ABSTRACT

Recent trends in the number and composition of overseas students in Britain are summarized, and the accompanying statistics are presented. Among the trends are the following: (1) since 1967 the public sector has become dominant in the totals for overseas students, and within that sector nonuniversity institutions have become more important than the university in numerical terms (polytechnics have been a particularly fast-growing group); (2) the proportions of overseas students, after falling during the 1960's at least in universities, recovered in the 1970s and are now higher than in the 1960s; (3) the proportion of overseas students in the student body is particularly large at the postgraduate level in the universities, and in some fields exceeds the British students; (4) recently the undergraduate courses have shown overseas students' greatest growth; (5) overseas students are particularly concentrated in engineering and technology, and to a lesser extent in science and other applied subjects; (6) there has been some shift in the overseas countries of origin away from the poorest and richest countries and towards the middle-income countries; and (7) Europe is badly underrepresented among overseas students in Britain. ## OVERSEAS STUDENTS IN BRITAIN - SOME FACTS AND FIGURES\*

1. This short paper provides an overview of recent trends in the number and composition of overseas students in Britain. It should be read in conjunction with the Statistical Appendix on which it is largely based and with the companion paper entitled "Overseas students and government policy 1962-1979". The paper purports to be no more than a preliminary survey, drawn as it is from already published statistics. Many of the questions it may raise in the reader's mind could only be answered by further extensive studies involving original research.

### The data base

2. The major source of information on overseas students in Britain is the British Council's annual compilation 'Statistics of Overseas Students in Britain', which draws on various official and unofficial sources. The data for what is here called 'the public sector' - including universities, polytechnics and other institutions of higher and further education - are fairly hard data of good quality. For many of the categories outside the public sector (Appendix - Table 11) however, the figures are only approximate: this applies particularly to industrial, business and professional trainees and to students at private colleges, though less so to student and pupil nurses or to language assistants. Thus any aggregates which include non-public sector overseas students have a measure of approximation built into them.

3. A second caveat must be given at the outset, and this concerns time series tables for overseas students in Britain. One very naturally wants to examine the trends in overseas student numbers and composition. In broad terms such an exercise is quite feasible and legitimate, but any detailed analyses must take account of certain changes over the years in definition and categorisation, of which the more important examples are:

---

\* This paper is based largely on the tables in the statistical Appendix, prepared by Michael Kendall from data kindly made available by the British Council, Association of Commonwealth Universities and the University Grants Committee. The generous help of these bodies is acknowledged, and particularly their willingness to make available data for recent years in advance of publication. Peter Williams and Michael Kendall have worked together in preparing this paper.

- (i) changes in definition of overseas students until 1967 overseas students were defined in terms of 'permanent home residence'. When separate levels of fees for overseas students were introduced, it became more convenient to identify overseas students in public sector institutions as those paying the overseas student fee. As with any attempt at categorisation in this kind of area, certain anomalies result. Some students from overseas are then classified as 'home students' because they have qualified to pay a 'home' fee; while others who regard Britain as their country of domicile find themselves classified as 'overseas students' for fee purposes. This point is germane to the argument as to whether the introduction of separate overseas student fees in 1967 caused a drop in overseas student numbers<sup>1</sup>.

It is also interesting to note that in 1975/76 the ACU showed 3,259 (1.4%) of home students giving an overseas country of domicile, while two years later (in 1977/78) 1,907 'overseas students' on a fees basis gave the UK as their domicile. It seems at least possible that there are rather more students of foreign and overseas commonwealth nationality in British education and training institutions than is indicated by the current official figures drawn on a fees basis.

A second change in definition concerns Ireland which from 1971/2 onwards (when there were 2,425 Irish students in the UK, mostly nurses) was counted as 'overseas', having prior to that been in the 'home' category.

- (ii) within the UK certain categories of public sector institution have been reclassified in the past 20 years, and this affects series tables for categories of public sector institution. The main changes - affecting Colleges of Advanced Technology becoming Universities, the creation of the Polytechnics, and separate categorisation of colleges of education - are summarised in the footnote to Table 1 of the Appendix.

---

For 1967/68 the Association of Commonwealth Universities published its statistics for overseas students in British universities on the old permanent home residence basis and on the new fees basis. The change of classification meant that when 'fees' was introduced as the criterion for defining students as home or overseas, 2022 former overseas students now became 'home students', and 232 former home students now became 'overseas students'. Thus the change of definition lowered the overseas student total in universities by 1800 students. Those who claimed that the apparent drop in overseas student numbers in 1967/68 of 1600 was due to the introduction of differential fees may well have been right, but not in the sense they intended to convey! What they thought was a sign of deterrence may in fact have been mainly a case of re-classification.

