ABSTRACT

A four-year federally funded project created this resource guide and interactive multimedia computer software program that are designed to increase knowledge and skills about assistive technology for people with disabilities. Project ASTECH targets special educators, related service personnel, and others who need to learn about assistive technology. The specific areas of assistive technology included in the software are computer access, augmentative communication, and environmental control. Individuals can learn about these areas within three main modules. The first module, Exploring the Possibilities, gives an overview of these three areas by discussing the characteristics and categories of devices, by showing representative devices, and by illustrating examples of students using the devices. The second module, Assessment and Application, takes the learner through the assessment process by first giving general information about assessment. Then the module provides specific information about the aspects of motor, sensory, and cognitive performance that may affect technology support decisions. Through guided applications and student applications, learners can apply information they have learned about assessment with specific case studies. The final module, Installation, Programming, and Troubleshooting, gives general information and then applies it to representative devices. The printed 3-ring binder resource guide supplements information presented in the software program. (CR)

OVERVIEW OF PROJECT ASTECH: ASSISTIVE TECHNOLOGY TRAINING THROUGH MULTIMEDIA

The Occupational Therapy Education Department in the School of Allied Health at the University of Kansas Medical Center had a four-year federal grant (#HO29K20160) funded by the Department of Education. The purpose of Project ASTECH was to create an interactive, multimedia computer software program and resource guide that would increase knowledge and skills about assistive technology. Project ASTECH targets special educators, related service personnel, and others who need to learn about assistive technology. The specific areas of assistive technology included in the software are computer access, augmentative communication, and environmental control. Individuals can learn about these areas within our three main modules (Exploring the Possibilities; Assessment and Application; and Installation, Programming and Troubleshooting).

Exploring the Possibilities gives an overview of these three areas by discussing the characteristics and categories of devices, by showing representative devices, and by illustrating students using devices. The **Assessment and Application** module takes the learner through the assessment process by first giving general information about assessment. Then the module provides specific information about the aspects of motor, sensory, and cognitive performance that may affect technology support decisions. Through guided applications and student applications, learners can apply information they have learned about assessment with specific case studies. The applications also discuss the contextual issues surrounding the students' successful use of assistive technology. The **Installation, Programming, and Troubleshooting** module gives general information and then applies it to representative devices.

This printed Resource Guide supplements information presented in the software program. It is in a 3-ring binder to allow you to include additional information that you find useful.

LEGISLATION

Federal legislation has an impact on the provision of assistive technology devices and services to students. Therefore, professionals providing assistive technology services to students need to be familiar with these laws. This section gives you information about these laws and their implementation. We have also included information focusing specifically on IDEA. However, IDEA is under legislative revision, so you may want to add that information to your Resource Guide as it becomes available.

There are many issues surrounding the school's responsibilities in providing assistive technology services and devices. We have included several handouts that address these issues.

	Part H (ages 0-3) <ul style="list-style-type: none"> developmental delay (State defined), or physical or mental condition with high probability of developmental delay 	Early Intervention - "assistive technology devices and services"	Payor of last resort
Title I - Vocational Rehabilitation Services of the Rehabilitation Act Funding (federal and state)	<ul style="list-style-type: none"> physical or mental impairment causing employment impediment, and benefit (employment outcome) from VR services, and requires VR services for employment 	Employment - "rehabilitation technology, assistive technology devices and services, rehabilitation engineering"	Personal preference vs. availability and cost Necessary for employment
Medicaid/Medicare/Bureau Funding (federal and state)	<ul style="list-style-type: none"> financial income standards 	Health Care - "durable medical equipment, prosthetics, orthotics"	Medical necessity Acute care vs. long term Independence vs. care

INDIVIDUALS WITH DISABILITIES EDUCATION ACT AND ASSISTIVE TECHNOLOGY

The Individuals with Disabilities Education Act of 1990 (IDEA), the reauthorization of Public Law 94-142 the Education for All Handicapped Children Act (EHA), specifically addresses the provision of assistive technology devices and services. The IDEA regulations, issued September 29, 1992, include the following references to assistive technology devices and services:

300.5 Assistive technology device

As used in this part, assistive technology device means any item, piece of equipment or product system, whether acquired commercially off the shelf, modified or customized, that is used to increase, maintain, or improve the functional capabilities of children with disabilities.

300.6 Assistive technology service

As used in this part, assistive technology service means any service that directly assists a child with a disability in the selection, acquisition, or use of an assistive technology device. The term includes:

- (a) The evaluation of the needs of a child with a disability, including a functional evaluation of the child in the child's customary environment;
- (b) Purchasing, leasing, or otherwise providing for the acquisition of assistive technology devices by children with disabilities;
- (c) Selecting, designing, fitting, customizing, adapting, applying, retaining, repairing, or replacing of assistive technology devices;
- (d) Coordinating and using other therapies, interventions, or services the assistive technology devices, such as those associated with existing education and rehabilitation plans and programs;
- (e) Training or technical assistance for a child with a disability, or if appropriate, that child's family; and
- (f) Training or technical assistance for professionals (including individuals providing education or rehabilitation service), employers, or other individuals who provide services to employ, or are otherwise substantially involved in the major life functions of children with disabilities.

300.308 Assistive technology

Each public agency shall ensure that assistive technology devices or assistive technology services or both, as those terms are defined in 300.5 - 300.6 are made available to a child with a disability if required as a part of the child's

- (a) Special education under 300.17;
- (b) Related services under 300.16; or
- (c) Supplementary aids and services under 300.550(b)(2).

300.17 Special Education

... means specially designed instruction, at no cost to the parents, to meet the unique needs of a child with a disability ...

300.16 Related Services

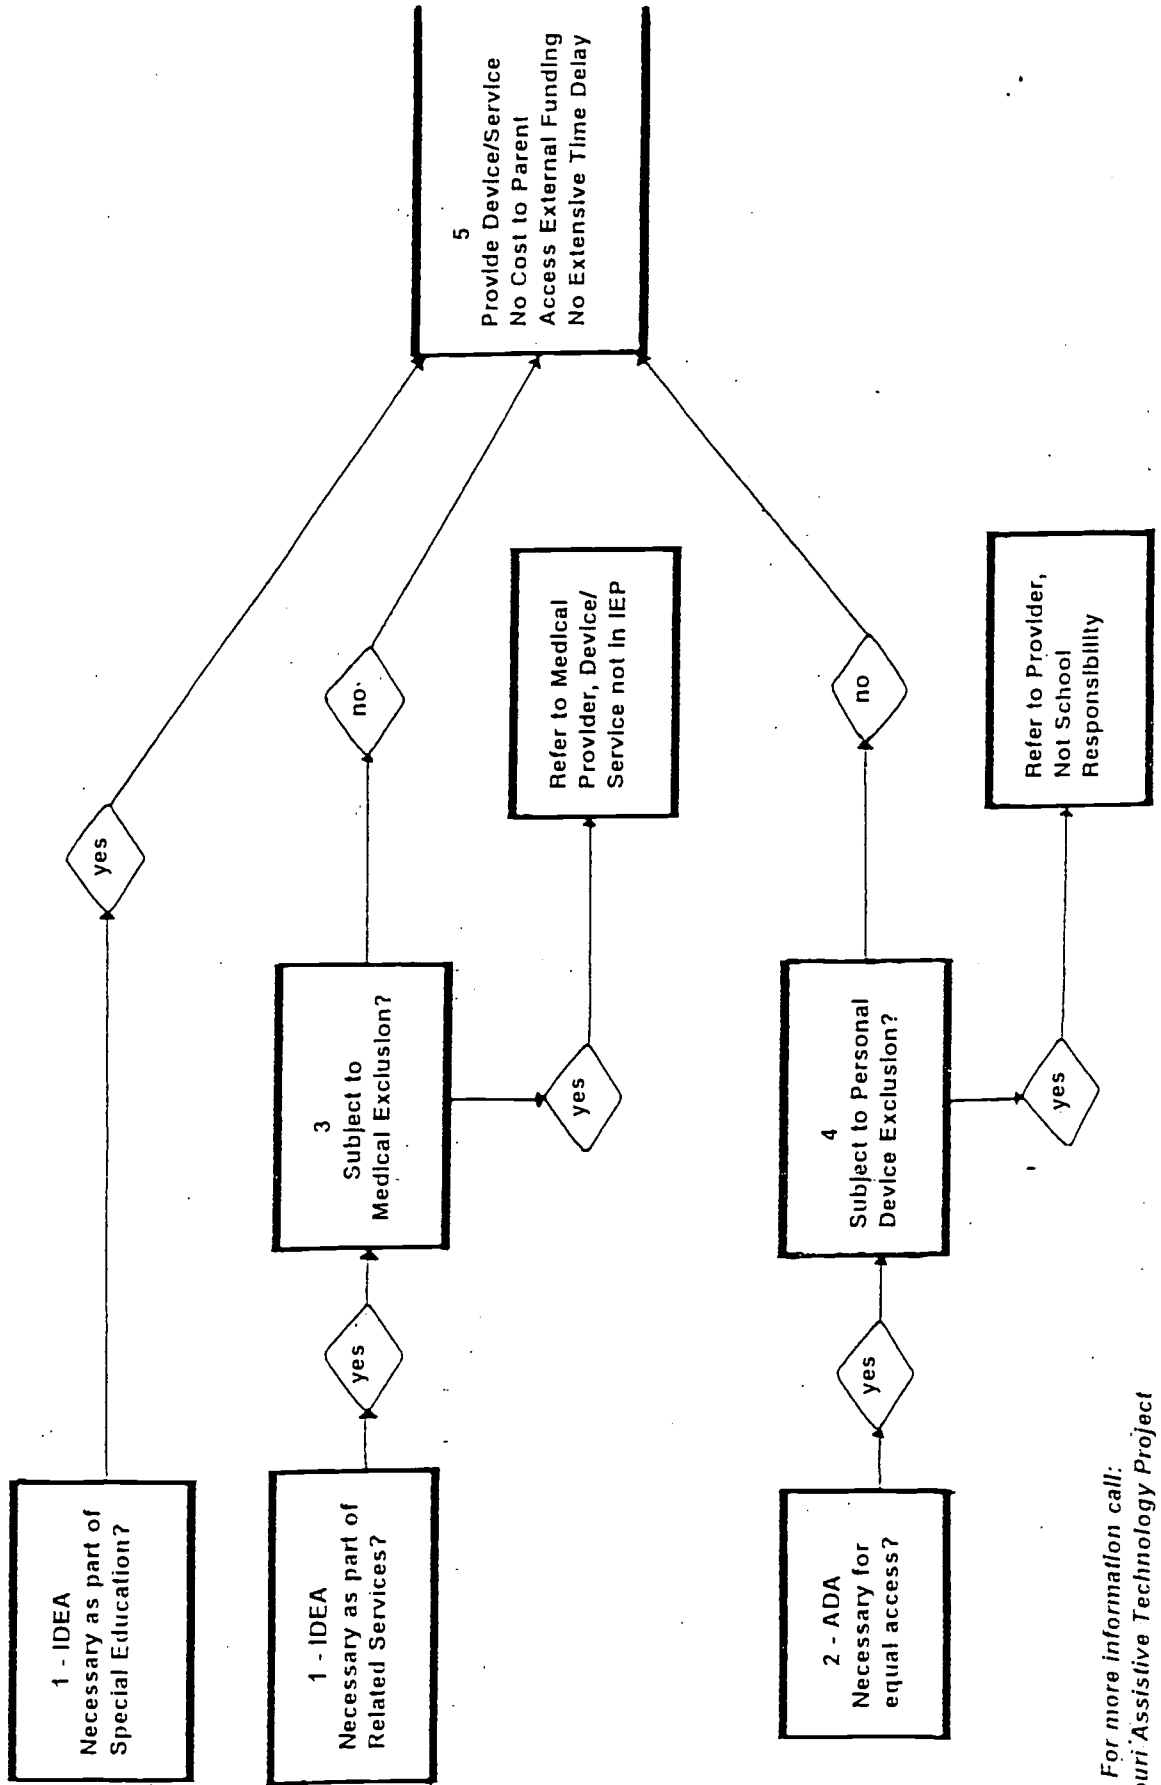

... means transportation and such developmental, corrective, and other supportive services as are required to assist a child with a disability to benefit from special education ...

300.550 (b)(20) Least Restrictive Environment - General

... removal of children with disabilities from the regular educational environment occurs only when the nature or severity of the disability is such that education in regular classes with the use of supplementary aids and services cannot be achieved satisfactorily.

ASSISTIVE TECHNOLOGY DECISION MAKING FOR SCHOOLS

Reference Notes

1. Necessary as part of special education or related services?
 - Is the assistive technology needed to implement or accomplish educational goals and objectives as found in the IEP? This would include supplementary aids and services provided to maintain a student with a disability in the regular classroom.
 - Is the device or service needed as a related service to allow the student to benefit from a special education program? This would include being able to access the special education program as decided in the IEP decision.
 - Which device or service will meet the "appropriate" standard as established by the Rowley decision?
 2. Necessary for equal access?

Is the device or service needed to provide the student with equal access to the programs and services offered by the agency?
 3. Subject to medical exclusion?

Does the device or service fit the medical exclusion clause of IDEA for related services? A blanket policy that specifies excluded devices based on cost or other factors is not legally defensible. Prior individualized cases dealing with the determination of medical versus educational have used the following standards:

 - **EXPERTISE REQUIRED** - What is the level of expertise required to deliver the device or service? If a medical doctor delivers the assistive technology, it is more likely to be considered medical than if delivered by non-M.D. professionals.
 - **INTRUSIVENESS** - What is the level of intrusiveness of the device or service? The more intrusive, the more likely it is to be considered medical. Devices that are surgically implanted would be examples of ones that are very physically intrusive that would likely be excluded as medical.
 - **DELIVERY ENVIRONMENT** - What environment is the device/service delivered? If it can only be delivered in a hospital, it is more apt to be determined medical than if it can be delivered at home or school or other settings.
 - **PRESCRIPTIVENESS** - How prescriptive is the device or service to the person? The more specific the prescription the more likely it is to be medical, versus a recommendation for a device or service that is less specific.
 - **PURPOSE** - Is the device or service required to sustain life or needed to attain developmental or educational goals? The more life sustaining, the more likely the assistive technology is to be determined to be medical.
 - **ELIMINATION OF DISABILITY** - Does the assistive technology correct the limitation or does it compensate for and/or diminish the limitation? The more the device/service corrects the disability, the more likely it is to be determined to be medical. Assistive technology that does not correct limitations but rather compensates for or augments the attainment of developmental or educational goals would likely be deemed educational.
 4. Subject to personal device exclusion?

Does the assistive technology fit in the ADA exclusion for personal devices as follows:

"This part does not require a public entity to provide to individuals with disabilities personal devices, such as wheelchairs; individually prescribed devices such as prescription eyeglasses or hearing aids; readers for personal use or study; or services of a personal nature including assistance in eating, toileting, or dressing."
 5. Other payors available?

Are other entities responsible for payment for the device or service? Even if the device or service is determined to be required, external funding may be used as available. However, provision of the device or service cannot be delayed while attempting to secure external funding. A device may need to be rented on a temporary basis until funding is arranged and the device is delivered.
- NOTE: Students covered by provisions of Section 504 would follow IDEA standards if the assistive technology needs are related to the educational program, since Section 504 refers to IDEA standards for educational/instructional issues. Other assistive technology needs related to access to non-instructional programs and services would follow the ADA standards.

Including Assistive Technology in the IEP

With the IDEA regulations, a variety of options exist for addressing assistive technology during the IEP process. After a comprehensive evaluation has considered assistive technology needs, appropriate devices and/or services may be included in IEP goals and objectives or may be specified as part of special education, related services, and/or supplementary aids and services needed for the regular classroom.

Examples of IEP Objectives with Assistive Technology Included

- Reading** Utilizing an enlarging system, the student will identify the Dolch sight vocabulary words from the first grade list.
- The student will demonstrate knowledge of following brailled directions within a given instructional reading level.
- Using an electronic communication system, the student will retell a story in their own words.
- Writing** Using an electronic spell checker, the student will correct misspelled words within own compositions.
- Using a word processing program with screen-reading speech output, the student will proof-read and recognize/correct errors in word selection (words which do not represent intended meaning) within own compositions.
- The student will write familiar words (e.g. colors, numbers, names) using a writing aid.
- Using an alternative input device, the student will keyboard 12 words per minute.
- Using a writing aid, the student will sign his/her name.
- Math** The student will solve two-step story problems using addition with an electronic calculation aid.
- The student will count one to ten using an abacus.
- The student will tell digital time at random five-minute intervals on a braille clock face.
- Behavior** The student will report to class and complete assignments on-time using an electronic organizer.

Reprinted with permission of the Missouri Assistive Technology Project

Strategies While utilizing video-text translation during lectures, the student will recognize advance organizers provided by the speaker as signals of important points to be presented.

**Speech/
Language** Using an assistive listening system, the student will demonstrate understanding of functional vocabulary.

Using an electronic communication system, the student will produce two-word phrases while role playing.

The student will use language to express own wants and needs utilizing an alternative communication system.

Leisure The student will demonstrate the ability to participate in frisbee as a recreational activity using a disk with auditory output.

The student will demonstrate the ability to participate in bowling as a recreational activity using a ball pusher.

Motor The student will demonstrate the ability to ambulate with an assistive device.

The student will demonstrate the ability to propel a wheelchair within a restricted area.

Self-Care The student will self-dress using buttoning device and sock device.

Classroom The student will participate in class discussions utilizing an augmentative communication system.

The student will produce written classroom assignments utilizing an electronic writing system.

The student will read assigned classroom material utilizing a scanning and screen-reading (with speech output) system.

The student will read assigned classroom material utilizing a page-turning device.

SPECIAL EDUCATION ASSISTIVE TECHNOLOGY POLICIES: MYTH OR REALITY?

Dr. Diane Cordry Golden
Missouri Assistive Technology Project

Increasing use of assistive technology to address a myriad of educational needs for students with disabilities has created a corresponding rise in assistive technology policy questions. Exactly what is a district's responsibility for providing assistive technology under IDEA? Is it different under ADA? How can a school determine if a student needs a device for an "appropriate" program. Who is qualified to decide what is "appropriate"? Are there limitations in a district's responsibility for devices that seem to be medical, or those that are personal use? Should the device go home? Who is responsible for maintenance and repair of devices? As with most areas of special education policy, there are few easy answers to these questions. Based on current OSEP policy letters, administrative and legal decisions, and other information sources, a number of guiding principles seem to be developing. Hopefully, these emerging guidelines will help schools meet their legal obligations and do what is right for kids, without causing financial ruin along the way.

