*READING PROGRAMS, READING ACHIEVEMENT, COMPARATIVE ANALYSIS,
FIRST GRADE, *BASAL READING, *PHONICS, *SENSORY EXPERIENCES,
SEX DIFFERENCES, RACIAL DIFFERENCES, GOLDSBORO, NORTH CAROLINA

THE PURPOSE OF THIS STUDY WAS TO COMPARE THE FOLLOWING APPROACHES TO
TEACHING FIRST GRADE READING (1) A TRADITIONAL BASAL READER, (2)
BASAL READER PLUS INTENSIVE PHONICS INSTRUCTION, AND (3) THE LATTER
TWO METHODS PLUS SENSORY EXPERIENCES. THESE THREE APPROACHES WERE
TRIED FOR 140 SCHOOL DAYS (1 YEAR), USING 28 FIRST-GRADE CLASSES.
THEY WERE EXAMINED FROM THE STANDPOINTS OF PUPIL ACHIEVEMENT ON THE
WHOLE AND ACHIEVEMENT WITHIN CERTAIN GROUPS OF CHILDREN. AMONG THE
GROUPS CONSIDERED WERE BOYS VERSUS GIRLS, NEGROES VERSUS WHITES, AND
REPEATERS VERSUS NONREPEATERS. ALSO CONSIDERED WERE FACTORS OF
GENERAL MATURITY AND LEVEL OF HOME ENVIRONMENT. READINESS TESTS, AN
INTELLIGENCE TEST, ACHIEVEMENT TESTS, AND NONTEST DATA WERE USED TO
OBTAIN THE PROJECT RESULTS. THESE RESULTS SHOWED THAT NO ONE OF
THESE THREE APPROACHES WAS CONSISTENTLY SUPERIOR TO THE OTHER TWO IN
ALL AREAS OF ACHIEVEMENT CONSIDERED. CERTAIN TEST SUBSCORES,
HOWEVER, DID INDICATE SUPERIORITY OF THE SENSORY EXPERIENCES
APPROACH. WHERE THE DIFFERENCES WERE NOT SIGNIFICANT, THE DIFFERENCE
WAS STILL IN FAVOR OF THIS APPROACH IN ALL INSTANCES. THE BASAL
READER APPROACH WAS SECOND BEST FOR NEGRO SUBJECTS. FOR WHITE
SUBJECTS, THERE WAS NO DIFFERENCE BETWEEN THE BASAL READER AND
PHONICS APPROACHES. FOR REASONS OF UNCONTROLLED VARIABLES,
COMPARISONS OF TOTAL BOYS VERSUS TOTAL GIRLS COULD NOT BE MADE. IT
WAS SUGGESTED THAT IF THE STUDY WERE DUPLICATED WITH DIFFERENT
CHILDREN AND TEACHERS, HOWEVER, QUITE DIFFERENT RESULTS MIGHT BE
OBTAINED. (JH)

AN EVALUATION OF THREE APPROACHES

TO TEACHING READING IN FIRST GRADE

ACKNOWLEDGEMENTS

Special acknowledgement and gratitude is owed to Dr. Annie
Lee Jones, Associate Professor in the School of Education,
University of North Carolina, for her services as consultant to
the project and her valuable assistance in conducting workshops
with teachers who participated in the project. It is with deep

gratitude that we acknowledge her personal contribution, to the
planning and implementation of this project. We are also indebted
to Dr. Roy E. Sommerfeld and Dr. Kinnard White, of the School of
Education, University of North Carolina, for their assistance in
interpretation of the statistical data of the project.

Grateful appreciation is also expressed to the administrators,
supervisors, teachers, and other personnel of the Goldsboro City
Schools who had a part in this project. Their enthusiasm, and
flexibility, and knowledge were essential ingredients in the
planning and execution of this project.

The assistance of the clerical staff of the Superintendent's
Office of the Goldsboro City Schools is gratefully appreciated.
Special thanks are due to Mrs. Ruby S. Dortch, Secretary for the
project, for her excellent clerical work, and also for her
unfailing loyalty and encouragement.

In conclusion, we express our sincere appreciation to the
North Carolina Department of Public Instruction, Dr. Charles F.
Carroll, Superintendent, and to the Goldsboro City Board of
Education, Mr. William A. Dees, Chairman, for their endorsement
of this project.

CHAPTER 1

ABSTRACT

The major purpose of this study was to compare three approaches to teaching first-grade reading--a traditional basal reader approach (BR), an approach using basal readers plus an intensive phonics approach (P), and an approach using the latter two methods plus sensory experiences (SE). These three approaches were tried for one year (140 school days), with 10 classes using the BR approach, 9 using the P approach, and 9 using the SE approach. Thus, all 28 first-grade classes in the Goldsboro City Schools participated in the project.

Two major questions were posed in the study: (1) Do a majority of the children achieve significantly better under one of these three approaches? (2) Does a particular method work better for certain groups of children than others? Among the groups considered were boys vs. girls; Negroes vs. whites; and repeaters vs. non-repeaters. Also considered were the factors of general maturity and level of home environment.

Readiness tests, an intelligence test, achievement tests, and non-test data were used to obtain answers to the above questions. Also, sub-test scores were analyzed statistically in an effort to determine which factors were more significant.