(iii) in the case of some sending countries there have been significant boundary changes. 'Pakistan' formerly included the area of Bangladesh, but now no longer does so; 'Malaysia' formerly incorporated Singapore, and so on.

Thirdly, it should be noted from the outset that British Council figures intentionally exclude some categories of overseas students and trainees altogether, in particular (i) those in secondary schools, of whom there are thought to be quite a large number in the private sector, and (ii) those who come for periods of less than six months. Probably the first of these omissions is the more important. Questions arise in one's mind about the link between attendance at private schools and later attendance at public sector higher education institutions.\* Should, for example, some foreign exchange and other benefits and some costs from the private secondary sector account be weighed with the tertiary account, on the grounds that the motivation for secondary school attendance in Britain is to gain access to higher and further education? Do overseas students use public school attendance to get residence qualifications which entitles them to 'home fees' in tertiary education? Further enquiry into such questions would seem to be needed.

#### Overall Numbers and Proportions

4. Accepting the caveats and definitional limitations listed above, the growth of overseas student numbers can be summarised from Table 1 as in Table A below. From this it can be seen that the overall numbers have increased by more than one and a half times in the past eighteen years, but this is compounded of very different rates of growth between the public and non-public sectors. The public sector of higher and further education has grown by 244% while the private sector has increased by only 67% over the same period. The trends have not been at all even however. Up to 1967 the non-public category was in fact the larger. But in the last ten years the position has entirely changed. The absolute number of non-public sector students has dropped; the public sector has almost trebled, and its share of the total has increased from 45% to 70% since 1967. Herein surely lies some of the explanation of the high level of recent government concern over the number and cost of overseas students in Britain.

---

\* Whilst these questions have been raised here in relation to private secondary schools, they are equally pertinent to certain categories covered by the British Council figures, for example to those in private colleges or on non-advanced courses in further education.

TABLE A. Growth and Composition of Overseas Student Numbers 1959/60 to 1977/78, by main category of institution

YEAR	PUBLIC SECTOR						ALL OTHER		GRAND TOTAL	
	Universities		Non-University		Total		Students	%	Students	%
	Students	% Total	Students	% Total	Students	% Total				
1959/60	11,001	(23)	13,997	(29)	24,998	(53)	22,522	(47)	47,520	(100)
1967/68	15,866	(23)	15,225	(22)	31,091	(45)	38,740	(55)	69,831	(100)
1977/78	35,888	(29)	50,219	(41)	86,107	(70)	37,652	(30)	123,759	(100)
Growth 1959-77	226%		259%		244%		67%		160%	

5. The trends in each of the main sectors shown in Table A are analysed in later sections of the paper, and are summarised at the end (paragraph 31).

6. As well as the overall number, the proportion of overseas students in the total UK student body is also of interest to policy makers. The evidence on this point from the Statistical Appendix (Tables 2, 4 and 7) is summarised in Table B below, covering universities and the non-university public sector. It can be seen from this table that the proportion of overseas students in the public sector has increased in the 1970s after a fall in the 1960s. Over the past ten years the increase in the proportion at universities has been considerable at both undergraduate and postgraduate levels. The Robbins Committee estimated in 1962/63 that some 10% of places in higher education were occupied by overseas students, and assumed in its projections that this proportion of overseas students in higher education would continue, reaching about 50,000 in 1980/81. But overseas student numbers grew faster than predicted by Robbins and already in 1977/78 stood at 58,563 for universities and advanced courses in non-university higher and further education institutions.

TABLE B. Overseas students as proportion of total student body in UK public sector institutions, selected years

Year	Universities			Other HE/FE
	Postgraduate	Undergraduate	Total	
1959/60			10.2	
1965/66	28.7	5.3	9.2	
1967/68	25.0	3.8	7.5	6.7
1975/76	34.2	6.5	11.7	8.8
1977/78	36.6	7.3	12.3	

7. The number and proportion of overseas students in the public sector seem to have increased for at least two years after 1975/76 the 'base year' used in the January 1977 DES circular, which tried to set limits on the expansion in the number of overseas students. However it is not clear that this represents any flouting of government policy by the institutions. To substantiate this it would be necessary to study the trend of admissions in the last few years, for it is possible for the trend of overall enrolments to move in a direction contrary to the trend in admissions in the short-term\*. Moreover, many candidates must already have been accepted for the 1977/78 academic year by the time the DES circular was issued in January 1977.

