AN EXAMINATION WAS MADE OF THE VARIOUS PATTERNS OF INTERPERSONAL BEHAVIOR OF YOUTHS WHICH DISTINGUISH DELINQUENTS FROM NONDELINQUENTS. THREE GROUPS WERE EMPLOYED IN THIS STUDY. GROUP ONE CONSISTED OF IDENTIFIED DELINQUENTS. GROUP TWO CONSISTED OF UNBEARABLE YOUNGSTERS AS DETERMINED BY THE TEACHER. GROUP THREE CONSISTED OF A MATCHED CONTROL GROUP. THE SUBJECTS WERE SELECTED FROM THE LOCAL JUNIOR HIGH SCHOOLS. THE RANGE OF DATA AND RESPONSES VARIED BETWEEN 135 TO 168 SUBJECTS. THE ACTIVITIES INDEX WAS ADMINISTERED TO ALL SUBJECTS. INFORMATION WAS ALSO OBTAINED FROM QUESTIONNAIRES SENT TO THE TEACHERS. INTERVIEWS WITH THE PARENTS, AND THE SUBJECTS 'LIFE CARDS.' ANALYSES OF DATA WERE MADE USING CHI-SQUARE PROCEDURES. THE GENERAL FINDINGS SUGGESTED THAT DELINQUENT AND UNBEARABLE SUBJECTS WERE NOT THE SAME. ALSO THE DISTANCE BETWEEN THE DELINQUENT AND THE PARENT INLICATED THE HOSTILITY WAS DIRECTED AGAINST THE ENTIRE SOCIETY AND NOT JUST THE SCHOOLS. FURTHER INVESTIGATION HAS SUGGESTED ON THE RESPONSE OF THE TEACHERS TO SUCH BEHAVIOR AND THE DIFFERENCES IN HANDLING THE DELINQUENT AND UNBEARABLE-TYPE STUDENTS. (RS)

#### INTRODUCTION

study sponsored by the U.S. Office of Education. The purpose of the study was to test the hypothesis that disaffected youngsters appear in the first years of school and their subsequent careers, as delinquents or otherwise, depends on their subsequent experiences in school. Basically the focus was upon the school and its relation to and interaction with those students who were identified as problems. These children can be grouped into two distinct categories—those considered problem children in the school but who do not have any record of arrest or juvenile detention, and those children with court records (adjudicated delinquents) who may or may not be problems inside school.

The definition of delinquency for research purposes has always been problematical. The use of court records to isolate a sample of juvenile delinquents has been one of the most popular techniques (e.g., Pierson & Kelly, 1963), but sampling from "caught" delinquents tends to confound

delinquent behavior as such with those characteristics that are associated with the fact of being apprehended by the police. In other words, one might, in addition to selecting a sample of delinquents, also be selecting a sample from a certain socio-economic level, education, occupation, income, and cultural background. For example, the Gluecks' study of "Family Environment and Delinquency" as reviewed by Gold (1963) was criticized because the two groups in the study (delinquents and non-delinquents) differed on socio-economic level, with the delinquents being significantly lower. Dell (1963) has also indicated that one of the factors appearing to facilitate delinquency was a low level of socio-economic status. However, Pine (1965) found no significant relationship between social class status and delinquent behavior. But Dell took his sample from the court records and Pine did not, and those children whose antisocial acts bring them into court are more likely to be from a lower socio-economic level than those released by the police to their parents.

In addition to these problems in definition and sampling, delinquency research has also suffered from a lack of a

ERIC

White the state of the state of

rigorous methodology. As Stern (1958) has pointed out, much of this work has been essentially clinical-anecdotal. Those studies that have attempted to employ objective personality tests have, according to: Schuessler and Cressey (1950) in a review of 113 studies up to 1950, found no consistent distinctions between delinquents and non-delinquents.

The importance of the home environment has been suggested repeatedly in this literature. The Gluecks (1950) felt that the homes that their subjects came from were emotionally as well as financially impoverished. The lack of a proper parent-child relationship was also emphasized in a psychoanalytically-oriented study by Eissler (1949), who suggested that all of us are by nature delinquent, but are diverted by proper development of ego and super-ego controls.

An entirely different basis for the association between inadequate home environment and adjudicated delinquency was brought out by Goldman (1950), who found that police officers were more likely to hold

a youthful offender for court action if aware that the child came from a broken home. This certainly has a very significant bearing on the interpretation of family conditions as a causal factor in delinquency, especially when the delinquents are sampled from court records. Clearly, if this practice is widespread, the correlation between delinquency and a broken home would be very high but obviously not indicative of causality in the conventional sense.

In relation to the school, an older study by Wickman (1928) has shown that teachers generally pay little attention to withdrawing or submissive behavior but regard disorderly, disruptive behavior as indicative of serious disturbance. A further study by Uger (1938) has similarly noted the tendency of teachers to refer students who antagonize them rather than those who do not disrupt the class but who may have more serious behavior problems.

Despite these isolated findings the general picture remains unclear. An extensive review by Wilkins (1963) finds no definitive conclusions among this literature

ERIC

and he states that "it must be concluded that . . . causes [of delinquency] remain unknown."

A number of writers have discussed the significance of rebellion and protest against existing mores on the part of the delinquent as a possible etiological factor. This is almost a tautology, as the application of the word delinquent is in large part a function of the observation of antisocial acts. To turn around and observe that those persons chosen because of these acts do indeed act antisocially is not particularly surprising. It is none the less interesting and important to be able to select <u>Ss</u> according to this sort of criteria.

One of the most interesting areas for this antisocial behavior is the school interaction. What form does
this antisocial behavior take in the school? Is it detected
and remembered and reacted to by the teacher? Are the
parents of these youngsters aware of these acts? Are there
ways in which some teachers respond to such pupils that
tends to meliorate further disturbance?

We have tried to isolate the role ti the school plays and the teacher-student interaction in this study.

It was hoped that by looking at the school, the students, and the parents simultaneously, many of the variables isolated by other studies and suggested by other researchers could be looked at in interaction with each other in one system. The school is probably the most stable and most intrusive factor in a child's life outside of the family. The relations that the students have with their teachers and classmates must certainly be very important ones in terms of the etiology of delinquency. They are not the only ones; as Roth (1957) has said "There is no one explanation of delinquent behavior." But the school must certainly be one of the factors. As Scharzmann (1965) has noted, the educator may react in terms of the student's expectations and thus, unintentionally, reinforce his already delinquent behavior. It is very likely that the school situation provides an opportunity for the formation of a vicious circle. Some youngsters come to school with an expectation of being struck down, of failing, of being picked on and may in anticipation react defensively toward the teachers with hostility, and aggressively, thus soliciting from the teacher the very behavior that they had

fearfully expected and apparently confirming their choice of response.

The specific purpose of the study then was to attempt to isolate those factors which contribute to a pattern of delinquent behavior and to assess the possible role that the school plays in reinforcing this behavior. It has been proposed that prior to his enrollment in school the potential delinquent already possesses those traits of distrust, rejection, and hostility so often found in the delinquent. This developmental viewpoint hypothesizes that the subsequent experience of the student while in school only serves to intensify these initial trends. Unfortunately, little systematic evidence for this point of view is available.