The term "assistive technology" is not synonymous with expensive computer equipment.

Assistive technology (AT) includes a vast array of devices that are least often computer-based. Assistive technology includes devices to address mobility, visual, hearing, and speech

limitations, along with thousands more. For each device that is computer-based there are literally hundreds that are not.

It is helpful to understand that for any task there is always a range of assistive technologies that might assist in accomplishing the desired result. For example, making print accessible to a student with a visual impairment can be done a number of ways. A low tech solution might be using a simple hand held magnifier. A high tech solution could be a scanner and speech synthesizer. The use of another student as a reader might be a "no tech" solution. The challenge of identifying appropriate assistive technology for a given student, to address a given need, in given environments requires consideration of the full continuum of options available.

As of today, IDEA does not provide an exemption for "personal use" devices.

IDEA requires all students be provided with assistive technology as needed for delivery of a free appropriate public education (FAPE.) The only exception to this requirement is for those devices that are determined to be "medical." There is no such exception for

"personal use" devices. There are a number of groups who feel that IDEA should be amended to exclude schools responsibility for providing "personal use devices." However, even if such an amendment were to occur, the interpretation of what is and is not "personal use" would be very problematic for many types of assistive technology. In many cases, it is difficult if not impossible to distinguish between a device that is "personal use" versus one that can be readjusted and used by another student. A custom seating system is not the same as the standard wheelchair on hand in most airports, but both could be considered "personal mobility systems." Would the degree of customization be a factor in the device qualifying as personal use or would any "wheelchair", no matter how generic, be considered personal use? A programmable hearing aid with an earmold made from an ear impression is much more custom fit than an assistive listening system with a volume control knob on the receiver and walkman type earphones. Would one be district responsibility and the other not? As is apparent, even if some exemption for personal use devices were added by amendment or OSEP policy interpretation, it would likely raise as many questions as it would answer.

The difference between "medically necessary" and "educationally necessary" is clear as mud.

The exemption that does currently exist in IDEA is for devices needed for medical treatment. However, in reality, many pieces of equipment are needed both for medical and educational purposes. The general

guidelines established by case decisions distinguishing between medical and educational related services can be used to assist in understanding when assistive technology devices may be considered medical and thus outside of the school's responsibility. In general, the following factors seem important to consider:

Expertise required -- What is the level of expertise required to deliver the device or service? If a medical doctor typically delivers the assistive technology, it is more likely to be considered medical than if delivered by non-M.D. professionals.

Intrusiveness -- What is the level of intrusiveness of the device or service? The more intrusive, the more likely it is to be considered medical. Devices that are surgically implanted would be ones that are very physically intrusive that would likely be considered medical rather than educational.

Delivery environment -- What environment is the device/service delivered? If it can only be delivered in a hospital, it is more apt to be determined medical than if it can be delivered at home, school or other settings.

As indicated previously, many devices are needed for both medical and educational purposes. In a perfect world, those that are medically necessary would be provided by an entity other than the school as a "payor of first resort." Unfortunately, not all children have access to coverage for medically necessary assistive technology. Some students have no medical insurance and others are insured by private policies which do not pay for assistive technology. Access to basic coverage for medically necessary AT is inconsistent at best. For those students who are Medicaid eligible, medically necessary AT is covered. Schools are well advised to understand the Medicaid procedures in their state and provide case management support to assist families access all Medicaid covered AT. Similar case management is helpful when a private insurer will cover AT. Schools might also want to consider advocating for full medical coverage for all children. If all medically necessary AT were provided by other entities, schools could focus their attention on those devices that are educationally necessary. Unfortunately, it doesn't work that way. When a device can be considered medical or educational, special education is the system with the clear statutory requirement to provide not the medical system.

Determining if a device is required for FAPE is no easy task.

The differentiation between when a device is absolutely required for FAPE versus when the device is beyond the basic floor of "appropriate" can be extremely difficult. This situation frequently arises with the use of a

computer for instruction. The computer may have no adaptations and is simply being used as a method of instruction. Is the computer use necessary for FAPE or would another instructional medium be equally effective?

In addition, the standard of equal access from the Americans with Disabilities Act (ADA) and Section 504 may need to be considered. While FAPE for a blind student may be met by providing all written materials on audio cassette and by transcribing all dictated writing assignments, these same provisions might not meet an equal access standard. If for example, the student was expected to produce a term paper based on a set of audio cassette reference materials, the lack of access to a braille, "hard copy" of the reference materials would limit the student's ability to cross-reference and do other similar reviews that can be done by students with a print version of the materials. If all other students were able to use computers with word processing to prepare their papers, and no adaptations allowed the blind student to use word processing, the student would be limited in their ability to review and revise their written work. This is likely to be seen as a lack of equal access.

Deciding a student needs assistive technology is only the beginning.

Deciding that a student needs assistive technology for FAPE is only the beginning of the issues that should be discussed and addressed within the IEP. Depending upon the

IEP team discussions, the IEP may indicate that the student will be using a screen reading and highlighting system (a general description) or the IEP might specify that the student will use *SoundProof* which is a specific "brand name" screen reading and highlighting system. There are a number of such systems and districts must understand that if they specify a name brand, that is what they have obligated themselves to provide. There are reasons to specify a particular brand and reasons to use a more general description. Whatever the decision, it should be made purposefully based on the situation at hand, not done from a lack of information or misperceptions (e.g. the IEP team thought all screen reading systems were called *SoundProof*.)

If a device is specified in the IEP, then the device must be available and must be functioning properly. If it is not available or is not working, the district is failing to properly implement the IEP as written. This is no different than specifying that a student will receive physical therapy and then not providing it. If an IEP specifies a device that another agency (such as Medicaid) is funding, the district cannot legally wait for that agency to procure the device. If it is in the IEP, it must be provided as IDEA requires, as soon as possible after the development of the IEP. Most states have guidelines regarding what "as soon as possible" means, but in no case will waiting for an external funding source to finish its process be acceptable.

Repair and maintenance of a device specified in an IEP should also be considered during the IEP development. How will a loaner or alternative systems be provided to assure that the IEP can continue to be implemented if and when the device needs repair? If the IEP specifies a device as needed for FAPE and it has been provided by the family, an insurance carrier, Medicaid, or other source, the district is responsible for assuring that the device is working properly even though it is not district owned.

Schools must consider the student's need for device use at home to achieve goals and objectives as specified on the IEP. If a student needs a device to produce homework assignments or to read assigned text, there is no question that the device must be available for home use, or the district must have another alternative available to allow the student to accomplish the activities. While it is clear that schools cannot limit devices to in-school use only, it is also clear that all devices available at school do not have to be sent home. The decision must be made based on the educational and instructional activities to be completed outside the school setting.

The field of assistive technology has no clear credentialing standards.

There is no such thing as a state license or teaching certificate that allows an individual to "prescribe" assistive technology. Given the

vast array of devices, it is very unlikely that there never will be one credential for assistive technology. Even trying to set up a system whereby certain types of equipment are "prescribed" by an individual with a specific credential is riddled with problems. With the exception of a very limited number of devices, most assistive technology is not "prescribed." While it might make sense to require that an audiologist recommend and fit a specific hearing aid, it is not logical to extend that concept to the requirement that an audiologist must recommend a specific TTY for an individual. The decision regarding which assistive listening system to purchase for a school might be based on information about a number of options provided by an audiologist with the final decision made by the school given the size of room, the numbers of students who will use the receivers, etc. So while an audiologist's "prescription" might be a reasonable requirement to acquire some types of hearing-related devices, it would not be logical for all or even most.

In the area of computer access, there simply is no such thing as a credential that qualifies an individual to provide a "prescription" for computer access. One individual who is knowledgeable about adaptations for individuals with visual impairments may have no expertise in adaptations for persons with mobility limitations. Not all occupational therapists have training in computer adaptations, while some do.

The area of augmentative communication is one of the most convoluted with respect to credentialing. Speech language pathologists, occupational therapists, special educators and others lay claim to qualifications for "prescribing" augmentative systems. Augmentative communication systems are no different from any other area of assistive technology. There are devices within the continuum that tend to be more prescriptive than others and while some systems can be very personal and customized, others (like a picture book for ordering at McDonalds) can be very generic and used by more than one student.

A very wise person once said that the piece of assistive technology that is "right" for a person is the one they use. No formal evaluation procedures and resultant prescription should ever be given more weight than common sense, that is what the student chooses to use and seems to work.

Training, training, and more training . . .

Educational staff need to be knowledgeable and current on AT issues. Trained staff will be able to participate in good decision making about what is appropriate for students.

Training will not create an overflow of requests for assistive technology. Quite the opposite, when staff is knowledgeable about the full range of AT, they can effectively evaluate the need for devices and can address misconceptions about AT, such as the most expensive is always the best. With training staff will be able to show that in many cases appropriate AT is cost effective and may eliminate the need for expenditures on human supports for students.

With training, school staff can critically consider the student's needs in the classroom for AT use. No outside evaluator will ever be able to make the same observations that those who work with the student day in and day out in the school environment can make. Frequently, the best way to collect information about which device might be most appropriate is to have a student use the device in the school environment. A formal evaluation might be used to narrow the choices down to a few devices, then a less formal assessment can be done by trying out devices. While securing devices for a trial period can be difficult, in the long term trying devices can save dollars by reducing purchases that turn out to be inappropriate and unused. Some schools have cooperatively developed lending libraries of equipment to use for try-out and assessment purposes.

Focus on the positive.

As we approach the year 2000, technology will continue to advance and offer more options for students with disabilities. The use of AT has allowed students with disabilities to achieve outcomes previously thought impossible. Very little is as satisfying as seeing a student previously non-verbal, communicating for the first time or a student previously dependent on a human reader, reading text independently through the use of AT. Hopefully educational personnel can look past the quagmire of policy controversy and aggressively seek to deliver AT for all the right reasons, because of its positive impact on student achievement.

Ten Assistive Technology Realities

- REALITY #1:** Determining when a device is needed for FAPE (free appropriate public education) is no easy task.
- REALITY #2:** There is no cookbook for including AT in an IEP.
- REALITY #3:** There is no IDEA exemption for personal use devices.
- REALITY #4:** The difference between "medically necessary" and "educationally necessary" is clear as mud.
- REALITY #5:** If its in the IEP, the school **MUST** make sure the device is available and functioning properly . . . regardless of who paid for or owns the device (school, family, Medicaid, etc.)
- REALITY #6:** If you name a specific brand name device in an IEP, that is the device the school is obligated to provide.
- REALITY #7:** Schools cannot limit AT to in-school only use . . . but not all devices available at school must go home.
- REALITY #8:** A computer is not the answer to every AT need . . .
- REALITY #9:** There is no magic wizard with all the AT expertise and certainly no AT credential that makes someone an expert in all areas of AT.
- REALITY #10:** AT is not going to go away or become any less complex . . . so get informed and comfortable with it as soon as possible.

ASSISTIVE TECHNOLOGY: IS IT MEDICAL OR EDUCATIONAL?

Prior individualized cases dealing with the determination of services as either medical or educational have used a number of standards as described below. While none of the cases from which these were drawn were specific to assistive technology, the concepts are likely to be those used in deciding a medical versus education assistive technology question.

* **EXPERTISE/COMPETENCE REQUIRED**

What is the level of expertise/competence required to deliver the device or service? If a physician **must** deliver the assistive technology, case law suggests it will be considered a medical service and excluded as a related service. Assistive technology delivered by individuals other than physicians are less clear and seem to be influenced by other factors.

* **INTRUSIVENESS**

What is the level of intrusiveness of the device or service? The more intrusive, the more likely it is to be considered medical. Devices that are surgically implanted would be examples of ones that are very physically intrusive that would likely be considered medical.

* **DELIVERY ENVIRONMENT**

What environment is the device/service delivered? If it can only be delivered in a hospital, it is more apt to be determined medical than if it can be delivered at home or school or other settings.

* **PURPOSE**

Is the device or service required to sustain life or needed to attain developmental or educational goals? The more life sustaining, the more likely the assistive technology is to be determined to be medical.

* **LIABILITY/RISK**

What is the liability and risk assumed by the school in providing the assistive technology? If for example, the device breaks down or the service provider is ill and the assistive technology cannot be delivered is the situation life threatening? The greater the liability and risk, the more likely the assistive technology may be considered medical.

* **BURDEN**

What is the burden on the school district if the assistive technology is provided? Time and expense have both been included as factors in the consideration of burden. If the assistive technology device or service is close to a level of "virtual constant care" it may be considered medical.

School Responsibility for Maintenance of Assistive Technology Under IDEA

Q: Are school districts responsible for the costs of maintaining, repairing, or replacing a student's assistive technology device, even if it is not school-owned?

When an assistive technology device is part of a student's Individualized Education Plan (IEP), the school has the responsibility for making certain the device is available for purposes of implementing the student's IEP. In most cases, the school is liable for the costs of maintenance, repair, or replacement of the device even when it is not owned by the school.

The Office of Special Education Programs (OSEP), in response to a request from the Illinois Assistive Technology Project, addressed this issue in a 1994 policy letter. The request involved an augmentative communication device which parents of a student purchased so that their son was "able to access the device continually" rather than being limited to use for IEP-designated activities only.

In its letter, OSEP stated, *"...if the device that the parents have agreed to furnish is no longer in working order, and therefore is no longer available for purposes of implementing the student's IEP, the public agency is responsible for either continuing to implement the student's IEP by providing a substitute device, or for reconvening the student's IEP team for purposes of reviewing the student's IEP, and if appropriate, revising its provisions."* In other words, the district has only two options: provide a fully operational device as written in the IEP (either repair the existing device or replace it with an equivalent one) or revise the IEP.

Under the Individuals with Disabilities Education Act (IDEA), a school district is responsible for providing assistive technology devices that are part of a child's special education, related services, or supplementary aids and services. The device is to be provided at no cost to parents. If the parents in this case had not purchased the device specified in their child's IEP, the school district would be responsible *for both providing and maintaining* the device.

The OSEP letter recognizes that there may be some situations in which having the school assume liability for a non school-owned device may "create a greater responsibility for the public agency than the responsibility that exists under federal law". For example, a school could choose to use a family-owned captioning decoder to allow a student to watch instructional television programming at school. However, since this decoder would receive much use at home for "non-IEP" purposes, the school may not want to use it to meet IEP

needs and thus assume liability for its overall maintenance. Rather, it may be more effective for the school to own a decoder that could be used at school and sent home only when the student was assigned to watch a program during off-school hours.

With both school-owned devices and those that schools are obligated to maintain, school personnel are frequently concerned about damage that may occur off school property, since they have limited ability to oversee the care and use of the device once it leaves the school. Regardless of these concerns, the mandate to provide devices off-property is clear. Schools cannot limit devices to in-school use because of anticipated or real fears of damage. Rather, schools must examine the specified IEP goals necessitating the equipment leave school, consider all equipment alternatives, and then provide that which is needed for FAPE. As with all decisions related to assistive technology, each must be made on a case-by-case basis considering the unique educational needs of the student.

Whatever the approach, the basic responsibility for the school still remains: assure access to working equipment as needed per the IEP. Depending on the circumstances, a school may choose to assume maintenance liability of a non-school owned device, or it may be more effective for the school to own a duplicate or comparable device for which it retains sole ownership and maintenance responsibility, rather than becoming entangled in maintaining equipment that it doesn't own.

To receive a copy of the OSEP policy letter or if you have questions about other assistive technology issues, contact:

School Responsibility to Provide Computers Under IDEA

Q: When is it the responsibility of a school to provide computer equipment at school or at home to a student with a disability?

It should come as no surprise that the school's responsibility depends on the individual characteristics and needs of the student. As with the provision of any type of assistive technology, decisions about computers must be made on a case-by-case basis. In the process of writing an Individualized Education Program (IEP), the IEP team must consider if and when assistive technology is necessary to meet educational goals and objectives. By asking some questions, the process can be made a bit more manageable.

Is computer equipment necessary for the student to receive a free **appropriate** public education (FAPE)? In *Board of Education v. Rowley*, the U.S. Supreme Court said that the "appropriate" of FAPE is a basic floor of opportunity consisting of access to specialized instruction and related services designed to provide educational benefit to the child with a disability. Thus the question focuses on "appropriate" rather than "best."

It may be useful to distinguish between *computer equipment needed for communication (to access or produce oral or written communication)* versus *computer equipment to be used solely as an instructional medium (in the same way that books, flash cards, loop tape records, etc. are used)*. Even the latter differentiation can be muddled in cases such as the student with a learning disability who needs spell checking software to produce print well, but whom can certainly write (pencil and paper) without a computer.

Computers for Communication Access

In the case of students who need alternatives to access or produce written/oral communication, the IEP team must consider all options including computer based. For a blind student, options to access and produce print might include tape recording, braille (hard copy), reader (human assistance), and a computer system utilizing scanning, screen-reading (voice output), braille output, etc. The IEP team should ask which option or options are appropriate for meeting the instructional objectives. If more than one option is appropriate, in which situations should an alternative be used? Minimally the IEP team should specify the alternative(s) to be used at school and home in light of the instructional objectives and expectations in each setting.

One caution, a school cannot lower expectations for a student at home or school due to the need for alternative access. It would not be acceptable to waive some homework assignments for students who need alternative access or production if the homework assignments are required of other students.

Reprinted with permission of the Missouri Assistive Technology Project

When choosing between alternatives for access, the standard for "appropriate" might include the following questions:

- ◆ Will one or more alternatives allow the student to be independent rather than relying on human assistance?
- ◆ Will one or more alternatives allow the student to be educated in a less restrictive environment (LRE)?
- ◆ Will one or more alternatives allow for truly equal access in terms of student time and effort? (Producing a book report by dictating, transcribing, revising by dictating, etc. is not equal to producing one on computer with a word processor.)

If the computer based system is the option that allows for independence, LRE, and truly equal access, it may well be the (or one of the) alternatives needed to meet the "appropriate" standard.