8. The issue of proportions naturally leads on to the question of whether and how far it can be said that overseas students are depriving UK students of places. Unfortunately the 'displacement effect' if any cannot be calculated from these tables. In the case of university admissions it can be seen (Appendix Table 6) that, as might be expected, a lower proportion of overseas applicants than home applicants is accepted for undergraduate study. To draw valid conclusions from this one would need to study carefully the qualifications of each group of applicants and to be sure that what UCCA calls the 'real field' of candidates (those fully qualified and persisting with their applications) is truly comparable for the two groups. It is noteworthy that in the areas known to be most competitive, such as medicine, the proportion of overseas undergraduate acceptances is particularly low; and it is highest in science which is one of the areas where there is greatest difficulty in attracting qualified UK applicants.

\* Note: UCCA reports overseas undergraduate admissions to British universities as 5,271 in 1975, 5,479 in 1976, 5,705 in 1977 and 5,573 in 1978.

Further research is needed into the extent to which overseas students may deprive of places (i) UK qualified applicants and (ii) UK applicants better qualified than the overseas applicants themselves. Or are overseas students simply 'infilling' places already existing which might otherwise remain empty?

9. The question of infilling (and therefore low real cost) as against courses directly geared to catering wholly for overseas students is impossible to resolve at the aggregate level covered by the statistics in the Appendix Tables or by Table B above. One needs to get down to the level of specific institutions and courses. An average of 7 or 10% of overseas students at a certain level or in a certain subject may be compounded of a large majority of institutions and courses with only 3 or 5% overseas students whilst a small minority of courses has 50 or 70% overseas students. The key question here is the degree of concentration.

10. The very high proportions of overseas students in the postgraduate population in UK universities (Table 2) suggest that some such courses do indeed cater mainly for overseas students. This is borne out by Table 5 showing that in engineering and also in agriculture, forestry and veterinary science, the overseas postgraduates account for well over half the students. Clearly one cannot talk of mere 'infilling' in these instances. Even in such cases however it does not necessarily follow that these overseas postgraduates are a straight liability even to the UK education system itself (let alone to Britain's overall economic and diplomatic interests). It could be that a significant portion of these overseas postgraduates are making an important contribution to British scientific and technological research programmes by assisting leading academic research workers. Educationalists might also claim they are valuably contributing both to the quality of studies of their UK counterparts and to sustaining programmes whose continuation is vital to the retention of the best British academics in higher education. There is obviously scope for serious enquiry here. It must be accepted that relevant evidence would be both subjective and objective in nature. Of course even if it were found that the balance of long term advantage to the British education system was negative, the tenure system for academic staff might preclude the possibility of making substantial savings by closing particular courses in the short-term.

#### Trends in the university sector

11. Appendix Tables 2, 6 present the main body of evidence about overseas student numbers and trends in British universities. The first striking point to be noticed is that the numbers have trebled in the last twenty years (Table 2).

Second, in contrast to the Robbins Committee expectation of a firm trend towards a higher proportion of postgraduates in the overseas student body in universities, the undergraduate element has remained strong. Not only that, but between 1973 and 1977 the undergraduate proportion in the overseas student body rose from 40% in 1972/73 to 48% in 1977/78 and thus reverted almost to the level of 1965 when undergraduates constituted a majority of overseas students (Table C below). This development has contradicted forecasts that as university institutions developed overseas, students would be much less inclined to come to Britain for study at undergraduate level. One explanation of the trend probably lies largely in a tendency for wealthy but possibly vulnerable minorities, especially in Malaysia and certain other Asian countries, to seek undergraduate places in Britain for their children (see below - para 28).

TABLE C

Overseas Students in the Public Sector of British Higher and Further Education - Selected years

\* included in other higher and further education

Sources: Appendix Tables 2 and 7

Figures in brackets denote percentages by level for universities, and for other higher and further education separately.

12. Third, the overseas university students are concentrated very heavily in engineering and technology, science and other applied subjects (Tables 3 and 4) and this concentration, already marked in 1967/68, has increased in the decade since. Only in engineering and technology do overseas students account for a really substantial proportion of the total UK undergraduate student body - 22% in 1977/78. At postgraduate level however they account for a third or more of students in every subject group except education; with exceptionally high proportions in medicine, dentistry and health (44%), agriculture, forestry and veterinary science (56%) and engineering and technology (58%).