CHAPTER II

INTRODUCTION

Since American democracy is highly dependent on spoken and written words, one of the major tasks of the elementary school is to help children to develop skill and understanding in the language arts areas. Donald D. Durrell and Alice K. Nicholson, in Development in and through Reading, (N. S. S. E. Yearbook, Part 1, 1961), state:

> "Richness of experience and acquisition of desirable habits are the major concern of early education, and these support and are supported by language abilities, both spoken and written. The interaction between experiences and language is constant. Without suitable experience, language is meaningless; without language, experiences are often unrewarding. In early education, both the program of experiences and the growth of language require planning."

Of the four areas of the language arts--reading, writing, listening, and speaking--reading is the one area on which success in all other curriculum areas is dependent. That is, success in English, mathematics, science, social studies, foreign languages, etc., will depend to a large extent on a student's having developed adequate reading skills.

It is a well-known fact that more research studies have been done in the area of reading than in any other area of the school curriculum. Yet, the value and the validity of a large percentage of these studies are questionable for a number of reasons. For example, many are based on extremely small populations, yet sweeping conclusions are made by the researchers. Also, inadequate

controls were used in a number of studies. In addition to the criticisms with regard to the methodology which can be leveled at much of reading research, there is the problem of conflicting results and conclusions among studies. There are, in addition, problems of comparing results of studies using identical methods, because of different measurement procedures and criteria of growth. Also, even when research results have been conclusive, it is often not practical, in terms of administrative and financial considerations, to "throw-out" the old and institute a new "crash" program. Finally, there is always the consideration that what was successful in one case may not succeed in another.

The present study is a response to all of the above problems. In addition, it is a response to specific problem areas in the Goldsboro City Schools. Levels of reading achievement in the Goldsboro City Schools have not been as high as would be predicted on the basis of intelligence test scores and other indications of capacity for achievement. Also, teachers felt that more sharing of ideas among teachers and more commonality among methods of instruction at a particular grade level would result in higher pupil achievement. It was the opinion of personnel in the Goldsboro City Schools that these problems should first be attacked at the first grade level, with successively higher grades being involved in later research.

This project was thus conceived with the idea of comparing traditional methodology in first-grade reading with approaches which included some new aspects, yet did not represent a complete revolution in method. In other words, approaches were needed which

would be feasible and practical, would involve a minimum of expense
if continued in future years, and would be based on sound principles
of learning. It was decided that all first-grade teachers in the
school system would be involved in the project. The specific
areas of methodology, phonics, and sensory experiences, were
chosen because of teachers' feelings that these areas had not
been sufficiently emphasized. Also, in reading research there
have been conflicting conclusions with regard to the value of
phonics, and a relative neglect of the area of sensory experiences.
No research study could be found which involved the three
approaches used in the present study.

In addition to the purposes of this study as related to local
problems and as a response to the need for further research in
reading, this project is part of a cooperative effort among 27
projects sponsored by the U. S. Office of Education. All of
these projects deal with some aspect of the teaching of first-
grade reading. In order to make comparisons among these 27
projects, a Coordinating Center was established at the University
of Minnesota. Conferences for the project directors were held to
plan common measures of readiness, intelligence, and achievement
to be used and common non-test data to be gathered. Each study
is reported individually. However, studies of the total 27
projects will be made by the University of Minnesota Coordinating
Center.

CHAPTER III

STATEMENT OF PROBLEM

The specific problem under consideration in this study was to evaluate the relative effectiveness of three approaches to teaching reading--a basal reader approach (BR), a basal reader plus an intensive phonics approach (P), and a basal reader plus intensive phonics plus a sensory experience (SE). Considered in this evaluation were the effects of the various approaches on the total subject population and their relative effects on certain sub-populations, using the following variables--race, sex, repeating first grade, home environment, amount of pre-school experience, physical handicaps, chronological age, reading readiness, and intelligence.

Specifically, the following null hypothesis were tested:

1. That observed differences in mean reading achievement for total populations for the three methods--BR, P, and SE--do not differ significantly.

2. That there will be no significant differences in mean reading achievement between:

   a. Boys and girls.

   b. White and Negro subjects.

CHAPTER IV

METHODOLOGY

DESCRIPTION OF THE COMMUNITY POPULATION

Goldsboro has a population of 28,873 people. The average educational achievement, according to the 1960 census, is 9.6 years of school, with 34.9% of the population having completed high school. With an increase in population of 34.6% from 1950 to 1960, due to the reactivation of Seymour Johnson Air Force Base and the migration of workers from the farm to the city, Goldsboro increased its civilian labor force to 4,635. The census divides the labor force into 39.4% white collar occupations, 17.3% employed in manufacturing industries, 35.1% miscellaneous, and 8.2% unemployed. The median family income for the employed population is $3,444.00, with 43.1% of the families making under $3,000.00. This figure represents 1,266 families, with 1,000 of these making less than $2,000.00.

TEACHER CHARACTERISTICS

There were 28 teachers involved in this study. All were female, and all were married with the exception of one in the P approach and two in the SE approach. All teachers but one had at least a batchelor's degree, three had master's degrees, and all held the standard elementary certificate issued by the North Carolina Department of Public Instruction.