The present investigators concentrated their efforts in the following areas.

- An isolation of the interpersonal pattern which categorizes the delinquent.
- 2. An assessment of the parental and teacher reactions to this behavior.

3. The demonstration that teachers, besides being capable of reinforcing delinquent behavior, are equally capable of channeling this energy into more socially acceptable areas.

The specific hypotheses relevant to the study were:

- 1. The delinquent pattern of behavior can be found in all social class levels of society.
- 2. In those cases in which actual delinquency
  has occurred data will show that both teachers
  and parents have denied or withdrawn significant
  measure of emotional support from the child.

#### GENERAL PROCEDURE AND DESIGN

#### Subjects

Three groups of subjects were employed in this study. One group, hereafter referred to as the delinquent group (D) were those subjects who had been in trouble with the authorities both inside and outside school and were on probation at the time of the study. The "unbearable" youngsters (U) were identified as those subjects who, while not encountering any difficulty from the legal authorities, were identified by teachers as aggressive trouble makers, generally causing concern to school personnel. The term "unbearable" was given to them by the teachers and its use was continued for this project. The control youngsters (C) were age-and class-mates of the above subjects but were not identified as sources of trouble either inside or outside of school. All subjects in the three groups were matched in addition to age and grade on sex, color and occupation of father In terms of the latter criterion, approximately one fourth were craftsmen and foremen; one fourth

service workers and laborers; and the remainder operatives and kindred workers.

Due to the complexity of the study and to other factors already enumerated in the grant's progress reports, the number of subjects available differed depending on the sources of the data. The majority of the subjects were white males approximately fifteen years old and in junior high school.

# Schools

During the preliminary part of the project, a search of the Children's Court records was undertaken in order to identify those youngsters who had been in trouble with the authorities in the years preceding the investigation. A total of 405 cases was ultimately isolated. These individual cases were further subdivided into city, county, public and parochial schools. In addition, medical records, intelligence data, parental information, and previous court records were summarized for each of the identified delinquents. From this search, four city junior high schools contributing 25 per cent of

the total delinquency cases and 50 per cent of the city delinquency cases were identified. The entire sample of (D), (U), and (C) subjects was obtained from these four schools.

## Data Sources

In order to help identify the characteristic patterns of interpersonal behavior which exemplified each of the 3 samples, the Activities Index (Stern, 1963) was administered to all subjects. This provides a measure of twelve personality needs factors reflecting and individual's relationship to significant others in his environment. There were no specific hypotheses concerning the performance of the three groups on the Activities Index.

In addition to the administration of the Activities Index, information was obtained for each subject
from questionnaires sent to his teachers, from interviews
with either the parent or guardian, and from the student's
school life card.

The teacher questionnaire, specifically developed for this project, obtained data relevant to the teacher's

impressions of the child. She was required to judge, among other things, his academic performance, social adjustment, and general personality pattern.

A total of 306 teachers who had participated in the school careers of the initial pool of 168 matched students in the study were located and sent the forms. An unusually high percentage (80%) of these teachers responded to the request for information. This resulted in a total of 2054 questionnaires being returned to us. Of these, 1516 were specifically applicable to the 45 matched cases (38 male, 7 female) that made up the final study groups.

It is possible that the teachers that responded were different from those that did not on some variable very relevant to the content of the questionnaires. The fact that such a high number of forms were returned is encouraging and, we feel, indicative of a valid sample, although this cannot be substantiated. There is also no assurance that those who did respond did so in an equally careful way. This technique also put a high premium on the memory of the teacher for a particular

respondents may be taken from the fact that usable forms were returned in large numbers even from the see who had had our subjects in kindergarten and first grade--eight to nine years earlier.

The interview with the parents centered around the socioeconomic level of the family, the child's school adjustment and activities, his general behavior, and future educational plans.

Data were available from these three sources for 45 subjects in each of the three matched groups, making a total of 135 subjects. The analysis was done using the chi-square test comparing the three groups of subjects on a series of variables. With few exceptions only chi-squares significant at less than the .02 level or better are mentioned in the section on results. The large number of significant values made the task of presenting the data quite difficult and some choices had to be made, we felt, in order to put this material in a digestable form.

Restricting the summary to the clearly significant findings very much sharpens the interpretation of the results.

Both the teacher's questionnaire and the parental interview were included primarily to assess the pattern of acceptance and rejection each of the subjects obtained both at home and in school. The information obtained from these sources was also of great aid in general group description. It should be noted that neither the interviewer, teacher or parent knew that the child had been classified or was being studied for any specific purpose other than a general investigation of teenagers.

Finally, the "life card" for each of the students in each school was searched for additional information pertinent to the subject's academic achievement and attendance record. Data was available in this instance for all 168 of the originally selected subjects, 56 in each of the three groups. These results are quite straightfoward and are essentially an actuarial approach in which the already existent school records were pulled together. There was little or no subjective judgment as far as the

staff of the project was concerned, although, of course, this was not true of the data as entered by the teachers themselves in years past.

Copies of the Activities Index, the teacher questionnaire, parental interview form, and school record summary can be found in the Appendix to this report.

#### RESULTS

In this section we present an abbreviated summary of the data analysis. Because of the large number of significant chi-squares and the breadth of area that they cover, only a summary of the main contributions to chi-squares significant at the .02 level or better will be given in this section. The complete chi-square table for each of these cases will be found in Appendix II.

The results section will consist of four parts: attendance record and academic achievement, the teacher questionnaire, the sociological data, and the AI information. Under each general topic will be presented the chi-squares when available. These will be listed by number and this number will also refer to the appropriate chi-square table at the back of this section. Whenever possible these chi-squares have been grouped as to general areas within the main part.

# Academic Achievement and Attendance Record

The attendance data showed great similarity between the three groups. The distribution of the number of days

of absence was almost rectangular with the median number of days falling at the 5-27 day range (the frequencies ran from 0 to 90 days). The number of students who were absent more than 27 days decreases gradually until all the cases are accounted for. The attendance record was broken down, not only for the three groups of the project but also analysed by school years from kindergarten to ninth grade. No apparent trend existed over the school years and there were no differences between the three groups.

In some cases, the column totals are not consistent across tables due to missing information.

- 1. Grade repeated once. The value of 2.7 was obtained (4 df and N.S.), there being no apparent differences between the three groups. The average number of students who repeated a grade for all the groups combined was 3.4. The highest number of repeating students occurred at the seventh grade (more than two ce as many students as most of the other grades).
- 2. Above average mathematics. This chi-square was based on those students who were classified by the

teachers as being above average students of mathematics. The three study samples were grouped into grades 1 - 3, 4 - 6, and 7 - 9. The chi-square was equal to 13.6 (df = 4, p < .02). The largest departures from the expected frequencies were during the years 7 - 9 and were from both the (C) and the (U). The (C) had much more than expected above-average youngsters in math in junior high, the (U) many fewer at that grade level.

#### Tracher Questionnaire

The first general topic that we looked at was the possible presence of a sex effect for the teacher ratings.

