procedures for the first year of such a program are as follows:

1. Schools for the Deaf.

Information similar to that collected during the developmental phase of the project would be collected on every individual enrolled in a school for the deaf in the United States. After the first year, other kinds of information would be collected, some annually and some less frequently. A decision as to the final content of the form to be used each year would be made in consultation with the advisory committee.

Standard achievement and intelligence tests would be supplied by the central office and administered by the schools in accordance with uniform procedures.

A schedule for data collection would be established to permit the preparation of:

- a. National summaries prior to the beginning of each school year.
- b. Summaries for individual schools prior to the beginning of each school year.
- c. Detailed analyses and detailed statistical tables within twelve months of the close-out date for returning the forms (probably in the Spring of each year).

## 2. Classes for the Deaf.

Efforts would be made to obtain and maintain a complete listing of schools with classes for the hearing impaired.

A national sample of not less than fifty schools with classes for the deaf would be asked to prepare a form similar to Appendix III, for all of their hearing impaired students.

Statistical summaries containing data comparable to the data from the schools for the deaf would be published.

Visits and meetings with representatives of state departments of education and schools with classes for the deaf would be held with a view toward expanding the system to include all of these schools.

## 3. Other Hearing Impaired

Information developed to date indicates that there are many hearing impaired students enrolled in regular schools who are receiving special training or assistance on an itinerant basis. Knowledge about the extent of hearing loss and other characteristics of these students is required.

In states where records on these students are now available at a central point, data similar to that collected on students in schools and classes for the deaf would be collected on individual students.

In states where records are now kept at the local level only, summary statistics would be gathered. In addition, state officials would be encouraged to develop procedures for collecting individual records at the state level.

Procedures for subsequent years will evolve from the experience gained in the operation of the program. However, in subsequent years the program should provide resources for improving methodology and evaluating the data flowing into the system.

In summary these recommendations suggest:

1. The establishment of a permanent program for the collection of data on hearing impaired children and procedures for a sequential and segmented approach to the major operational and coverage problems.
2. Major policies for the program should be determined by representatives of the sources and users of the data.
3. The program include resources for improving methodology and evaluating data.

## APPENDIX I

Detailed Tables, Showing Characteristics of Students in the Five-State Area.

Explanatory Notes and Definitions.

For a better understanding of the data in the tables that follow, explanatory notes and definitions for some of the terms used in the tables are given below.

### NOTES AND DEFINITIONS

Five-State Area - The five-state area includes Maryland, Pennsylvania, Virginia, West Virginia and the District of Columbia.

#### Type of School

Schools for the Deaf - These consist of a building or group of buildings that are used exclusively for the instruction of hearing handicapped children. In residential schools for the deaf a majority of the students remain overnight on weeknights during the school year. In day schools for the deaf a majority of the students go home at the end of the school day. Data were obtained from seven residential schools and two day schools in the five-state area.

Classes for the Deaf - These are special classrooms set aside for the instruction of hearing handicapped children. These special classes are usually held in a school for students with normal hearing. Hearing impaired students attend the special classes on either a full-time or part-time basis. Only two of the five states provided information on classes for the deaf.

Itinerant Programs - These are generally programs in which a teacher travels to two or more schools to provide special instruction to hearing handicapped children. Except for these periods of special instruction, the children attend regular classes.

All Types of Schools - The tables showing data for "All Types of Schools" contain summations of the three programs cited above, students enrolled in schools, classes and itinerant programs for the hearing impaired.

Age - Age as defined here is as of December 31, 1966.

Hearing Threshold Levels - Approximately sixty-five percent (65%) of the records with audiometric information were reported in terms of ASA standards. Records for the remaining thirty-five percent (35%) were reported in terms of ISO standards. The data from these records were converted to the ASA standards by subtracting ten decibels (10 dB) from the reported ISO values.

Adjusted Battery Medians - The reported battery medians were adjusted mathematically, so that all students in a given age level were assumed to have reached that age on December 31, 1966. The achievement tests were assumed to have been given on that same date. As noted previously, the reported scores came from a wide variety of tests given to the students.

Adjusted Reading Levels - The reported reading levels were adjusted mathematically, so that all students in a given age level were assumed to have reached that age on December 31, 1966. The tests for reading levels were assumed to have been given on that same date. Reported reading levels also came from a wide variety of tests.

Intelligence Quotients - Scores for non-verbal tests of intelligence were used. Scores that were more than two-years-old were not used. The scores came from a wide variety of tests.

Total Years Attended Schools - The total number of years the child was reported to have attended school prior to the 1966-67 school year was used.

Ability to Hear and Understand Speech Without Use of a Hearing Aid - Classification was based on a subjective judgment made by the student's teacher.

Ability to Hear and Understand Speech With Use of a Hearing Aid - Classification was based on a subjective judgment made by the student's teacher.

Lipreading Ability - Classification was based on a subjective judgment made by the student's teacher.

Methods Used to Communicate to Others - Manual includes both the manual alphabet and the language of signs. The use of gestures was reported mainly for children just starting school.

Reading Ability - Classification for this variable was based on a subjective judgment made by the student's teacher.

SPECIAL NOTE REGARDING THE FORMAT OF THE TABLES

Many of the tables that follow run several pages. The main table titles are repeated on each page, and the sections of the tables are identified by letters following the table numbers and by appropriate subheadings which appear above the numerical data.

TABLE 1. NUMBER OF HEARING IMPAIRED STUDENTS RECEIVING SPECIAL EDUCATION IN A FIVE-STATE AREA, BY TYPE OF SCHOOL, SEX & AGE: 1966-67 SCHOOL YEAR\*

## APPENDIX II

Tabular Summaries of Data From a National Survey of Identification Audiometry Programs and Educational Services for the Hearing Impaired.

---

The tables that follow contain summaries of the descriptive information received from each state. A separate publication now in preparation will contain a more detailed description of these programs.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Alabama	Hearing clinics held in 4 cities for children referred by physicians. No other areas have regularly scheduled programs.	Clinics open to any child between the ages of one week & 21 years.	Not available.
Alaska	Not reported.	Recommended that all children K to grade 3 be tested annually, every 3 years beyond grade 3.	Not available.
Arizona	State divided into 3 districts & recruitment started to place audiometrist in each district.	Recommended that all children in K, grades 1, 3, 5, 7, 9, 11, plus new students, teacher or parent referrals & known cases be tested.	1966-67 school year - About 75,000 children tested.
Arkansas	Entire state covered.	Some schools test all children every other year, some alternate grades, some do grades 1, 2, 5, 7, plus any suspected hearing problems from all other grades.	1965-66 school year - 61 of 75 counties, all cities reported, 77,545 screened, 2,180 referred, 46 of 75 counties, 829 followed up.
California	Most of state covered.	If every child cannot be tested every year, all children in as many grades as possible with priority to K, grades 2, 3 & all referred children are tested.	1963-64 school year - 714 out of 1624 forms returned. 982,802 screened. (23.2% of enrollment.) 26% were tested by mobile units.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Colorado	Report	Not Received.	
Connecticut	Entire state covered.	Children in grades 1, 3, 6, 10 are screened; many schools are beginning to screen all children K, grades 1, 2, 3.	Not available.
Delaware	Entire state covered.	Children in K, grades 1, 3, 5, 8, 11, special education classes & new children.	<p>1966-67 school year - 54,375 given pure tone audiometric test. 229 referred to school nurses by speech &amp; hearing therapists for audiological/otologic examination. 2821 failed screening test given by school nurse. 2128 given threshold test by school nurse. 1101 referred by nurses for audiological/otologic examination. 51 schools have special sound treated audiometric testing rooms; 123 audiometers owned by public schools.</p>

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
District of Columbia	Entire city covered.	Junior primary, grades 1, 3, 7, 9 (parochial only), 10, all new children, & referrals.	No records are available. Statistical summary will be available for 1967-68 school year.
Florida	No statewide program. 8 of 67 county school systems offer identification audiometry under auspices of Exceptional Child Education.	Testing varies within 8 reported counties. 2 counties test all children. Of other 6 counties: one tests grade 1 only; one tests grade 1 & referrals; one tests grades 1, 6 & referrals; one tests grades 1, 3, 7, one tests grades 2, 5, 7; one tests grade 1. special education students & students in basic classes in grades 2, 3, 4, 5, 6.	Available for only one county (Bay). 1967-68 school year: 1,438 tested.
Georgia	Entire state not covered but there is some testing in a majority of counties. 108 of 159 counties reported number of children screened.	Grades tested vary. Emphasis places on testing grade 1 & teacher referrals. State recommendation is that all children should be tested at least 4 times while in school.	1966-67 school year - 108 counties reported. 147,396 screened. 7,267 failed screening 4,001 seen by physician.
Hawaii	Entire state covered.	K, grade 2, teacher referrals, new children & old known cases.	1966-67 school year - 138,550 screened. 2-5% of newly screened were referred to otologic clinic or to private doctor.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE : JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Idaho	No organized statewide identification audiometry program. Some testing is done in a few areas of the state.	No organized statewide identification audiometry program.	1965 - 20,000 tested by Easter Seal Society.
Illinois	No organized statewide identification audiometry program. Testing is done in many parts of the state, but no data received from local areas.	No organized statewide identification audiometry program.	local areas.
Indiana	Entire state covered.	Grades 1, 4, 7, 10, plus new students & all those suspected of having hearing defects.	Not available.
Iowa	Entire state covered with exception of a few counties.	Each demographic area screens different grades. 38 of more than 90 areas screened grades 1, 3, 6, 9, in 1966-67 school year.	1966-67 school year - 239,577 screened. 26,659 received threshold test after failing screening. 16,285 received threshold test as a result of referrals, rechecks or reasons other than screening. 8,546 referred for medical consultation. 1,147 identified as needing regularly scheduled direct special educational services. 4,394 identified as needing indirect, periodic, consultative, or other type of service.