Computers for Instruction

Most, if not all, students with and without disabilities could benefit from the use of computer-based instruction at school and home. Schools are not required by IDEA to provide access to educational benefits beyond what is provided to students without disabilities. For example, a school would probably not be required by IDEA to provide a computer with instructional software *for the purpose of providing a means of home instruction* to a student with a learning disability. Home enrichment of instruction that was provided at school via computer is not likely to be considered a part of FAPE. However, if a computer and software were the only alternative for the student to be able to complete practice drills that were also assigned as homework for other students, the equipment must be provided.

As with access options, the IEP team must consider all alternatives for instructional media from traditional curricular materials such as books, worksheets, and flash cards, to more high-tech options that are computer based. The IEP team should ask which option or options are appropriate for meeting the instructional objectives and if more than one option is appropriate, in which situations should an alternative be used? The challenge is one of clarifying instructional objectives and expectations for both school and home so that a determination of appropriate media can be made.

In summary, computer systems must be viewed as one tool among many to be considered in meeting the access and instructional needs of students with disabilities; a tool that should always be considered as an option, should never be considered as the only option, and one that must be provided if necessary for FAPE.

For more information, contact: **The Missouri Assistive Technology Project, 4731 South Cochise, Suite 114, Independence, Missouri, 64055-6375. Phone: 800/647-8557 (Voice) or 800/647-8558 (TT).**

Can assistive technology aids or equipment be limited to in-school use? A policy letter from the federal Office of Special Education Programs (OSEP) clearly states *no*.

An OSEP policy letter was sent in response to a parent who had asked that her child's school provide a CCTV for his use at home. The CCTV (closed-circuit television) is an electronic enlarging device that enlarges images and increases contrast. The student was visually impaired, and needed the device for completing homework, reading books, and finishing any assignments from school.

The policy letter, dated November 1991, stated "**If the Individualized Education Program (IEP) team determines that a particular assistive technology device item is required for home use in order for a particular child to be provided FAPE (free appropriate public education), the technology must be provided to implement the IEP.**"

School systems cannot categorically deny any request that assistive technology go home, for reasons including the lack of adequate property insurance coverage. Each decision must be made on a case-by-case basis, recognizing each child's strengths and weaknesses in an educational context.

A school's responsibility for providing assistive technology at home is limited to those devices which are needed for a student to pursue his or her educational objectives. Schools may offer other alternatives to allow for activities to be performed at home rather than providing assistive technology so long as such alternatives are appropriate.

For example, alternatives that might allow a student with a vision impairment to access print at home could be to provide all materials in large print or on audio cassette in lieu of providing a CCTV for home use. Similarly, for a student who is unable to write, an adapted computer may be used to generate print, while another alternative might be for the student to dictate assignments. **Decisions regarding which alternative is appropriate must consider the educational activities to be performed or completed at home.** In the example of the student unable to write, dictation might be appropriate for short daily assignments, but inappropriate for longer written work. Again, decisions about providing assistive technology at home must be made on a case-by-case basis.

ISSUES IN ASSISTIVE TECHNOLOGY

EDUCATION

When is it a school's responsibility to provide an assistive technology device for a student when it is considered a personal device, such as a hearing aid?

When a school determines that a child with a disability requires a device in order to receive a free appropriate education, and when the child's IEP specifies that the child needs the device, the school has a responsibility to provide the device. This is true even when the device is a personal device such as a hearing aid.

This policy was clarified in a policy letter from the Office of Special Education Programs (OSEP) issued November 19, 1993. The letter explained that in the past, it had been OSEP's position that a school was not required to purchase a hearing aid for a student who was deaf or hard of hearing because a school was not responsible for providing a personal device. However amendments in 1990 to the Individuals with Disabilities Education Act (IDEA) added the terms "assistive technology device" and "assistive technology service" to the language of IDEA.

The definition of "assistive technology device" is "any item, piece of equipment, or product system, whether acquired commercially or off the shelf, modified, or customized, that is used to increase, maintain, or improve the functional capabilities of children with disabilities". Personal use devices such as hearing aids, wheelchairs, and augmentative communication systems and other such devices are covered under this definition. Again, the question is no longer whether the device is a personal use device, but whether it is needed by the student to receive a free appropriate public education.

In addition, under IDEA, a school must ensure that assistive technology devices and assistive technology services, or both, are made available to a child with a disability if required as part of a child's education, related services, or supplementary aids and services. As such, when the IEP team has determined that a device, even those such as hearing aids, are needed for a child to receive a free appropriate public education, the school is responsible for providing the device at no cost to the child and his or her parents.

ISSUES IN ASSISTIVE TECHNOLOGY

ISSUES

Under what conditions can a school require parents to use their insurance to pay for assistive technology devices that are needed for the child's education?

Parents do NOT have to make use of their health insurance if they would incur any financial loss in the process. Schools are required to provide a free appropriate public education to students. This means that devices or services related to a child's education must be provided by the school "without charge" or "without cost".

The U.S. Department of Education issued a regulation on this issue in the *Federal Register* on December 30, 1980. It states that proceeds of insurance must not be taken by school districts when parents will face a realistic threat of financial loss. Financial loss includes, but is not limited to, the following:

- an increase in premiums or the discontinuation of the policy; or
- an out-of-pocket expense such as the payment of a deductible or percentage of coinsurance incurred in filing a claim; or
- a decrease in available lifetime coverage or benefit under an insurance policy.

Issues for Parents

While the above policy is very clear, there are some issues to consider in its implementation:

- ▲ Are parents given all of the factual information in order to make an informed decision?
- ▲ Are parents led to believe that without insurance payments, less service will be provided to their child?
- ▲ Are parents feeling intimidated to sign over their insurance?
- ▲ Are parents feeling "guilty" that if they don't sign, they will be hurting their child?

Many children will incur extensive medical costs due to illness or injury over the years in which they are enrolled on their parent's medical insurance. Therefore, parents should think carefully prior to allowing their private insurance to be billed for special education-related services of local school districts.

MISSOURI ASSISTIVE TECHNOLOGY PROJECT

ISSUES

EDUCATION

There has been a long delay in the school providing assistive technology for my child while the school is searching for outside funding sources. Must a child wait for the device until the school locates a funding source?

If the IEP team has determined that an assistive device or service is necessary for a child's free appropriate public education (FAPE), the school has an obligation to provide the assistive technology. It is permissible for the school to seek funding from outside sources (such as a charitable organization, agency, local corporation, etc.) to help pay for the device or service. However, the search for funding cannot delay implementation of a child's IEP.

The Office of Special Education Programs (OSEP) has addressed the issue in a policy letter relating to assistive technology. The letter states that "no delay is permissible between the time a child's IEP is finalized and when special education and related services is provided". The letter explains that there are some circumstances which require a short delay (e.g. working out transportation arrangements or an IEP meeting which occurs during the summer). However, the intent of the law and regulations is quite clear. Services set out in the IEP will be provided beginning immediately after the IEP is finalized. This may necessitate renting or leasing a device while seeking alternative funding sources.

Can a school make parents responsible for locating a funding source for educationally related assistive technology?

If it has been determined that an educationally-related device is needed for a student, the district cannot require a child's parents to be responsible for locating funding sources. The district can request the involvement of the parents in the funding search, but it is the responsibility of the district to find a means of providing the device, not the parents. Devices or services related to a child's education must be provided by the school without charge or without cost to the parents. Also, remember that if external funding cannot be arranged, the district still must provide the device as specified in the IEP.

COMPUTERS

The Project ASTECH software explores computer input and output devices, discusses assessment, and introduces installation, programming and troubleshooting strategies. We have compiled a list of each device mentioned in the Project ASTECH software and the companies that distribute these devices for your use. In our software program it would be impossible to include information about every available device on the market. Our purpose was to give you categories and characteristics of devices with representative examples. You are encouraged to add information about other devices to your Resource Guide.

We have included some specific information to assist you in the search for the correct computer access match for your students. As you find more information, you can add it to this 3-ring binder. One handout we have included discusses different features of trackballs. The expanded keyboard, mini keyboard, and keyboard emulator comparison charts included in the Project ASTECH software were reproduced to give you quick access to this information.

In the Project ASTECH software, we discussed keyboard emulators, focusing on flexible keyboard emulators. We have included, in this Resource Guide, information about the Adaptive Firmware Card, even though it is no longer produced because you may be in a school district which has Apple IIe computers. We have also included examples of dedicated keyboard emulators, along with the input device or method with which they are used.

You learned about voice recognition as one input option in the Project ASTECH software, so we have listed specific voice recognition systems along with the companies who distribute them. Although you learned about characteristics of abbreviation/expansion and word prediction software in the ASTECH program, we did not list specific products in our software. Therefore, we have listed several products for your information and use. We encourage you to get demo software whenever possible.

The programming, troubleshooting, and implementation checklists you learned about in the Project ASTECH software also are included for your future use.

Project ASTECH does not discuss specific software that may be appropriate for students. Because we feel that this information may be useful for school-based personnel, we have included a list of software and software companies.

Trackball Features

✓Access

How much space does the trackball require? Does it interfere with other activities (i.e., typing, answering phone, weight shifts)? How is the trackball plugged in, installed and activated? Can this be done by user or others in environment easily?

✓Mounting

How will the trackball be mounted?? Is it within the user's arc of accessible activation? Does it need to be adjusted vertically? If so, will the ball fall out of trackball, slip out of place when not being used or still work when trackball is mounted at 45-90 angle (note, many balls don't calibrate correctly when angled)?

✓Compatibility

Does the make and model of trackball work with the make and model of computer and software being used? Can it be adapted to work across several setups if needed? Is it compatible with user's access mode (i.e., hands, typing aides, mouthsticks, etc.)?

✓Buttons

How many buttons are they and what do they do? Where are they located? How are they activated (method and force needed)? How wide, long and deep are they? Can they moved/adjusted? if so, how?

✓Button to ball ratio

How far are the buttons from the ball (distance) and does this fit user's activation mode? Are buttons at same height as ball? Can user use ball and buttons with minimal amount of movement? Are buttons accidentally activated when using ball or vice versa?

✓Balls

What kind of ball is used for tracking? How big is it and does this fit user's activation mode? How smooth is the glide and can it be adjusted (i.e., loosen or tighten springs)? How is it attached to trackball?

✓Drag/lock feature/button programability

Can one of the buttons be programmed to act as a drag lock so user does not have to hold button and roll ball at same time? Can this feature be easily turned on or off by user?

✓Software options

Does software come with the trackball to customize its use? Is it compatible with current computer system, applications, and other pieces of assistive technology being used? Can macros (multiple step operations combined into a few actions), "hotspots" (commonly used locations on screen) and buttons be programmed? Can speed of tracking and clicking be adjusted via software? Can software be easily turned on/off?

✓Cost and availability

Selected Dedicated Keyboard Emulators

The ASTECH software differentiates between flexible keyboard emulators (which allow a variety of input devices to be used) and dedicated keyboard emulators (which typically allow one type of input device to be used). Here is a chart which lists some dedicated keyboard emulators and the type of input device or method that is used. We have also included if the emulator is used with an IBM/compatible or Macintosh computer. To get more information regarding the company that sells the product, look at the company listing in the General Information section of this Resource Guide.

CrossScanner (IBM, MAC)	Switch-Scanning	RJ Cooper and Associates
Discover:Switch (MAC)	Switch-Scanning	Don Johnston Inc.
Expanded Keyboard Emulator (EKE) (IBM)	Expanded Keyboard	Words+, Inc.
Freedom Writer (IBM)	Switch-Scanning	World Communications
Handicode (IBM)	Switch-Morse code	Microsystems Software, Inc.
HandiKey (IBM)	Switch-Scanning	Microsystems Software, Inc.
Help U Key (IBM)	Switch-Scanning	World Communications
Morse Code WSKE (IBM)	Switch-Morse code	Words+, Inc.
Revolving Doors (MAC)	Switch-Scanning	Madenta
Scanning WSKE (IBM)	Switch-Scanning	Words+, Inc.
WinSCAN (IBM)	Switch-Scanning	Academic Software, Inc.
WiVIK2 (IBM)	Switch-Scanning	Prentke Romich Co.

Voice Recognition Resources

Following is a list of voice recognition or voice input systems that can be used for computer access. There are also some Macintosh® computers that have limited voice recognition capabilities. Prices for these voice recognition systems were correct as of 1996.

<u>Voice Input System</u>	<u>Company</u>	<u>Compatibility</u>	<u>Price</u>
DragonDictate	Dragon Systems	Windows & DOS	\$395-1995.00
IBM VoiceType Dictation	IBM	Windows & OS/2	\$990.00
Power Secretary	Articulate Systems	Macintosh & Windows	\$990-2495.00

Abbreviation/Expansion and Word Prediction Software Resources

Following are a list of software programs which allow the user to use abbreviation expansion (AE) and word prediction (WP) to increase the rate they can input information into the computer. See the Vendors List, also in the ASTECH Resource Guide, for company addresses and phone numbers. Most companies have demo software available upon request.

COMPUTER GENERAL PROGRAMMING STEPS*

Programming is the completion of specific steps with equipment to enable - students to do something they could not do before. When we discuss programming with computers, the desired result is that students will have a custom setup (overlay or scanning array) to use with their alternate input device. Although there are many alternate input devices, there are 7 general steps that apply to programming most of them.

Programming Steps (when using an overlay)

1. **Analyze software** to determine what keys and mouse commands are used to operate the software program.
2. **Plan the printed overlay**
consider:
 - what student sees
 - what student hears
 - key arrangement on overlay in terms of size, location, display and feedback
3. **Program the overlay**
 - a. create keys
 - b. add text and/or picture labels to keys that will appear on the printed overlay
 - c. program the key content (i.e., information sent to the computer when the student presses the key on overlay)
4. **Save the overlay**
5. **Print a paper copy of the overlay**
6. **Load, or send, the overlay to the expanded keyboard**
7. **Try the overlay** and make changes, if necessary.

You will find these general programming steps apply to most alternate input devices, however, programming steps may be more complex when programming some alternate input devices and devices that require certain keyboard emulators.

* Taken from Project ASTECH software

COMPUTER GENERAL TROUBLESHOOTING STRATEGIES*

Troubleshooting is a strategy used to locate and correct a problem. When using an alternate input device, a common problem you may encounter is you press a key on the overlay/keyboard and nothing happens or the wrong keys appear on the screen.

General Troubleshooting Checklist:

Device _____
Company Name _____
Company Phone # _____
Date _____
Problem _____

Is the device turned on?

Is the correct cable used?

Is the cable securely plugged in?

If you are using an expanded keyboard, is there a problem with the overlay?

Make sure that you have only one overlay installed on the keyboard .

If using a standard overlay, make sure the bar code on the back of the overlay is not covered or damaged.

If you are using a custom overlay, make sure that the correct overlay has been sent/loaded to the keyboard .

After using these general troubleshooting strategies, if the device still does not work correctly do the following:

- Check the device manual for more detailed, specific troubleshooting strategies.

- Call the company. Make sure you have the device in front of you when you call.

* Taken from Project ASTECH software

TOWARD DEVELOPMENT OF A SWITCH TRAINING HIERARCHY

(MUSSELWHITE, 1990)

BEGINNING CAUSE EFFECT: Large simple graphics with movement; typically, screen would blank between activations

Fireworks (*Fireworks/Blocks/Car*)
Happy Faces (*New Cause Effect*)*
Music & Boxes (*New Cause Effect*)*
Switches, Pictures, & Music*

Funny Noises (*New Cause Effect*)*
Master Blaster (*ACTT*)
Switch 'n See (*ACTT*)
Cause Effect Clown (*All*)

INTERMEDIATE CAUSE EFFECT: medium-sized graphics with less bold movement; screen does not blank between activations

Blocks (*Fireworks/Blocks/Car*)*
Dancer (*New Cause Effect*)*
R J's Switch Progressions (*RJCooper*)
This Is The Way (*UCLA--Switch PP*)
Join the Circus (*Dev Equip*)
Switch It--Change It (*UCLA*)
Reading Magic Lib-AFC<space>(*All*)

Car (*Fireworks, Blocks/Car*)*
Jimmy Jumper (*page turn; ECS*)
Zoo Time (*UCLA --Switch PP*)
Switch Surprise (*NCC Software*)
Mr/Mrs Potato Head/Antics (*Herb*)
Switch It -- See It (*UCLA*)

ADVANCED CAUSE EFFECT: small graphics or small movement; no blanking between activations

Creature Antics (*Dev Equip*)
Jimmy Jumper (*activations; ECS*)
Slot Machine (*Slot Machine, etc*)

Creature Chorus (*Dev Equip*)
RJ's SwitchProgressions(*RJCooper*)
Explore A Classic (*All*)

MAINTAINING SWITCH ACTIVATION: Holding switch down causes action to continue

Dancer (*New Cause Effect*)*
Happy Faces (*New Cause Effect*)*
Kaleidoscope (*Slot Machine, etc*)
Switches, Pictures, and Music*

Funny Noises (*New Cause Effect*)*
Stickybear Opposites (*Dev Equip*)
Switch 'n See (*ACTT*)

Reprinted with permission of Caroline Musselwhite

SWITCH RELEASE: Activation does not begin until switch is released

Dancer (<i>New Cause Effect</i>)*	Dinosaurs (<i>UCLA</i>)
Funny Noises (<i>New Cause Effect</i>)*	Rockets to the Moon (<i>UCLA</i>)*
RJ's Switch Progressions (<i>R.J. Cooper</i>)	Fast Food Game (<i>UCLA</i>)
Feet w/ AFC/<ret> (<i>BertaMax</i>)	

STEP SCANNING: One press yields one action on screen (e.g., game token moves one space; scanning arrow moves one position)

Big & Small (<i>Access Unlimited</i>)	Car (<i>Fireworks/Black's/Car</i>)
Dinosaurs (<i>UCLA</i>)	First Letter Fun (<i>NECC</i>)
Rabbit Scanner (<i>Access Unlimited</i>)	Scanning with Academics*
Rockets to the Moon (<i>UCLA</i>)	Sharon's Sampler (<i>Find Jack-All</i>)

BEGINNING TIMED ACTIVATION: User must activate (or deactivate) switch to achieve response

Anli-Aircraft (<i>New Cause Effect</i>)*	Eensy Weensy Spider (<i>UCLA</i>)
Rabbit Scanner (<i>Access Unlimited</i>)	Scanning with Academics*
Ship (<i>New Cause Effect</i>)*	Sight Words (<i>UCLA</i>)
Stop That Cow (<i>New Cause Effect</i>)	Make It In Time (<i>Dev Equip</i>)
Learn to Scan (<i>Dev Equip</i>)	The Scanning Game*
Switch Games*	Scanning Fun (<i>All</i>)

EARLY TWO SWITCH USE: User has two switches, each of which provides a specific input to the computer*

Interaction Games (<i>selected; DE</i>)	Switch Games/Pinball*
Scanning w/ Academics (<i>Maze</i>)*	Facemaker - AFC<space/ret>

* *Public Domain*

SOFTWARE UPDATE

MONSTERS & MAKE-BELIEVE PLUS (Pelican or AU -- \$59.95): This disk provides a range of activities, including: manipulating monster parts to create a monster, write a "Monster Myth", save monsters and myths, print monsters or myths in different sizes (miniature, tall, skinny, big, etc.). Three features that make it particularly exciting for children with special needs are: 1) Large print option for children with visual impairment, or children at a distance from the computer; 2) Voice output to read a word or an entire page; 3) Printed versions of all monster parts, so children can attempt to match a model.