Does the sex of the teachers seem to be related to the pattern of their judgments (memories) about students?

Again, in some cases the column totals will not be consistent across tables due to information being unavailable.

1. Knowledge of trouble outside of school. The chi-square was 18.66 (df = 4, p < .01). This was based on the junior high grades only. The greatest discrepancy was in the category of "suspecting trouble." The male teachers suspected trouble less often than expected and

the female teachers more often than expected. A large contribution to the chi-square also came from the category "knowledge of delinquent acts." The male teachers had much more professed knowledge than expected.

- 2. Knowledge of trouble inside of school. The chi-square was 27.33 (df = 5, p < .01). This was for the junior high and the elementary school grades combined, although the chi-square for the junior high alone was also significant (28.22, with df = 4, p < .01). The male teachers have less information about students generally, but they are much more knowledgable about disciplinary troubles in the case of those they do report about. The male teachers seem to have more knowledge than the female teachers about such disciplinary problems as truancy, property damage, and behavior problems.
- 3. Behavior problems inside of school. The chisquare was 52.61 (df = 8, p < .01). This was based on
  the junior high and the elementary grades combined. In
  this case the categories that contributed most to the chisquare were a) in contrast to the previous case, the men
  now claim fewer "no information" cases than the women,

b) the men were less aware than expected of a lack of attention and refusal to work, c) the men were also less aware of attention-getting problems, d) the men were more aware of frequent truancy, and e) the men were more aware of illicit smoking. The chi-square for the junior high alone was also significant at the .01 level (18.93 with 7 df.) and the primary sources of the chi-square were the same.

All the following chi-squares focus on the differences between the three groups. Also, all chi-squares are based on the data combined over grades.

- 4. Academic Achievement. The chi-square was 57.93 (df = 8, p < .01). The principal contributions to the chi-square came from the (C) being remembered as superior and average more often than expected and the (U) and the () as more often below average and failing. The (U) and (D) had fewer superior than expected but the (U) even less than the (D).
- 5. Application as a Pupil. The chi-square was 123.8 (df = 6, p < .01). The (C) group was remembered as the hardest working while the (D) and the (U) both seem

to have worked equally little, if at all.

- 6. Satisfaction in School. The chi-square was 134.2 (df = 6, p < .01). The (C) enjoyed the situation much more than expected while the (U) and the (D) enjoyed it much less. The (U) seemed somewhat less satisfied than the (D).
- 7. Social Adjustment to the School. The chisquare was 117.8 (df = 4, p < .01). Again the (C) group
  was better adjusted than expected and when compared to
  the (U) and (D) the latter two were very similar to each
  other and strikingly different from the (Cs).
- 8. Social Adjustment to Peers. The chi-square was 50.2 (df = 4, p < .01). The (C) was much better adjusted than expected and the (D) and (U) were less adjusted to peers than expected.
- 9. Extent of Extra-Curricular Participation. The chi-square was 34.6 (df = 6, p < .01). The (C) participated more than expected and the (D) and (U), who were approximately the same.
- 10. Type of Participation. The chi-square was 9.9 (df = 2, p < .02). The (C) group tended to be

followers more often than expected and the (D) and (U) were leaders more often than expected. The (U) tended to be leaders more often than did the (D) group.

- 11. <u>Trouble Outside of School</u>. The chi-square was 70.7 (df = 6, p < .01). The (C) had less trouble than expected and the (D) and (U) more trouble than expected.
- was 106.6 (df = 8, p < .01). Again, the (C) has less trouble than expected while the (D) and (U) had more.

  The (U) was distinguished from the (D) by much greater degree of trouble due to poor scholarship than expected.
- square for behavior problems in School. The chisquare for behavior problems in school in terms of a
  more specific breakdown was 130.3 (df = 12, p < .01).

  Two variables were particularly high in the amount that
  they contributed to the chi-square. Aggressive acts and
  defacing property (overt, external hostility) was particularly high for the (U) and low for the (C). On the
  other hand the problem of tardiness and truancy was quite

different for the (D) and the (C), the (D), of course, being much more truant than expected and the (C) much less. The absence of problems was an important category also. The (Cs), as expected, had fewer problems than either the (U) or the (D).

- 14. Contact with Parent or Guardian. The chisquare for the teacher's contacts was 42.0 (df = 4, p < .01). The (C) had fewer school-initiated contacts than expected but had a great deal more parent-initiated ones. In contrast the (U) had more contacts initiated by the teacher but less by the parents than expected. The (D) group seemed midway between the other two; the expected frequencies were quite similar to those observed.
- the teacher's memory of the student's plans was 18.4

  (df = 6, p < .02). The main contribution to the chisquare came from the plans to continue school after junior
  high-- 'e (C) had more such plans, the (U) had less than
  expected. The (U) were higher than expected, however, in
  planning to attend trade or business school, though; the

20 Miles 2.

- the (C) were lower on this type of continuing education.
- 16. Reality of Plans. This was the only non-significant chi-square run on this set of data 4.6 (df = 6, p > .02). There seemed to be teacher-judgment differences between the three groups in terms of the reasons for the nonreality of the plans.
- data to be presented in this section has to do with a question asking for the teacher's personality description of the students. The three groups have been malyzed in terms of the percent of teachers characterizing them as a particular personality type and this was done separately for grades K 3, 4 6, 7, 8 and 9. The minth grade data are based upon only two of the four junior high schools because the other two did not have minth grade classes.

This has been presented in terms of a series of graphs (see Figures 1 - 5). The most clear cut result of this is the finding that the (C) are remembered as being consistently more respectful, polite, humble, cooperative, friendly and self sufficient. The (D) and the (U)