TABLE 1 -- SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Kansas	Entire state will be covered by 1969.	Grades 1, 3, 5, 7, 10 & all new children.	Not reported.
Kentucky	Entire state covered.	Grades 1, 3, 5.	1966-67 school year - 30,300 screened out of a total school population of 80,000. 5,000-8,000 were referred.
Louisiana	Entire state covered.	Grades 1, 4, 8, 11.	1966-67 school year - 48,993 screened. 7,130 given threshold tests. 1,485 referred for medical examination. 1,008 received otologic examination.
Maine	Testing is widespread throughout state; controlled at local level.	There are 22 speech correctionists subsidized by State Department of Education who provide screening tests to all students referred. There are 6 speech & hearing clinics serving school children.	Not reported.
Maryland	No organized statewide program. Testing done in many parts of state.	State Department of Health recommends annual testing of all kindergarten & school-age children & all new children. There is some testing variation among counties. Generally, school-age children are screened every other year.	Not reported.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Massachusetts	Entire state covered.	All grades.	1965-66 school year - 982,674 screened. 29,480 failed. 27,769 accepted as correct referrals by an ear specialist or general practitioner.
Michigan	Entire state covered.	All grades every other year plus classes for mentally handicapped plus pre-school program.	1965-66 school year - 745,487 screened. 26,075 failed. 12,270 referred to otologist or otolaryngologist.
Minnesota	State Department of Health assisted in screening at least portions of 57 out of 87 counties during 1966-67 school year. Possible that school systems within most counties have some program.	Children in K, grades 1, 2, 3, 5, 7, 9, 11; children with known hearing problems; new students & parent & teacher referrals. Pre-schools are also tested whenever possible.	Not available for programs other than State Department of Health programs. Sept. '67 to Jan. '68 - 103,914 screened. 1,132 4-year-olds screened.
Mississippi	No organized statewide identification audiometry program. Some hearing through county health departments, volunteer groups, speech clinicians public schools. & university audiometry screening teams.		testing is done employed by local

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Missouri	Some areas of state conduct separate hearing screening programs. Other areas are serviced by cooperative programs of state agencies.	Not reported.	Not reported.
Montana	No organized statewide identification audiometry program.		
Nebraska	No organized statewide identification audiometry program. Some programs conducted at local level, but no specific data received.		
Nevada	Report	Not Received	
New Hampshire	No organized statewide identification audiometry program. Union sets up hearing testing schedule.	At local level, supervisory	
New Jersey	Not reported.	Children in K, grades 1, 2, 3, 4, 5, 6, 7, 9, 11; teacher referrals, new pupils, & those recovering from tonsillectomies or communicable diseases.	Not reported.
New Mexico	Entire state covered.	Children in grades 1, 3, 6, 9.	Unknown.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Area or Ages Covered Annually	Year & Number of Children Screened
New York	Entire state covered.	All children tested annually with priorities to children in K, grades 1 & 3, new pupils, pupils with known hearing impairment, pupils exhibiting symptoms of emotional or learning disability, pupils having speech difficulties, pupils recently recovered from any illness with possible significance for hearing health, pupils suspected of having hearing problems referred by teachers, parents or physicians.	Not reported.
North Carolina	Beginning an organized statewide identification audiology program through Speech & Hearing Special Education Section, Department of Public Instruction.	Number of grades tested is determined at local level. Suggested that all children in grades 1, 3, 5, 7, 9, or in grades 2, 4, 6, 8 & any of high school grades be tested.	1966-67 school year - Approximately 176,028 children tested.
North Dakota	Although there is no organized statewide identification audiology program, screening programs are quite extensive throughout the state.	Programs vary but most areas provide 4 tests through 12 grades.	1966-67 school year - Approximately 40,000 out of 167,000 children tested.
Ohio	Entire state covered.	Recommended that children in K, or grade 1 & grades 3, 6 & 9 be tested. Actual grades screened depends on local resources.	1965-66 school year - 377,268 screened. 9,262 referred. (2.45%)

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Oklahoma	96% of total school population of state covered by organized programs.	At least K, grades 1, 3 & 5 plus other grades, referrals & new transfer pupils. Other grades when able.	1966-67 school year: Health departments - 96,414 screened, 2,200 referred (2.3%). City schools - 96,573 screened, 1,742 referred (1.8%).
Oregon	Entire state covered.	Children in K, grades 1, 3, 5, 7, & 9 & children with known losses. New enrollees, high school students & other special cases may be tested through teacher-nurse referrals.	1965-66 school year - 168,551 elementary school children screened. 7,855 referred for audiological examination (4.7%). 4,192 referred for medical examination (2.3%). 4,460 children (elementary, high school, & preschool) referred by teacher or nurse for testing. 867 referred for audiological examination (19.4%). 487 referred for medical examination (10.9%). 717 rechecks (elementary) tested. 318 referred for audiological examination (44.4%). 89 referred for medical examination (12.4%).

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Pennsylvania	Entire state covered.	Children in K, grades 1, 2, 3, 7 & 11, & special ungraded classes, children with known or suspected hearing loss & new enrollees.	1965-66 school year 1,483,595 screened. 83,031 failed. 40,170 referred. 26,039 seen by physician
Rhode Island	33 of 39 school departments. 5 pre-schools.	K, grades 1, 4, 7, 10 & special.	1966-67 school year - 19,000 screened.
South Carolina	No organized statewide identification audiometry programs. Many school districts have their own hearing conservation programs, some on a countywide basis.	Most commonly, grades 2 & 6 & teacher referrals.	1966-67 school year - 2806 tested.
South Dakota	Some schools conduct hearing screening programs. A speech & hearing mobile unit travels throughout state.	Programs vary.	1966-67 school year - 19,523 tested for hearing & speech by mobile unit.
Tennessee	Entire state covered.	Grades 2, 4, 6, transferees, & special referrals.	1966-67 school year - 23,218 tested.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Years & Number of Children Screened
Texas	All School districts in 19 counties & approximately 625 other school districts.	Some districts screen all children annually; some screen all children every other year. Some screen grades 1, 3, 5, 7 & 12.	1965-66 school year-761 out of 1330 school districts (254 counties) reported programs. 870 audiometers in state 128 speech therapists doing testing. 1061 school nurses doing testing. 47 lay people doing testing. 734,463 children screened. 18,969 children referred. 7,624 children consulting a physician. 7,430 children receiving remedial attention.
Utah	Eleven school districts.	No organized statewide identification audiometry program.	Not reported.
Vermont	Entire state covered.	Children in grades 1, 2, 3, 5, 7 & 9 plus any suspected of having hearing problems.	Approximately one fifth of school enrollment.
Virginia	Entire state covered. Some areas do not use pure-tone audiometric testing.	Children in all grades.	1966-67 school year-89,501 tested. 4,564 had hearing defects. 2,345 had a medical follow-up.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section A - Coverage

State	Area of State Covered	Grade or Ages Covered Annually	Year & Number of Children Screened
Washington	No organized statewide identification audiometry program.	Usually, children in K through 10 are screened at least once every 3 years. All new children are screened.	Not reported
West Virginia	No organized statewide identification audiometry program. No counties have regular program.	Some areas screen grades 3, 5, 7 & 9; some screen grades 1, 3, 7, 9 & referals. Frequency of occurrence of testing varies.	Not available.
Wisconsin	Report	Not received.	
Wyoming	165 school districts serving 83,355 children (97.25% of pre-school enrollment).	Most school districts screen odd number or even number grades.	1965-66 school year - 83,355 screened.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Alabama	No regular screening program - need as determined by the audiologist.	clinic tests are given according to audiologist.	Only certified audiologists are used in clinic programs.
Alaska	500, 1000, 2000, 3000, 4000, 6000.	25 dB(ISO) - all frequencies. 10 dB(ASA) - all frequencies except 4000; 20 dB(ASA) - 4000.	Volunteers who may be instructional aides, Headstart teachers, or interested persons.
Arizona	At least 500, 1000, 2000, 4000.	15 dB(ASA) or 25 dB(ISO) at one or more frequencies.	Volunteers; may be trained by nurses, audiometrists, or State Hearing Consultant.
Arkansas	500, 1000, 2000, 4000, 6000.	30 dB(ISO) in one or more frequencies in either ear.	Volunteers trained by qualified Hearing Consultant.
California	At least 500, 1000, 2000, 4000.	15 dB(ASA) at any one frequency.	Certified personnel: (1) school nurses (2) teachers of lip-reading (3) school audiometrists. Specific criteria set forth for certification by State Legislature.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted, By
Colorado	R e p o r t	N o t R e c e i v e d	
Connecticut	500, 1000, 2000, 4000, 6000.	10-15 dB(ASA) & 20-25 dB(ISO) for one or more frequencies.	Trained technicians, speech & hearing clinicians, or school nurses trained to conduct tests.
Delaware	250, 500, 1000, 2000, 4000, 8000.	25 dB(ISO) at one frequency in one ear in speech range (500, 1000, 2000) or 25 dB(ISO) at 2 frequencies in one ear outside speech range (250, 4000, 8000) or 15 dB(ASA) at one frequency in one ear in speech range or 15 dB(ASA) at 2 frequencies outside speech range.	School nurses. Qualifications for screening testing involve either evidence of successful completion of a course in audiometric testing given at University of Delaware or participation in an in-service training program given by State Department of Public Instruction.
District of Columbia	1000, 2000, 4000, 6000.	Greater than 15 dB(ASA) at 1000 or 2000, &/or greater than 30 dB(ASA) at 4000 and 6000.	Hearing technicians having a Bachelor's Degree working under training & supervision of Audiology Clinic, & graduate students.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Florida	No organized statewide program. 4 of 8 reported county school districts test at 500, 1000, 2000, 4000.	No organized statewide program. Levels vary among county school districts.	No organized statewide program. In 5 of 8 reported county school districts, speech/hearing clinicians perform screening.
Georgia	125, 250, 500, 1000, 2000, 4000, 6000, 8000 (optional).	30 or 35 dB(ISO) at any 2 frequencies in same ear or 40 dB or more at any one frequency.	Volunteers trained by technicians & who are under supervision of local public health nurse.
Hawaii	500, 1000, 4000, 6000.	30 dB(ISO) at any 2 frequencies.	Speech & hearing therapists.
Idaho	No organized statewide identification audiometry program. No information is available for the few areas where testing is done.		
Illinois	No data received from areas that conduct programs.		
Indiana	No organized statewide identification audiometry program. Procedures vary among school corporations.		