DESCRIPTION OF FIRST-GRADE POPULATION

The population for this study included all first graders in the Goldsboro City Schools. Traditionally, first grade children

in the Goldsboro City Schools have been assigned to classes so
that the classes would be as nearly comparable as possible as to
age range, normal range of ability, and socio-economic status
range. However, students were assigned to a school according to
their place of residence, which made it impossible to have exactly
the same range of students in each class, according to the above
characteristics. Due to the cost of transporting children and
the problems with parents which might result from this, it was
decided to continue the present policy of pupil assignment.
Therefore, in the data analysis, there is comparison of total
treatment groups and special sub-populations, but no comparison
of one classroom with another. Within a school, teachers were
randomly assigned to classes, so as to compensate, insofar as
possible, for the fact that children were not randomly assigned
to classes.

There was a total experimental population of 751 children in 28
classrooms in the study at the beginning of the experimental period.
This does not include a number of children who were enrolled after
the beginning of school or who had missed parts of the readiness
tests. Class size ranged from 26 to 38 pupils, with an average
class size of 30 pupils. Table 1 shows the number of classes per
school and the teaching method used in each class. From this
table, it will be observed that there were 10 classes in the BR
approach, 9 in the P approach, and 9 in the SR approach. Of the 10
classes in the BR approach, 5 were white and 5 were Negro, and in
the other two approaches, 5 classes were white and 4 were Negro.
There were 385 white students and 366 Negro students in the project.

TABLE I

NUMBER OF FIRST-GRADE CLASSROOMS PER SCHOOL

AND METHOD OF INSTRUCTION USED IN EACH CLASSROOM

School	Total Number of Classes	Number of Classes per Method
A	7	2 BR
		2 P
		3 SE
B	6	2 BR
		2 P
		2 SE
C	4	2 BR
		1 P
		1 SE
D, E, F	3 (Per School)	1 BR (Per School)
		1 P (Per School)
		1 SE (Per School)
G	2	1 BR
		1 P

FINAL SAMPLE POPULATION

Two criteria were the major determinants in the selection of the final population for statistical analysis of data:

1. Only subjects who completed all of the tests were included in the final population.

2. Only subjects for whom complete non-test data was available were included in the final population.

However, the actual experimental population varied, depending on the statistical analysis being done. The reason for this was that in cases where there were gaps in data, if there were no gaps in the variables being considered in a particular analysis, that subject was included in the analysis.

The final total population was 681, with 334 white and 347 Negro subjects. In the statistical tables, the actual population for that particular analysis is indicated. Also final population breakdowns by sex, treatment, etc., will be found in the tables.

SCHOOL CHARACTERISTICS

The seven schools in this study are well-equipped with instructional materials, audio-visual equipment, books, etc. Each school has its own library, and services of a librarian. The average per pupil cost of public school education was between $300.00 and $400.00

The length of the school year was 180 days, and the length of the school day was 6 hours. The amount of time per day devoted to language arts instruction in all first grade classrooms was approximately 3 hours, as recommended by the North Carolina Department of Public Instruction. It was impossible to state

actual time per day spent on reading activities, since reading
is so interwoven with other language arts areas. However,
through classroom visits and study of the teachers' daily
schedules, the project director felt that comparable amounts of
time per day were spent on reading and related activities in all
classrooms.

Of the 180 school days, 140 days were considered as the
experimental period. This excluded 20 days at the beginning of
the school year, and 20 at the end. Readiness tests were given
prior to the beginning of the experimental period and achievement
tests immediately following this period.

PLANNING AND SUPERVISION

Prior to the opening of school, a three-day workshop was held
for all teachers in the project, and the principals of the schools
involved. The staff for the workshop consisted of the superintendent
of the Goldsboro City Schools, the project director, a consultant
from the School of Education at the University of North Carolina
at Chapel Hill, and a representative from the Scott-Foresman
Company. The purpose of the workshop was to familiarize teachers
with the project, to assign instructional methods to teachers, and
then to orient teachers to the particular method of instruction
which they would be using, and to work out any final problems with
regard to the carrying-out and implementation of the project.

During the school year, meetings of all teachers were held
about once a month. Also, throughout the year, meetings of teachers
of each experimental group were held.

The project director visited each classroom in the project on an average of three times during the experimental period, for the purpose of observing the reading instruction.

The director made herself available throughout the project to the teachers and school principals for individual conferences with regard to instructional procedures, gathering of statistical data, meeting individual differences, etc.

CLASSROOM METHODOLOGY

The first grade classes were assigned to experimental methods according to the plan in Table 1. Teachers within a school chose the method they would teach, from the three methods.

The North Carolina basal texts--The Scott-Foresman series-- were all used in all classes. This basal reading program provides for a sequential development in reading, with reading skills and interests built continuously, from one level to the next.

The teachers, in planning their work, used the basal text guidebooks' suggestions, which develop and present lesson plans based on what is known about the learning processes of children and which follow the following sequence:

1. Preparing for reading--reading readiness.

2. Interpreting the stories.

3. Extending skills in reading.

4. Extending interests in reading.

For each teaching method, the following general plans were used:

BR Approach:

The Scott-Foresman texts, designed for first-grade pupils and

traditionally used supplementary materials were used to teach reading in the ten classes which made up this group. Students were taught using the plans, methods, and materials, which had previously been used in all first grade classrooms. This group was considered as the control group.