ERIC AFUIT TEXT PROVIDED BY ERIC

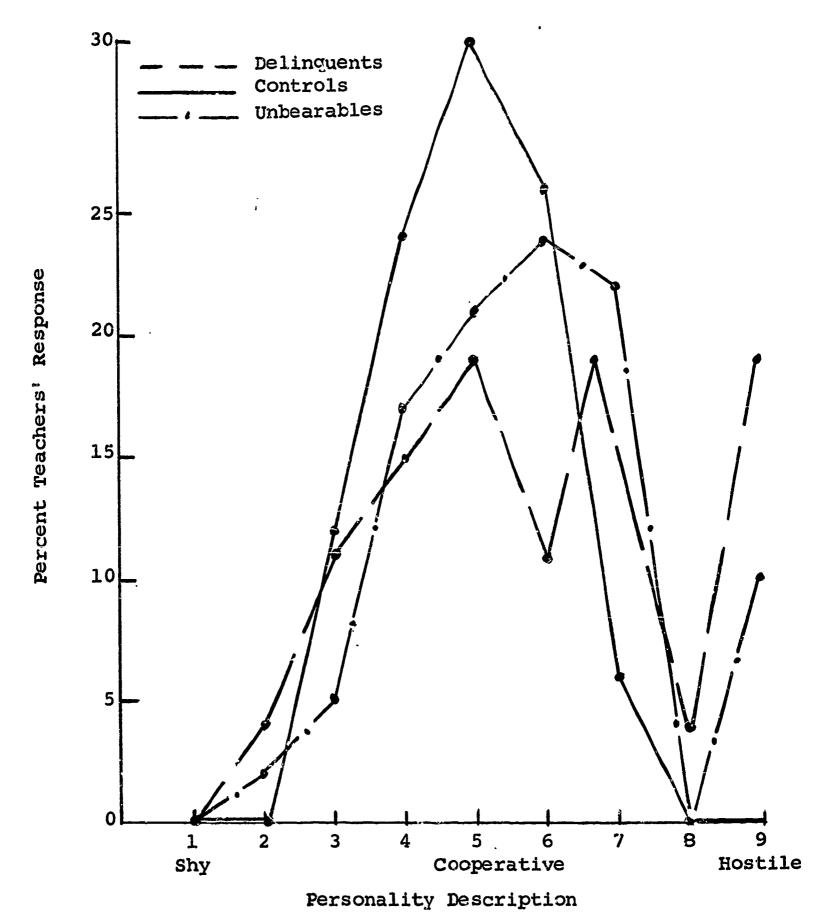

Fig. 5. Personality description as a function of the grade in school--Grade 9 (2 schools missing--no ninth grade).

ERIC Full Text Provided by ERIC

appear much more similar to one another throughout the school years. The (C) are also consistently less overtly demonstrative and overtly hostile (emotional, impulsive, domineering, hostile and abusive).

A very interesting trend appears to have taken place for the (U) and (D) groups on these same variables of overt anti-social activity. In grades

K - 3 the (D) are more commonly remembered as the anti-social types, but the (U) gradually overtake them through the years and by the eighth grade are clearly considered to be the more aggressive. In the ninth grade the trend is broken but two missing schools for this grade make this last set of data questionable.

The raw data for this set of graphs was also analyzed by the chi-square. The chi-square was 304.3 (df = 16, p < .01). The data in the graphs is, of course, supported. The (C) are much more respectful, polite, humble, cooperative, friendly and self-sufficient than expected. The (D) and (U) are much less than expected on these variables. The (D) and (U) are on the other hand much more emotional, impulsive and attention-getting.

ERIC

Another large distinction comes in the category hostile, antagonistic, and abusive; the (C) are low here, the (D) and (U) much more frequent than expected.

### Sociological Data

The following analysis may not all agree on the totals for the three groups because of the difficulty of obtaining data on some of the variables for some of the families. The following are the chi-squares that were significant at better than the .02 level.

- of adjustment of child. The chi-square for this comparison of the (C), (D) and (U) was 23.5 (df = 2, p < .01). The three groups were contrasted in terms of their parents previous awareness of/or concern for the child's problems. The (C) group parents were very similar to the expected frequencies but the (D) and (U) were quite disimilar. The (D) parents were much less aware and or concerned than expected while the (U) parents were much more aware and or concerned than expected.
  - 2. Family participation in family activities.

The chi-square for this comparison was 31.8 (df = 6, p < .01). The three groups were contrasted in terms of the degree of participation of the whole family in activities.

The (D) family participates much less than expected and the (C) family much more than expected. The (U) family participated somewhat more than expected.

- 3. Parents participation in vacations. The chisquare was 20.8 (df = 4, p < .01). The comparison was in terms of vacations taken separately, together, or not at all. The (D) were much less likely to take vacations together than expected and the (C) much more likely than expected. The three groups were approximately equal in terms of their likelihood of not taking any vacation at all, although the (D) were somewhat more likely than the other two not to take any.
- 4. Family participation in child's recreation.

  The chi-square was 33.3 (df = 2, p < .01). The distinction was in terms of some participation versus no participation on the part of the parents. The (D) were much more likely than expected to take no part in their children's recreation and the (C) much less likely to do

this. The (U) group fell between.

- 5. The parent's method of discipline. The chisquare was 21.1 (df = 6, p < .01). The (C) and (D) parents were the most apart in terms of the predicted cell frequencies with the (U) falling between them at nearly the predicted frequency. The (C) parents tend to use the friendly--discussion--approach to discipline while the (D) tend to use it much less than expected. The (D), on the other hand, tend to use the scolding, threatening, verbal reprimand techniques while the (C) do so much less than expected.
- 6. <u>Deviations from accepted behavior norm of community among the siblings</u>. The chi-square for the three groups in terms of presence or absence of behavior problems in the siblings was 10.6 (df = 2, p < .01). The primary contributor to the chi-square was the (Ds) who had much more than expected sibling delinquency. The (C) and (U) groups, surprisingly, do not differ on this question very much.
- 7. Attitude of child toward school. The chi-square was 15.1 (df = 4, p < .01) for the youngster's attitude as

judged by the parent's or the parole officer. The (C) and the (D) were most different from one another, with the (U) falling at approximately the expected frequencies. The (C) like school much more than expected, the (D) dislike it more.

- The chi-square was 16.4 (df = 4, p < .01) for the three groups versus whether they are judged by the parent to have been liked, average, or been in difficulty with the teachers. The (C) had less difficulty with the teachers than expected, the (U) group parent's remembered that they had a lot more difficulty than expected and the (D) were remembered to have had much more average relationships with the teachers than expected.
- 9. Presence of behavior problems in school. The chi-square for this comparison of the parent's report was 33.0 (df = 2, p < .01). The principle contribution to the chi-square was from the (U) who had more behavior problems and the (C) who had a report of much less.
- 10. <u>School mobility</u>. The chi-square for the three groups as contrasted by their attending one junior high

school versus two was 9.6 (df = 2, p < .02). The (U) were more likely to attend two junior highs than expected and the (C) much less likely.

- 11. Participation in extra-curricular activities.

  The chi-square for this comparison based on the teacher report was 12.9 (df = 2, p < .01). The (C) group participated in activities more than expected and the (D) less than expected. The (U) were about equal to the expected frequencies.
- 12. Peer group relationships outside of school.

  The chi-square for this comparison based on the parents

  and the PO was 10.2 (df = 2, p < .02). The (C) tended

  more often to be a leader and the (D) more often the

  follower. The (U) were approximately equal to the expected

  frequencies.
- as expressed by the parent. The chi-square for the presence or absence of plans for the child by the parent was 12.4 (df = 2, p < .02). The parents of the (C) more often than expected had plans, while the (D) were less likely than expected to have plans.

ERIC

### Personality Test Data: Scales

In order to aid the reader in interpreting the results of this section, a very brief description of the Activities Index scales has been included (Stern, 1963).

### Need-Press Scale Definitions

- 1. aba <u>Abasement</u>--ass <u>Assurance</u>: self depreciation versus self-confidence.
- 2. ach <u>Achievement</u>: striving for success through personal effort.
- 3. ada <u>Adaptability--dfs</u> <u>Defensiveness:</u> acceptance of criticism versus resistance to suggestion.
- 4. aff <u>Affiliation</u>: friendliness versus unfriendliness.
- 5. agg <u>Aggression</u>--bla <u>Blame Avoidance</u>: hostility versus its inhibition.
- 6. cha <u>Change</u>--sam <u>Sameness</u>: flexibility versus routine.
- 7. cnj <u>Conjunctivity</u>--dsj <u>Disjunctivity</u>: planfulness versus disorganization.
- 8. ctr <u>Counteraction</u>: restriving after failure versus withdrawal.
- 9. dfr <u>Deference---rst Restiveness</u>: respect for authority versus rebelliousness.
- 10. dom <u>Dominance</u>—tol <u>Tolerance</u>: ascendancy versus forbearance.