#### Trends in non-university higher and further education

13. Tables 7-10 of the Statistical Appendix and Table C above set out the main facts in this sector. Overall numbers (discounting category transfers) have quintupled in the twenty years from 1958/59, rising from 10,441 to 50,219 in 1977/78. Since 1964/65 the numbers have trebled. The advanced course category has been fairly constant within the total, representing 42% in 1964/65 and 45% in 1977/78, though it fell to rather under a third in the early 1970s (32.6% in 1972/73), so the trend in the 1970s has been in rather sharp distinction to that of the 1960s. It is the growth of polytechnic numbers - 2½ times as many overseas students in 1977/78 as only four years earlier (Table 7) - that has been most spectacular.

14. As a proportion of total students in this sector the overseas students share has risen from 6.7% in 1966/67 to 9.5% ten years later (Table 7).

15. As with the universities one finds that on advanced courses it is engineering and technology, and social administrative and business studies that account for the great majority of the overseas students (Table 9). Together these accounted in 1977/78 for 72% of overseas students on advanced courses in polytechnics and 68% of those on advanced courses in other non-university higher and further education establishments. At the non-advanced level, which is almost entirely concentrated outside the polytechnics, the 13,377 students doing GCE and SCE constituted 58% of classified non-advanced students outside polytechnics. Further information about the educational histories and aspirations of this large 'GCE and SCE' group, constituting one in six of overseas students in the public sector in Britain, would probably yield some fascinating insights.

16. Amongst the advanced course overseas students it is those on degree courses who have increased most rapidly (Table 10), doubtless reflecting the development of degree courses in the polytechnics in recent years.

Overseas students outside the public sector of education

17. Trends in this sector are shown in Appendix Table 11, and Table D below. These highlight the 'catch-all' nature of this grouping, which contains some very disparate elements. Over the last twenty years a most significant component of this sector has been private colleges whose numbers of overseas students have risen from 5,500 to 19,800 between 1962/63 and 1977/78, increasing their share of non-public sector overseas students from 17% to 53% in the same period (Table D). Nursing has also been prominent: it rose rapidly to reach a peak of 20,000 students in 1973/74 but four years later had declined to less than half. Inns of Court have had a steadily decreasing number of overseas students over the last two decades, and their share of the non-public sector overseas students has also declined. The same applies to "industry/professional/government etc".

TABLE D

Overseas Students outside the Public Sector in Selected Years

Category.	1962/63		1967/68		1972/73		1977/78	
	No	(%)	No	(%)	No	(%)	No	(%)
Inns of Court *	2,333	(7.0)	1,697	(4.4)	538	(1.4)	383	(1.0)
Nursing	13,542	(40.7)	17,735	(45.8)	19,839	(52.7)	9,910	(26.3)
Private colleges*	5,534	(16.7)	8,594	(22.2)	9,076	(24.1)	19,826	(52.7)
Other (mainly industry/professional/govt)*	11,826	(35.6)	10,714	(27.6)	8,171	(21.8)	7,533	(20.0)

Source: Appendix Table 11

\* Approximate

18. The history of the non-public sector, at least as recorded in British Council statistics, is very different from that of the public sector. After an extremely rapid rise in the early 1960s (mostly accounted for by the nursing group) the numbers then stabilised and in 1977/78 when they stood at 37,700 they were less than ten years earlier. Once again however it must be emphasised how diverse are

the components of the group and for this reason it seems necessary to discuss each sub-category separately. The figures in Table 11 should be regarded as minima for the category in question, and represent under-recording, perhaps to a high degree in some cases. The British Council is obliged to depend on the willingness of organisations and institutions to provide figures, and this can vary from one body to another, and one year to another.

19. The Inns of Court. The figures given are approximate only, but there has undoubtedly been a real decline from 2,800 in 1959/60 to 400 in 1977/78. In 1959/60, 1110 of the students were reported to be from Nigeria, compared with only 9 in 1977/78. The decline in numbers has been at least partly due to a tightening up of educational and related requirements in this country, for overseas students wishing to read for the bar.