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Iowa	<p>Sweepcheck: Individual screening.                      500, 1000, 2000, 3000, 4000, 6000.                      Group screening-Johnston method.                      (250)*, 500, 1000, 2000, 3000, 4000, 6000.                      *Used as indicator frequency for ambient noise conditions in screening environment.</p>	<p>15 dB(ASA) at any frequency in either ear. ISO equivalents are allowed, but an average ISO screening level is not encouraged.</p>	<p>State certified speech or hearing clinicians conduct screening.                      Criteria for certification include:                      (1) Master's degree or equivalent from state approved agency;                      (2) training institution attests to competency &amp; completion of program of courses concerned with speech, hearing &amp; language.</p>
Kansas	<p>250, 500, 1000, 2000, 4000.</p>	<p>25-30 dB(ISO) at 2 or more frequencies &amp; 40 dB(ISO) at one or more frequencies.</p>	<p>Audiologists, speech &amp; hearing clinicians, trained technicians, or school nurses who are trained to conduct these tests.</p>
Kentucky	<p>250, 500, 1000, 2000, 4000, 8000.</p>	<p>15-20 dB(ASA) at 2 or more frequencies &amp; 30 dB(ASA) at one or more frequencies.</p>	<p>Volunteers.                      If local school district has a speech &amp; hearing program, speech correctionist may train volunteers.</p>

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1963

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Louisiana	500, 4000.	25 dB(ISO) at any frequency.	Program varies among school systems. Testing is conducted by: (1) volunteers who are trained & assisted by speech therapists; (2) speech therapists, volunteers, nurses from State Department of Health, audiologist from State Department of Health, or (3) volunteers trained by audiologist from State Department of Health.
Maine	Locally controlled programs.	data not available.	
Maryland	500, 1000, 2000, 4000.	25 dB(ISC) at any frequency.	Trained public health nurses, school nurses, hearing-screening technicians, volunteers. It is recommended by State Department of Health & State Department of Education that all screeners attend workshops conducted by State Department of Health.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Massachusetts	250, 500, 1000, 2000, 3000, 4000, 6000 (ASA). 500, 1000, 1500, 2000, 3000, 4000, 6000 (ISO).	15 dB(ASA). 25 dB(ISO).	Persons conducting testing must be approved by state.
Michigan	250-4000.	Failure at any frequency in either ear is a basis for retesting.	State approved persons.
Minnesota	250, 500, 1000, 2000, 4000, 6000.	2 or more tones in either ear, testing level - 25 dB(ISO) for frequencies 1000, 2000, 4000, 8000 & 30 dB(ISO) for frequencies 250 & 500.	If school uses State Department of Health program, volunteers are trained to administer tests under supervision of technician from State Department of Health. Technicians are supervised by consultants who have Bachelor's degree or Master's degree & experience in speech &/or hearing disorders. In independent programs, nurses, speech therapists, or health instructors usually conduct screening. There are no requirements or qualifications.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Mississippi	No organized statewide identification audiometry program.		
Missouri	Following information is in regard to areas of state serviced by state 500, 1000, 2000, 4000, 6000, 8000.	20 dB(ASA) or 30 dB(ISO) at one frequency or more in one or both ears.	cooperative programs: Public health nurses or volunteers conduct screening. There are no enumerated qualifications for volunteers.
Montana	No organized statewide identification audiometry program.		
Nebraska	No organized statewide identification audiometry program.		Screening is generally carried out by a public health or school nurse, speech & hearing clinician, audiologist or teacher. These testers may use the services of the Hearing Consultant for the State Department of Health & Education for testing procedures & follow-up.
Nevada	Report	Not Received.	

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
New Hampshire	No organized statewide identification audiometry program. Program controlled at local level.		School nurses.
New Jersey	125, 250, 500, 1000, 2000, 4000, 8000.	15 dB at any one frequency in one or both ears.	School nurses.
New Mexico	250, 500, 1000, 2000, 4000, 8000.	20 dB(ASA) at 2 frequencies in one ear or 30 dB(ISO) at 2 frequencies in one ear.	School nurses, public health nurses, or volunteers. Consultant from State Health & Social Services Department trains persons. There are no qualifications.
New York	250, 500, 1000, 2000, 3000, 4000, 6000.	25 dB(ISO) at 2 or more frequencies in either or both ears, one of missed frequencies in speech area(500, 1000, 2000, 3000) & other frequency outside speech area.	Certified school nurse-teacher.
North Carolina	Beginning an organized statewide identification audiometry program. Suggested that a sweep test of recommended frequencies (500, 1000, 2000, 3000, 4000) be given.	15-20 dB(ASA) at 2 or more frequencies.	Speech & hearing therapists, public health nurses, or school nurses State Department of Public Instruction will hold a hearing conservation workshop when requested by city or county unit.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
North Dakota	Programs vary. Usually 500, 1000, 2000, 4000, 8000 are used.	30 dB(ISO) at 2 or more frequencies.	Public health nurses or speech clinicians usually conduct tests.
Ohio	250, 500, 1000, 2000, 4000, 8000.	30 dB(ISO) at 250 & 500 25 dB(ISO) at all other frequencies.	Testers are trained by staff members of State Department of Health. Testers are selected locally. No educational level is required.
Oklahoma	500, 1000, 2000, 4000, 6000.	25 dB(ISO) at 2 or more frequencies.	Trained volunteers & nurses. State Department of Health provides service training to public health & school nurses on conducting hearing conservation programs.
Oregon	1000, 2000, 4000, 6000 - Johnston Group Test.	20 dB(ISO) at one frequency in either ear.	Audiometrist's graduation from a 4-year college is basic educational requirement. Training is provided by State Department Board of Health.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B- Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Pennsylvania	350, 500, 100, 2000, 4000.	25 dB(ISO) at 2 or more frequencies in one or both ears.	School nurses, designated medical technicians &/or speech & hearing personnel.
Rhode Island	250, 500, 1000, 2000, 4000, 6000, 8000.	20 dB(ISO) at 500-2000, 8000. 25 dB(ISO) at 4000, 6000.	Audiometric technicians
South Carolina	No organized statewide identification audiometry program. If audiometric test is used - 1000, 2000, 4000, 8000.	20 dB(ASA) at 2 frequencies.	In many areas school nurses do screening & in other areas speech clinicians. Several areas have volunteer teams who after receiving instruction from a clinician conduct screening.
South Dakota	Mobile unit project: 1000, 2000, 4000, 6000.  School nurses & speech clinicians: 1000, 2000, 3000, 4000 & sometimes 6000.	Any one of following levels in either ear - 20 dB(ISO) at 1000, 2000. 30 dB(ISO) at 4000. 25 dB(ISO) at 6000.  25 dB(ISO) at any one frequency.	Audiometric technicians having at least a B.A. in speech & hearing.  School nurses & speech clinicians.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Tennessee	250, 500, 1000, 2000, 4000, 8000.	27 dB(ISO) at 500, 1000, 2000.	Speech & hearing therapists having Bachelor's or Master's Degree with certification in speech & hearing, & audiometric technicians having a high school education course work in audiometric testing (work under supervision of regional supervisor of Public Health Department). School health nurses aid in routine screening.
Texas	500, 1000, 2000, 4000, for ISO calibration. 250, 500, 1000, 2000, 4000 for ASA calibration.	25-30 dB(ISO) or 15-20 dB(ASA) in 2 or more frequencies in one ear.	Speech therapists, school nurses & volunteers conduct testing. No specific requirements. State Department of Health furnishes training to schools that request it.
Utah	No organized statewide identification audiometry program. Each district uses its own screening levels.		
Vermont	125 to 8000.	15 dB(ASA).	Trained volunteers.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section B - Initial Screening Procedures