- 11. e/a <u>Ego Achievement</u>: striving for power through social action.
- 12. emo <u>Emotionality--plc Placidity</u>: expressiveness versus restraint.
- 13. eny Energy--pas Passivity: effort versus inertia.
- 14. exh <u>Exhibitionism</u>—inf <u>Inferiority Avoidnace</u>: attention—seeking versus shyness.
- 15. f/a <u>Fantasied Achievement</u>: daydreams of extraordinary public recognition.
- 16. har <u>Harm Avoidance</u>--rsk <u>Risktaking</u>: fearfulness versus thrillseeking.
- 17. hum <u>Humanities</u>, <u>Social Science</u>: interests in the Humanities and the Social Sciences.
- 18. imp <u>Impulsiveness--del Deliberation</u>: impetuousness versus reflection.
- 19. nar <u>Narcissism</u>: vanity.
- 20. nur <u>Nurturance</u>: helping others versus indifference.
- 21. obj <u>Objectivity-pro Projectivity</u>: detachment versus superstition (Al) or suspicion (El).
- 22. ord <u>Order--dso <u>Disorder</u>: compulsive organization of details versus carelessness.</u>
- 23. ply <u>Play</u>--work <u>Work</u>: pleasure-seeking versus purposefulness.
- 24. pra <u>Practicalness</u>—ipr <u>Impracticalness</u>: interest in practical activities versus indifference.

- 25. ref Reflectiveness: introspective contemplation.
- 26. sci Science: interests in the Natural Sciences.
- 27. sen <u>Sensuality--pur <u>Puritanism</u>: interest in sensory and esthetic experiences versus austerity, or self-denial.</u>
- 28. sex <u>Sexuality</u>--pru <u>Prudishness</u>: heterosexual interests versus their inhibition.
- 29. sup <u>Supplication--aut Autonomy</u>: dependency versus self-reliance.
- 30. und <u>Understanding</u>: intellectuality.

In order to determine whether the (C) group differed from the (D) and (U) groups,  $\underline{t}$  values were calculated. The results indicated that the (C) scored significantly higher on those scales stressing intellectuality. The (C) were higher on Understanding,  $\underline{t}=2.88$ ,  $\mathrm{df}=51$ ; and Achievement,  $\underline{t}=3.63$ ,  $\mathrm{df}=51$ . Of all the results to come out of this study, the none too surprising one that the (C) perform better on almost anything relating to achievement has been the most consistent. Clearly, results such as these were expected. The (C) subjects were also superior on scales relating to Nurturance,  $\underline{t}=2.62$ ,  $\mathrm{df}=51$ ; and on the Counteraction scale dealing with restriving after failure.

ERIC

For this comparison the computed <u>t</u> value was 5.32 with 51 degrees of freedom. These results point to a certain amount of empathy and perseverance on the part of the (Cs), at least when compared to the average of the (D) and (U) subjects.

results were obtained. The (D) and (U) students scored, significantly higher than the (Cs) on the succorance scale;  $\underline{t} = 3.14$ , df = 51; humanism scale,  $\underline{t} = 2.49$ , df = 51; emotionality scale,  $\underline{t} = 2.31$ , df = 51; and on the play scale,  $\underline{t} = 2.48$ , df = 51. The succorance scale stresses dependency as opposed to self-reliance and the results appear closer to the presumed unconscious needs of the (D) than to his overt behavior. The higher response of the (Ds) an '/Js) to the humanities and social science items of the humanism scale--interests not ordinarily associated with (D) individuals--is also of considerable interest.

All the above results were for (C) subjects compared with the (D) and (U) combined as a group. In

addition, however, matched <u>t</u> tests were also computed for the (D) versus the (Cs) and (C) versus (Us) on the <u>Activ</u>
<u>ities Index scales</u>.

were found to be significantly higher than both the (D) and (U) groups on those scales stressing intellectuality and a striving for success. For the humanism scale, the computed t value was 2.52 for the (C) versue (U) comparison and 2.43 for the (D) versus (U) comparison. On the achievement scale the respective t values were 3.56 and 3.30. As in the previous section, all degrees of freedom were 51. Finally, for the counteraction items the appropriate t values were computed to be 3.93 in both comparisons. Clearly from these and the previous data, the pattern of perservance and attainment of success was evident for the (C) subjects, at least when compared with the (D) and (U), and the latter do not appear to differ much from one another.

The (C) group was also higher than the other two on harm avoidance;  $\underline{t} = 3.90$  and 3.05 respectively, and on the nurturance scale (the corresponding  $\underline{t}$  values were 2.73

ERIC

and 2.98). These latter results suggest that a conservative, empathic pattern of interpersonal relationships may be characteristic of the (C) youngsters.

These data cited above represent the most clearcut results; that is those for which there was a significant difference for the (C) over both the other groups.

For other isolated scales however, there were some
significant differences obtained between (C) and (U)
or (C) and (D) but not both. No differences were found
for the (D) versus (U) comparison on any of the Activities
Index scales.

### <u>Factors</u>

The Al results may also be interpreted in terms of the 12 factors which account for most of the interpretable variance shared by the 30 scales. A brief description of each of the factors follows.

Factor 1. Self-Assertion. This factor reflects a need to achieve personal power and socio-political recognition. It is based on items which emphasize political cal action, directing or controlling other people, and

the acceptance of roles involving considerable group attention. Score Sum: Ego Achievement, Dominance, Exhibitionism, Fantasied Achievement.

Factor 2. Audacity-Timidity. The second factor is more personally than socially oriented. The emphasis here is on aggressiveness in both physical activities and in interpersonal relationships. It is of interest that this personal aggressiveness should also be associated with a high level of interest in science. Score Sum: Risktaking, Fantasied Achievement, Aggression, Science.

Factor 3. Intellectual Interests. The factors with the highest loadings in this dimension are based on items involving various forms of intellectual activities. These include interests in the arts as well as the sciences, both abstract and empirical. Score Sum: Reflectiveness, Humanities-Social Sciences, Understanding, Science.

Factor 4. Motivation. This factor, like 1 and 2 above, represents another form in which need achievement may be expressed. Here, however, are the more conventional

ERIC

forms of striving most recognizable among students, involving elements of competitiveness and perseverance as well as of intellectual aspiration. Score Sum: Achievement, Counteraction, Understanding, Energy.

Factor 5. Applied Interests. A high score on this factor suggests an interest in achieving success in concrete, tangible, socially acceptable activities. The items involve orderly and conventional applications in business and science. Score Sum: Practicalness, Science, Order.

Factor 6. Orderliness. People with high scores on this factor have indicated a marked interest in activities stressing personal organization and deliberativeness. Although some of the items are concerned with long range planning and relatively high level time perspective, the major emphasis here is on the maintenance of ritual and routine and the avoidance of impulsive behavior. Score Sum: Conjunctivity, Sameness, Order, Deliberation.