HUMAN BEING MACHINE (R.J. COOPER: Try Before You Buy -- \$75): This program allows single switch or TouchWindow users to create a crazy body (*Build a Body*) or a silly face (*Looney Goonies*). All creations can be printed. A great intro to timed switch activation, or a super mainstreaming activity.

EXPLORE A STORY SERIES (AU -- \$39.95): This series offers story writing with animation. A number of screens are available, with backgrounds and characters that can be written about "as is" or modified and animated. Graphics and animation are excellent. A sub-category is the *Explore A Classic* series, with animated versions of old favorites such as *The Three Little Pigs*.

SILLY SANDWICH (UCLA -- \$25): This PowerPad program allows users to build a "silly sandwich" by choosing from 6 or 12 items. Two levels: I= select any item; II=memory game (items presented disappear, next player must choose it). Excellent game for teamwork, memory, and sequencing.

SWITCHES, PICTURES, AND MUSIC (PD): A switch press yields bold pictures and children's music. Options: levels of music feedback, choice of 11 songs and 13 pictures. Bold graphics for beginning switch users.

M.A.C. SERIES (PD): Matching, picture vocabulary programs, with each disk presenting a category (e.g., clothes, foods). Range of presentation features can be changed, such as level (# of foils), automatic scan, dwell time. Variety of schedule features can also be altered, such as reinforcement schedule, instruction schedule, and criterion for correct. Nice graphics and intelligible speech.

USEFUL ADDRESSES

- ABLE-NET**, 360 Hoover Street, N.E., Minneapolis, MN 55413. Sells switches, switch interface, etc. Excellent technical support and workshops.
- ACCESS UNLIMITED - SPEECH ENTERPRISES**, 3535 Briarpark Dr, Suite 102, Houston, TX, (713-781-7441). Supports development of software, videos, etc., disseminates information hardware, and software (generic and special needs), provides excellent training.
- ACTT (ACTIVATING CHILDREN THROUGH TECHNOLOGY)**, 27 Horrabin Hall, Western Illinois U., Macomb, IL 61455 (309) 298-1014. Develops range of software plus resource materials
- BURKHART, LINDA**, 8503 Rhode Island Avenue, College Park, MD 20740. Develops a wide range of light-tech to high-tech materials, including switches, books, and joystick replacer box.
- CLOSING THE GAP**, P.O. Box 68, Henderson, MN 56044. Disseminates information, books, newsletter, and supports major conference.
- DEVELOPMENTAL EQUIPMENT**, P.O. Box 639, Wauconda, IL 60084 (800-999-4660). Sells range of computer peripherals (TouchWindow, AFC) plus special needs software.
- DUNAMIS**, 3620 Highway 317, Suwanee, GA 80174 (800-828-2443). Provides extensive support for PowerPad, plus selling other peripherals, special needs software, and providing a range of workshops.
- EXCEPTIONAL CHILDREN'S SOFTWARE**, P.O. Box 487, Hays, KS 67601. Sells software including *Jimmy Jumper* series.
- HART, INC.**, 320 New Stock Road, Asheville, NC 28804 (800-222-9149-NC; 800-654-8012 outside NC). Sells extensive range of generic software.
- INVO-TEK**, Engineering Research Center, 700 W. 20th Street, Fayetteville, AR, 72701 (501) 575-7659. Developed *TalkingEyePoint Board*
- KEY TECHNOLOGIES**, P.O. Box 1997, Morganton, NC 28655 (704-433-5302). Southeastern distributor for range of technology products from Zygo, Dev. Equip. Numerous workshops.
- MECC**, MINNESOTA EDUCATIONAL COMPUTING CONSORTIUM, 3490 Lexington Ave, N., St Paul, MN 55126 (800-228-3405, ext 693). Over 200 educational programs developed and marketed.
- R.J. COOPER**, 24843 Del Prado, Suite 283, Dana Point, CA, 92629. (714) 240-1912. Develops software for children and adults with severe physical and/or cognitive disabilities.
- REACH, INC.**, 890 Hearthstone Dr., Stone Mountain, GA, 30083. Sells Switch PowerPad
- TOYS FOR SPECIAL CHILDREN**, Steven Kantor, 385 Warburton Avenue, Hastings-on-Hudson, NY, 10706 (914-478-0960). Toys and computer interfaces, such as multiple switch box.
- UCLA MICROCOMPUTER TEAM**, 1000 Veteran Ave., Room 23-10, Los Angeles, CA 90024 (213-825-4821). Develops excellent programs for PowerPad, single switch, TouchWindow.

AUGMENTATIVE COMMUNICATION

The Project ASTECH software explores augmentative communication devices, discusses assessment, and introduces installation, programming and troubleshooting strategies. We have compiled a list of each augmentative communication device introduced in this software. This list provides contact information for the companies that distribute these devices. In the Project ASTECH software program, you learned about several representative examples of dedicated and computer-based devices. Because there are numerous devices and augmentative software programs available, we have included a matrix to help you sort through these devices.

You will find the Checklist for Overlay Design in your Resource Guide which may be useful in guiding you as you develop the vocabulary that will be programmed into the student's device. Programming, troubleshooting, and implementation checklists also are provided for your future use.

This section also includes the official position statement and report on the role of the speech-language pathologist in alternative and augmentative communication approved by the American Speech-Language-Hearing Association. You may refer to the selected augmentative communication readings and resources for additional information.

Contents

List of Devices in ASTECH Software	1AC
Sorting Through Augmentative Communication	2AC - 9AC
Checklist for Overlay Design	10AC - 12AC
Programming Checklist	13AC
Troubleshooting Checklist	14AC
Implementation Checklist	15AC - 17AC
ASHA Position Statement and Report	18AC - 22AC
Selected Readings & Publications	23AC - 26AC

LIST OF DEVICES - AUGMENTATIVE COMMUNICATION

We have mentioned devices as representative examples within our software program. Here is a list of those devices and the companies from which they may be purchased. These companies also sell other products in which you may be interested. The companies' addresses and phone numbers are listed in the Resource List of the General Information section of this Resource Guide.

<u>Device</u>	<u>Company</u>
AlphaTalker™	Prentke Romich Co.
Dial Scan	Don Johnston, Inc.
DigiVox®	Sentient Systems Technology, Inc.
DynaVox®	Sentient Systems Technology, Inc.

Information about Sorting Through Augmentative Communication

These handouts were developed to help therapists and educators "sort through" the available augmentative communication devices. It is not simply a product information sheet but rather is set up to narrow down options. It is not an expert system, but it does eliminate some devices based upon the individual's needs. The sorting matrix is used after the evaluation when you know the individuals' needs and are ready to look at device options. By the time you look at the matrix, it has already been determined that the individual needs a "high tech" solution—but remember, not everyone needs a voice-output device.

Begin your sorting with the type of access method the individual will use. Circle those devices (see, you've already eliminated some). Continue the sorting by circling those devices which continue to be options. In each column you will be eliminating more devices. When you are finished, you will have a list of devices that may be appropriate and you can get more information about them.

The sorting matrix is for dedicated voice-output devices only. You have a separate handout for computer-based augmentative communication solutions. Although it is not set up for you to "sort through", we have listed which input methods and devices can be used with the software, as well as with which type of computer and operating system the software works. You also have a list of speech synthesizers.

Our goal is for this information to be useful to you. Our sorting matrix includes categories that we consistently consider in our evaluation. Obviously, there are others (such as computer access, rental programs, vendor support, etc) which we consider. Due to limited space we could not include everything. If you have a category that you address all the time, then you should add it so that the matrix is useful for you.

If you have questions or comments, please contact us.

SORTING THROUGH AUGMENTATIVE COMMUNICATION

AUGMENTATIVE COMMUNICATION SOFTWARE

In addition to dedicated augmentative communication devices, computer software and voice synthesizers are available that will provide voice-output for individuals with speech impairments. When augmentative communication software is used with a portable computer, an individual has an augmentative communication system that is portable as well as a computer that can be used for other tasks, if needed. The software is generally priced separately from the computer and the speech synthesizers. The documentation for the software will state which speech synthesizers can be used. Some manufacturers/vendors have demo disks available at no charge or for a minimal charge. The input code is: K=Keyboard, M=Mouse, J=Joystick, MC=Morse Code, S=Scanning, T=Touch Screen

Checklist for Overlay Design - CODE

Mark needed vocabulary in red.

Initiation

1. Greetings
 - Hello
 - Hi Hi, how are you?
 - How are you doing? How are you? Hi, what's happening?
 - It's good to see you
 - Other
2. Way to get someone's attention
 - Excuse me
 - Would you come here?
 - I have a question
 - I need help
 - Other
3. Introduce self; provide personal information.
 - My name is _____
 - Age _____ Where live _____
 - I go to school at _____ I'm from _____
 - Other _____
4. Ask questions to gain information or initiate topics
 - Is it time to _____ What time is it?
 - Where is _____ Why?
 - What's for lunch? _____ What are we going to eat?
 - How are you feeling? _____ Do you want to play a game?
 - What did you do _____ (yesterday, last night, last weekend)
 - What are you going to do (tonight, tomorrow, this weekend)
 - What do you like to do?
 - What do you like to watch on TV?
 - Other _____
5. Other
 - (give compliments) You look nice I like what you're wearing
 - (insults)
 - Names
 - Other

Facilitation

1. Indicate physical state/feelings.
 - I'm fine I'm tired I'm hurt I'm mad/angry
 - I love I miss I'm homesick I'm sick I'm hot
 - I'm cold I'm hungry I'm thirsty I like it
 - I don't like it I don't feel well
 - I'm uncomfortable in my wheelchair I've had enough
 - I am having a good day I am having a lousy day
 - Other

2. Seek help when needed.
 - I need help Please come here Please change my overlay
 - I want something added to (taken off) my overlay
 - I want to go outside go swimming go for a walk
 - eat drink go to the bathroom play a game talk to
 - sit in the hall watch tv listen to music go home
 - play on the computer go to the library play cards
 - write a letter go shopping sit by the girls/boys
 - go to my classroom go to PT go to OT go to speech
 - take a nap see the nurse listen to talking books
 - go on a field trip go to Blake Hall
 - I want to get out of my wheelchair
 - Other
 -
 -
 -
3. Polite social forms
 - Please Excuse me I'm sorry That's too bad
 - Thank you
 - Other
4. Provide time frame
 - Yesterday today morning afternoon tonight
 - last night last weekend tomorrow this weekend
 - vacation I went I will go I did I will
 - day night did
 - Other
5. Add detail to clarify.
 - time markers (above)
 - identifying phrases:
 - Someone from home
 - Someone in my class
 - Someone in my unit
 - My teacher
 - My friend
 - My family
 - Other
 - Other

Regulation

1. Express lack of understanding.
 - I don't know I don't understand Please repeat
 - What do you mean?
 - Other
2. Change topic appropriately.
 - I have a question to ask There is something I want to know
 - I have something to tell you.
 - Other
3. Interrupt politely.
 - Excuse me May I please interrupt
 - I need to say something
 - Other

4. Request more time.
 - Please wait. I need more time to finish.
 - Other
5. Indicate a mistake was made.
 - Oops! I didn't mean to say that That was a mistake
 - I made a mistake
 - Other
6. Maintain interest and monitor understanding.
 - Oh really? What happened next? How did you feel?
 - Other

Closure

1. Terminate conversation
 - Bye-bye Goodbye So long See you later
 - It was nice talking to you See you soon Later Gator
 - Other

Other Vocabulary

1. Special Purpose (sports, clubs)

2. Names

3. Other

prayer pledge of allegiance birthday greeting/song
 favorite:
 food
 activity
 color
 subject
 important recent events

AUG COM GENERAL PROGRAMMING STEPS*

Programming is the completion of specific steps with equipment to enable students to do something they couldn't do before. In the area of augmentative communication the desired result is a spoken message.

SIX GENERAL STEPS

1. Turn on the device
2. Tell the machine that you want to program a message
3. Choose a storage area/key
4. Enter the message
5. Store the message
6. Retrieve the message

Some devices will simply follow the general steps. Other devices may have several substeps within a step.

* Taken from Project ASTECH software

AUG COM GENERAL TROUBLESHOOTING STRATEGIES*

Troubleshooting strategies are used to locate and correct a problem. When using an augmentative communication devices, a common problem is that the device has NO SPEECH OUTPUT--which means you do not hear the device speak a message when you press a key.

GENERAL TROUBLESHOOTING CHECKLIST

Device _____
Company Name _____
Company Phone # _____
Date _____
Problem No Speech Output

Is the device on?

Is there a volume control?
Is the volume loud enough?

Is the battery charged?

Does the device have a method to turn the speech on/off?
Is speech on?

Is there a message programmed?

After using these general troubleshooting strategies, if the device still does not have speech output do the following:

- Check the device manual for more detailed, specific troubleshooting strategies.
- Call the company. Make sure you have the device in front of you when you call.

* Taken from Project ASTECH software

CHECKLIST FOR SUCCESSFUL IMPLEMENTATION OF AN AUGMENTATIVE COMMUNICATION DEVICE

	Yes	No	Comments
<p>1. Selection of the device involved all appropriate persons:</p> <ul style="list-style-type: none"> a. The student was involved in the selection of the device b. The parent(s)/guardian(s) were involved in the selection of the device c. Appropriate team members were involved in the selection of the device 			
2. An appropriate switch site/movement has been selected using the student's most consistent and efficient motor movement			
3. An appropriate switch has been selected			
4. The device is connected appropriately <ul style="list-style-type: none"> a. The switch is connected appropriately 			
5. The equipment is positioned appropriately so the student can easily access it <ul style="list-style-type: none"> a. The switch is positioned appropriately b. The device is positioned appropriately c. Positioning of the equipment does not take a significant amount of time 			
6. An appropriate staff member is appointed primary facilitator of the student's aug com device <ul style="list-style-type: none"> a. Primary facilitator is given extra planning time for : <ul style="list-style-type: none"> 1) ongoing vocabulary review 2) ongoing staff and family consultation 			
7. Appropriate training has been completed: <ul style="list-style-type: none"> a. All staff working with a student have been appropriately trained b. The student has been appropriately trained <ul style="list-style-type: none"> 1) The student has been trained in naturalistic communication settings c. The parent(s)/guardian(s) have been appropriately trained d. The siblings have been appropriately trained e. Classmates have been appropriately trained f. Peers have been appropriately trained g. A sufficient amount of time is allowed for all the above for training 			

8. Support is given to staff members			
9. The device is always available			
10. The device is always turned on			
11. The battery is charged systematically			
12. Expectation for the student's use of the aug com device are consistent across environments			
13. Daily activity (lessons) plans are written to include the student's use of the aug com system <ul style="list-style-type: none"> a. Student uses and is expected to use the device during all subjects, story time, snack/lunch, etc. 			
14. Appropriate IEP goals are written to improve the student's communication with the aug com device			
15. The vocabulary is appropriate <ul style="list-style-type: none"> a. The appropriate symbols were selected <ul style="list-style-type: none"> 1) The appropriate type of symbols was selected 2) The appropriate size of symbols was selected b. Motivating vocabulary was selected <ul style="list-style-type: none"> 1) Jokes, riddles were included 2) Peer slang (e.g., "Cowabunga dude!") was included 3) Holiday vocabulary was included 4) Recent events (both personal and public) were included 5) Songs were included c. The vocabulary is age-appropriate d. The student has the ability to initiate topics with the vocabulary e. The student has the ability to ask questions with the vocabulary f. Vocabulary is available for each activity during the day g. If overlays are used, the correct overlay is on for the correct activity h. The student is able to respond to classroom questions using the device i. Appropriate persons (e.g., student, parents, primary facilitator, teacher, other staff members, peers) were included in the collection/development of the vocabulary j. Vocabulary is reviewed/updated in a systematic manner 			

16. The "voice" on the device is appropriate for the student a. The voice matches the gender of the student b. The voice matches the age of the student			
17. The student is allowed enough time to respond			
18. Response to the student's communication attempts are similar to responses given to verbal students			
19. The student is allowed to respond independently . The student's communication attempts are not anticipated			
20. The student is able to transport the device easily a. The student is able to use the device in and out of a wheelchair b. The student is able to use the device inside and outside			
21. The aug com system is insured so that everyone feels comfortable with taking it everywhere			

Augmentative and Alternative Communication

*Committee on Augmentative Communication
American Speech-Language-Hearing Association*

The following document, developed by the American Speech-Language-Hearing Association (ASHA) Committee on Augmentative Communication, was adopted as an official statement by the ASHA Legislative Council (LC 11-90) in November 1990. (See Report: Augmentative and Alternative Communication, Asha, 33 (Suppl. 5) 7-10. Members of the committee included Carolyn Watkins (chair), Diane Bristow, Joan Bruno, Vince Byers, Avis Dawkins, Michelle Ferketic (ex officio), Rita Glass, Mark Mizuko, Barry Romich, and Tina Williams, with the guidance of Teris K. Schery (1988-1990 vice president for clinical affairs).

Position Statement

It is the position of the American Speech-Language-Hearing Association that communication is the essence of human life and that all people have the right to communicate to the fullest extent possible. Furthermore, provision of augmentative and alternative communication (AAC) services is within the scope of practice of speech-language pathologists and audiologists (ASHA, 1990).