20. Nursing. The number of student and pupil nurses from overseas rose to a peak of almost 20,000 in the early 1970s, but has now suffered a decline. Nursing students constitute a high proportion of hospital staff, and in addition to receiving training they provide essential labour for the hospitals. It is reasonable to assume that the recruitment of overseas nursing trainees was primarily in response to Britain's own shortages and the difficulty of attracting young people to enter and remain in the profession. The recent decline in overseas nursing student numbers to under 10,000 in 1977/78 is due to a number of factors. Increased unemployment has made it easier to attract 'home' trainees to nursing, while at the same time tighter money has led to a reduction in training places. The minimum entrance requirements have gone up, so that it has become more difficult to obtain admission with a poor showing of 'O' levels. In addition, nursing schools are now generally asking for an interview prior to admission, which makes it difficult for intending trainees who are not already in the country.

Little is known about the extent to which trainees from overseas return to their countries of origin after their training has been completed. Only a very small number come on sponsored training schemes, with a clear obligation to return home after training. In 1977/78 Ireland (2336 trainees), Malaysia (1984), and Mauritius (732) were the leading overseas countries with nursing trainees in Britain, and together accounted for more than half the total.

21. Other Hospital. This category numbering 1300 in 1977/78 has only been used by the British Council since 1968, and the figures are approximate. They cover training other than nursing which takes place in hospitals, e.g. hospital administration, physiotherapy etc.

22. Language Assistants. These are trainee teachers who are attached to British schools for practical experience. Numbers are approximate. None are from the Commonwealth, the majority coming from France, Germany and Spain. Numbers have fallen over the past few years to 3000 in 1977/78.

23. Industry, Business, the Professions and Government. This includes full-time trainees in industry at all levels, many taking qualifications by day release, block release, etc; those studying to be accountants, solicitors, architects etc., who are not on full-time courses; and trainees who come for practical experience with Government departments, the armed forces, nationalised industries, etc. Figures are very approximate and the trends shown in Table 11 look very erratic.

24. Other Institutions including Private-Colleges. These include a wide variety of institutions independent of LEA and Government funding, schools of English, secretarial colleges, colleges of music, dance and drama etc. Some examples are given by the British Council. There are no official statistics covering this broad field, which includes both colleges recognised as efficient by the DES and others. The British Council collects its own statistics directly from the colleges in many cases, and knows that there is a high level of under-recording (despite the 20,000 reported in 1977/78) particularly from the unrecognised colleges. Any study of the impact of overseas students on the British economy and balance of payments might need to look rather closely at this group.

#### Countries of origin of overseas students

25. Table 12 shows the countries sending most overseas students to British public sector institutions in four different years, starting with 1964/65. It is striking that Malaysia and Iran in 1977/78 accounted for 23,000 students, well over a quarter of the total number of overseas students in the public sector that year. Seven countries - Malaysia, Iran, Nigeria, Hong Kong, USA, Greece and Sri Lanka - accounted for half the total number of public sector students, 42,864 out of 86,107.

26. An extraordinary feature of the list of countries with over 1000 public sector students in 1977/78 is that not a single Common Market country is among them (if one excludes Greece which is now in process of accession).

27. Those countries which have become much more prominent in the list in recent years are Malaysia, Iran, Hong Kong and Greece. The numbers from India, Pakistan and Ghana appear to have declined in absolute as well as relative terms, despite a trebling of overall overseas student totals in the public sector. These changes reflect a more general pattern which is that over the past ten years numbers of overseas students from the very poorest countries have declined in universities, though not in the non-university public sector in Britain. Throughout the public sector there seems to have been a percentage shift from the poorest countries with incomes per capita of under \$500 p.a. and from the richest countries with incomes of over \$5000 to the middle income countries which include the 'oil-rich' and more prosperous developing countries (Tables 14 and 15).

28. Table 13 confirms for the four largest countries of origin the strong growth of enrolments in undergraduate courses, in university, in polytechnic advanced courses and in other HE/FE non-advanced courses. It is rather remarkable that of the 8,500 increase in overseas undergraduates in British universities in the five year period 1972/3 to 1977/8 Malaysia alone should account for 3,700 (44% of the increase) Iran for 1,500 (18%) and Hong Kong for 1,000 (12%). These countries together were thus responsible for almost three quarters of the increase. In these and other countries one can readily identify wealthy groups, sometimes constituting ethnic minorities, who might wish to take out 'insurance' for their children's future in the form of a British qualification with international currency. But this is pure speculation and it is clear that a rather close study would be needed to determine the background socio-economic and political status of those sending their children here to study.

#### Sponsorship and Finances of overseas students

29. Not a great deal seems to be known about the sources of income or expenditure of overseas students in Britain even though this is vital information in relation to the impact of overseas students on the British economy and balance of payments. The British Council (Statistics of Overseas Students in Britain, 1977/78) states:

At present there is little information about the sources of finance of all categories of overseas students. It is believed that only about one-quarter of all overseas students i.e. some 30,940, are supported by some form of scholarship award.