P Approach:

The basal text program plus an intensive phonics program in reading activities was used in addition to and correlated with the basal text, in this group. The phonics program used was the Murphy-Durrell Speech-to-Print materials. Orientation of teachers to this program placed emphasis on the following concepts, suggested and advocated by researchers in the area of phonics:

1. Phonics is only one of several good methods of teaching word recognition.

2. A program of phonics is essential to the total program of reading instruction.

3. As in other reading activities, readiness for phonics must be established.

4. Teachers should use a systematic approach to phonics.

SE Approach:

In this group, the basal text program used in the BR and P approaches, plus the Murphy-Durrell phonics program used in the P approach, were used. In addition, a "sensory experience" approach was used, in which the teacher supplemented her reading program with many aural, oral, and visual teaching aids, materials, etc., which appealed to the various senses.

The reading program for this group was further supplemented
by the use of audio-visual materials and equipment--tape
recordings, filmstrips, movies, records, supplementary
library books, games, etc.

TESTS ADMINISTERED [*]

All tests were administered by members of a specially trained
testing team, under the supervision of the school psychologist.
The testing program to be followed was developed by the 27 directors
of the cooperative projects, at a meeting in Minneapolis in
June, 1964.

The following tests were administered to all students at the
end of the 20-day pre-experimental period:

Readiness--

> Murphy-Durrell Diagnostic Reading Readiness Test
>
> Metropolitan Readiness Test, Form A
>
> Thurstone Pattern Copying Test
>
> Thurstone Identical Forms Test

Intelligence--

> Pintner-Cunningham Primary Test

The Murphy-Durrell, Metropolitan, and Thurstone readiness
tests were all 1964 editions. Thus, there is no discussion of
them in Buros' Mental Measurements Yearbook, of which the latest
edition was published in 1960. However, the project directors
felt that a single measure of readiness would not tap all areas
that were important. Thus, it was agreed to use a composite of
measures, in the hope of obtaining a more complete assessment of
readiness.

The Pintner-Cunningham Primary Test, 1964 revision, was used as the measure of intelligence. Harcourt, Brace, and World revised the norms for this test in 1965. However, scores had to be reported to the University of Minnesota before the new norms were received. Therefore, raw score data, rather than I. Q., was used in the data analysis.

During the experimental period, the Scott-Foresman Basic Reading Tests for The Three Pre-Primers, Fun with Our Friends, and More Fun with Our Friends. (These tests were not used in the other projects.) In accordance with the suggestions in the manuals for administering these tests, they were to be administered to each group of students within a class upon completion by that group of the book for which the test was designed. These tests were teacher-administered. There was some misunderstanding as to when these tests were to be administered, on the part of teachers, and in many cases they were not administered upon the students' completion of a book. Therefore, the results of these tests are not included in the analysis of data.

At the end of the experimental period, the following subtests of the Stanford Achievement Test, Primary I Level, Form X were administered to all first-graders:

> Word Reading
>
> Paragraph Meaning
>
> Vocabulary
>
> Spelling
>
> Word Study Skills

---

* A list of tests and test publishers appears in Appendix A.

Since there was no recommendation in the test manual for
estimating a single composite socre on reading achievement, the
subtest scores were considered separately in the final data
analysis.

A number of other tests were administered as part of the
cooperative aspect of the research. However, they did not relate
specifically to this study, and thus are not included in the data
analysis. However, these test were administered according to the
cooperative testing schedule, and data was retained on them. It
is anticipated that this data will be studied in the near future.
Thus brief mention of the measures is made here. The San Diego
Teacher Inventory of Approaches to Reading was administered to all
teachers in the study, prior to the beginning of school, in the
summer of 1964. The San Diego Reading Attitude Inventory was
administered to all children in the study, during the experimental
period. It was administered by the classroom teacher in each
classroom at a time when reading instruction would not be taking
place. A series of tests was administered individually to a
stratified random sample of 20 boys and 20 girls in each treatment
group (a total of 120), at the end of the experimental period.
These tests were: (1) the Gates Word Pronunciation Test, (2) the
Fry Oral Test of Phonetically Regular Words, (3) the Gilmore Oral
Reading Test, (4) the Karlsen Phonemic Word Test. This testing
was completed within seven days after the end of the experimental
period. One member of the testing team administered all of the
Gilmore tests, and the other members administered the other three
tests. Also, at the end of the experimental period, two writing

samples were obtained from all pupils in the study. The directions
for obtaining these samples were obtained from a sub-committee of
the project directors. This measure was administered by the
classroom teachers. The writing samples for the sample population
described above were sent to the University of Minnesota
Coordination Center for analysis.

The scoring of all tests administered for this study was done
by members of the project staff. Each test was scored by one
staff member and rechecked by another staff member, with the
exception of the Thurston Pattern Copying Test, which was scored
by the project director.

NON-TEST DATA

As much non-test data as possible was obtained on each
teacher and each child in this study. It was not anticipated
that all of this data could be used, or would even be of value,
in answering the questions posed in this particular study.
However, it was felt that some of it might be of value in follow-
up studies and as material for future use by teachers in the
guidance and counseling of individual students and in planning
instruction to meet individual needs. A summary of all data
obtained will be found in Appendix C.

RECORDING OF DATA

All data gathered throughout this study, on teachers and
children, was coded according to instructions from the University
of Minnesota Coordination Center (See Appendix C) and recorded on
data sheets. I. B. M. cards were made from these sheets, and were
computer-analyzed at the University of Minnesota. Results of these
analyses are reported throughout the remainder of this project.