Factor 7. Submissiveness. The preceding factor suggests a strong defensive system, based on rigid internal

The submissiveness factor also implies a high level of control, but one which is based on social conformity and other-directedness. The items emphasize humility, deference, getting along ith others, keeping in one's place, etc. It is of interest that the Nurturance scale items should appear in this context, suggesting that the submissive individual's interest in supportive activities is based to a considerable extent on his own unexpressed need for such help. Score Sum: Adaptability, Abasement, Nurturance, Deference.

Factor 8. Closeness. This factor is closely related to Factor 7, with which it shares both the Nurturance and Deference scales. However, the abasive and self-denying qualities implicit in Factor 7 are absent here.

In their place is an acceptance of items which recognize one's need for warmth and emotional supportiveness. Score Sum: Supplication, Sexuality, Nurturance, Deference.

Factor 9. Sensuousness. The thirty items associated with this factor are concerned with activities of a sensual

character. The items suggest a measure of self-indulgence along with a delight in the gratifications which may be obtained through the senses. Score Sum: Sensuality, Narcissism, Sexuality.

Factor 10. Friendliness. Persons with high scores on this factor are indicating an interest in playful, friendly relationships with other people. These interests invo we simple and uncomplicated forms of amusement enjoyed in a group setting. Score Sum:

Affiliation, Play.

Factor 11. Expressiveness-Constraint. This factor stresses emotional lability and freedom from self-imposed controls. Individuals with high scores on this factor are cutgoing, spontaneous, impulsive, and uninhibited. Score Sum: Emotionality, Impulsiveness, Exhibitionism, Sexuality.

Factor 12. Egoism-Diffidence. This factor reflects an extreme preoccupation with self. The items are concerned with appearance and comfort, as well as with fantasies in which the self obtains unusually high levels of gratification. The responses to other items in this group suggests

that reality itself is interpreted in egocentric terms, but this may be not so much a matter of autistic distortion as of narcissistic egoism. Score Sum: Narcissism, Fantasied Achievement, Projectivity.

Factor scores were generated for each of the subjects in the sample and a one-way analysis of variance calculated, followed by a Scheffé test for all two-by-two contrasts in which significant F-ratios were obtained.

These results are summarized in Figure 6 which contrasts the three groups (38 males in each) with one another on the basis of norms derived from a sample of 603 high school boys.

The (C) appear to be the more intellectually oriented, with marked applied interests and a tendincy towards orderliness and submissiveness. This is a further reflection of the same conventionality already noted for these subjects. The only significant difference here, however, is in Factor 4, Motivation, where the (C) are higher than the (D) it do not differ from the (U).

Means, sigmas and F-ratios are given in Table 1.

### DISCUSSION

The intent in this final section of the report was to discuss the general results of the study and how they focused on the objectives of the project. Indeed, an attempt was made to keep this material from becoming another results section, but at the same time, to give the reader an overall picture of the data.

As stated in the introduction, one of the main purposes of the study was to specify those modes of interpersonal behavior which distinguished delinquents from non-delinquents. The main section of results for this came from the Teacher Questionnaire and Parental Interview.

Generally speaking, the results indicated that when they did participate in school activities the (D) and (U) youngsters tended to be leaders rather than followers. This was especially true of the (U) subjects. Unfortunately data were not available to determine whether this was a coercive type of leaders ip, although one would suspect that this might be true. Other data from the

parental Interviews it was determined that the parents of the (D) subjects tended to use more physically oriented modes of discipline than did the (C) parents and possibly this became the (Ds) mode of behavior when they controlled a situation.

Also related to interpersonal behavior were the data which indicated that the adjustment of the (C) group to both school and peers was far superior to that of the other graps. Clearly, these results were as expected. Both evidence from the literature and from anecdotal reports shows the (D) to be poorly adjusted socially. We have confirmed this.

Somewhat surprising results from the Parental

Interviews on the student's peer group relationships outside of school show that the (C) group tended to be leaders, while the (Ds) followed. It could not be determined whether this discrepancy was due to a difference between the teachers' and parents' observations or whether it presented an in-school versus an out-of-school difference. This

latter hypothesis appeared to be somewhat less likely than the possibility of parental pride.

The second major purpose of the project was to evaluate the responses made by both parents and teachers to a child's delinquent behavior. Perhaps a logical starting point for the discussion of the pertinent data in this area would be to look at whether the teachers and parents were even aware of or suspected the existence of any problems.

An interesting result was that the male teachers suspected trouble less often than the female teachers in terms of "outside of school" behavic problems. On the other hand, the male teachers reported recalling more about disciplinary trouble inside the school than did the female teachers. This might conceivably be due to the fact that the male teachers tend to have such problems referred to them for handling, but it may also be that they tend to elicit more hostile responses from delinquent boys anyway.

Both teachers and parents report less trouble

for the (C) both inside and outside of school, as expected. This helps to support the validity of their responses since the (Ds) and (Us) were in fact selected on the basis of whether or not they had in fact been in trouble with the community or in the school. However, there is no conclusive evidence available to indicate what the response of the teachers was to the behavior of the subjects.

Additional data again showed that the teachers regarded the (C) students as polite and cooperative, and were inclined to classify the (U) and (D) subjects as aggressive, hostile and abusive. However, the teachers' overt responses to this behavior could not be determined.

In terms of the parents' responses to their child's problems, some very interesting results were found. The parents of the (D) youngsters were generally unaware and/or unconcerned with their child's problems, while the (U) parents were very much concerned. They reported that they were aware that the teachers had a lot of trouble with their child. The (Us) had also moved about more and had been enrolled in more schools. The (C) parents reported

average child-teacher relationships, which was indeed expected.

Some insight into the responses of the parents of the three groups of subjects to their child's actions was indicated in those data bearing on family participation. It was very likely that the (D's) parents took no part in their activities or indeed participated in any family activities. This verifies the frequent report by (Ds) of no parental guidance, interest, etc. In addition, when the parents of the (D) youngsters did respond to their child's being in trouble, it was likely to be physical discipline, as opposed to a more Socratic type of treatment found in the (C) homes. For this analysis, the (U) parents tended to fall somewhere in between.

The Activities Index results showed that the (C) students put emphasis on achievement-oriented, goal-directed types of behavior. They differed considerably from the (D) subjects in this respect, but not from the (U).

The findings in general suggest that the (U) and (D) subjects are not the same. The former seem to have focussed specifically on the school setting as one in which to rebel, displaying a great deal of resentment in their responses here and at home. There is a family relationship, but it might perhaps be better described as involving negative closeness. The (D) youngsters on the other hand seem to have been turned off much earlier and are much more nearly indifferent to the school process. The distance between them and their parents suggested by these data is seemingly toogreat to bridge any more, and the implication is that their hostility is directed then against the entire world, and not just the parent surrogates of the schools who seem to be the (Us) preferred target.

The sources of these differences are not clear.