State	Frequencies Used	Failure Levels	Tests Conducted By
Virginia	500, 1000, 2000, 4000.	25 dB (ISO). 20 dB(ASA) at any 2 frequencies or 30 dB(ASA) at any one frequency.	Graduate speech therapists, visiting teachers, graduate hearing therapists, & trained volunteer groups.
Washington	No organized statewide identification audiometry program. 250, 8000.		Public health nurses or speech therapists do testing. Trained technicians or school nurses are trained.
West Virginia	No organized statewide audiometry program. Usually 1000, 2000, 4000, 6000 when audiometric testing is used.	Usually 20 dB at 2 or more frequencies.	No qualifications or training requirements.
Wisconsin		R e p o r t   N o t   R e c e i v e d .	
Wyoming	500, 1000, 2000, 4000, 6000.	20 dB(ASA).	School nurses, speech therapists, county superintendents, teachers, principals, office help, conduct tests. Minimal instruction is given to those conducting tests. Each district can obtain assistance from State Department of Education.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Alabama	No regular follow-up testing. Services including additional testing are provided as necessary by clinical audiologists.			Clinic required to notify Crippled Children's Service when further treatment &/or special educational aids or training is indicated.
Alaska	Threshold test.	Not reported.	Public nurses, speech or hearing therapists or well-trained & experienced volunteers.	Recommendations for otologic examinations, audiological evaluations, hearing aid fittings, & educational follow-up.
Arizona	Rescreen. Threshold test.	15 dB(ASA) or 25 dB(ISO) at one or more frequencies.	Nurses who have received training, audiometrists, hearing consultants Speech & hearing therapists, or in speech & hearing clinics at universities or hospitals.	Medical referral. Referrals for special educational aids or services.
Arkansas	Threshold test.	30 dB(ISO) at one or more frequencies in either ear.	School nurse, public health nurse or Hearing Consultant.	Referral by letter to parent--to family physician for further examination & referral to otologist if indicated.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further testing	Failure Levels	Tests Conducted By	Type of Referrals
California	2 threshold tests 2 months apart.	Not reported.	Certified personnel.	Notification & consultation with parents. Medical referral. Observation & retesting of children whose test results appeared invalid, or whose suspected loss was insufficient to meet criteria for medical referral.
Colorado		R e p o r t   N o t	R e c e i v e d.	
Connecticut	Threshold test.	10-15 dB(ASA) & 20-25 dB (ISO) for one or more frequencies.	Trained technicians, speech & hearing clinicians, or school nurses trained to conduct tests.	Further audiological testing & otologic examination. Child's family is responsible for audiological & otologic examinations. Form is generally returned to school. If audiological examination is required, school nurse or appropriate school personnel with permission of parent or guardian may arrange for examination.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Delaware	Threshold test.	25 dB(ISO) or more at one frequency in one ear in speech range (500, 1000, 2000) or 25 dB(ISO) or more at 2 frequencies in one ear outside speech range (250, 4000, 8000) or 15 dB(ASA) or more at one frequency in one ear in speech range or 15 dB(ASA) or more at 2 frequencies in one ear outside speech range.	School nurses & speech & hearing clinicians.	Parents are informed & encouraged to obtain audiological/otologic examination through State Board of Health clinic program or through private physicians. Special education placement recommended by State Department of Public Instruction.
District of Columbia	Threshold tests (air & bone) & speech tests.	Not reported.	Hearing technicians having Bachelor's degree working under supervision & training of audiology clinic & graduate students.	Clinic failures & children with positive otologic history are referred to onsite ENT clinic for examination, diagnosis & minor treatment. Referrals to schools made by audiology clinic staff.
Florida	No statewide program. 6 of 8 reported county school districts give threshold test after second screening; 2 districts give threshold test after initial screening.	No statewide program. Levels vary among county school districts.	No statewide program. In 4 of 8 reported county school districts, speech & hearing clinicians perform threshold tests.	No statewide program. All 8 reported county school districts refer threshold failures for medical/audiological examination. 4 of these counties request a copy of the physician's report be returned.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Georgia	Rescreen. Threshold test.	30 or 35 dB(ISO) at any 2 frequencies in same ear or 40 dB(ISO) or more at any one frequency.	Public health nurse or audiometrist.	Otologic follow-up screening clinics. Board certified otologists screen threshold test failures & make recommendations for medical, audiological, psychological &/or other treatment procedures.
Hawaii	Threshold test within 2 weeks of initial screening.	Greater than 30 dB(ISO) at 2 or more frequencies in one or both ears at 500, 1000, 2000, 4000, 6000.	Speech & hearing therapists.	Referred to Department of Health Otologic Clinic or family physician. If, after medical treatment, hearing is still deficient, referral is made for special educational placement.
Idaho	No organized statewide identification audiometry program. No information available for the few areas where testing is done.			
Illinois	No data received from areas that conduct programs.			
Indiana	No organized statewide referral vary among school corporations.			criteria for
Iowa	Threshold test.	20 dB(ASA) at 2 or more frequencies in either ear ISO equivalent allowed.	Speech or hearing clinicians.	Audiological & otologic.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Kansas	Threshold test for: screening failures; children who have a history of ear &/or upper respiratory infection; & teacher or speech & hearing clinician referrals.	25-30 dB(ISO) at 2 or more frequencies & 40 dB (ISO) at one or more frequencies.	Audiologists, speech & hearing clinicians, trained technicians or school nurses who are trained to conduct these tests.	Further audiological testing & otologic examination. Child's family is responsible for arranging otologic examination by a physician. Form is returned to school.
Kentucky	Threshold test for: screening failures; children who have a history of ear &/or upper respiratory infection; & teacher or speech & hearing therapist referrals.	Not reported.	Audiologists.	Further audiological testing & otologic examination at one of 3 regional speech & hearing centers.
Louisiana	Threshold test.	Not reported.	Program varies among school systems. Testing is conducted by: (1) speech therapists (2) nurses & speech therapists, or (3) nurses.	Person supervising program requests State Department of Health to send otologist to see referrals.
Maine	Locally controlled	programs - data not available.		

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Furner Testing	Failure Levels	Tests Conducted By	Type of Referrals
Maryland	Rescreen. Threshold test.	25 dB(ISO) at 2 or more frequencies & 40 dB(ISO) at one or more frequencies	State Department of Health speech & hearing consultants, public health & school nurses, or trained technicians.	Initial referral to family physician. Audiological & otologic referral in consultation with family physician. Form is returned to health department &/or school. If no family physician, family may be referred to Crippled Children's Hearing Clinic.
Massachusetts	Threshold test.	20 dB(ASA) at 2 or more frequencies in same ear or 30 dB(ASA) at any one frequency. 30 dB(ISO) at 2 frequencies in same ear or 40 dB(ISO) at one frequency.	Persons conducting tests must be approved by State.	Notice to parents for referral to otologist. Copy of report is returned to school.
Michigan	Preliminary threshold.	Not reported.	Persons conducting tests must be approved by State Department of Health	Notice to parents for otologic clinic. Copy of report returned to school.
Minnesota	Rescreen in 2 weeks. Threshold test.	25 dB(ISO) at 2 or more frequencies in speech range (1000, 2000, 4000, 8000) or 30 dB(ISO) or more in 2 consecutive frequencies outside of speech range (250, 500).	Not reported.	Referred to family physician who decides whether or not child is referred for further audiological or otologic examination. Report from physician or clinic is requested but not required.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Mississippi	No organized statewide identification audiometry program.			
Missouri	Following information Rescreening - Threshold test.	on is in regard to areas of Rescreening - 15 dB(ASA) or 25 dB(ISO) at 2 or more frequencies in one or both ears. Threshold test- 30 dB (ASA) or 40 dB(ISO) at 2 frequencies in one or both ears.	of State serviced by Rescreening & threshold test are conducted by public health nurses.	State cooperative programs: Referral to family for physician's report or ear & hearing examination. Physician is asked to return form to school or nurse. Public health nurse has responsibility for follow-up of children referred. Recommendation regarding educational placement made by specialists involved in diagnosis.
Montana	No organized statewide identification audiometry program.			
Nebraska	No organized statewide identification audiometry program. Data not available about local programs.			
Nevada	R e p o r t	N o t R e c e i v e d.		
New Hampshire	No organized statewide identification audiometry program. Program controlled at local level.			Children with losses of 20 dB(ASA) or 30 dB(ISO) or more referred to otologist.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
New Jersey	Rescreen. Threshold test.	20 dB in one or both ears at any 2 frequencies.	Not reported.	Parents advised to contact family physician for further examination. Proper school authority notified.
New Mexico	Threshold test. More than one threshold test is made before referral.	20 dB(ASA) at 2 frequencies in one ear or 30 dB (ISO) at 2 frequencies in one ear.	Nurses conduct threshold test.	Referral to otologist. Care through Crippled Children's Services for medically indigent.
New York	Threshold test.	25 dB or more(ISO) in either or both ears.	Certified school nurse-teacher conducts test.	Parents advised to take child for otologic examination.
North Carolina	Threshold test.	25 dB or more(ISO) in either or both ears.	Tests are conducted by speech & hearing therapists, public health nurses or school nurses.	Parents are responsible for further audiological testing & otologic examination. Parents are advised by proper school authority.
North Dakota	Threshold test.	Not reported.	Tests are conducted by public health nurses or speech clinicians.	Referred for medical attention to family physicians.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Ohio	Threshold test.	25-30 dB(ISO) at any frequency or any one frequency at 500-2000, or 50 dB(ISO) at any one frequency & consideration of case history.	Tests conducted by public health nurses, school nurses, & speech & hearing therapists.	Referral either to family physician or to a pediatric otological diagnostic center. Referral for special education to State Department of Education, Division of Special Education, made by local administrator.
Oklahoma	Threshold test.	25 dB(ISO) at 2 or more frequencies in other ear or 35 dB(ISO) at one frequency in either ear.	Public health nurse Speech pathologists.	Medical referral made to family physician with cooperative follow-through, when necessary, on referrals for further attention.
Oregon	Threshold test.	Average loss of 20dB(ISO) in either ear for frequencies 500, 1000 & 2000 &/or average of 25 dB(ISO) in either ear for frequencies 3000, 4000 & 6000.	Audiometrists.	Audiometric referral. Medical screening at otological diagnostic clinic.
Pennsylvania	Threshold test.	30 dB(ISO) or more at 2 or more frequencies in one or both ears, or 35 dB(ISO) or more at one frequency in either ear.	School nurses, designated medical technicians, &/or speech & hearing personnel.	After clearance with family physician, referral is made to otologist &/or one of the audiology centers participating with program.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Rhode Island	Threshold test.	Not reported.	Audiologist.	Otologist for further examination. School nurse responsible for follow-up.
South Carolina	Threshold test.	Not reported.	Hearing consultant from State Department of Education, hearing & speech clinician, or nurses trained in audiometric testing.	Referral to otologist for further examination. It is school administrator's responsibility to follow-up. Otologist is to complete form.
South Dakota	Mobile unit project; Threshold test. Threshold diagnosis.	Not reported.	Audiometric technicians having at least a B.A. in speech & hearing. Audiologist having an M.A.	Parents' responsibility to obtain medical attention for child.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Tennessee	Threshold test.	Not reported.	Speech & hearing therapists having Bachelor's or Master's degree with certification in speech & hearing, & audiometric technicians having a high school education & course work in audiometric testing (work under supervision of regional supervisor of Public Health Department).	If audiogram indicates child has loss or if child has history of earaches or draining ears, parents are notified through local health department or by speech & hearing therapist. Doctor's or clinical report is required. Health department, parents, teachers, medical profession, speech & hearing centers, or any interested person may refer child for special educational services. Local school system determines if special educational aids or services are needed.
Texas	Threshold test.	25 or 30 dB at 2 or more frequencies (500, 1000, 2000, 4000) in the same ear.	Speech therapists, lay people, and nurses.	Referral to family physician. Parents are responsible for medical examination. Family physician may refer child for further testing & otologic examination.
Utah	No organized statewide identification audiometry program. Its own referral criteria.			Each district uses

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Vermont	Threshold test.	Not reported.	Registered nurse.	Referrals & follow-ups are responsibility of local school districts.
Virginia	Threshold test.	25 dB(ISO). 20 dB(ASA) at 2 frequencies or 30 dB(ASA) at one frequency.	School nurse.	Medical referral. A doctor or clinic report is required.
Washington	No organized statewide Threshold test.	Statewide identification audiometry program.		Further audiological testing or otologic examinations. Family is responsible for arranging for otologic examination.
West Virginia	No organized statewide identification audiometry program.			Parents & family physician are notified & it is suggested that child be re-examined.
Wisconsin	Report	Not received.		