Sponsored students who arrived in Britain in 1977-78 included 1334 United Nations Fellows, 24 Council of Europe Fellows, 33 OECD Fellows. Arrivals under the various schemes of British Government Technical

Assistance numbered 7497 Study Fellows. The British Council awarded through its overseas Representatives 572 scholarships mainly for postgraduate studies. This figure is made up of 511 British Council Scholarships and 61 British Council Fellows and Euroscholars. The number of scholarships awarded by the Confederation of British Industry was 89. 65 Marshall Scholars arrived. There were also 193 Rhodes Scholars in the country.

30. The DES/ODM estimated a "stock" total of 12,000 students under Aid in 1977/78, whereas the British Council figures of sponsored students, totalling 9807, refer to new arrivals, apart from Rhodes Scholars. Moreover, many of the Technical Assistance Study Fellows are excluded from the Council's figures for the public sector of education, either because they are in training establishments outside the public sector of education or because they are in Britain for under six months. No valid estimate can therefore be made about awards from other sources e.g. home governments, employers, etc.

#### Main features and trends

31. This has not been an exhaustive survey, but it does to some extent portray the 'relief' of the overseas student terrain. Certain trends and certain 'lumpinesses' in the overseas student numbers are evident. Just a few of these may be highlighted here

- (1) Since 1967 the public sector has become dominant in the totals for overseas students given by the British Council, and within that sector non-university institutions have become more important than university in numerical terms. Polytechnics have been a particularly fast-growing group.
- (2) The proportions of overseas students, after falling during the 1960s, at least in universities, recovered in the 1970s and are now higher than in the 1960s.
- (3) The proportion of overseas students in the student body is particularly large at postgraduate level in the universities, and in some fields exceeds the British students.
- (4) Nevertheless it has recently been undergraduate courses where overseas students' growth has been greatest within the universities, contrary to some earlier expectations.
- (5) Overseas students are particularly concentrated in engineering and technology, and to a lesser extent in science and other applied subjects.
- (6) There is a large 'lump' in the HE/FE sector of overseas students doing GCE and SCE courses.

- (7) The non-public sector totals, though fairly constant, conceal a dramatic shift from nursing to 'other private colleges'.
  - (8) There is a heavy concentration by country with the seven largest 'senders' accounting for half the overseas public sector students, and the two largest for over a quarter.
  - (9) There has been some shift in the overseas countries of origin away from the poorest and richest countries and towards the middle-income countries.
- 
- (10) Europe is badly under-represented among overseas students in Britain.

32. What is perhaps most clear from this paper is that 'overseas students' is a category which covers a host of different situations which could, through careful analysis, be better distinguished from each other. There would appear to be considerable scope for selecting priorities in policy terms rather than applying totally indiscriminate measures to all overseas students irrespective of type and level of study, sponsorship or country of origin.

33. Just a few of the topics on which much more information is most obviously needed are

- (i) concentration of overseas students by course
- (ii) sponsorship of overseas students
- (iii) longitudinal studies/life histories of students to trace their routes through the British education system, and their stay in Britain more generally
- (iv) entry qualifications, length of courses and performance on them by overseas students relative to British students.
- (v) those categories outside the public sector for which present data are described as only "approximate"
- (vi) distribution of overseas students in "other private colleges" by type of course to show for example proportions on English language courses, on courses leading to GCE and other academic qualifications, on other specified types of courses etc.

Source British Council; Statistics of Overseas Students in Britain, various editions.

Notes a. The Colleges of Advanced Technology were transferred to the University Sector in 1964/65, having been previously included in Non-University Higher and Further Education.

b. The new definition 'Overseas Students for the Purposes of Fees' has been used for public sector students from 1967/68 onwards.

c. Students from the Republic of Ireland are included from 1971/72 onwards, not having previously been regarded as overseas students. (In 1971/72 there were 2425, of whom 2010 were nurses; in 1977/78 there were 3173, of whom 2336 were nurses.)

19 d. Polytechnics are distinguished as a separate category of Higher and Further Education from 1973/74 onwards, having previously been included with the 'other' colleges. (i.e. technical colleges, colleges of technology etc). Figures for the Colleges of Education were merged in 1977/78.

(Notes to Table 4)

Source 1975/76, unpublished figures from University Statistical Record; 1977/78, unpublished figures from University Grants Committee.