CHAPTER V

ANALYSIS OF DATA .

The statistical analyses were performed by computer according to the University of Minnesota version of MANOVA. Multivariate analysis of variance, using a general linear hypothesis model, was the major statistical procedure used in this study.

A two-way analysis of variance (ANOVA)-sex x race-of pre-measures and Pintner raw score I. Q. was run. The variables were as follows:

1. Murphy-Durrell Identification of Phonemes - (rights minus wrongs)

2. Murphy-Durrell Capital Letter Names - (number correct)

3. Murphy-Durrell Lower Case Letter Names - (number correct)

4. Murphy-Durrell Total Capital and Lower Case Letters - (number correct)

5. Murphy-Durrell Learning Rate - (number correct)

6. Thurstone Pattern Copying - (number correct)

7. Thurstone Identical Forms - (number correct)

8. Metropolitan Word Meaning - (number correct)

9. Metropolitan Listening - (number correct)

10. Metropolitan Matching - (number correct)

11. Metropolitan Number - (number correct)

12. Metropolitan Copying - (number correct)

13. Metropolitan Alphabet - (number correct)

14. Metropolitan Total - (number correct)

_ 15. Pintner Raw Score I. Q.

Also included in this analysis were:

16. Repeater status

17. Maturity index

18. Home environment

F-ratios for the variables considered are found in Table 2.
The large race differences and the sex differences indicated that
both race and sex should be blocked, and this procedure was
generally followed for the remainder of the analyses.

The correlation matrices for the eighteen variables listed
above are presented in Table 3 (White Males), Table 4 (White
Females), Table 5 (Negro Males), and Table 6 (Negro Females).
These matrices indicate non-significant correlations between
Repeater Status (Variable 16) and all other variables for all
subjects. They show fairly high correlations between I. Q. and
the other variables. A number of very high intercorrelations on
the Murphy-Durrell subtests were found. A pooled correlation of
all subjects was made. However, since the four groups were rather
dissimilar, it was decided that more information could be gained
from the separate matrices.

A four-way analysis of variance--treatment x repeater x sex
x race--of pre-measures, achievement measures, and I. Q. was run.
The variables were as follows:

1. Murphy-Durrell Identification of Phonemes

2. Murphy-Durrell Total Capital and Lower Case Letters

3. Murphy-Durrell Learning Rate

4. Thurstone Pattern Copying

TABLE 2

F-RATIOS FOR PRE-MEASURES, I. Q., REPEATER-STATUS,
MATURITY INDEX, AND HOME ENVIRONMENT

Variable	Sex	Rar	Sex x Race
M-D Phonemes	.3567	199.2761	.1268

Home Environment	.2189	26.1172**	.3559

* These differences are significant at the .05 level.
** These differences are significant at the .01 level.

5. Thurstone Identical Forms

6. Metropolitan Word Meaning

7. Metropolitan Listening

8. Metropolitan Matching

9. Metropolitan Numbers

10. Metropolitan Copying

11. Metropolitan Total

12. Stanford Word Reading

13. Stanford Paragraph Meaning

14. Stanford Vocabulary

15. Stanford Spelling

16. Stanford Word Study Skills

17. I. Q.

There were a number of significant F-ratios at the .01 level. These were as follows:

1. Treatment effect - Variables 12, 14, and 15

2. Repeater effect - Variables 6, 12, 13, 14, 15, 16, and 17

3. Sex effect - All Variables

4. Race effect - All Variables

5. Treatment x Repeater - Variable 14

6. Treatment x Sex - None

7. Treatment x Race - Variables 4, 5, 12, and 15

8. Repeater x Sex - None

9. Repeater x Race - Significant over-all, but no specific variables

10. Sex x Race - None

11. Treatment x Repeater x Sex - Variable 1

12. Treatment x Repeater x Race - None

13. Treatment x Sex x Race - None

TABLE 3

CORRELATION MATRIX FOR WHITE MALES FOR THE READINESS VARIABLES, I. Q., REPEATER, MATURITY, AND HOME ENVIRONMENT

14. Repeater x Sex x Race - None

15. Treatment x Repeater x Sex x Race - None

Because of the above interactions, which have been described, especially on the pre-measures, the above analysis could not be interpreted.

The analyses which were used in the final interpretations of data were as follows:

1. Whites only--2-way analysis of variance (Sex x Treatment) for pre-measures and post-measures separately.

2. Negroes only--2-way analysis of variance (Sex x Treatment) for pre-measures and post-measures separately.

Table 7 gives the F-ratios for the 2-way analysis of variance for white subjects on the Murphy-Durrell Readiness Test. Table 8 gives the same information for the Thurstone Tests, and Table 9 for the Metropolitan Test. Tables 10, 11, and 12 give the same information for Negro subjects.

Because of the significant F-ratios on certain readiness measures, which were different for Negro and white subjects, co-variance was used in the 2-way analysis of variance for post-measures. For white subjects, the co-variance involved Variables 4 (Thurstone Pattern Copying) and 5 (Thurstone Identical Forms). It will be noted from Tables 7, 8, and 9 that these were only pre-measure variables with significant F-ratios. For Negro subjects, the co-variance involved Variables 1 (Murphy-Durrell Identification of Phonemes), 6 (Metropolitan Word Meaning), 8 (Metropolitan Matching), 9 (Metropolitan Numbers), and 11 (Metropolitan Total). It will be noted from Tables 10, 11, and 12

*Significant at .01 level.
**Significant at .05 level.

that these were the pre-measure variables with significant F-ratios.