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAMS BY STATE: JANUARY 1968

Section C - Follow-Up Procedures

State	Type of Further Testing	Failure Levels	Tests Conducted By	Type of Referrals
Wyoming	Threshold test.	20 dB(ASA) or more for all frequencies above 250 or 35 dB(ASA) for all frequencies above 2000.	Audiometric specialists at residential school &/or otologist, school nurses, or at certified speech and hearing clinics	Referral to State Department of Education, Division of Special Services. Arrangements are made for State Consultant to come to school for purpose of further testing & consultation with child, parents & school personnel. Referral then made to medical personnel or to certified speech & hearing clinic. In cases of high tone & unilateral losses rechecks are encouraged as well as medical examination.

TABLE 1 - SUMMARY OF IDENTIFICATION AUDIOMETRY PROGRAM BY STATE: JANUARY 1968  
Section D - Authority & Administration

State	Statutory Provision	Program Administered By	Records	
			Type	Kept By
Alabama	No state law requiring hearing testing.	State Crippled Children's Service, part of the Division of Vocational Rehabilitation & Crippled Children's Service, State Department of Education.	Individual records on all persons served in clinic program. Contains otologic & audiological information.	State Crippled Children's Service.
Alaska	No state law requiring hearing testing.	Speech & Hearing Specialist. Branch of Child Health, Department of Health & Welfare.	List of children to be screened & those who need further testing; Hearing Conservation Form - interpretation & recommendations whenever a significant hearing loss is indicated.	State Department of Health & Welfare.
Arizona	No state law requiring hearing testing.	Maternal & Child Health Services in the Division of Preventive Medical Services in the State Department of Health. Local school or public health nurse is responsible for own program with help from county or district audiometrist, or State Hearing Consultant.	Individual.  School & county statistical records.	Local schools. County health departments. State Department of Health, Maternal & Child Health Services.

			Type	Kept By
Washington	No state law requiring hearing testing.	No organized statewide identification audiometry program. Local school districts are developing programs. State Department of Health is aiding county & city health departments.	Results of screening test, threshold test, physician's report.	Child's school health folder, local health departments, State Health Department & State Superintendent of Public Instruction.
West Virginia	No state law requiring hearing testing.	No organized statewide identification audiometry program. Programs are administered locally by Easter Seal, P.T.A., speech therapists or school nurse.	Screening test sheets & audiogram.  Copies of records state agency.	Local health department, school health nurse, or speech therapist.  are not sent to
Wisconsin	Report	Not Received		
Wyoming	State law implies that hearing screening is responsibility of school district.	State Department of Education has taken position that they will aid local school districts with hearing screening program. Recently, State Department of Health indicated desire to head up total hearing screening program.	Report of those with "significant losses."	State Department of Education.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Alabama	Residential school for the deaf & blind. Full-time classes.	Board of Directors. Local schools boards; standards are set by Department Special Education, State Department of Education.	Type of education depends on need of child.
Alaska	Classes & speech & hearing therapists. Programs are provided wherever there are 5 or more children with a bilateral loss of 40 or more dB.	Consultant, State Department of Education. Educational Specialist, Bureau of Indian Affairs, Branch of Education & Administrators, Branch of Welfare. Alaska Crippled Children's Association.	Not reported.
Arizona	Residential school. Day classes. Itinerant speech & hearing therapy	Created through the State Legislature, controlled by Board of Directors. Local school board & district administrator, Division of Special Education, State Department of Public Instruction.	Criteria for therapy include: (a) severity of problem, (b) social & emotional maturity, (c) intelligence, (d) existence of other problems.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968  
Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Arkansas	<p>School for the deaf: day classes &amp; residential services. Day classes. Speech &amp; hearing therapists.</p>	<p>Board of Directors. State Director of Special Education in the Instructional Services Division of the State Department of Education has the responsibility for the educational programs for the hearing impaired.</p>	<p>(a) IQ of 75 or above, (b) better-ear average loss of 50 dB or greater (ISO) &amp; a relatively flat audiometric contour or average of 50 dB or greater (ISO) for 2 better frequencies within 500-2000 frequency range &amp; an abruptly falling audiometric contour, or functions as hard-of-hearing child.</p>
California	<p>State residential schools. Special day classes. Remedial classes in conjunction with regular classes.</p>	<p>State Superintendent of Public Instruction. Legislature has made provisions which require each school district to provide educational opportunities for hearing impaired children age 3 to 18. Special day classes are maintained by governing boards of school district or by county superintendents of schools.</p>	<p>Kind of service child receives depends upon: (a) degree of hearing loss (b) age at onset of impairment, (c) speech &amp; other language facility, (d) physical condition, (e) mental &amp; emotional ability &amp; other related factors.</p>
Colorado	Report	Not Received.	

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Connecticut	<p>Residentials schools.</p> <p>Special classes in public schools.</p> <p>Itinerant programs.</p>	<p>One school controlled by Board of Directors; one is controlled by Board of Trustees &amp; the State Board of Education.</p> <p>All programs are administered by local school district under the general supervision of the state Speech &amp; Hearing Consultant, State Department of Education, Bureau of Pupil Personnel &amp; Special Educational Services.</p>	<p>Child is unable to benefit from the regular classroom program supplemented with tutoring.</p> <p>Pre-school-age children who have been diagnosed by medical &amp; non-medical specialists as having a hearing impairment.</p> <p>Programs are being planned for 68-69 school year for school-age children with severely impaired hearing.</p> <p>Child indicates a need for speech &amp; hearing services.</p>
Delaware	<p>Residential schools for deaf or hard-of-hearing.</p> <p>Day schools for deaf &amp; hard-of-hearing.</p> <p>Classes for deaf or hard-of-hearing.</p> <p>Supportive education (tutoring) from itinerant teacher.</p> <p>Regular class adjustment.</p> <p>Speech reading &amp; speech conservation program from speech &amp; hearing clinician.</p>	<p>Out-of-state program administered by State Department of Public Instruction.</p> <p>All in-state school programs administered at local school district level under general supervision &amp; encouragement of State Department of Public Instruction, Pupil Personnel Services. Pre-school therapy programs are available through State Board of Health, Speech &amp; Hearing Services.</p>	<p>Depends upon needs of child as determined by a committee composed of a speech &amp; hearing therapist, teacher of the deaf, school psychologist &amp; supervisor of the physically handicapped.</p>

TABLE 2- SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
District of Columbia	Residential school. Special classes - day classes for hard-of-hearing & deaf. Itinerant hearing therapy. Speech correction & improvement. Individual instruction in school subjects.	Board of Directors. Director of Special Education.  Speech correction, speech improvements & itinerant hearing therapy programs under Director of Speech & Hearing Center.	Recommendations are made for various programs on basis of audiological examination.
Florida	Residential school for deaf & blind.  Day classes.  Speech/hearing clinicians, itinerant instruction.	Board of Directors responsible directly to State Superintendent of Public Instruction & Board of Education. County school districts administer their own program with financial support from the State Department of Education via State Legislature.	Better-ear average greater than 60 dB at 500, 1000 & 2000 cps. Usually 6 years of age minimum. Must have IQ of at least 80 without other severe handicaps.
Georgia	Residential school.  Classes for hearing impaired. Itinerant services.	Vocational Rehabilitation Division of State Department of Education under State Board of Education. State Department of Education sets standards for establishment & maintenance of programs which must be met by local school systems in order for them to receive state funds.	Children between ages of 6-21 if too deaf to go to regular public schools.

State	Types of Services	Authority and Administration	Eligibility
Iowa	<p>Residential school for deaf.</p> <p>Full-time special classes for hard-of-hearing students with language deficit.</p> <p>Day classes contained in regular schools for deaf students.</p> <p>Resource classes &amp; regular classes for hard-of-hearing with language deficit.</p> <p>Regular classes &amp; such services as hearing conservation, amplification, auditory training, speechreading, etc. for hard-of-hearing students without language.</p>	<p>Created by State Legislature &amp; controlled by State Board of Regents.</p> <p>Other programs are administered by Special Education Division of State Department of Public Instruction.</p>	<p>Recommendations are made for various programs on basis of degree of hearing level &amp; ability to develop language &amp; communication skills.</p>
Kansas	<p>Residential school.</p> <p>Special classes.</p> <p>Itinerant teaching programs.</p>	<p>State Board of Regents.</p> <p>Day school controlled by Board of Trustees.</p> <p>All other programs are administered by local school districts under general supervision of State Department of Public Instruction, Division of Special Education.</p>	<p>Children with greater than 60 dB better-ear loss.</p> <p>Children with 30-60 dB better-ear average loss.</p> <p>Children with 20-30 dB better-ear average loss.</p>