Note Figures for overseas students given above do not precisely correspond with those given by the British Council (e.g. Table 3)

(a) Total includes 1 student subject of study unknown (b) Total includes 5 students subject unknown (c) Total includes 4 students subject unknown.

12. Third, the overseas university students are concentrated very heavily in engineering and technology, science and other applied subjects (Tables 3 and 4) and this concentration, already marked in 1967/68, has increased in the decade since. Only in engineering and technology do overseas students account for a really substantial proportion of the total UK undergraduate student body - 22% in 1977/78. At postgraduate level however they account for a third or more of students in every subject group except education; with exceptionally high proportions in medicine, dentistry and health (44%), agriculture, forestry and veterinary science (56%) and engineering and technology (58%).

#### Trends in non-university higher and further education

13. Tables 7-10 of the Statistical Appendix and Table C above set out the main facts in this sector. Overall numbers (discounting category transfers) have quintupled in the twenty years from 1958/59, rising from 10,441 to 50,219 in 1977/78. Since 1964/65 the numbers have trebled. The advanced course category has been fairly constant within the total, representing 42% in 1964/65 and 45% in 1977/78, though it fell to rather under a third in the early 1970s (32.6% in 1972/73), so the trend in the 1970s has been in rather sharp distinction to that of the 1960s. It is the growth of polytechnic numbers - 2½ times as many overseas students in 1977/78 as only four years earlier (Table 7) - that has been most spectacular.

14. As a proportion of total students in this sector the overseas students share has risen from 6.7% in 1966/67 to 9.5% ten years later (Table 7).

15. As with the universities one finds that on advanced courses it is engineering and technology, and social administrative and business studies that account for the great majority of the overseas students (Table 9). Together these accounted in 1977/78 for 72% of overseas students on advanced courses in polytechnics and 68% of those on advanced courses in other non-university higher and further education establishments. At the non-advanced level, which is almost entirely concentrated outside the polytechnics, the 13,377 students doing GCE and SCE constituted 58% of classified non-advanced students outside polytechnics. Further information about the educational histories and aspirations of this large 'GCE and SCE' group, constituting one in six of overseas students in the public sector in Britain, would probably yield some fascinating insights.

16. Amongst the advanced course overseas students it is those on degree courses who have increased most rapidly (Table 10), doubtless reflecting the development of degree courses in the polytechnics in recent years.

Overseas students outside the public sector of education

17. Trends in this sector are shown in Appendix Table 11, and Table D below. These highlight the 'catch-all' nature of this grouping, which contains some very disparate elements. Over the last twenty years a most significant component of this sector has been private colleges whose numbers of overseas students have risen from 5,500 to 19,800 between 1962/63 and 1977/78, increasing their share of non-public sector overseas students from 17% to 53% in the same period (Table D). Nursing has also been prominent: it rose rapidly to reach a peak of 20,000 students in 1973/74 but four years later had declined to less than half. Inns of Court have had a steadily decreasing number of overseas students over the last two decades, and their share of the non-public sector overseas students has also declined. The same applies to "industry/professional/government etc".

TABLE D

Overseas Students outside the Public Sector in Selected Years

Category.	1962/63		1967/68		1972/73		1977/78

\* Approximate

18. The history of the non-public sector, at least as recorded in British Council statistics, is very different from that of the public sector. After an extremely rapid rise in the early 1960s (mostly accounted for by the nursing group) the numbers then stabilised and in 1977/78 when they stood at 37,700 they were less than ten years earlier. Once again however it must be emphasised how diverse are

Note Applications are for undergraduate places in the year in question. The figures show the relationship between total number of applicants for each subject group, and the total number of acceptances. They do not show the proportion of applicants who were accepted for the subject group for which they applied, since candidates may, of course, be accepted in groups other than the one for which they originally applied.

**Source** Student numbers. British Council Statistics of Overseas Students in Britain various editions.

Percentages. Basic Education Statistics for the U.K.: Further Education, various editions

- Notes** (a) Advanced courses are courses leading to degrees and other qualifications above the standard of instruction required for OND or GCE 'A' level, or courses of equivalent standard.
- (b) Percentage column includes polytechnics throughout, and the former Colleges of Education from 1975/76.

- Notes (contd)
- (c) Colleges of Advanced Technology were transferred to the university sector in 1964/65, having previously been included in the above figures.
  - (d) The 'fees' definition of overseas students is used from 1967/68 onwards.
  - (e) Students from the Republic of Ireland are included from 1971/72 onwards.