AAC refers to an area of clinical, research, and educational practice for speech-language pathologists and audiologists that attempts to compensate and facilitate, temporarily or permanently, for the impairment and disability patterns of individuals with severe expressive, and/or language comprehension disorders. AAC may be required for individuals demonstrating impairments in gestural, spoken, and/or written modes of communication.

Roles and Responsibilities

The speech-language pathologist and audiologist practicing within the area of AAC shall:

1. Recognize and hold paramount the needs and interests of individuals who may benefit from AAC;
2. Acquire and maintain the knowledge and skills to provide quality professional services;
3. Utilize a service delivery approach that incorporates the goals, objectives, skills, and knowledge of various disciplines, as well as that of the individual and family members;
4. Implement a multimodal approach to facilitate effective communication;
5. Facilitate the individual's integration of AAC use in daily life;
6. Acquire and maintain knowledge about funding issues as they relate to AAC systems and services, education and research; and
7. Recognize the need for and promote basic and applied research in AAC.

*Committee on Augmentative Communication
American Speech-Language-Hearing Association*

The following report was developed by the American Speech-Language-Hearing Association (ASHA) Committee on Augmentative Communication. Members of the committee included Carolyn Watkins (chair), Diane Bristow, Joan Bruno, Vince Byers, Avis Dawkins, Michelle Ferketic (ex officio), Rita Glass, Mark Mizuko, Barry Romich, and Tina Williams, with the guidance of Teris K. Schery (1988-1990 vice president for clinical affairs).

Introduction

Communication is the essence of human life. Approximately 2 million Americans are unable to speak or demonstrate severe communication impairments (ASHA, 1987).

Individuals requiring augmentative or alternative communication (AAC) may demonstrate impairments in gestural, spoken, and/or written modes of communication. There is a wide range of disabilities that may leave an individual without adequate ability to communicate through gestures, speech, and/or writing. These include congenital and acquired conditions, progressive neurological diseases and temporary conditions (Vanderheiden & Yoder, 1986).

The First Amendment of the Constitution of the United States guarantees the right of freedom of speech. For persons with severe communication impairments this is more than a constitutional issue. It is the belief of the American Speech-Language-Hearing Association (ASHA) that, in order to realize their constitutional right, persons with severe communication impairments should have access to an AAC system and services.

Public awareness of the needs and capabilities of individuals with disabilities has grown rapidly in recent years. The provision of services to individuals with disabilities, including those with AAC needs, is directed and encouraged by specific federal (U.S. Department of Education, 1988), state, and private initiatives. These initiatives range from guaranteeing civil rights (e.g., Public Law 101-366, the Americans with Disabilities Act) to providing funds for education, research, products, and services. These developments have contributed to the rapid growth of services and technology development in the area of AAC. ASHA has

joined many other professional and advocacy organizations in providing leadership in the development of this field.

AAC is an area of clinical and educational practice that attempts to compensate temporarily or permanently, for the impairment and disability patterns of individuals with severe communication disorders (ASHA, 1989). For nearly a decade the document, "Position Statement on Nonspeech Communication" (ASHA, 1981) has guided the members of the Association in addressing the needs of individuals using AAC. Recently, "Competencies for Speech-Language Pathologists Providing Services in Augmentative Communication" (ASHA, 1989)¹ defining the skills necessary to provide services to individuals using AAC was published. The area of AAC has continued to grow and develop at a rapid rate. The knowledge base has expanded, creating new materials, skills, and resources. As a result of this progress, and in keeping with the ASHA Executive Board policy of periodic review of products and position statements (EB 123-87), "Position Statement on Nonspeech Communication" (ASHA, 1981) has been updated to reflect current philosophy, knowledge, and practices.

This revised document reflects changes in terminology, the roles of the speech-language pathologist and audiologist, and the service delivery model. The need for an individual to demonstrate specific cognitive prerequisites prior to initiating intervention has not been sufficiently documented (Kangas & Lloyd, 1988). It is recognized, however, that not all individuals will be able to utilize a high tech system following an initial intervention program. Selection of a multimodal system (e.g., one that may include natural gestures, a manual board and electronic communication device) is advocated. Competencies are defined and the roles of speech-language pathologists and audiologists are broadened.

Terminology

Individuals with severe communication disorders are

¹Hereafter referred to as "Competencies."

Reference this material as follows:

American Speech-Language-Hearing Association. (1991). Report: Augmentative and alternative communication. *Asha*, 33 (Suppl. 5), 9-12.

those who may benefit from AAC—those for whom gestural, speech, and/or written communication is temporarily or permanently inadequate to meet all of their communication needs. For those individuals, hearing impairment is not the primary cause for the communication impairment. Although some individuals may be able to produce a limited amount of speech, it is inadequate to meet their varied communication needs. Numerous terms that were initially used in the field, but are now rarely mentioned, include speechless, nonoral, nonvocal, nonverbal, and aphonic.

An **AAC system** is defined as an integrated group of components, including the symbols, aids, strategies, and techniques used by individuals to enhance communication. The system serves to supplement any gestural, spoken, and/or written communication abilities. The following key terms used throughout the document are defined below:

- **Symbol** - a visual, auditory and/or tactile representation of conventional concepts (e.g., gestures, photographs, manual sign sets/systems, picto-ideographs, printed words, objects, spoken words, Braille).

- **Aid** - a physical object or device used to transmit or receive messages (e.g., a communication book, board, chart, mechanical or electronic device, or computer).

- **Strategy** - a specific way of using AAC aids, symbols, and/or techniques more effectively for enhanced communication. A strategy, whether taught to an individual or self-discovered, is a plan that can facilitate one's performance.

- **Technique** - a method of transmitting messages (e.g., linear scanning, row-column scanning, encoding, signing and natural gesturing).

- **Multimodal System** - an approach which utilizes the individual's full communication capabilities, including any residual speech or vocalizations, gestures, signs, and aided communication.

- **Interdisciplinary** - an approach which incorporates the goals, objectives, skills, and knowledge of various disciplines, as well as that of the individual and the family members. This approach may be implemented by either a single team member serving the primary role in consultation with other team members (often defined as transdisciplinary), or by several team members, each implementing the goals and objectives of the other disciplines as indicated.

The Role of the Speech-Language Pathologist and Audiologist

AAC services should be provided by a team that follows an interdisciplinary service delivery model. The team membership, may include but is not limited to the following: speech-language pathologist, audiologist, the individual using AAC, caregivers, educator, extended family and friends, occupational therapist, optometrist, physical therapist, physician(s), psychologist, manufacturers' representative(s), rehabilitation engineer, representative of funding agency(ies), seating and fitting specialist, social worker, third-party agent, and vocational counselor.

Planning and coordinating team services should be the primary responsibility of the professional(s) treating

and providing ongoing intervention with an individual using an AAC system. This professional(s) needs to possess knowledge in the area of language development and communication interaction, both of which are critical to the success of an individual's AAC program. In most instances, the speech-language pathologist is the person most qualified to meet these requirements (ASHA, 1981). The professional role of the speech-language pathologist is based on the guidelines set forth in "Competencies" and includes the following:

- Identification of persons who might benefit from AAC intervention;
- Determination of specific AAC components and the strategies needed to maximize functional communication;
- Development of an intervention plan to achieve maximal functional communication between individuals who use AAC components and their communication partners;
- Implementation of an intervention plan to achieve maximal functional communication;
- Evaluation of the functional communication outcomes of the intervention plan;
- Evaluation and application of evolving AAC aids, techniques, symbols and strategies in AAC;
- Advocacy for increased attention from community, regional, government and education agencies to the communication and funding needs of persons with severe speech and language impairments;
- Consultation with the individual using AAC, family, caregivers and allied personnel regarding communication status and AAC needs and intervention approaches;
- Provision of inservice education for medical and allied health personnel, other health and education professionals, and consumers on the communication needs and AAC potential of individuals with AAC needs;
- Coordination of AAC services;
- Development of follow-up procedures to evaluate the effectiveness of an individual's AAC system;
- Development of procedures to disseminate clinical, educational, and research information in AAC; and
- Recognition of the need for and promotion of basic and applied research in the field of AAC.

The primary role of the audiologist in the service delivery model is the assessment and treatment of auditory function. The hearing evaluation may be best accomplished through a cooperative approach with the speech-language pathologist or other AAC member(s) on the team. The standard audiological assessment may need to be adapted to meet the optimal response mode and strategies of the individual using AAC. The audiologist shall develop and maintain an appropriate listening environment for the person using AAC. The audiologist should participate, as needed, in the ongoing intervention program.

Service Delivery

- 1) Determination of the AAC Intervention Program

An interdisciplinary approach to an assessment for an AAC system is recommended. The purpose of the assessment is to develop an effective intervention program. It may include evaluation of physical, sensory, emotional, cognitive, and educational performance; speech and language skills; auditory skills; correct seating and positioning; general communication skills; communication needs (conversational and written) for social, emotional, educational, and/or vocational purposes; and family needs. Consideration should be given to the individual's present and future skills and needs. The nature and quality of supportive services should be addressed, as well.

In view of limited empirical data to support the requirement for prerequisite skills, communication intervention should be initiated at the level of existing cognitive skills. It is also recognized that some individuals may not demonstrate sufficient progress in the treatment program to require ongoing intervention by the speech-language pathologist.

2) Selection and Development of an Effective AAC System

Once the need for intervention has been determined, the AAC system, which can provide the individual with the most effective and functional communication, needs to be selected and developed. The system should be multimodal, including a range of techniques and strategies to provide the individual with a functional AAC system in multiple environments and situations. System selection involves the consideration of aided and unaided AAC techniques, including natural speech and gestures. In addition to determining the physical means of access, a symbol system with appropriate vocabulary and communicative messages should be implemented.

3) Service Implementation and System Integration

Once a system has been selected, the individual using AAC will be provided with training in strategies to enable effective utilization of the techniques and symbol systems for the achievement of communicative competence, as defined by the communication needs of the individual and the message-receiving community. This instruction includes use of appropriate techniques and selected symbols; strategies for developing language for effective communicative interaction in both structured and natural environments; facilitation of language (re)acquisition, and speech training, if appropriate, pragmatic communication goals; and the training of persons who interact with individuals using AAC. The speech-language pathologist must allocate sufficient time to implement the AAC system effectively.

4) Follow-Up and Ongoing Evaluation

Appropriate implementation includes: (a) the ongoing evaluation of communication/interaction effectiveness; (b) the need for appropriate alteration of the system and communication strategies, if indicated; (c) preparatory training for future facilitators; and (d) training for future use of different or more complex systems.

Speech-language pathologists and audiologists who are knowledgeable about AAC have a professional responsibility to share information through inservices and interpersonal communication with other professionals who may be serving the individual using AAC.

Quality Assurance

1) Ethics

The Code of Ethics (ASHA, 1990) of the American Speech-Language-Hearing Association, stresses the professional responsibility of speech-language pathologists and audiologists in providing services. Professionals in the area of AAC must observe the fundamental rules of ethical conduct. Components of the Principles of Ethics that are particularly relevant to the area of AAC are:

Principle of Ethics I: Individuals shall hold paramount the welfare of persons served professionally.

- A. Individuals shall use every resource available, including referral to other specialists as needed, to provide the best service possible.
- B. Individuals shall evaluate services rendered and products dispensed to determine effectiveness.

Principle of Ethics II: Individuals shall maintain high standards of professional competence.

- B. Individuals shall identify competent, dependable referral sources for persons served professionally.

● Ethical Proscriptions

1. Individuals must neither provide services nor supervision of services for which they have not been properly prepared, nor permit services to be provided by any of their staff who are not properly prepared.

Principle of Ethics III: Individuals' statements to persons served professionally and to the public shall provide accurate information about the nature and management of communicative disorders, and about the profession and services rendered by its practitioners.

● Ethical Proscriptions

1. Individuals must not misrepresent their training or competence.
2. Individuals' public statements providing information about professional services and products must not contain representations or claims that are false, deceptive, or misleading.
3. Individuals must not use professional or commercial affiliations in any way that would mislead or limit services to persons served professionally.

Principle of Ethics IV: Individuals shall honor their responsibilities to the public, their profession, and their relationships with colleagues and members of allied professions.

● Ethical Proscriptions

1. Individuals must not participate in activities that constitute a conflict of professional interest.

Principle of Ethics V: Individuals shall uphold the dignity of the profession and freely accept the profession's self-imposed standards.

● Ethical Proscriptions

1. Individuals shall not engage in violations of the

Principles of Ethics or in any attempt to circumvent any of them.

2. Individuals shall not engage in dishonesty, fraud, deceit, misrepresentation, or other forms of illegal conduct that adversely reflect on the profession or the individual's fitness for membership in the profession.

2) Efficacy

Speech-language pathologists must determine whether an individual's AAC progress bears a direct relationship to the type and frequency of AAC intervention. As such, the speech-language pathologist must assume responsibility for developing outcome measures that focus on the effectiveness of AAC services. This requires that the speech-language pathologist carefully selects the behaviors and measurement tools that will accurately reflect the impact of the intervention (Beukelman, 1986).

3) Professional Preparation

Competency areas, knowledge base, and skills are identified in "Competencies." All speech-language pathologists and audiologists should have the knowledge and skills to evaluate and provide services to the individual with severe communication impairments, although it is acknowledged that clinicians will have developed varied levels of competence in the area of AAC service delivery.

Although educational preparation and training programs offering instruction or clinical experience in AAC have increased, not all programs provide sufficient AAC training. It is imperative, therefore, that speech-language pathologists and audiologists who provide services to individuals using AAC participate in ongoing continuing education. This can be achieved through consultation with experienced AAC providers, conference and workshop attendance, and researching the AAC literature.

Individual Rights

The speech-language pathologist and audiologist should recognize and hold paramount the interests and rights of the individual using an AAC system by being sensitive to individual cultural and linguistic needs. Individuals using an AAC system should be an integral part of the service delivery process. The individual's interests should be a primary consideration in the selection and implementation of a communication system. Opinions of the individual, family and caregivers need to be sought and considered when providing new or updating existing families and caregivers equipment and services.

Funding

It is important for the speech-language pathologist coordinating AAC services to have access to

current funding information. In order to maintain quality services, every effort should be made not to compromise the needs of the individual on the basis of cost. Funding is needed to support the assessment process, system acquisition and maintenance, intervention programs, and follow-up services. In addition, funds need to be available to support research and continuing education activities.

Research

There is a major need to expand the research upon which AAC service delivery is based. Both basic and applied research are needed. Some of the areas that have been identified include: (a) all aspects of symbols/systems; (b) assistive technology; (c) development of communication competence and interaction; (d) literacy; (e) education, vocation, and quality of life; (f) efficacy; (g) epidemiological and demographic characteristics; (h) training of professionals and communicative partners.

ENVIRONMENTAL CONTROL

The Project ASTECH software explores environmental control devices, discusses assessment, and introduces installation, programming and troubleshooting strategies. A list of all the environmental control devices mentioned in the Project ASTECH software is included in your Resource Guide to assist you in contacting companies and ordering these devices. In our software program it would be impossible to include information about every available device on the market. Our purpose was to give you categories and characteristics of devices with representative examples. You are encouraged to add information about other devices to your Resource Guide.

In the ASTECH software program, you learned about several representative samples of simple and complex devices. Because of the number and varying degrees of complexity of environmental control devices, we have included a comparison chart to help you sort through devices. You also will find directions for constructing your own battery interrupt, which was shown and discussed in the software.

The programming and troubleshooting strategies you learned about in the software are included in checklist forms for your future use.

Kids On

Battery Interrupter

Materials

24 or 24 Gauge, Polarized Stranded Wire (Radio Shack #278-1301 or #278-1385)

Miniature Inline Jack (Radio Shack #274-333)

Double-Sided Copper Clad Board

Rosin Flux Remover (Radio Shack #64-2051)

Rosin Core Solder

Equipment

Soldering Iron

Hack saw

Wire Strippers/Cutters

Needle Nose Pliers

Scissors

Permanent Ink Marker

Use a battery to help gauge size of the coppersquare

Instructions

1. Determine a size for the battery interrupter that you are going to make. The interrupter should be of comparable size to the batteries in the device in which it will be used. Place an appropriately sized battery over the copper board and use a marking pen to mark its size. (The width of the copper square should be approximately equal to the diameter of battery. Use a small hack saw to cut out the copper square.

Bevel edges and corners of copper square

2. After cutting out the copper square you will notice that the edges of the square are rough and jagged and corners are sharp and pointed. For this reason, the edges and corners of the copper square should be beveled. Use a small metal file to smooth the rough edges and round the sharp corners.

3. Use wire cutters to cut a piece of the polarized wire that is about 6 to 8 inches long. (This length should be adequate for most situations; however, if your particular application requires a longer or shorter length, cut the wire to the desired length.) After the wire has been cut, the leads at both ends must be separated and stripped. To separate the leads, use the wire cutters to make a small cut directly between the two

Split wire leads and separate

Reprinted with permission of the Macomb Projects

BEST COPY AVAILABLE

12EC

Strip about 1/4 to 3/8 inch of the protective plastic insulator from each lead

leads at both ends of the wire. Carefully pull the leads apart. Note that each lead retains its own protective plastic insulator. Separate the leads by about 1/2 to 3/4 inch on one end of the wire and by 1 1/2 to 2 inches on the other.

4. Use wire strippers to carefully remove 1/4 to 3/8 inch of the protective plastic insulator from each of the wire leads. After all four leads have been stripped, you will be ready to solder the bare wire leads on one end of the wire to the copper square.

5. Position the copper square in front of you and select the end of the wire that has the leads separated by only 1/2 to 3/4 inch. Flatten the exposed wire extending from each lead (do not twist the strands together). Position the wire along one edge of the copper square. The insulator of the wire lead you are soldering should be touching the edge of the copper square. Flip the copper square over and repeat this procedure with the other lead.

6. Connect the miniature phone jack to the other end of the wire. Unscrew the protective plastic cap from the phone jack, thread the wire leads through the cap and slide the cap down the wire and out of the way. Thread one of the exposed wire leads through the hole in the positive (short) terminal. Thread the wire through from the inside to the outside, bend the exposed wire over so that it is flush with the terminal, and solder it in place. Do the same thing with the remaining lead and the negative (long) terminal. After both connections have been soldered, cut a small piece of electrical tape and carefully wrap it around the connection on the positive (short) terminal making sure that all of the exposed wire is covered. Slide the protective plastic cap back down over the exposed connections and reconnect it to the jack.