The subjects were too few, and too homogeneous in class background perhaps, to bring this into better focus. There is something in the life pattern of the (U) which narrows his aggression and keeps him out of trouble with the juvenile

ERÎC

The findings in general suggest that the (U) and (D) subjects are not the same. The former seem to have focussed specifically on the school setting as one in which to rebel, displaying a great deal of resentment in their responses here and at home. There is a family relationship, but it might perhaps be better described as involving negative closeness. The (D) youngsters on the other hand seem to have been turned off much earlier and are much more nearly indifferent to the school process. The distance between them and their parents suggested by these data is seemingly toogreat to bridge any more, and the implication is that their hostility is directed then against the entire world, and not just the parent surrogates of the schools who seem to be the (Us) preferred target.

The sources of these differences are not clear.

The subjects were too few, and too homogeneous in class background perhaps, to bring this into better focus. There is something in the life pattern of the (U) which narrows his aggression and keeps him out of trouble with the juvenile

authorities. The response of the teachers to such behavior, and the differences in their handling of (D) and (U) type students is in clear need of investigation. Such a study will require a concurrent analysis, however, unlike the essentially retrograde design employed in the present case.

# STERN ACTIVITIES INDE!

### Form 1158

## George G. Stern, Syracuse University

This booklet contains a number of brief statements describing many different kinds of activities. You will like some of these things. They will seem more pleasant than unpleasant to you, perhaps even highly enjoyable. There will be others that you will dislike, finding them more unpleasant than pleasant. The activities listed in this booklet have been obtained from a great many different persons. People differ in the kinds of things they enjoy, like to do, or find pleasant to experience. You are to decide which of these you like and which you dislike.

### **DIRECTIONS**

Print the information called for at the top of the special answer sheet: your name, the date, your age and sex, etc. Then, as you read each item, blacken space

- L if the item describes an activity or event that you would like, enjoy, or find more pleasant than unpleasant.
- D-if the item describes an activity or event that you would dislike reject, or find more unpleasant than pleasant.

Be sure to fill in the whole space between the dotted lines with a heavy, black mark, using the special pencil provided. You need not spend much time on any one item; go through the list quickly, being sure to answer every item. Do not make any marks in this booklet.

- Legend: L if the item describes an activity or event that you would like, enjoy, or find more pleasant than unpleasant.
  - D if the item describes an activity or event that you would dislike, reject, or find more unpleasant than pleasant.
- 1. Taking the blame for something done by someone I like.
- 2. Setting difficult goals for myself.
- 3. Concealing a failure or humiliation from others.
- 4. Having other people let me alone.

- 5. Getting what is coming to me even if I have to fight for it.
- 6. Being quite changeable in my likes and dislikes.
- 7. Scheduling time for work and play during the day.
- 8. Working twice as hard at a problem when it looks as if I don't know the answer.
- 9. Seeing someone make fun of a , rson who deserves it.
- 10. Persuading a group to do something my way.
- 11. Bei() a newspaperman who crusades to improve the community.
- 12. Listening to music that makes me feel very sad.
- 13. Taking up a very active outdoor sport.
- 14. Keeping in the background when 13m with a group of wild, fun-loving, noisy people.
- 15. Toughening myself, going without an overcoat, seeing how long I can go without food or sleep, etc.
- 16. Diving off the tower or high board at a pool.
- 17. Learning about the causes of some of our social and political problems.
- 18. Doing something crazy occasionally, just for the fun of it.
- 19. Imagining what I would do if I could live my life wer again.
- 20. Feeding a stray dog or cat.
- 21. Taking special precautions on Friday, the 13th.
- 22. Washing and polishing things like a car, silverware, or furniture.
- 23. Making my work go faster by thinking of the fun I can have after it's done.
- 24. Being good at typewriting, knitting, carpentry, or other practical skills.
- 25. Understanding myself better.
- 26. Learning how to prepare slides of plant and animal tissue, and making my own studies with a microscope.
- 27. Holding something very soft and warm against my skin.
- 28. Talking about how it feels to be in love.
- 29. Belonging to a close family group that expects me to bring my problems to them.

- 295. Concentrating so hard on a work of art or music that I don't know what's going on around me.
- 296. Studying rock formations and learning how they developed.
- 297. Reading in the bathtub.
- 298. Reading about the love affairs of movie stars and other famous people.
- 299. Being with someone who always tries to be sympathetic and understanding.
- 300. Working out solutions to complicated problems, even though the answers may have no apparent, imadiate usefulness.

#### Interview with Parents

As you know from our letter, we are making a study of teen agers. We hope to find out what things they like to do, and what they don't like to do. We want to learn in what ways they are different and in what ways they are alike. We also want to try to understand the more personal things in their lives that ordinarily are not known by outsiders. That is why we have come to you. We feel that as a parent, you can be extremely helpful to us in this study, and that you could give us information that we could not get in any other way.

Neither your name nor your child's name will appear in any results published from this study, but the kind of information you can give us will be very helpful in understanding teen agers all over the country.

Some of my questions may seem quite personal. You don't have to answer any question if you don't want to.

Before we start, would you like to ask me any questions about it?

#### \*\*\*\*\*

1.	Where was your child born?
2.	(If not parent) What is your relationship to child?
3.	Where was mother born?
	• • • • • • • • • • • • • • • •
4.,	Has your family moved furing the last five years?
	How many times?
5.	Who are the members of your household? Husband Wife

	No. of children at home No. of children in family
	Do any relatives live with you? (specify) A yone who is
	not a relative
6.	Has your child ever lived with any one other than his parents?
	(If yes, specify)
7. Occupation	Is mother employed? At what kind of job?
and	Full-time? More than one full-time job?Part-time
Education	What was the highest grade mother completed in school?
of Parents	(If below 8th grade) Was there any special reason why you left
	school then?
	(If mother is absent from home, indicate here, giving reason
	for absence)
8.	Could you tell me a little about child's father?
	(If absent, give reason
	for absence). Does he work full-time?What kind of work
	does he do?Does he have more than one
	full-time job?Part-time?How many years of schooling
	did he complete?(If below 8th grade) Was there any
	special reason why he left school then
	•••••••••••••
9. Sources	(If no one employed) Can you tell me how you manage?
of	Investments, rent, etc
Income	A.D.DO.A.AG.AA.BA.P.T.D, O.A.S.I, Disability pension Non-disability
	pension Private insurance Unempl. Comp
10.	(If some one is employed in family) Do you have any additional
	income such as from rent pensions insurance
	other
11.	Are there any things that your family usually do all together?
Family	For example, eating meals together going to church
Activities	together picnics, vacations, other recreation
	work around the house Do you do any of these things
	together sometimes once in a while never