Table 13 gives the F-ratios for the 2-way analysis of variance for white and for Negro subjects on the post-measures (Stanford Achievement Test--subtest scores). For white subjects, treatment differences significant at the .01 level of confidence were found on Word Reading, Vocabulary, Spelling, and Word Study Skills, but not on Paragraph Meaning, although this was significant at the .05 level. For Negro subjects, treatment differences significant at the .01 level of confidence were found on Word Reading, Paragraph Meaning, Vocabulary, and Spelling, but not on Word Study Skills at either the .01 or .05 level.

Since significant F-ratios were found for the three methods of instruction (or treatments)--BR approach, P approach, and SE approach--t-tests were run. This was done to determine where the significant differences between means occurred. Table 14 gives the mean and variance for each method of instruction. The scores are given separately for Negro and white subjects, and for male and female subjects. Table 15 gives the significant t-scores for the BR and P approaches, the P and SE approaches, and the BR and SE approaches.

Table 16 shows the mean raw scores and the equivalent grade score conversions (from the test booklets) for each subtest of the Stanford Achievement Test. This table was included simply to present a general notion of the grade levels at which children in the different methods were achieving at the end of the year. However, since grade scores do not relate on a one-to-one basis to raw scores, it is entirely possible that, had grade scores been used throughout this analysis, the results would have been different.

TABLE 13

Word Study Skills												
BR	30.44	30.00	30.19	1.5	1.5	1.5	32.33	34.26	33.46	1.7	1.6	1.7
P	26.55	29.23	27.93	1.4	1.5	1.5	33.74	33.34	33.57	1.8	1.7	1.8
SE	27.55	29.06	28.30	1.5	1.5	1.5	36.05	38.26	37.43	1.9	2.0	1.9

However, the use of grade scores would have resulted in an inaccurate picture. Therefore, this table is not an "official" one, with regard to interpretation of results, but merely to show what the raw scores actually mean, in terms of level of reading achievement.

CHAPTER VI

RESULTS

As stated in Chapter III, the purpose of this study was to evaluate the effectiveness of three approaches to teaching reading in first grade-a basal reader approach (BR), a basal reader plus an intensive phonics approach (P), and a basal reader plus intensive phonics plus a sensory experience approach (SE).

Because of the data analysis problems (discussed in Chapter V), it was not possible to test the hypotheses as stated. This was due to two major causes. First, the large interactions of sex and race and the large race differences rendered a number of MANOVA analyses uninterpretable. Secondly, significant F-ratios for treatment (method of instruction) on a number of the readiness measures were not controlled by co-variance in a number of the MANOVA analyses. Therefore, these analyses could not be used. The analyses discussed in Chapter V were the only ones which could be used in the final data interpretation. These analyses, which were done for Negroes and whites separately, because of significant differences, could not be combined to obtain F-ratios for total population. For reasons stated above, comparisons of total boys vs. total girls could not be made.

The following findings are based on the information of Tables 14 and 15. Although they may not unequivocally confirm or disprove the hypotheses stated in Chapter III, they do give some bases on which to reject these hypotheses. (The findings are based on the t-scores which were significant at the .01 level of confidence.)

The findings are as follows:

1. There were no significant differences between Approaches BR and P for white boys, white girls, or total white population.

2. There were significant differences between Approaches BR and P for total Negro population on Word Reading and Paragraph Meaning, and for Negro boys, Negro girls, and total Negro population on Spelling. These differences all favored Approach BR.

3. There were significant differences for white boys on Vocabulary and Word Study Skills, for white girls on Spelling and Word Study Skills, and for total white population on Word Reading, Vocabulary, and Word Study Skills, between Approaches P and SE. These differences all favored Approach SE.

4. There were significant differences for Negro boys on Word Reading, Paragraph Meaning, and Vocabulary; for Negro girls on Word Reading, Paragraph Meaning, Vocabulary, and Spelling, between Approaches P and SE. These differences all favored Approach SE.

5. There were significant differences for white boys, white girls, and total white population on Word Reading and Word Study Skills; for white boys and total white population on Vocabulary; and for white girls and total white population on Spelling, between Approaches BR and SE.

6. There were significant differences for total Negro population on Word Reading and for Negro boys, Negro girls, and total Negro population on Vocabulary, between Approaches BR and SE. These differences all favored Approach SE.

CHAPTER VII

CONCLUSIONS AND SUMMARY

From the results presented in the preceding chapter, it can be seen that no one of the three approaches was consistently superior to the other two, in all areas of achievement. However, significant differences were found in a sufficient number of areas to justify drawing some conclusions as to the relative merits of the different approaches.

However, there were some problems in this study, which plague most research on methods of instruction. Because of these problems, the results may be only artifacts of the particular situation in which they occurred. Among these problems is the teacher variable. In this study, every attempt was made to keep teachers informed as to the particulars of the approach to instruction which they were following. However, it was an impossibility to insure that all teachers in a particular approach were following the same procedures. This was done, insofar as possible, but this variable could not be completely controlled. Also, although it was ascertained that the populations for the three approaches were not significantly different on mean chronological age, mean I. Q., and mean level of home environment, and although Negroes and whites, and boys and girls were considered separately, and readiness differences were controlled for, still, all variables could not be controlled. Thus, it is possible that, in addition to differences in methodology, some other variable was operating, which contributed to the differences in results for the three approaches.