Tips on Batteries

Batteries play an important role in the performance and reliability of many everyday appliances, toys, and devices. Because of the different types, sizes, and electrical characteristics of the batteries, care must be taken in selection and replacement.

Here are some hints from AbleNet for selecting and using batteries that will give your equipment the power needed to run efficiently:

- Batteries are not interchangeable! They do not deliver the same level of current, voltage or length of service.
- Alkaline batteries will always outlast regular (carbon-zinc) batteries. An alkaline battery used in a motor toy will last up to 1,000% longer than most carbon-zinc batteries.
- Do not combine different types, ages, grades, or name brands of batteries in the same device.
- Make sure that battery contacts are clean and shiny; also store batteries in a cool area. Heat greatly reduces battery longevity.
- Never attempt to recharge a battery unless it is clearly marked "rechargeable."
- Alkaline, silver, mercury, nickel-cadmium, and lithium batteries must not be disposed of by burning because toxic substances can be released into the environment. Check community sources for appropriate disposal.
- To slow down a toy, wrap a dead battery in aluminum foil.

ENVIRONMENTAL CONTROL GENERAL PROGRAMMING STEPS*

Programming is the completion of specific steps with equipment to enable students to do something they could not do before. When we discuss programming simple environmental controls, the desired result is that students can turn electrical appliances on and off.

Programming Steps

You will find these general programming steps apply to most simple environmental control units that turn electrical appliances on and off, however, programming steps may be more complex when programming more complex ECUs.

1. Identify or set code on receiver module

Codes may be made up of letters, numbers or colors. The code identifies which receiver module/appliance will be turned on and off.

2. Identify or set code on transmitter

The code on the transmitter must match the code on the receiver module.

3. Use corresponding button on transmitter to turn appliance on and off

Some environmental control units will simply follow these general steps. Other devices may have several substeps within a step.

* Taken from Project ASTECH software

ENVIRONMENTAL CONTROL GENERAL TROUBLESHOOTING STRATEGIES*

Troubleshooting is a strategy used to locate and correct a problem. When using an environmental control unit, a common problem you may encounter is the appliance does not turn on or off.

General Troubleshooting Checklist:

Device _____
Company Name _____
Company Phone # _____
Date _____
Problem _____

Have the correct codes been programmed or identified?

Are you using the correct button on the remote transmitter?

Is the appliance in the "on" position?

Does the appliance work when plugged into a regular electrical outlet?

Have you checked the batteries in the remote transmitter?

After using these general troubleshooting strategies, if the device still does not work correctly, do the following:

- Check the device manual for more detailed, specific troubleshooting strategies.
- Call the company. Make sure you have the device in front of you when you call.

* Taken from Project ASTECH software

ASSESSMENT

In the Project ASTECH software, you learned that the "team" is involved in assessing students and matching assistive technology to meet those students' needs. We have included a handout which defines who makes up the assistive technology team and the roles and responsibilities of each team member. It is important that each team has clearly defined responsibilities and roles which meet the needs of the team and their specific situation. Another handout, Description of Areas to be Assessed and Known Tests to Be Used, has been provided for you to list the specific tests used in your setting. This may assist your team in designating assessment responsibilities and protocol.

We have provided screen printouts from the Project ASTECH software and made them into useable forms for you to use. Please use whichever form you find most useful. The context questions are listed on both forms so you can address these issues regardless of which form you choose to use.

You may have noticed the Scanning Assessment Tool software that is in a separate folder on your CD. This section of your Resource Guide includes the manual that you will need in order to use it.

Content

Roles of Team Members	1A - 2A
Assessment Areas	3A
Computer Access Assessment	4A - 8A
Augmentative Communication Assessment	9A - 13A
Environmental Control Assessment	14A - 17A
Scanning Assessment Tool	18A - 33A

ROLES OF TEAM MEMBERS

Research and practice suggest that teams function best when roles and responsibilities are clearly delineated. The members who usually make up a child's team are described below:

- **Child** - Children are the only constant on the team, bringing with them their unique personalities, abilities, challenges, and fantasies. The children are active participants, and their opinions must be respected and valued. After all, they are the ones who will or will not benefit from technology, and will or will not use it.
- **Family** - The family provides support and helps to develop the child's world knowledge base. It is important to realize that many families have concerns unrelated to their children with disabilities that will affect their level of participation. In some cases, cultural issues and existing family dynamics may even inhibit active involvement. Varying degrees of participation are understandable and acceptable. The family can be a child's best advocate and can develop a child's sense of confidence, self-esteem, and independence.
- **Aides/instructional assistants** - These individuals work with teachers to implement the curriculum and make learning possible. They play a key role in fostering peer interaction, self-confidence, and independence.
- **Audiologists** - Audiologists test hearing, recommend hearing technologies, and provide instruction in the use of hearing technologies. They also give suggestions for enhancing children's listening skills.
- **Classroom teachers** - The classroom teacher is responsible for the child's total education program. The teachers must balance the activities and time available during the school day and collaborate with the family and other professionals to ensure that the "educational path" is followed. They develop and implement educational strategies that allow assistive technology users to participate in classroom activities so that functional, academic, and social goals can be accomplished.
- **Occupational therapists** - Occupational therapists, like physical therapists, evaluate children's posture and mobility. Occupational therapists then recommend and implement procedures and devices that will meet seating and mobility needs. In addition, occupational therapists help determine which devices and strategies children can use to access other technologies, such as those for learning and communicating, as well as moving.
- **Peers** - Children's peers may be friends, classmates, helpers, and tutors. Peers provide emotional support and a special link to certain aspects of children's lives in which adults have little involvement. They provide models for learning and communicating.
- **Physical therapists** - Physical therapists evaluate children's posture and mobility and are subsequently involved in recommending and implementing a variety of techniques, devices, and strategies that will appropriately, position the children to facilitate their comfort, proper development, and safety, and that will increase their mobility.

Reprinted with permission of the American Speech-Language-Hearing Association

- **Physicians** - Physicians address medical issues and monitor medical complications. They are involved in the prescription of the seating and, and often, the mobility device. The physician helps to procure funding from third-party payers (e.g., insurance companies).
- **Psychologists** - Psychologists assess children's intellectual abilities and learning styles. They must be skilled at making necessary adaptations to determine a child's cognitive functioning, taking into account present physical disabilities and behavioral characteristics.
- **School principals, directors of special education, superintendents** - These designated leaders have job descriptions that involve management of educational programs and fiscal issues. They are leaders and set the tone. They understand the school system and often can make things happen. They have the authority to allocate staff time as deemed appropriate. Their support is often critical to the successful implementation of assistive technology.
- **Special educators** - Teachers with special education backgrounds develop an in-depth understanding of each child's cognitive profile and learning style as they relate to the curriculum. Based on this knowledge, the special educator can modify curriculum goals and materials and provide additional resource support, such as recommending software that enables children to participate in classroom activities (e.g., art projects, creative, writing).
- **Speech-language pathologists** - Speech-language pathologists suggest ways to maximize a child's speech, language, and communication during each activity (e.g., use of a communication device during circle time and a miniboard at home during bathtime). They often help develop vocabularies, design overlays, suggest strategies to facilitate interaction, and integrate speech and language development into the educational curriculum.
- **Team facilitator** - This individual possesses the knowledge and the skills to coordinate team meetings, ensure follow-through of team goals, see that time lines are met, and generally manage team activities so that no activity deemed important "falls through the cracks."
- **Technical resource personnel** - Rehabilitation engineers and / or technologists and assistive equipment suppliers / manufacturers help make decisions when specific technology is being considered. They can assist in procuring, designing, fitting, and maintaining the equipment and can also help setting up / modifying equipment and software and designing work stations.

The individuals cited above play an important part in helping children use technology effectively. The roles they play often vary; those who implement the use of technology are not always the same as those who prescribe or design it.

Description of Areas to be Assessed and Known Tests to Be Used

Areas to be Assessed

Description and Known Tests To Be Used

___ Vision	Measures a student's near and far point visual acuity, eye muscle control, depth perception, color blindness, orientation/mobility skills, and the need for/use of magnification and refraction systems. Known tests to be used: _____ _____
___ Hearing	Measures a student's hearing acuity for pure-tones and speech, middle ear function, central auditory processing skills, and the need for/use of amplification systems. Known tests to be used: _____ _____
___ Health/Motor	Measures a student's physiological and neurological condition including gross and fine motor skills, metabolic functioning, evidence of disease or injury, and the need for/use of personal mobility systems. Assessment may also include laterality, directionality, balance, kinesthetic skills, tactile skills, and ambulatory/postural problems. Known tests to be used: _____ _____
___ Speech/Language	Measures a student's articulation skills, auditory perception, voice, fluency, receptive/expressive language development, and the need for/use of augmentative or alternative communication systems. Known tests to be used: _____ _____
___ Intellectual/Cognitive	Measures a student's general mental abilities including specific strengths and weaknesses, and sensory perceptual learning processes. Known tests to be used: _____ _____
___ Adaptive Behavior	Measures a student's ability to function and maintain self independently, and the degree to which the student meets satisfactorily the culturally imposed demands of personal and social responsibility. Known tests to be used: _____ _____
___ Social/Emotional Behavioral	Measures a student's behavioral/social/emotional development in relation to learning, interpersonal relationships, and self. Known tests to be used: _____ _____
___ Academic Achievement	Measures a student's educational skills and achievement levels including pre-academic, academic, career, and vocational education with and without the use of assistive technology as appropriate. Known tests to be used: _____ _____

Computer Assessment Questions

Motor:

- Can the student accurately press a 1/2" key?
 - Can the student reach all 4 corners of the regular keyboard?
 - Can the student press the keys at a rate which is acceptable to the student and meets the classroom expectations?
- Can the student accurately press a 3/4" to 1" key or area?
- Can the student move the cursor on the computer screen using a mouse?
 - Can the student control the click function of the mouse?
- Can the student control the cursor on the screen using a trackball?
- Can the student control head movements?
- Is the student's speech easily understood?
- Can the student accurately touch an area that is smaller than the size of a key on the regular keyboard?

Sensory:

- Does the student have normal vision, with or without corrections such as eyeglasses?
- Does the student have normal hearing, with or without corrections such as hearing aids?
- Does the student respond as other students to touching textured surfaces?

Cognitive:

- Does the student understand the concept of cause and effect?
- Does the student have letter and number recognition skills?
- Does the student demonstrate age appropriate memory skills?

Computer Access Assessment Checklist

Name _____

Date _____

	Y	N	Comments
Motor			
<i>Note: The student should be in an optimal, functional position</i>			
Keyboard			
Can accurately press a 1/2" key, can include using a keyguard			
Can reach all 4 corners of the regular keyboard			
Mouse			
Can move the cursor on the computer screen using a mouse			
Can control the click function of the mouse			
Trackball/Joystick			
Can control the cursor on the screen using a trackball			
Can control the cursor on the screen using a joystick			
Expanded Keyboard			
Can accurately press a 3/4" or larger key or area			
Can reach all four corners of a 10"x20" rectangle			
Mini Keyboard			
Can accurately touch an area that is smaller than the size of a key on the regular keyboard			
Has difficulty touching all corners of a regular keyboard			
Headpointers			
Can control head movements			
Voice Input			
Speech is easily understood			
Switch			
Has a consistent, reliable movement			
*Checking the yes column indicates that the input device may be an option			
Sensory			
Has normal vision, with or without corrections such as eyeglasses			
Has normal hearing, with or without corrections such as hearing aids			
Responds as others to touching textured surfaces			
Cognition			
Understands cause and effect			
Has letter and number recognition skills			
Demonstrates age-appropriate memory skills			

Context Issues:

Does the student want to use the computer with the input/output device?

What type of computer (Mac, PC) does the student currently have or need to use?

Who is buying the input/output device?

Where will the student use the computer?

Who will train the student to use the input/output device?

Introduction

What is the Scanning Assessment Tool?

The Scanning Assessment Tool program provides scanning accuracy and speed information for single-switch users. This information is collected using three modes: auto, inverse, and step scanning. Data from up to ten sessions may be graphed or tabulated at once. In this way, a client's performance using different scanning modes and/or delay times ("speeds") may be compared, and improvement over time may be demonstrated.

Intended Users

The Scanning Assessment Tool was designed for use by Occupational Therapists, Speech-Language Pathologists, and other assistive technology providers, to help determine the most effective scanning technique for individual clients. This manual assumes basic familiarity with Macintosh™ use. Please refer to the documentation supplied with your Macintosh™ (including the "Macintosh Basics" program) for more information.

System Requirements

- The Scanning Assessment Tool requires the following hardware:
- A Macintosh™ computer with 512x342 or greater screen resolution.
 - Either HyperCard 2.1 or higher, or HyperCard Player.
 - System 7.0 or higher.
 - A hard disk drive.
 - A Macintosh Switch Interface (Don Johnston Developmental Equipment part number M09), Ke:nx (Don Johnston Developmental Equipment part number M42), or equivalent.
 - Switches.

Installation

Follow these steps to install the Scanning Assessment Tool on your hard drive:

- Turn on your Macintosh™ and open the folder on your hard drive where the Scanning Assessment Tool will be placed.
- Insert the Scanning Assessment Tool disk into the disk drive.
- Double-click on the Scanning Assessment Tool disk icon to open the disk.
- Drag the “Scanning Assessment Tool ” and “Scanning Assessment Tool-LS” files to the desired folder on your hard drive.
- Check to be sure you have installed the Don Johnston Macintosh Switch Interface or Ke:nx according to the manufacturer’s instructions.
- Refer to the Macintosh Switch Interface or Ke:nx user’s manual to connect the desired switch.

-It is important to use the Scanning Assessment Tool on your hard drive, and not on the floppy disk, to ensure accurate scan timing. To conserve hard drive space, the file “Scanning Assessment Tool-LS” may be eliminated on Macs with 512x342-resolution screens (e.g., Mac Classic).

Operation

Overview

The Scanning Assessment Tool consists of a set-up screen, three linear scanning arrays (3, 6, and 9 boxes), and graphing and tabulating utilities. When you run the Scanning Assessment Tool, a title screen is displayed (Figure 1). Click on the "Begin Assessment" button. At this time, the set-up screen is displayed (Figure 2). Specify the desired set-up parameters (number of boxes, scanning mode, delay time, name of switch, and switch position). To begin the first session, click the "Begin Session" button or choose "Begin Session" from the Assessment menu.

At the beginning of each session, the linear scan array is displayed with the scanning mode in the lower right corner (Figure 3). To begin each trial, position the mouse pointer over the "Begin Trial" button. Your client activates his or her switch to begin the trial. This avoids false starts and the client not being ready when the trial begins. After the switch is released, the computer says, "Ready, set, go," and the trial begins.

For each trial scan, after the computer says "Go," it waits for the amount of time you specified as the Starting Delay on the set-up screen. Then, the scan begins. A smiling face is displayed at the target box in the array. The hatch-marked, thick-bordered box is the current position of the scan.

If the client correctly selects the target box, two short beeps are heard. After every third correct selection, the computer provides verbal reinforcement ("Good!" or "Terrific!"). A buzzer sound is heard if the incorrect box is selected, or if no selection is made by the end of one scan through the array. This is the end of the trial.

After each trial is completed, you may cancel the trial or cancel the session if desired (see "Assessment Menu Commands," below). To continue with the next trial, position the mouse over the "Begin Trial" button. The client activates the switch to start the next trial.

After the session is completed or canceled, the program returns to the set-up screen. From there, you can make changes to the set-up (see "The Set-Up Screen," below). You can also graph the data, perform file-management operations, or quit (see "Assessment Menu Commands," below).

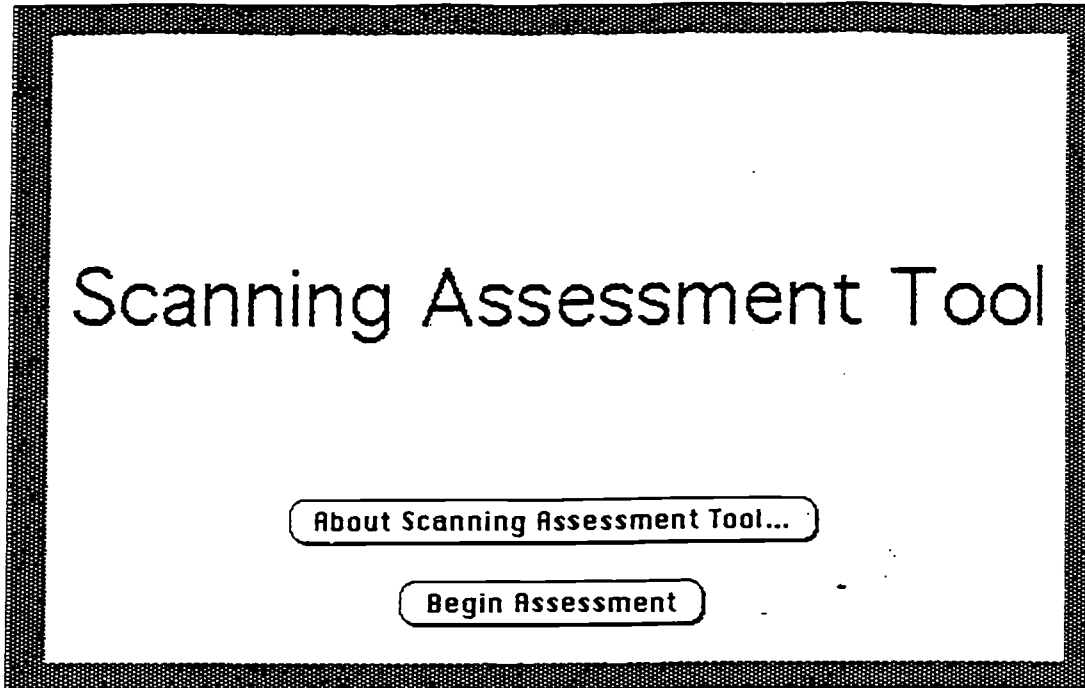

Figure 1: The title screen.