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Kentucky	Residential school. Classes for the deaf. Classes for hard-of-hearing. Itinerant program.	All programs are administered by State Department of Education, Division of Special Education.	Criteria for placement in residential school or special class: children whose hearing loss is so severe that they are unable to comprehend & learn speech & language even though hearing aids may be useful to some; generally have a hearing loss of 70 dB(ASA) or more in both ears.
Louisiana	Residential school. Day classes. Speech & hearing therapy.	Controlled by State Board of Education. One day class administered by local school board, & one by local school board & State Board of Education.	Not reported.
Maine	Residential school. Classes for hearing impaired. Supplementary tutoring services. Provision of desk-type amplifier. Home tutoring program.	Controlled by State Department of Mental Health & Corrections State Department of Education subsidizes local communities for supplementary tutoring services, provision of desk-type amplifiers, home tutoring program & classes. State Department of Education also pays cost of secondary education for students who graduate from residential school & who attend residential school in Connecticut.	Not reported.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Maryland	Residential school. Special classes. Itinerant speech &/or hearing clinicians.	Created by State Legislature & controlled by Board of Visitors. State Department of Education establishes framework providing educational services to hearing impaired. Each county board of education develops its own programs within framework established by State.	No fixed eligibility requirements.
Massachusetts	Residential schools for deaf. Day school for deaf. Speechreading & auditory training by speech & hearing specialist for hard-of-hearing.	Each controlled by Board of Trustees. Other programs are administered by State Department of Education, Division of Special Education.	Not reported.
Michigan	Residential school. Special school or classes for those with severe hearing loss who have little or no language. Teacher counselor for hard-of-hearing in regular classes.	Created by State Legislature & controlled by State Department of Education sets forth rules & regulations governing all other educational programs.	Educational classification for children with hearing loss should be considered flexible depending upon: (a) age at onset (b) general physical condition (c) social adjustment (d) intellectual & academic abilities (e) willingness of principal & regular teachers to accept child (f) family understanding & cooperation (g) preparation & background of speech correctionist, special teacher or teacher counselor who is to help such pupils. An otolaryngologist must certify diagnosis of all children enrolled in approved educational programs.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Minnesota	Residential school for deaf. Day classes for deaf. Speech therapy.	Administered by Department of Public Welfare. All day school programs are administered by Hearing Consultant in State Department of Education, Special Education Section. Consultation services for educational programs are provided on request by Hearing Consultant in State Department of Education.	Level of ability to function in an academic setting, <u>not</u> degree of hearing loss, determines amount & type of instruction. Some characteristics of need are: (1) defective speech. (2) reading problems (3) lowered level of abstractions in use of language (4) social inadequacy arising from frustrations.
Mississippi	Residential schools. Day school. Some educational programs are available in schools throughout the state.	One residential school is controlled by Board of Trustees; one was created through the State Legislature & is controlled by State Department of Education & Board of Trustees.	Not reported.
Missouri	Residential school. Day school. Special classes.	Controlled by State Department of Education. Controlled by local school board. Controlled by local school boards & State Department of Education.	Not reported.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration.	Eligibility
Montana	Residential school. Day classes.	Created by State Legislature & is controlled by State Board of Education. Administered by local school district under general supervision Department of Public Instruction.	Not reported.
Nebraska	Residential school. Day classes in one school.	Nebraska State Department of Education. Local school board.	Admittance to these programs is based on the information from psychological, medical, otologic & audiological examinations.
Nevada	Report	Not received.	
New Hampshire	Residential school.	Board of Trustees. State Department of Education has authority to pay for out-of-state training.	Not reported.
New Jersey	Residential school. Day school. Special classes. Supplemental instruction.	Created by State Legislature & controlled by State Department of Education. Administered by local school board. State Department of Education administers special classes.	Determination of kind of services for which a child may be eligible comes from a child study team in each local district.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
New Mexico	Residential school. Day classes. Pre-school oral training. Oral day school classes. Speech & Hearing therapists	Board of Regents. Albuquerque Hearing & Speech Center. Local school board.	Hearing loss great enough that child cannot achieve in public schools.
New York	Residential schools. Day schools. Special classes - conservation of hearing classes. Itinerant program. Regular class with supplementary instructional assistance.	Residential & day schools are variously controlled by State Education Department, Boards of Trustees, State Department of Public Welfare, State Board of Social Welfare, Board of Directors & local school boards. State Education Department, Division for Handicapped Children has responsibility for providing professional advice & guidance to local public school districts in relation to duties & general management of programs for handicapped children.	Kind of service needed depends upon such factors as (a) degree of hearing loss (b) age at onset (c) speech & other language facility (d) physical condition (e) mental ability (f) emotional stability.
North Carolina	Residential schools. Speech therapists.	Board of Directors. All other programs are administered by local school districts under general supervision of State Department of Public Instruction, Speech & Hearing Special Education Section.	Not reported.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
North Dakota	Residential school for deaf & hard-of-hearing. Day class (full-time) for hard-of-hearing. Supplementary instruction & acoustic aids. Medical & educational consultation. Speech correction & language training.	Created by State Legislature & controlled by Board of Administration. Local school board.	Not reported.
Ohio	Residential school. Day school. Classes for deaf & hard-of-hearing. Speech & hearing therapy.	Created by State Legislature & controlled by State Department of Education. Local school board & in some cases under supervision of State Department of Education.	Children are referred for educational placement on basis of findings of otologist, school psychologist & educator.
Oklahoma	Residential school for deaf. Day school for deaf. Classes for hard-of-hearing.	State Department of Public Welfare. Department of Communication Disorders, Oklahoma University Medical Center. Local school boards.	Eligibility for services based on medical findings, speech & hearing clinical services of universities & public health guidance centers & educational consultation.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Oregon	<p>Special schools for children whose loss is great enough to interfere with language development &amp; educational programs. Special classes. Speech &amp; hearing therapists.</p>	<p>Residential school administered by State Board of Control. State law stipulates that local school districts shall provide special education for hearing impaired children or may contract with another district for such services if there are too few such children in district to provide a program.</p>	<p>Minimum requirements are that a child must have an average loss of 35dB(ISO) in the speech range in better ear. Certification for eligibility requires a determination made on the advice of qualified educational &amp; medical authorities that child has the mental health &amp; ability to benefit from special education.</p>
Pennsylvania	<p>Residential schools. Day schools.  Special classes. Itinerant teaching program.</p>	<p>Programs centrally directed by State Department of Public Instruction. Each residential school is controlled by a Board of Trustees. Day school is controlled by local school board.</p>	<p>Residential &amp; day schools, as certified by otologic &amp; audiological report: (a) child's hearing may be non-functional for ordinary purposes of life or (b) child's hearing loss precludes use of auditory stimuli as main avenue of learning &amp; forces dependence upon other modalities or (c) child's acuity of hearing &amp;/or its integrative processes interfere with normal acquisition &amp; use of meaningful language concepts. Over 60 dB(ASA) better-ear loss. Special classes - 30-60 db(ASA) better-ear loss. Itinerant teaching program - 20-30 dB(ASA) better-ear loss.</p>
Rhode Island	<p>Residential school for deaf. Day classes/itinerant program.</p>	<p>Administered by State Board of Education. Administered by school districts.</p>	<p>Not reported.</p>

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
South Carolina	Residential school. Classes for hearing impaired. Itinerant program.	Board of Commissioners. Classes & itinerant program are administered by State Department of Education.	Not reported.
South Dakota	Residential school - deaf education with hearing & speech center available. Speech therapy & speech-reading to hearing impaired students.	State Board of Regents.	Not reported.
Tennessee	Residential school. Special classes for severely hard-of-hearing &/or deaf. Itinerant program. Speech & hearing therapists.	All programs are administered by the local school board under the general supervision of the State Department of Special Education.	Eligibility determined by an otological or an audiological examination.
Texas	Residential school. Public day classes. Countywide & multi-countywide day school for deaf. Local pre-school day classes. Speech & hearing therapy.	State Education Agency. All other programs are administered by local school districts under authorization & subject to audit, program review, &/or accreditation.	Pupil eligibility determined by: (a) chronological age, (b) grade placement & academic achievement level, (c) written comprehensive psychological report, (d) physician's report describing handicap, (e) audiogram, (f) recommendation of local placement committee, (g) parental approval.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Utah	Residential school. Day classes. Itinerant programs. Speech & hearing correctionists.	Programs are administered by State Board of Education.	Not reported.
Vermont	Those with severe losses are referred to residential school or to State Association for the Crippled. No local services other than diagnostic services.	Residential school controlled by Board of Trustees.	Not reported.
Virginia	Residential schools.  Some services available in: Easter Seal Centers; public schools; clinical speech & hearing centers; Crippled Children's Bureau; pre-school age centers for deaf.	One controlled by Board of Visitors & one by Board of Directors. All other programs are administered by local school districts under general supervision of State Department of Special Education.	Must be resident of Virginia, age 6 to 20 years.

TABLE 2 - SUMMARY OF EDUCATIONAL SERVICES FOR HEARING IMPAIRED CHILDREN BY STATE: JANUARY 1968

Section A - Types of Services, Administration and Eligibility

State	Types of Services	Authority and Administration	Eligibility
Washington	Residential school. Day school. Special classes. Itinerant teaching program.	Department of Institutions, Division for the Handicapped. Local school district. All other programs are administered by local school districts under general supervision of State Superintendent of Public Instruction, Division of Special Education.	Not reported.
West Virginia	Residential school. Special class. Itinerant program.	State Department of Education. Local school. State Director of Special Education helps coordinate programs at local level.	Not reported.
Wisconsin	Report	Not Received.	
Wyoming	Residential school. Special class. Itinerant program.	State Department of Education. State Commissioners. Local school district.	Criteria is permissive.

APPENDIX IV

Materials Used in the National Survey of Identification Audiometry  
Programs and Educational Services for the Hearing Impaired.

## GALLAUDET COLLEGE

KENDALL GREEN, WASHINGTON, D.C. 20002

OFFICE OF PSYCHOLOGICAL RESEARCH

In February of 1966 under a grant from the U. S. Office of Education, Gallaudet College began a project to develop a nationwide system for reporting hearing impaired children.

The need for national information on hearing impairment has been expressed by most organizations and individuals concerned with the problems of this population. The lack of reliable data is apparent. Essentially, the reporting system will provide the information necessary for more accurately planning for the facilities and personnel needed to provide adequate educational and health services for the hearing impaired. The reports will give program supervisors the opportunity to compare their programs with programs in other areas and Researchers will have a source from which to draw accurate local and national samples of hearing impaired persons.

One of the data collection methods being considered is to obtain an individual record on each school-age child with impaired hearing including those in special schools and classes and those in regular schools. It is recognized that some areas of the country, because of inadequate identification programs and related services, may require some time before they can realistically participate on a statewide basis in the reporting system. For such states, the system can be initiated for those parts of the state (counties or school districts) that do have systematic identification programs. Additional areas of the state then could be added when they are able to participate.