Do you and your child usually take your vacations separately

	together (Specify)	• • • • • • • • • • • • • • • • • • • •
	Some married couples enjoy doing ma	any things together; some
Parents'	find that they do very few things	together. Could you tell me
Activities	if you and your husband are interes	sted in some of the same
	things, spending time with the same	e people, etc Or do
	you each follow your own separate :	interests?
13.	All parents spend a certain amount	of time away from their
	homes in activities such as working	_
	tions, having a good time, going to	
	you give me some idea of how much	
	spend away from home in such activ	<u> </u>
	Mother: Employment	(no. of hours per work)
	Father: Employment	
14.	When did your child have his last	physical examination?
Medical	Does he need medicate	al care? Has he been
	under a doctor's care for any reason	on?., Could you tell
	me why? Has he ever had to	be in a hospital?
	For what reason? Does he	nave any physical handicap?
	Has he had any serious illnes	ss? (Specify)
15.	Would you tell me a little about he	ow your child gets along
Cnild- Family	with other members of the family?	His father
Relation-	His mother or guardian	• • • • • • • • • • • • • • • • • • • •
ships	His brothers or sisters	2 • • 0 0 • • • • • • • • • • • • • • •
	Are there any activities that he en	specially enjoys doing with
	his brothers or sisters?	· · · · · · · · · · · · · · · · · · ·

	TO.	is there any adult outside of your immediate family that your
		child seems to like a great deal? Whom
		What do they do together

- Y Club
- 10. and 11. Code for school taught pupil.
- 12. Reminiscence of pupil.
  - 0 No information.
  - 1 Very well.
  - 2 Slightly
  - 3 Not at all
  - 13. Contact with child since in grade.
    - 0 No contact with child.
    - 1 Contact because had child in other grade (or home room), etc.
    - 2 Accidental contact, meeting on street, etc.
    - 3 Purposeful contact initiated
       by student
    - 4 Purposeful contact initiated by teacher
    - 5 Past contact purposeful soon after left grade but now only accidental, if at all.
    - 6 Contact as counselor for child.
    - 7 Contact unexplained
    - 14. Academic achievement.
      - 0 No information
      - 1 Superior
      - 2 Above average
      - 3 Average
      - 4 Below average
      - 5 Failing
      - 6 Tends to be below average
      - 7 Tends to be above average

- 15. Application as a pupil.
  - 0 No information
  - 1 Worked exceptionally hard
  - 2 Adequate motivation
  - 3 Didn't try very hard
  - 4 Didn't try at all
  - 5 Variable, generally pro school
  - 6 = Variable, generally anti school
  - 7 Variable, depending on work
  - 16. Satisfaction with school.
    - 0 No information
    - 1 Enjoyed it
    - 2 Indifferent
    - 3 Disliked it
    - 4 Strongly disliked it
    - 5 Varied, generally pro school
    - 6 Varied, generally anti school
    - 7 Varied, neither pro nor anti
  - 17. Social adjustment rating to school personnel.
    - 0 No information
    - 1 Below average
    - 2 Average
    - 3 Above average
  - 18. Social adjustment to peers.
    - 0 No information
    - 1 Below average
    - 2 Average
    - 3 Above average
  - 19. Opinion of coder about teacher rating.
    - 0 No information
    - 1 Generally favorable, accepted child
    - 2 Generally unfavorable, rejected child.
    - 3 Seems to be ambivalent.

- 20. Extent extra-curricular participation.
  - D No information
  - 1 No participation
  - 2 Little participation, 2 or less activities
  - 3 Moderate participation,
    3-5 activities.
  - 4 Extensive participation, 5 or more activities
- 21. Type of participation.
  - 0 No information
  - 1 Pupil tended to be follower
  - 2 Pupil tended to be leader
  - 3 Pupil tended to be
     "leader" or gang derogatory use
- 22. Personality description.
  - 0 No information
  - 1 Extremely shy and withdrawn
  - 2 Timid and apprehensive
  - 3 Cautious, controlled behavior
  - 4 Respectful, polite, humble
  - 5 Cooperative, friendly, self-sufficient
  - 6 Outgoing, playful, selfassured
  - 7 Emotional, impulsive, attention seeking
  - 8 -DDomineering, aggressive, self-assertive
  - 9 Hostile, antagonistic, abusive
- 23. Personality tendency as determined by coder.
  - 0 No information
  - 1 Cooperative-composed
  - 2 Submissive-restrained
  - 3 Assertive-împulsive

- 24. Knowledge of trouble outside of school.
  - 0 No information
  - 1 No knowledge of trouble
  - 2 Knows of or about delinquent
     act
  - 3 Knows of anti-social acts:
     pranks, bad crowd, boy-girl
     trouble, fights.
  - 4 Suspects trouble
  - 5 Knows of no trouble when in teacher's grade, but teacher does know or suspect trouble since that time
- 25. Knowledge of trouble inside school.
  - 0 No information
  - 1 No knowledge of trouble
  - 2 Knows of disciplinary trouble truency, damaging, behavior problems.
  - 3 Knows of anti-social acts: smoking, fighting, stealing in school.
  - 4 Knows of trouble due to poor scholarship
  - 5 Suspects t\_Juble
  - 6 Trouble about health measure
- 26. Schavior problems in school.
  - 6 No information
  - 1 Aggressive
  - 2 Attention getting
  - 3 Frequent truancy
  - 4 Damaging or defacing property
  - 5 Sme "ing

- 6 Lack of attention, refusal to
  work
- 7 Nervous mannerisms
- 8 Physical defects
- 9 No evidence of problems
- X Poor personal habits
- Y Frequent tardiness

- 27. Contact with parent or guardien
  - 0 No information
  - 1 No cortact
  - 2 Contact, parent called to discuss problems, school initiated.
  - 3 Contact, parent came
     with problem
  - 4 Contact for school social occasions.
  - 5 No contact, parent refused to come, uncooperative
  - 6 Contact with other relative
  - 7 Contact unexplained
  - 8 Contact only by accident.
  - 9 Parent called because child ill
  - X Contact regarding need for clothes, financial duties, health
  - Y Parent came for homework, child ill
  - 28. Indication of plans.
    - 0 No information
    - 1 Plans to continue schooling.
    - 2 Plans to work after school
    - 3 Plans to quit school at legal age and work

    - 5 Never made or is able to make serious plans
    - 6 Plans military service
    - 7 Plans marriage
    - 8 Plans to attend trade or business school
    - X Shows creative ability in music, art
    - Y Others

- 29. Reality of plans.
  - 0 No information
  - 1 Realizes capabilities
  - 2 Doesn't realize capabilities
  - 3 Incapable of realizing plans
  - 4 Economic difficulties in fulfilling plans
  - 5 Physical difficulties in fulfilling plans
  - 6 Unrealistic, thoughtless
  - 7 Realizes environmental & economic difficulties, taking best course.
- 30. Child's interest in school official.
  - 0 No information
  - 1 Interested in lower grade
     teachers
  - 2 Interested in teacher questioned
  - 3 Interested in other teacher in school, or principal
  - 4 Coder feels child interested in teacher questioned
  - 5 School nurse
- 31. Att\_tude of person in whom
   interested. (Teacher's opinion).
  - 0 No information
  - 1 Taken special interest in child
  - 2 Gave leadership to child
  - 3 Ignored child
- 32. Evidence of teacher questioned interest in child.
  - 0 No information
  - 1 Teacher liked child, child
     uncooperative
  - 2 Agreeable relationship
  - 3 Disagreeable relationship
- 33., 34., 35. Code number of teacher claimed to be interested in child.
- 36. Miscellaneous information
  - 1 See attached letter and/or questionnaire