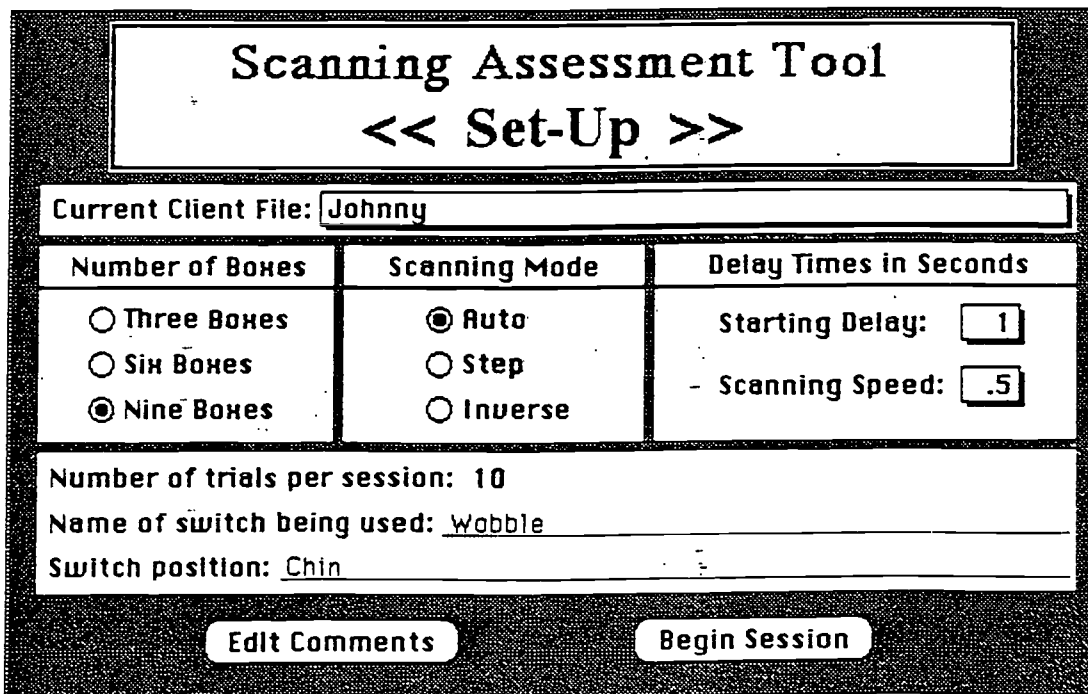

Figure 2: The set-up screen.

Figure 3: The 6-box scanning array. The 3- and 9-box arrays are similar.

The Set-Up Screen

The main display of the Scanning Assessment Tool is the set-up screen (Figure 2). It is where you specify the parameters of the scan, and the file to which performance data will be saved. The following controls are found on the set-up screen:

Current Client File

The box labeled "Current Client File" shows what client scan data file is open (Figure 2). Only one client file can be open at a time. After each scanning trial, the data for that trial are saved to the client file automatically. To start a new client file, or to open an existing file (to graph old data or append additional data), click on the box labeled "Current Client File." Please refer to "Assessment Menu Commands," below, for details about file commands.

Number of Boxes

The Scanning Assessment Tool provides linear scanning arrays of 3, 6, and 9 boxes in length for client testing. To select the number of boxes for subsequent test sessions, click on the "Three Boxes," "Six Boxes," or "Nine

Boxes” button (Figure 2). Please note that graphs and tables produced within the Scanning Assessment Tool do not specify the size of the scanning array. You can specify the number of boxes as a comment, however. Please refer to “Edit Comments,” below, for more information about comments. Please refer to the “Graph/Tabulate Data” menu command, below, for more information about graphs and tables.

Scanning Mode

The Scanning Assessment Tool provides testing of auto, step, and inverse scan modes. To select the scanning mode for subsequent test sessions, click on the “Auto,” “Step,” or “Inverse” button (Figure 2). In auto scan mode, the cursor moves along the scanning array until the switch is activated; switch activation makes the selection. In step scan mode, each momentary activation of the switch advances the cursor to the next box; not activating the switch indicates the selection. In inverse scan mode, prolonged activation of the switch moves the cursor along the scanning array; releasing the switch makes the selection. Performance across modes can be compared using graphs and tables. Please refer to the “Graph/Tabulate Data” menu command, below, for more information about graphs and tables.

Delay Times

Auto, step, and inverse scan modes have associated delay times: starting delay, scanning speed, and acceptance time. These are specified on the set-up screen. The values are given in seconds for all three times. Please note that scanning speed appears for auto and inverse scanning, and changes to acceptance time for step scanning.

Starting Delay

For all modes, the starting delay is the amount of time between the display of the target box on the scanning array, and the start of the scan. To change the starting delay, click on the number in the box to the left of the words “Starting Delay” (Figure 2). Type the new starting delay time in the box that appears. Click the “OK” button to keep the new time after you have typed it, or the “Cancel” button to keep the old time.

Scanning Speed

Auto and inverse modes have a delay referred to as “Scanning Speed.” This is the length of time the cursor remains at one box in the scanning array, before moving to the next box. (Note that this is not, strictly speaking, a “speed” value.) The scanning speed is displayed on the set-up screen whenever auto or inverse mode is used. To change the scanning speed, click on the number in the box to the left of the words “Scanning Speed” on the set-up screen. Type the new time in the box that appears. Click the “OK”

button to keep the new time after you have typed it, or the "Cancel" button to keep the old time.

Acceptance Time

Step mode has a delay referred to as "Acceptance Time." This is the length of time the switch must remain inactivated in order to select a box. The acceptance time is displayed on the set-up screen whenever step mode is used. To change the acceptance time, click on the number in the box to the left of the words "Acceptance Time" (Figure 2). Type the new selecting delay time in the box that appears. Click the "OK" button to keep the new time after you have typed it, or the "Cancel" button to keep the old time. Please note that acceptance time is also called a "speed" on graphs and tables produced by the Scanning Assessment Tool.

Number of trials per session

The Scanning Assessment Tool presents ten trials in each test session. The number is fixed to facilitate comparisons across sessions. For reference, the "Number of trials per session" is displayed on the set-up screen (Figure 2).

Name of switch being used

The blank space labeled "Name of switch being used" (Figure 2) allows you to record the type of switch in use. The switch name will be saved to the client's file and printed with performance graphs and tables. To edit the switch name, click just above the dotted line labeled "Name of switch to be used," then type in the name of the switch.

Switch position

The blank space labeled "Switch position" (Figure 2) allows you to record the position of the switch being used. The switch position will be saved to the client's file and printed with performance graphs and tables. To edit the switch position, click just above the dotted line labeled "Switch position."

Edit Comments

The Scanning Assessment Tool provides for comments to be saved in the client file and printed with graphs and tables. To edit the comments for the current client file, click the "Edit Comments" button (Figure 2). Please refer to the "Edit Comments" menu command, below, for more information and alternative forms of this command.

Operation

Begin Session

To begin a scan test session, you may click the "Begin Session" button (Figure 2). Please refer to the "Begin Session" menu command, below, for more information and alternative forms of this command.

Assessment Menu Commands

All program operations use menu commands. The Assessment menu appears in the menu bar at the top of the screen at all times while the Scanning Assessment Tool runs. The Assessment menu commands are as follows:

File commands

New Subject File...

To begin a new client file, choose "New Client File..." from the Assessment menu. You will be asked to name the new file. The program saves scanning data to the file automatically. You may wish to give each file the name of a client, for convenience in retrieving information later. To choose "New Client File..." using the keyboard, type command-N (hold down the ⌘ key and press N). You can also begin a new client file by clicking the "Current Client File" box on the set-up screen (Figure 2). Please refer to "The Set-Up Screen," above, for more information.

Open Subject File...

To continue to work with an existing client file, choose "Open Client File..." from the Assessment menu. You will be asked which file you want to open. After you open a file, the set-up screen (Figure 2) will reflect the parameters of the last scan saved in that file. You can graph and/or add to the data in the opened file. To choose "Open Client File..." using the keyboard, type command-O (hold down the ⌘ key and press O [not zero]). You can also open an existing client file by clicking the "Current Client File" box on the set-up screen (Figure 2). Please refer to "The Set-Up Screen," above, for more information.

Save File As...

To save a copy of the currently-open client file, and continue working with the copy, choose "Save File As..." from the Assessment menu. You will be asked to name the new file. The "Save File As..." menu command does not have a keyboard equivalent.

Test session commands

Begin Session

To begin a scan test session, choose "Begin Session" from the Assessment menu. At the beginning of each session, the linear scan array is

displayed (see Figure 3). To begin each trial, you position the mouse pointer over the "Begin Trial" button. Your client activates his or her switch to begin the trial. The computer says, "Ready, set, go," and the trial begins.

After three successful trials (trials in which the client selected the target box correctly), the program will provide verbal praise by speaking "Good!" or "Terrific!" After an entire session has been completed, the program will provide an audio-visual reward. After that, the program will return you to the set-up menu.

To choose "Begin Session" using the keyboard, type command-B (hold down the ⌘ key and press B). There is no keyboard equivalent for starting the trials within each session. You may also begin a session by clicking the "Begin Session" button on the set-up-screen (see Figure 2).

Cancel Last Trial

After a scanning trial has been completed, the data from that trial can be discarded if you decide the trial was invalid. To discard the data from the previous trial, choose "Cancel Last Trial" from the Assessment menu. To choose "Cancel Last Trial" using the keyboard, type command-T (hold down the ⌘ key and press T).

Cancel Current Session

Between trials or after the last trial during a session, the session may be interrupted. To interrupt a session, choose "Cancel Session" from the Assessment menu. You will be asked to confirm whether you want to interrupt the session. If any trials were completed in this session, you will be asked whether to keep or discard the data from those trials. To choose "Cancel Session" using the keyboard, type command-S (hold down the ⌘ key and press S).

Graphing commands

Graph/Tabulate Data

The data from any Scanning Assessment Tool client file can be graphed or tabulated. Choose "Graph/Tabulate Data" from the Assessment menu. A check mark will appear next to the "Graph/Tabulate Data" menu item. All sessions stored in the current client file will be displayed according to date, switch name, switch position, scanning mode, scanning "speed" (Figure 4). The number of sessions completed on each date with the same parameters (switch name and position, scanning mode and speed), is displayed as well. In this way, one line on the graph or one column in the table will include all sessions completed on the same date with the same parameters.

To graph or tabulate performance from one session (or one group of sessions with the same date and parameters), click on the line describing the session(s). The session(s) you have selected will appear in the lower section

Click on one or two of the completed session dates, then click on "Tabulate" or "Graph."

The following sessions have been completed for Johnny:

Date	Switch Name	Switch Position	Scanning Mode	Scanning Speed	* Sessions
1/17/94	Mouse	R. index finger	Auto	.3	2
1/22/94	Mouse	R. index finger	Auto	.2	1
1/22/94	Mouse	R. index finger	Auto	.1	1
6/11/94	Wobble	R. Elbow	Auto	.5	1
6/28/93	Wobble	R. Elbow	Auto	.3	1
1/17/94	Mouse	R. index finger	Step	.5	1
6/28/93	Wobble	R. Elbow	Step	.5	1

You have selected the following session(s) to tabulate or graph:

De-Select Sessions Edit Comments

Tabulate Graph Return to Set-Up

Figure 5: Selecting session(s) to be tabulated or graphed.

of the screen, next to the circle symbol. Click the "Tabulate" or "Graph" button to display the table or graph. The table and graph are explained further below.

A single table or graph may contain two sets of performance data. The Scanning Assessment Tool requires that no more than one parameter of the scan (switch name and position, scanning mode and speed) change across two data sets in the same table or graph. To compare performance across two sessions (or two groups of sessions) differing in more than one parameter, create separate tables or graphs for each, according to the procedure described above. Separate tables or graphs also are needed to compare more than two sessions or groups of sessions.

To compare performance across two sessions (or two groups of sessions) that differ in no more than one parameter, click on the line describing the first session(s). The session(s) you have selected will appear in the lower section of the screen, next to the circle symbol, and will become the left-hand column of the table or the circle symbol on the graph. Next, click on the line describing the second session(s). You will be asked whether you want to replace the first selection or to specify a second set of sessions (Figure 5). Click "Second." The session(s) you have selected will appear in the lower section of the screen, next to the square symbol, and will become the right-hand column of the table or the square symbol on the graph. Click the "Tabulate" or "Graph" button to display the table or graph. The table and graph are explained further below.

To replace one session (or group of sessions) with another, click on the line describing the new session(s), on the upper portion of the screen (Figure 4). You will be asked whether you want the new session(s) to form the first or the second part of the table or graph. To remove a session (or group of sessions) from the table or graph without replacing, click the "De-Select Sessions" button (Figure 4).

The Scanning Assessment Tool provides for comments to be saved in the client file and printed with graphs and tables. Please refer the "Edit Comments" menu command, above, for information about editing comments.

To return to the set-up screen (without tabulating or graphing), click the "Return to Set-Up" button (Figure 4), or choose "Graph/Tabulate Data" from the Assessment menu. To choose "Graph/Tabulate Data" using the keyboard, type command-G (hold down the ⌘ key and press G).

Display Table

To display a table of performance for the session(s) you selected, choose "Display Table" from the Assessment menu, or click the "Tabulate" button. A check mark will appear next to the "Display Table" menu item, and the table will be displayed (Figure 6). Each entry in the table consists of the number of correct trials in the session, followed by the number of each

Scanning Scores for Johnny:

Switch Name: Mouse
 Switch Position: R. index finger
 Scanning Mode: Auto

Session #	Number Correct by Scanning Speed	
	.3	.2
	January 17, 1994	January 22, 1994
1	6 (1 early, 2 late, 1 absent)	9 (1 early, 0 late, 0 absent)
2	9 (1 early, 0 late, 0 absent)	7 (1 early, 1 late, 1 absent)
3	8 (1 early, 1 late, 0 absent)	10 (0 early, 0 late, 0 absent)
4	9 (1 early, 0 late, 0 absent)	

Figure 6: Sample table.

Figure 7: Sample graph.

type of error made during the session. Three types of activation errors are possible: early (switch activation before the target is reached), late (switch activation after the target is passed), and absent (no switch activation during the entire scan). These results are provided only in tables and not on graphs.

To print the table, click the "Print Table" button or choose "Print" from the Assessment menu. Please refer to the "Print" menu command, below, for more information and alternative forms of this command.

To edit the comments, choose "Edit Comments" from the Assessment menu. Please refer to the "Edit Comments" menu command, below, for more information and alternative forms of this command.

To select other data for display in the table, click the "Change Table" button or choose "Display Table" from the Assessment menu. The previous screen of completed and selected sessions will be displayed (Figure 5). Please refer to the "Graph/Tabulate Data" menu command, above, for more information about selecting sessions to be tabulated and graphed.

To graph the data displayed in the table, choose "Display Graph" from the Assessment menu. Please refer to the "Display Graph" menu command, below, for more information about this command.

To return to the set-up screen, click the "Return to Set-Up" button (Figure 6), or choose "Graph/Tabulate Data" from the Assessment menu. To choose "Graph/Tabulate Data" using the keyboard, type command-G (hold down the ⌘ key and press G).

Display Graph

To display a graph of performance for the session(s) you selected, choose "Display Graph" from the Assessment menu, or click the "Graph" button. A check mark will appear next to the "Display Graph" menu item, and the graph will be displayed (Figure 7).

To print the graph, click the "Print Graph" button or choose "Print" from the Assessment menu. Please refer to the "Print" menu command, below, for more information and alternative forms of this command.

To edit the comments, choose "Edit Comments" from the Assessment menu. Please refer to the "Edit Comments" menu command, below, for more information and alternative forms of this command.

To select other data for display on the graph, click the "Change Graph" button or choose "Display Graph" from the Assessment menu. The previous screen of completed and selected sessions will be displayed (Figure 5). Please refer to the "Graph/Tabulate Data" menu command, above, for more information about selecting sessions to be tabulated and graphed.

To tabulate the data displayed on the graph, choose "Display Table" from the Assessment menu. Please refer to the "Display Table" menu command, above, for more information about this command.

BEST COPY AVAILABLE 152

Some screens provide an "Edit Comments" button. (Refer for example to the set-up screen). Clicking on this button is identical to choosing "Edit Comments" from the Assessment menu.

To continue using the program when you have finished editing, click the "Done Editing" button, or choose "Edit Comments" from the Assessment menu. To choose "Edit Comments" using the keyboard, type command-E (hold down the ⌘ key and press E).

Print

To print a table or graph, choose "Print" from the Assessment menu. To choose "Print" using the keyboard, type command-P (hold down the ⌘ key and press P). You can also print by clicking the "Print Table" or "Print Graph" button (see Figures 6 and 7).

During printing, you will be asked whether you want to print your comments along with the table or graph. Please refer the "Edit Comments" menu command, above, for information about editing comments.

Leaving the Scanning Assessment Tool

Quit Scanning Assessment

To leave the Scanning Assessment Tool, choose the "Quit Scanning Assessment" command from the Assessment menu. To choose "Quit Scanning Assessment" using the keyboard, type command-Q (hold down the ⌘ key and press Q).

GENERAL INFORMATION

While developing the Project ASTECH software and the Resource Guide, we uncovered many resources that may help you. We have compiled lists of these resources, which include selected companies that supply assistive technology devices and solutions, selected organizations and centers that support the users of assistive technology, and places where additional information on assistive technology can be found. We have also included information sheets provided free of charge from the National Information Center for Children and Youth with Handicaps (NICHCY), which describe disabilities commonly experienced by students. The information may be helpful for team members as well as families. NICHCY also functions as a national clearinghouse that provides information and referral sources to both parents of children with disabilities and the professionals who serve those children and families. For more information about NICHCY and its publications list, write

Closing the Gap Resource Directory

This Resource Directory includes charts that provide quick references to product features as well as individual descriptions of hardware and software products. Another section of this publication provides information about the companies who sell the assistive technology presented. Addresses for other organizations also can be found in the directory. See the following pages for examples of this information and the format used in this publication. This Resource Directory is included in the subscription price to *Closing the Gap*, or you can purchase it separately.

HARDWARE DESCRIPTIONS

12 Foot Cable for Apple IIGS RGB Monitor

Moonlight Software

Price: \$40.00

Device Type: other (cable)

Disability: n/a

Computer: Apple IIGS

Requirements: RGB monitor

12 foot cable for the Apple RGB monitor.