The following conclusions are made with the full realization that, if this study were replicated, insofar as this would be possible, with different children and different teachers in a different school system, quite different results might be obtained. Thus, the following conclusions would seem valid for first grade children in the Goldsboro City Schools, but may not prove valid for other school systems.

First, the sensory experience approach appears most effective of the three methods, for Negroes and whites, and for boys and girls. (It is assumed that, since this approach was best for Negroes and whites separately, it would be best for these two groups as a whole, although this could not be tested statistically.) The basal reader approach was second best for Negro subjects--both boys and girls, with the phonics approach being least effective. For white subjects, there was no difference between the basal reader and phonics approaches. Although all of the subtests did not show significant differences, there were a sufficient number to indicate superiority of one approach. Also, where the differences were not significant, the difference was still in favor of the sensory experience approach, in all instances.

In conclusion, it is quite possible that this study has really proved nothing new. At least token acceptance has been given for a long time to the theory that the more varied experiences a child has, the more he will learn. In reading, an approach which depends mainly on a "sight method", as did the basal reader approach in this study, or on a method combining the "sight method" with phonics alone, as did the phonics approach in this study, will not reach all children,

either. However, this study at least indicated that it does seem more beneficial than either of the other two approaches.

It is hoped that further research can be done, which will test the effectiveness of these approaches with certain subpopulations. This was the intent of this study, but the problems of data analysis, which were not discovered in time for re-analysis for inclusion in this report, prevented this. It is not the intent of the researchers to imply in this study that the sensory experience approach is best for all children, but rather that further study should be done to determine the types of children who would profit most from each of the three approaches described above.

APPENDIX A

TESTS AND TEST PUBLISHERS

TESTS AND PUBLISHERS

Intelligence Test

1. Pintner Cunningham Primary Test, Form A (General Ability Tests Revised).
   Harcourt, Brace, and World, Inc., New York, N. Y.

Readiness Tests

1. Metropolitan Readiness Test
   Harcourt, Brace, and World, Inc., New York, N. Y.

2. Murphy-Durrell Diagnostic Reading Readiness Test
   Harcourt, Brace, and World, Inc., New York, N. Y.

3. Thurstone Primary Mental Abilities Test (Pattern Copying and Identical Forms subtests).
   Harcourt, Brace, and World, Inc., New York, N. Y.

Reading Achievement

1. Stanford Achievement Test, Primary I Level, Form X
   Harcourt, Brace, and World, Inc., New York, N. Y.

Other tests, which were part of the Cooperative Study, but not a part of the data analysis of this study: (These were administered only to a small sample of students.)

2. Gates Word Pronunciation Test
   Designed for Office of Education studies.

3. Gilmore Oral Reading Test, Form A
   Harcourt, Brace, and World, Inc., New York, N. Y.

4. Karlsen Phonemic Word Test
   Designed for Office of Education studies.

5. Phonetically Regular Words Oral Reading Test
   Designed for Office of Education studies.

A number of other measures were given as part of the Cooperative Study. However, since these were not used specifically in this study, they are not included here. A complete list of these tests may be obtained from Dr. Robert Dykstra, College of Education, Department of Elementary Education, University of Minnesota, Minneapolis, Minnesota.

APPENDIX B

<u>SCOTT-FORESMAN BASAL READER PROGRAM</u>

SCOTT-FORESMAN BASAL READER PROGRAM

A. The readiness books

1. We Read Pictures

2. We Read More Pictures

3. Before We Read

B. Beginning reading--the pre-primers

1. Sally, Dick, and Jane

2. Fun with Our Family

3. Fun Wherever We Are

Supplementary materials

1. Think-and-Do Book--a workbook

2. Guess Who (Used only with those children who, after studying the above books, were not yet ready for the primer.)

C. Primer

1. Fun with Our Friends

D. First Reader

1. More Fun with Our Friends

E. Other Materials

1. Book--Time for Poetry (for teacher's use)

2. My Little Pictionary (a picture dictionary for first grade)

3. Big Book and Card Holder (for teacher's use)

APPENDIX C

DATA CARD CODES

I. INITIAL DATA

Column

1-2   Project Identification Number (See list of Directors below)

01 Elizabeth Anne Bordeaux, Goldsboro, N. C. (City Schools)
02 Jeane S. Chall, City University of New York
03 Donald L. Cleland, University of Pittsburgh
04 Edward Fry, Rutgers - The State University N. J.
05 Harry T. Hahn, Oakland Schools, Pontiac, Michigan
06 Albert J. Harris, City University of New York
07 Robert B. Hayes, Department of Public Instruction, Harrisburg, Pa.
08 Arthur W. Heilman, Pennsylvania State University
09 Thomas D. Horn, University of Texas
10 William M. Kendrick, San Diego County Department of Education
11 James B. Macdonald, University of Wisconsin
12 John G. Manning, Fresno State College
13 Sister M. Marita, Marquette University
14 Albert J. Mazurkiewicz, Lehigh University
15 Roy McCanne, Consultant, Colorado State Department of Education
16 Katherine A. Morrill, Moses Y. Leach School, Wallingford, Conn.
17 Helen A. Murphy, Boston University
18 Olive S. Niles, Springfield, Massachusetts Public Schools
19 Hale C. Reid, Cedar Rapids, Iowa Public Schools
20 Robert B. Ruddell, University of California
21 J. Wesley Schneyer, University of Pennsylvania
22 William D. Sheldon, Syracuse University
23 George D. Spache, University of Florida
24 Doris U. Spencer, Johnson State College, Vermont
25 Russell G. Stauffer, University of Delaware
26 Harold J. Tanyzer, Hofstra University
27 Nita M. Wyatt, University of Kansas