Source and Notes: see over

Source Student numbers are derived from Statistics of Overseas Students in Britain, 1967/68, 1972/73, 1977/78 (British Council). Annual per capita income categories are as given in the IBRD (World Bank) Atlas, 1978. See also Appendix III below. (N.B. No attempt has been made to look at changing income levels over the years).

Notes Percentages are calculated in relation to the number of students whose country has been classified by income level. 'Unclassified' includes students whose country of origin is unknown, although they are 'overseas students for the purposes of fees'.

The following overseas countries are included in the per capita income categories shown in the above table and had 100 or more students in U.K. universities in 1977/78.

Annual per capita income under \$200

(2540 students)

Bangladesh (265), India (678), Pakistan (506), Sierra Leone (118), Sri Lanka (453), Tanzania (181).

Annual per capita income \$200-499

(4396 students)

Egypt (633), Ghana (281), Indonesia (200), Kenya (489), Nigeria (1466), Sudan (432), Thailand (234), Zambia (264).

Annual per capita income \$500-1999

(11 650 students)

Algeria (536), Brazil (362), Chile (223), Colombia (100), Cyprus (528), Guyana (130), Iraq (1261), Jordan (369), Malaysia (4728), Mauritius (286), Mexico (305), Portugal (221), Rhodesia (476), South Africa (373), Syria (104), Turkey (878).

Annual per capita income \$2000-4999

(8255 students)

Greece (1742), Hong Kong (1468), Ireland (304), Iran (2108), Israel (184), Italy (227), New Zealand (149), Saudi Arabia (187), Singapore (887), Spain (161), Trinidad and Tobago (117), Venezuela (495).

Annual per capita income over \$5000

(6910 students)

Australia (633), Brunei (157), Canada (940), France (184), Germany (Federal Republic) (664), Japan (279), Kuwait (159), Libya (109), Netherlands (134), Norway (361), Switzerland (158), U.S.A. (2640).

Annual per capita income categories are as given in the IBRD (World Bank) Atlas, 1978. See also Appendix IV below. (N.B. No attempt has been made to look at changing income levels over the years).

Note

- (a) Polytechnics were included with HE/FE in 1967/68 and 1972/72.  
 (b) The following overseas countries are included in the per capita income categories shown in the above table and had 100 or more students in U.K. polytechnics in 1977/78.

Annual per capita income under \$200

(1610 students)

India (270), Pakistan (180), Sri Lanka (797), Tanzania (117).

Annual per capita income \$200-\$499

(2454 students)

Ghana (157), Indonesia (124), Kenya (256), Nigeria (1304), Zambia (142).

Annual per capita income \$500-1999

(5788 students)

Algeria (344), Cyprus (387), Iraq (167), Jordan (137), Malaysia (3253), Mauritius (226), Rhodesia (341), Turkey (286).

Annual per capita income \$2000-4999

(4162 students)

Greece (616), Hong Kong (585), Iran (1806), Singapore (463), Venezuela (148).

Annual per capita income over \$5000

(1338 students)

Brunei (157), France (138), Norway (138), United States (357).

- (c) The following overseas countries are included in the per capita income categories shown in the above table and had 100 or more students in other higher and further education institutions in 1977/78:

Annual per capita income under \$200 (3028 students)

Bangladesh (176), India (392), Malawi (113), Pakistan (441),  
Sierra Leone (208), Sri Lanka (1103), Tanzania (359).

Annual per capita income \$200-\$499 (6359 students)

Egypt (106), Ghana (375), Indonesia (344), Kenya (611), Nigeria (3401),  
Sudan (234), Thailand (384), Zambia (529).

Annual per capita income \$500-1999 (9951 students)

Algeria (147), Cyprus (686), Guyana (129), Iraq (735), Jamaica (107),  
Jordan (976), Malaysia (4875), Mauritius (300), Rhodesia (629),  
South Africa (228), Turkey (421).

Annual per capita income \$2000-\$4999 (11 817 students)

Bahrain (190), Greece (967), Hong Kong (2532), Ireland (232), Iran (6165),  
Israel (148), Saudi Arabia (289), Singapore (368), Trinidad and Tobago  
(128), Venezuela (433).

Annual per capita income over \$5000 (3293 students)

Australia (153), Brunei (284), Canada (154), France (182), Germany  
(Federal Republic) (149), Japan (189), Kuwait (375), Libya (450),  
Netherlands (126), Norway (172), Switzerland (195), United Arab Emirates  
(166), United States (418).