A first step in this project is to ascertain the status of identification audiometry and of programs of educational and health services for the hearing impaired, in order to determine if there is some program through which statewide statistics can be readily obtained. Accordingly, we are now conducting a survey of all the states to obtain detailed information about these activities. It should be noted that, since there is at present no ready reference source for this type of information on a nationwide basis, it is planned to publish the results of this study as a separate publication. Such a publication should be of interest to many persons and useful for many purposes unrelated to the establishment of a reporting system.

We are now soliciting your help in assembling the information for your state. Attachment A contains a series of questions. The answers to these questions will enable us to prepare a comprehensive report. We will be pleased to accept copies of printed or typewritten materials that will provide the answer to any of the questions.

To further assist you in preparing a reply, Attachments B and C illustrate some typical answers that we have received from states that have already responded to this survey.

We would appreciate hearing from you as soon as possible. If you have questions, please do not hesitate to contact us. If this query is going to be handled by someone other than yourself, please let us know to whom we should address future communications.

We realize that it will require a considerable amount of time to prepare your response to this survey. However, by assisting us in this major attempt to develop a systematic body of information about the hearing impaired, you will be making it possible for all of us to provide better services for hearing handicapped children.

## Attachment A

### Guidelines and Questions for Preparing State Report

#### I. General

In the sections that follow we have listed a series of questions that are designed to provide us with a comprehensive description of identification audiometry (hearing screening) programs, and the availability of educational and health services for hearing impaired children in your state.

Please answer the questions as completely as possible. If some information is not available, please tell us so. Wherever appropriate, you may substitute copies of papers, laws, guidelines or other printed material that describe any or all of the activities we are interested in.

In some states the activities we seek information about are conducted at the county or local level without any supervision or direction from the state government. In the event that you know that some counties are carrying out these programs, but you do not have detailed information about them, we would appreciate receiving the names of the counties and, if possible, the name and title of a person that we might contact directly for further information.

#### II. Information About Identification Audiometry

##### A. Authority and Administration

Is there a state law requiring that school children have hearing tests? If yes, please describe the law or submit a copy of the law.

Please describe the authority, responsibilities, and activities of agencies at the state level who may be engaged in hearing screening programs. Also give official names of these agencies.

B. Coverage

Please give the names of all counties or other areas in the state that conduct hearing screening programs on a regular basis. If all areas of the state conduct programs just indicate "entire state covered."

Please give for each area of the state conducting screening programs the following information:

How often are children tested?  
What ages or grades are tested annually?  
Who administers the program in each area?

C. Testing

If the methods and standards used in the hearing-screening programs are not the same in all areas of the state, please answer the following questions as they apply to each area.

What kind of hearing test is used?

If audiometric tests are used, at what frequencies are children tested?

Indicate the failure levels in dB's. Indicate whether ASA or ISO standards are used.

Are children tested individually or in groups?  
What are the qualifications and training requirements for the persons who conduct the screening tests?

Are there provisions for follow-up screening test?  
If so, what procedures are used in the second test?

What procedures are used for referrals for further audiological and otological examinations for those who fail screening tests? Is a doctor or clinic report required? Who keeps these reports? Who makes referrals for special educational services? Who determines if special educational aids or services are needed?

What kind of records are kept on the results of the screening tests? Who keeps these records? Are copies of records sent to a state agency? Please enclose copies of any statistical summaries of the results of screening programs that you have available.

III. Information About Educational Services

Describe the authority, responsibilities, title and activities of any agency at the state level, that provides special educational services for the hearing impaired.

What kind of educational services are available for children with loss of hearing? If the services vary from county to county, please describe the services that are available for each county separately.

Describe the basis for determining the kind of services a child may be eligible for. If possible, give estimates of the number of children who are receiving each type of special training?

List all schools which have special classes for the hearing impaired. Do the children attend these classes full time or part time?

If possible, give the number of teachers that are teaching in special classes.

Are there any speech and hearing therapists that are providing services to the hearing impaired? How many therapists? How many children do they serve? What kind of records are kept on children receiving special educational services? Are any records kept at the state level? If so, please submit blank copies.

IV. Health Services

Please describe in the same detail as asked for on the section on educational services, the extent, type and eligibility standards for health services provided for hearing impaired children.

If any health records are kept at the state level, please submit blank copies of forms used to keep these records. Are there any records kept at the state level or local level which give the results of audiometric examinations?

V. The Reporting Form

Attached to these materials are copies of individual reporting forms now being used in some states to provide information for the reporting system.

Please tell us if it would be possible to receive similar information from all or some of the hearing impaired children in your state? Please describe, fully, your ability to participate in this system.

## Attachment B

### Sample A

Hypothetical answers from a state with a well-coordinated program, at the state level, of identification audiometry and other services for the hearing impaired.

#### I. Identification Audiometry Programs

##### A. Authority and Administration

1. State law requires that every school-age child be given a hearing test at least three times during the first 10 years of school attendance. The method of screening is outlined in the State rules and regulations issued by the State Board of Education. Details are given below. A copy of the law and the rules and regulations are enclosed.
2. The State Board of Education and the State Department of Health are jointly responsible for the supervision of the identification audiometry program. The program is carried out on a local school district level.

##### B. Coverage

1. The entire State is covered.
2. All children in grades 1, 3, 5, 7, and 10 are screened. All new children are screened.
3. The administration of the hearing screening program is the responsibility of the local school board.

##### C. Testing

1. A pure-tone audiometer is used for testing. The audiometer must be calibrated at least every two years under the supervision of the State Department of Health.
2. For initial screening children are tested individually in 20 counties and in groups in 15 counties.

3. The following frequencies are tested:  
250, 500, 1000, 2000, 4000, 8000 cps.
4. Failure levels are 15-20 dB (ASA) for two or more frequencies and 30 dB (ASA) for one or more frequencies.
5. A follow-up threshold test is given on an individual basis to all children:
  - (a) Who fail the screening test
  - (b) Who have a history of ear and/or upper respiratory infection
  - (c) Who are recommended by classroom teacher or speech and hearing therapist. The frequencies used and failure levels for follow-up threshold testing are the same as for the initial screening.
6. All children who do not pass follow-up threshold testing are referred for further audiological testing and otologic examination. The child's family is responsible for arranging for the otologic examination by a physician. A form is returned to the school. If an audiologic examination is recommended, the school nurse or the parents may arrange for a free examination at a Speech and Hearing Clinic.
7. If a significant hearing impairment remains after medical treatment, a referral is made by the school nurse or principal to the Supervisor of Special Education of the local school district for a determination of the child's special educational needs.
8. Hearing tests are conducted by audiologists, speech and hearing therapists, trained technicians or school nurses who are trained to conduct these tests.
9. Results of the screening test are recorded in each child's school folder. A copy of follow-up threshold testing is also kept in the school folder. The physician's report and audiologic examination are kept by the school nurse.

A statistical summary of the results of screening programs is enclosed.

### III. Educational Services

1. All programs are administered by the local school district under the general supervision of the State Department of Special Education.
2. Types of Programs and Eligibility
  - (a) Itinerant teaching programs are provided twice a week for 1/2 hour sessions for children who have a 20-30 dB better ear average loss.
  - (b) Special classes are provided for children with a 30-60 dB better ear loss. These are full-time classes in a regular school building.
  - (c) Children with greater than a 60 dB better ear loss are eligible for special schools for the deaf. A copy of materials describing programs is enclosed.
3. Estimate of number receiving services
  - (a) Itinerant program: 1500
  - (b) Special classes: 500
  - (c) Special schools: 1000
4. There are 500 speech and hearing therapists who are providing services for both speech-handicapped and hearing-handicapped children. Each therapist is limited to a caseload of 65 students. There are 45 teachers who conduct special classes. They are either speech and hearing therapists or teachers with a background in special education or speech and hearing.
5. An annual report on a standard form on each child receiving special educational training is sent to the State Supervisor of Speech and Hearing Programs. These reports contain audiometric information as well as educational information. A blank form is enclosed.

IV. Health Services

1. All programs are administered by local Departments of Health under the authority of the State Board of Education.
2. Types of programs and eligibility - Hearing aid evaluations and follow-up checks on efficiency of aid are provided. Audiological and otological examinations are available. Follow-up medical treatment is available. These services are available for children with a 15 dB or greater loss in the better ear.
3. Records of services provided are kept at the local level.

V. Individual Reporting Form

Presently most of the information on the individual reporting form (Attachment D) can be obtained from the State form. However, the information on hearing aid use and communication skills would have to be obtained from the individual schools. It may be possible to modify the State form to include these items at a later date.

The State Board of Education and the State Department of Health would be willing to arrange for the completion of these forms and to discuss further participation in the reporting system.

Contact:

Miss Jane Jones  
State Supervisor of Special Education

and

Mr. James Doe, Director  
State Health Department

## Attachment C

### Sample 3

hypothetical answers from a state that does not have a state-wide program of identification audiometry or other services for hearing-impaired children.

#### I. Identification Audiometry

##### a. Authority and Administration

State laws require that the superintendent of each school district annually make known to the State Superintendent of Schools the number of children who require special educational services (health services) because of loss of hearing. (A copy of the law is enclosed). The State Department of Education has no authority over the local school districts and there is no Statewide coordinated program of identification audiometry. Recently, the State Health Department has employed an audiologist who is developing guidelines and standards and recommendations for developing hearing-screening programs throughout the State.

##### B. Coverage

There are, at the present time, two counties and two cities in the State that regularly conduct hearing-screening tests. A complete description of the program in County A is enclosed. For further information about County B write to Mr. John Doe, County B Education Department. For information about the programs in the two cities write to Mrs. John Roe, City Health Department, \_\_\_\_\_, \_\_\_\_\_ and Mrs. Sarah Jones, City Department of Education, \_\_\_\_\_, \_\_\_\_\_.

##### C. Testing

See B above.

## II. Educational Services

The State Department of Education provides the superintendent of each school district with a fixed number of dollars per year for each child reported to have a hearing loss. These funds are designed to provide special educational services for these children. Each school district is required to send an annual report on every child that receives special services. A copy of this report is enclosed.

Each school district employs the type of teachers and develops its own training programs to meet the needs of the hearing impaired children.