3-4   School number (within each project)
        Directions: Please assign each building a two-digit number, keep
        a copy of this list with the assigned numbers and send a copy to
        Minneapolis.

5   Classroom number (within each building in each project)
        Directions: Please assign each classroom within each school used
        in the project a one-digit number, keep a copy of this list and
        send a copy to Minneapolis.

6-7   Pupil Identification Number (within each classroom)
        Directions: Please assign, within each classroom, a two-digit
        number to each child, make a list of the names with the
        assigned identification numbers, send one copy of this list to
        Minneapolis and retain copies for reference during the progress
        of your study.

Column

8   Sex of Child: Punch 1 for boys; punch 2 for girls

9-10 Child's chronological age in months (nearest month)
    Punch 99 for all children 8 years 3 months and older.

11-12-13 Mental age in months (Pintner Cunningham Test)

14   Child's Ethnic Class according to code below. (Please notify
    Minneapolis immediately if any of the codes do not provide
    sufficient basis for classifying pupils into mutually exclusive
    categories for each field-of-column.

    X Information unavailable

    1 White (exclusive of #2) - (Projects using code 1 will not
      use categories 7, 8, 9, or 0)
    2 Mexican (including Spanish and Cubans)
    3 Indian (American) or Eskimo
    4 Negro (exclusive of Puerto Ricans)
    5 Puerto Ricans
    6 Chinese, Japanese, Filipino, and Hawaiian - other Polynesian
    7 These and zero may be assigned to sub-classes of whites
    8 which are important for individual projects - Please inform
    9 the Minneapolis office immediately if you wish to use such
      a supplementary sub-class so that other project directors
      can be informed and asked to use other code numbers.

15   Amount of pre-first-grade-school experience
    0 No kindergarten, pre-school or vacation bible school experience.
    1 less than 20 half-days total of such experience but some.
    2 21 half-days to 100 half-days total pre-first grade school.
    3 101 half-days to 200 half-days total pre-first grade school.
    4 201 half-days to 300 half-days total pre-first grade school.
    5 301 half-days to 400 half-days total pre-first grade school.
    6 401 half-days to 500 half-days total pre-first grade school.
    7 501 half-days to 600 half-days total pre-first grade school.
    8 601 half-days to 700 half-days total pre-first grade school.
    9 701 half-days to 800 half-days total pre-first grade school.

16-17 Durrell-Murphy Identification of Phonemes Right minus Wrongs.

18-19 Durrell-Murphy Capital Letter Names - number correct.

20-21 Durrell-Murphy Lower case letter names - number correct.

22-23 Durrell-Murphy Total capital and lower case letters - number correct.

24-25 Durrell-Murphy Learning rate - number of words learned.

26-27 Thurstone-Pattern copying - number correct.

28-29 Thurstone - Identical forms - number correct.

30-31 Metropolitan - word meaning - number right.

Column

32-33   Metropolitan - listening - number right.

Note: (Columns 34-57 may be gang punched for all children in any teacher's room)

X Information unavailable

  <u>Teacher Rating</u>

41 Class Structure
  1 Teacher structures for the children---gives detailed clear directions, and expectations are clearly spelled out in detail.

Column

2 Teacher is generally well organized and clear in assigning tasks---directions and expectations clear, but not spelled out as above.
3 There is a moderate degree of structure, and information on expectations. Some degree of vagueness.
4 There is generally more vagueness than clarity, and more looseness than structure.
5 Teacher is generally vague and directions seem confusing to the children.

42 Extent of Class Participation
1 High participation on part of most children at all times.
2 Moderately high participation on part of most children, most of the time but with some variability.
3 Teacher has a group of children who are participating well most of the time, but a fairly large group who are not consistently with the teacher.
4 Participation is highly variable, but tends to be low quite often.
5 Class is generally unresponsive with only a very few children actually participating.

43 Awareness of and Attention Paid to Individual Needs of Pupils
1 Teacher exceptionally aware of pupil needs with effective adjustment of instruction in light of these needs.
2 Teacher is generally aware of pupil needs and attempts to make the necessary instructional adjustments in light of these needs.
3 There is moderate awareness and adjustment of instruction by the teacher based upon the needs of individual pupils in the class.
4 Limited awareness of and attention paid to individual needs of pupils.
5 Total lack of awareness on the part of the teacher to the individual instructional needs of the pupils.

44 Overall Teacher Competence
1 Excellent
2 Good
3 Adequate
4 Poor
5 Incompetent

45-46 Pintner-Cunningham Primary Test - raw score

Writing Sample - Restricted Stimulus Measure