Recently, the State Department of Education has employed a Supervisor of Speech and Hearing Programs, who is now preparing guidelines and standards for use in the education of hearing-impaired children. When these guidelines have been completed, they will be distributed to the local areas for comments and for what it is hoped will be general acceptance by the school districts.

It is suggested that you write directly to the two counties and two cities for more details about the educational programs in those areas.

Enclosed is a copy of a statistical report showing the number of children receiving special education in each county of the State and also the number of full-time and part-time teachers employed in these programs in each county. For further information, you should contact the superintendent of education in each county. (A list of these is enclosed.)

Also enclosed is a list of all schools in the State that have special classes for the hearing impaired. The list is a few years old. Therefore, it is suggested that you obtain more recent information when you write to the local superintendents.

### III. Health Services

The situation with respect to health services is similar to that of the educational services. The State Health Department provides funds for hearing aids and other clinical services to each county. Records of individuals receiving this assistance are required by the State Health Department.

For further information you should write to the County Health Officer of each county. However, we are enclosing some material we have that describes health department activities in a few of the counties.

### IV. Individual Reporting Form

Except for the two counties and two cities with well-developed identification audiometry and programs of health and educational services, we do not believe we could provide much information on the rest of the State. We can make available some limited amount of information on those that are reported to the State Department of Education as requiring special educational services. Also the State Department of Education would be willing to cooperate with you in seeking to obtain the data from the two counties and two cities previously mentioned.

We believe it may be 3 or 4 years before identification has progressed to the point that adequate statewide records will be available.

**APPENDIX V.**

**Selected Letters Expressing Interest in a National Census of  
Hearing Impaired Children.**

GEORGE ROMANLY, Governor  
ALBERT E. HEUSTIS, M.D., Director

STATE OF MICHIGAN

Augustine Gentile, Ph.D.  
Research Professor  
Demographic & Educational Statistics  
Gallaudet College  
Kendall Green  
Washington, D.C. 20002.

Dear Doctor Gentile:

Doctor Mary Blair of the State Department of Education has referred your letter of April 26th to our office. We will be pleased to cooperate in any way that we can in a national reporting system

Our situation in Michigan is a rather complicated one. Identification audiometry is generally considered a health service throughout the state and identification programs are administered by local health departments with the cooperation and consultation of our state office. However, each program is to a large degree autonomous, and standards and procedures are not identical throughout the state.

Phases of the program concerning educational placement and programs of hearing impaired children do not fall into our area of operation but are the responsibility of the special education program administered by the State Department of Public Instruction.

Therefore, the information that you request, insofar as it pertains to the identification of the audiometry program, will require considerable compilation on our part since each separate health department in the state will be involved. Since you have originally written Doctor Blair, I assume that she will provide you the information required concerning special education programs.

We will be writing you in the future when we are able to do a little more compilation of information.

Sincerely,

  
Joseph Blanton  
Audiology and Speech Consultant

Dear Miss Gentile:

Enclosed you will find the complete report from the State of Delaware on the "Status of Identification Audiometry and Educational and Health Services for the Hearing-Impaired" study being conducted at Gallaudet College under a grant from the U.S. Office of Education.

As you will observe, many of the appendix documents are out of date and are in the process of revision to update. It is hoped that much work can be done on revising our numerous forms this summer.

It has been our pleasure to cooperate in this study and would request that the results be shared with the Department when complete. Please advise if you wish additional information or clarification.

Sincerely yours,

STATE OF MAINE

Department of Education

AUGUSTA, MAINE 04330

August 21, 1967

Mr. Augustine Gentile  
Office of Psychological Research  
Gallaudet College  
7th and Florida Avenue, N.E.  
Washington, D. C. 20002

Dear Mr. Gentile:

May I express further apologies for the lateness of this report. Our Bureau Chief is still on sick leave, leaving us short on staff that normally could perform studies and complete questionnaires such as yours,

First I want to advise you of our intent to include a request for a Speech and Hearing Supervisor in Maine's 1967-68 (academic year) State Plan under Title VI, Amendments to the Elementary and Secondary Education Act of 1965. We have needed this staff member for many years, and now it looks like federal funds, expected this fall, will be granted. As long as the grant program exists, the Speech and Hearing Supervisor will have a permanent position as far as we can tell at this stage.

This person will have, as one of his major functions, the responsibility of reviewing the entire state program of the testing, reporting, and serving hearing-handicapped school children in Maine. Consequently we expect that a comprehensive listing of these exceptional children will be accumulated in a central position, or site, here in Augusta. This will be done by joint efforts of our Supervisor, the office of Public Health Nursing, the Division of Crippled Children's Services and in cooperation with the Speech and Hearing Consultant in the Maine Department of Health and Welfare.

Presently our Maine School Laws are not written in such a manner as to involve our Department in activities at the local level regarding hearing testing. As you will see, the law specifies that testing will be done, but that the school committees are finally invested with the responsibilities of testing, recording and reporting.

Enclosed with this letter are the Health Record and the Notice to Parent or Guardian. Unfortunately our limited staff has found it impossible to even try to supervise (or police) the local efforts. There have been some gaps in the follow-up procedure, I am sure, after a child has been reported with a handicap. On the other hand, we are receiving many notices of defects, with

Mr. Augustine Centile

August 21, 1967

Page 2

requests for a special education program consisting of home instruction, small group tutoring, or an auditory trainer (desk-type amplifier). Thus our system is not completely ineffectual.

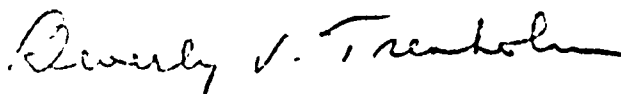

Copies of two statements from staff members in the Maine Department of Health and Welfare are enclosed for your consideration. This is privileged information and cautious use of the information will be much appreciated. I enclose them so that you will see the need of definite action before we can all be pulling together to form a good plan for the identification of these children.

My answer to your items in Attachment A will be sent to you next week.

Your study into the feasibility of a nationwide system for reporting hearing impaired children is an extremely worthwhile undertaking. Our State stands to gain a great deal from your findings.

Our area newspaper is publishing an article on this very topic next week. I will send you a copy of the item.

Sincerely yours,

Dear Mr. Gentile:

This is in regard to your research and/or demonstration project, An Investigation of Procedures in the Development of a Model Reporting System on Hearing Impairment by School Systems, which was funded under Public Law 88-164.

We are very interested in receiving information regarding your project, and would appreciate follow-up information and results if you have them available. In the event that your study is not completed, please place us on your mailing list for this information when it is available.

We will look forward to hearing from you and thank you for your consideration.

Sincerely,

A handwritten signature in cursive script that reads "John C. Baker".

Dear Mr. Gentile:

Enclosed is the information for Sections II and IV of Attachment A that you requested from this Department.

We are pleased to supply you with this information as there is a need for a nationwide system for reporting hearing impaired children.

If we can be of further service, please call on us.

Sincerely yours,

Dear Professor Gentile,

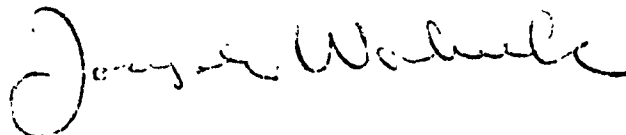

Thank you for inviting the Iowa State Department of Public Instruction to participate in your project to develop a nationwide system for reporting hearing impaired children. Your letter of April 24 and attached materials indicate the study will be involved in the collection of audiologic, health, and educational data. This comprehensive approach is consistent with the philosophy of hearing conservation services now being developed by this state agency. You may be assured of our whole-hearted cooperation and involvement in any way in which you believe we can make a worthwhile contribution to the success of your project goals.

I have cancelled my appointments for next week and will, during that period, direct my attention to carefully completing the initial survey questionnaire with valid data and attaching additional information which may give you an idea of our program's philosophy, development to date, and orientation towards future development.

I consider the successful achievement of your projects' goals to be of such importance that you may be assured of having top priority assigned to any further requests for information or other types of involvement.

Sincerely yours,

Pupil Personnel Services Branch  
Division of Special Education

Dr. Augustine Gentile  
Collaudet College  
Washington, D.C.

Dear Dr. Gentile:

The Division of Teacher Education of the City University of New York has been awarded a grant to develop a special education instructional materials center as part of a greater state and national network of such centers. Part of our projected goal is the development of instructional materials and the modification of existing materials so that they best meet the needs of children with diverse and often complicated learning problems.

We would be interested in reports of your project

AN INVESTIGATION OF PROCEDURES ON THE DEVELOPMENT OF A MODEL REPORTING SYSTEM ON HEARING IMPAIRMENT BY SCHOOL SYSTEMS,

which we feel would assist us in our preliminary analysis of instructional materials for exceptional children and youth. May we also be placed on your mailing list for any additional materials that result from your work in this area.

Thank you for your courtesy in answering this request.

Very truly yours,

*Gloria F. Wolinsky (fwm)*

ABSTRACT					
<p>In February 1966, the Division of Research, Bureau of Education for the Handicapped, Office of Education, in recognition of the need for factual information about the prevalence and characteristics of handicapped children, awarded a grant to Gallaudet College to develop a method for collecting and disseminating information on hearing handicapped children. This report describes activities related to the project and presents the results of these activities.</p> <p>As part of the project, detailed information was collected on 4,300 of the estimated 6,755 hearing impaired students enrolled in schools, classes and other special education programs in the states of Maryland, Pennsylvania, Virginia, West Virginia, and the District of Columbia. The data collected on these students are presented in the report and includes information on hearing threshold levels, ability to communicate, intelligence levels, achievement levels, methods used to communicate and some selected demographic characteristics.</p> <p>Also, as part of the project, every state in the country was surveyed to obtain descriptive information about hearing screening programs and educational services for the hearing impaired. The results of this survey are also presented in the report.</p> <p>On the basis of the knowledge gained during the project, it is concluded that a nationwide system for collecting data on hearing impaired students is feasible. Recommendations containing detailed procedures for the establishment of such a system are given in the final sections of the report.</p>