AC Adapter

Creative Switch Industries

Price: \$75.50

Device Type: switch

Disability: physical

Computer: n/a

Requirements: n/a

This control unit accepts any electrical appliance up to 1200 watts and converts it to switch use. It has 3.5 mm jack and 6 inch grounded cord to wall outlet.

Accent

Aicom Corporation

Price: \$395.00-\$995.00

Device Type: speech output

Disability: vision

Computer: IBM PC; other (Toshiba)

Requirements: n/a

A text-to-speech synthesizer. Various models available are Accent PC - full length PC plug-in card; Accent MC - Microchannel plug-in card; Accent SA - Stand-alone version; Accent 1600 - Toshiba T1600 and T1200; Accent XE - Toshiba T1000SE/XE/LE plug-in card; Accent SX - Toshiba T1200XE, T2000/SX/SXE plug-in card; and Accent L40-IBM PS/2 L40 SX plug-in card.

Access-I Personal Computer

WorkLink Innovations, Inc.

Price: \$5,600.00

Device Type: n/a

Disability: speech; vision; hearing; physical;

mental; learning

Computer: IBM PC

Requirements: n/a

Access I is a 486-66 DX2 expandable IBM compatible computer that is mounted on wheelchair. It can go all day without recharging. It accommodates 5 ISA expansion cards, and will use any IBM Compatible input/output device. It can access via radio waves an ethernet LAN with any type of computer that is attached to the LAN. It can remotely access another computer by means of peer-to-peer software. It will accommodate environmental control systems, voice input, voice output, head pointers, single-switch devices, etc.

ACS Controller

ACS Technologies

Price: \$1,895.00

Device Type: environmental control

Disability: physical

Computer: n/a

Requirements: n/a

A trainable infrared environmental controller operated by keyboard or scanning. The Controller has a 2-line, 16-character LCD display and 7 x 5-column membrane keyboard or scanning panel. The key size is 1/2 inch. This device will allow the user to control most devices that are controllable by infrared remotes: TV, VCR, Radio, Lights, etc. The controller is 2 x 4 x 8 inches and weighs 1.5 lbs. It easily mounts to a wheelchair. It can also be operated from a computer by connecting it to the serial port. Voice activation. Capable of operating infrared telephone (TASH).

ACS Controller with Voice Activate

ACS Technologies

Price: \$3,495.00

Device Type: environmental control

Disability: physical

Computer: n/a

Requirements: n/a

With the ACS Controller you can accomplish control of many devices without the need for wires, connections, or modification to standard devices. It can replace the remote control for your TV, VCR, and stereo and adds control for other appliances such as lights and phone. It can be operated by direct selection on the membrane keypad; row or column scanning; or one utterance commands. It has a preset vocabulary with the exception that you can enter a few new word commands. The Controller is 4"x7.5"x1.75" and weighs 18 ounces.

ACS EvalPAC with RealVoice

ACS Technologies

Price: \$3,995.00

Device Type: alternative keyboard; dedicated communicator; speech output

Disability: physical; speech

Computer: n/a

Requirements: n/a

The EvalPAC with RealVoice is a portable battery-powered communication aid with a human voice-quality, diphone-based speech synthesizer available in male or female voice. The EvalPAC can be mounted in a number of positions and can be attached to the front of the Epson keyboard. The EvalPAC can be accessed through the Light Pointer, scanning, joystick control, Morse code (single or dual switch), and the memkey board. The EvalPAC has the same built-in features of the RealVoice.

ACS Gross Motor Switches and Controls

ACS Technologies

Price: Priced individually

Device Type: environmental control; switch

Disability: physical

ACS Samy System

ACS Technologies

Price: \$4,100.00

Device Type: dedicated communicator; environmental control; voice input; speech output

Disability: physical; speech

Computer: n/a

Requirements: n/a

A portable Macintosh compatible communication vice and educational system. Features include to screen and scanning capabilities, built-in keyboard, hard disk drive (40MB or 105MB), and Mayer-John Talking Pictures and Board Maker program. Options include environmental control, Navigator voice control and RealVoice synthesizer (male, female, or the all child's voice). It can also be operated with an expansion keyboard or a mouse. An 8MHz 6800 processor is percent compatible with the Apple manufactured 1 Classic logic board engine. The built-in external SCSI ADB, floppy, printer, speaker, external CRT, and modem ports are all standard.

ACS ScanPAC with RealVoice

ACS Technologies

Price: \$3,695.00

Device Type: dedicated communicator; printed speech output

Disability: physical; speech

Computer: n/a

Requirements: n/a

A portable battery-powered communication aid with human voice quality, diphone-based speech synthesizer available in male or female voice. The ScanPAC can be easily mounted in a number of positions and be attached to the front of the Epson keyboard. ScanPAC can be accessed through scanning, joystick control, Morse code (single or dual switch). The ScanPAC has the same built-in features of the RealVoice.

ACS Twinkle Remote Sender and Receiver Switch

ACS Technologies

Price: \$975.00

Device Type: switch

Disability: physical

Computer: n/a

Requirements: n/a

The Twinkle switch is designed to allow an individual control any single or dual switch device by either left or right eye movement or left and right head movement within 6 to 10 feet of the Twinkle remote receiver. The user wears two small removable electrodes between eyes and ears. These electrodes monitor the microelectrical impulses generated when eye movement occurs. The Twinkle remote sender is a small box the user wears on their shirt or around their neck. The eye movements send infrared signals to the Twinkle remote receiver. System includes one remote sender, one remote receiver, charger, two mouse cables, one mouse supply of electrodes and cream, and a manual.

Hyper-ABLEDATA

Hyper-ABLEDATA is a software program maintained and updated regularly by the TRACE R&D Center at the University of Wisconsin in Madison. This database provides descriptions, company names and ordering information on thousands of assistive technology products. Following are some examples of screens from this program, including the main menu that allows you several ways to search for products. On the next page you will find an example of a function outline that allows you to define and narrow your search and a product description.

Main Menu

Hyper-ABLEDATA allows you to search for product or company information in different ways.

Choose the type of search you would like to do --->

No: 001406 keyguard (16 items)

KEYGUARDS

Generic name: KEYGUARD

Keyguards are designed to stabilize and position the user's hand directly over the computer keyboard, and to promote accuracy in keypressing by single finger, headstick, or mouthstick typists. These keyguards consist of a scratch resistant panel of clear plastic with holes above each key position. For the Apple II models, latching mechanisms are provided to hold down the SHIFT, OPEN-APPLE, and CONTROL keys. The keyguards are easily attached and removed from the keyboard. COMPATIBILITY: Keyguards are available for the

Useful Sites on the World Wide Web

The world wide web is full of information on almost every subject. Here are some specific addresses you can start with if you are looking for information on the web about assistive technology.

The Adaptive Technology Notebook
<http://www.crl.com/~pcone/notebook.htm>

Disability Information
<http://www.rehab.uiuc.edu/pursuit/dis-resources/dis-resources.html>

disABILITY Information and Resources
<http://www.eskimo.com/~jlubin/disabled.html>

NCIP (National Center to Improve Practice in Special Education Through Technology)
<http://www.edc.org/FSC/NCIP>

WebABLE
<http://www.webable.com/>

Many companies that provide assistive technology also have their own web sites. Usually you can reach this site by typing in the companies name.

Selected Low-Tech Equipment Catalogs

In the ASTECH software program, we mentioned that low-tech devices may be considered a form of environmental control that could be used for activities of daily living (ADLs) and recreation in the school setting. Therefore, we have listed several companies that supply low-tech assistive devices. You can request catalogs from these companies by calling the numbers listed below.

<u>Company</u>	<u>Phone numbers</u>
adaptAbility	800-266-8856
Cleo, Inc.	800-321-0595

General Information About

AUTISM

◇ Definition ◇

Autism is a developmental disorder which usually becomes evident before the age of three years. It is a neurological or brain disorder in which behavior, communication, and social interactions are the primary disabilities.

◇ Incidence ◇

The rate of incidence, or how often autism occurs in children, ranges from five to fifteen out of 10,000 births. The different estimates are based on slightly different definitions of autism.

It is three times more common in boys than girls and is rarely found in more than one child in a family.

Autism can be caused by a number of factors, but the cause in the vast majority is not known. It is known that autism is caused by biological, not psychological, factors.

◇ Characteristics ◇

Some babies show signs of autism from infancy. They may not like to cuddle and may show little interest in their families.

Typical characteristics of autism are often described as:

- difficulty relating to people, objects and events;

- repetitive movements such as rocking and spinning, head banging and hand twisting;
- insistence that the environment and routine remain unchanged;
- avoidance of eye contact;
- verbal and nonverbal communication skills are severely impaired;
- use of toys and objects is an unconventional manner, little imaginative play;
- severe impairment of social interaction development; and
- limited intellectual ability.

It should be noted that any one of these characteristics may occur in children with other disabilities. In these cases the term "autistic-like" behavior is used.

◇ Educational Implications ◇

Early diagnosis and educational evaluation of autism are very important, although help given at any age can make a significant difference.

Public Law 101-476, the Individuals with Disabilities Education Act (IDEA), formerly the Education of the Handicapped Act, now includes autism as a separate disability category. Children with autism will be eligible for special education and related services under this new category.

Until recently, children with autism have been eligible for special education and related

BEST COPY AVAILABLE

178

services under the category of "other health impaired." The regulations (CFR 300.5) to the Education of the Handicapped Act state, "Other health impaired means (i) having an autistic condition which is manifested by severe communication and other developmental and educational problems...". These regulations will be changed to reflect autism as a category included under the IDEA.

Emphasis in education needs to be on helping the child to learn ways to communicate and on structuring the environment so that it is consistent and predictable. Effective teaching includes attention to behavior plans, positive behavior management, and clear expectations and rules.

Many of these methods can be developed in conjunction with parents and followed through at home. Continuity and consistency between home and school environments can greatly aid in the security and progress of persons with autism.

While autism is a lifetime condition, with special training, supervision, and support, many adults with autism can live and work in the community.

General Information About CEREBRAL PALSY

◇ Definition ◇

Cerebral palsy is a condition caused by damage to the brain, usually occurring before, during or shortly following birth. "Cerebral" refers to the brain and "palsy" to a disorder of movement or posture. It is neither progressive nor communicable. It is also not "curable" in the accepted sense, although education, therapy and applied technology can help persons with cerebral palsy lead productive lives. It is not a disease and should never be referred to as such. It can range from mild to severe.

The causes of cerebral palsy include illness during pregnancy, premature delivery, or lack of oxygen supply to the baby; or it may occur early in life as a result of an accident, lead poisoning, illness, child abuse, or other factors. Chief among the causes is an insufficient amount of oxygen reaching the fetal or newborn brain. The oxygen supply can be interrupted by premature separation of the placenta, an awkward birth position, labor that goes on too long or is too abrupt, or interference with the umbilical cord. Other causes may be associated with premature birth, RH or A-B-O blood type incompatibility between parents, infection of the mother with German measles or other viral diseases in early pregnancy, and microorganisms that attack the newborn's central nervous system. Lack of good prenatal care may also be a factor. A less common type is acquired cerebral palsy: head injury is the most frequent cause, usually the result of motor vehicle accidents, falls, or child abuse.

◇ Incidence ◇

Between 500,000 - 700,000 Americans have some degree of cerebral palsy. About 3,000 babies are born with the disorder each year, and another 500 or so acquire it in the early years of life.

◇ Characteristics ◇

There are three main types of cerebral palsy: spastic—stiff and difficult movement; athetoid—involuntary and uncontrolled movement; and ataxic—disturbed sense of balance and depth perception. There may be a combination of these types for any one individual. Other types do occur, although infrequently.

Cerebral palsy is characterized by an inability to fully control motor function. Depending on which part of the brain has been damaged and the degree of involvement of the central nervous system, one or more of the following may occur: spasms; tonal problems; involuntary movement; disturbance in gait and mobility; seizures; abnormal sensation and perception; impairment of sight, hearing or speech; and mental retardation.

◇ Developmental, Educational, and Employment Implications ◇

Early identification of cerebral palsy can lessen developmental problems and lead to appropriate intervention when it helps the most. Early intervention programs are family-centered in which professionals and families work together with the child in specific activities. Educators, physical and occupational therapists, social workers, speech-language pathologists, psychologists and physicians can assist families by providing information and education.

Activities for children with cerebral palsy may include:

- speech and language therapy;
- occupational therapy;
- physical therapy;
- medical intervention;
- family support services;
- early education; and
- applied technology.

As a child gets older and begins formal schooling, the intensity of services will vary from individual to individual. Persons with cerebral palsy are usually able to attain a substantial degree of independence but, in some cases, may need considerable assistance. Services for the school age child may include continuing therapy, regular or special education, counseling, technical support, community integration opportunities, recreation and possible personal attendants. A key factor seems to be a supportive family. Often people with extensive involvement can be highly functional and independent. The HEATH Resource Center, the clearinghouse for Higher Education and Adult Training for people with Handicaps, states that a significant number of students with cerebral palsy are enrolled in colleges and universities.

Important advances have taken place in the last 15 years which have had a great effect on the long-term well-being of children born with cerebral palsy. Advanced technology has been applied to the needs of persons with cerebral palsy, including computers and engineering devices. Technological innovations have been developed in the areas of speech and communication, self-care, and adapting living arrangements and work sites. The future may bring even more significant applications.

Another important development has been the increased ability of persons with disabilities, including those who have cerebral palsy and other severe disabilities, to live independently in the community. Independent living opportunities include group shared and supervised apartments, or living in the community with appropriate support services. Independent Living Centers have proven to be important resources for persons with disabilities.

General Information About DOWN SYNDROME

◇ Definition ◇

Down syndrome is the most common and readily identifiable chromosomal condition associated with mental retardation. It is caused by a chromosomal abnormality: for some unexplained reason, an accident in cell development results in 47 instead of the usual 46 chromosomes. This extra chromosome changes the orderly development of the body and brain. In most cases, the diagnosis of Down Syndrome is made according to results from a chromosome test administered shortly after birth.

◇ Incidence ◇

Approximately 4,000 children with Down Syndrome are born in the U.S. each year, or about 1 per 1,000 live births. Although parents of any age may have child with Down Syndrome, the incidence is higher for women over 35. Most common forms of the syndrome do not usually occur more than once in a family.

◇ Characteristics ◇

There are over 50 clinical signs of Down Syndrome, but it is rare to find all or even most of them in one person. Some common characteristics include:

- Poor muscle tone;
- Slanting eyes with folds of skin at the inner corners (called epicanthal folds);
- White ("Brushfield") spots in the iris of the eye;
- Short, broad hands with a single crease across the palm on one or both hands;
- Broad feet with short toes;
- Flat bridge of the nose;
- Short, low-set ears;

- Short neck;
- Small head;
- Small oral cavity; and/or
- Short, high-pitched cries in infancy.

Individuals with Down Syndrome are usually smaller than their non-disabled peers, and their physical as well as intellectual development is slower.

Besides having a distinct physical appearance, children with Down Syndrome frequently have specific health-related problems. A lowered resistance to infection makes these children more prone to respiratory problems. Visual problems such as crossed eyes and far- or nearsightedness are higher in those with Down Syndrome, as are mild to moderate hearing loss and speech difficulty.

Approximately one third of babies born with Down Syndrome have heart defects, most of which are now successfully correctable. Some individuals are born with gastrointestinal tract problems that can be surgically corrected.

Some people with Down Syndrome also may have a condition known as Atlantoaxial Instability, a misalignment of the top two vertebrae of the neck. This condition makes these individuals more prone to injury if they participate in activities which overextend or flex the neck. Parents are urged to have their child examined by a physician to determine whether or not their child should be restricted from sports and activities which place stress on the neck. Although this misalignment is a potentially serious condition, proper diagnosis can help prevent serious injury.

Children with Down Syndrome may have a tendency to become obese as they grow older. Besides having negative social implications, this weight gain threatens these individuals' health and longevity. A supervised diet and exercise program may help reduce this problem.

◆ Educational and Employment Implications ◆

Shortly after a diagnosis of Down Syndrome is confirmed, parents should be encouraged to enroll their child in an infant development/early intervention program. These programs offer parents special instruction in teaching their child language, cognitive, self-help, and social skills, and specific exercises for gross and fine motor development. Research has shown that stimulation during early developmental stages improves the child's chances of developing to his or her fullest potential. Continuing education, positive public attitudes, and a stimulating home environment have also been found to promote the child's overall development.

Just as in the normal population, there is a wide variation in mental abilities, behavior, and developmental progress in individuals with Down Syndrome. Their level of retardation may range from mild to severe, with the majority functioning in the mild to moderate range. Due to these individual differences, it is impossible to predict future achievements of children with Down Syndrome.

Because of the range of ability in children with Down Syndrome it is important for families and all members of the school's education team to place few limitations on potential capabilities. It may be effective to emphasize concrete concepts rather than abstract ideas. Teaching tasks in a step-by-step manner with frequent reinforcement and consistent feedback has been proven successful. Improved public acceptance of persons with disabilities along with increased opportunities for adults with disabilities to live and work independ-

ently in the community, have expanded goals for individuals with Down Syndrome. Independent Living Centers, group shared and supervised apartments and support services in the community have proven to be important resources for persons with disabilities.

General Information About EMOTIONAL DISTURBANCE

◇ Definition ◇

Many terms are used to denote emotional, behavioral or mental disorders. Currently these students are labeled Seriously Emotionally Disturbed; however, efforts to improve both the definition and label are being addressed to be more inclusive in identification and service delivery. In general, most people would agree that the terminology should indicate that students who are eligible for special services under this label have behavior that is significantly different from that of their peers.

Public Law 94-142, The Education of the Handicapped Act, currently defines Serious Emotional Disturbance as "a condition exhibiting one or more of the following characteristics over a long period of time and to a marked degree, which adversely affects educational performance:

- An inability to learn which cannot be explained by intellectual sensory, or health factors;
- An inability to build or maintain satisfactory interpersonal relationships with peers and teachers;
- A general pervasive mood of unhappiness or depression; or a tendency to develop physical symptoms or fears associated with personal or school problems." (U.S. Federal Register 42, August 23, 1977, pp. 42478-42479.)

The Federal definition (as stated in the Federal Register) includes children who have schizophrenia. Children who have been identified as socially maladjusted (except those determined to be Seriously Emotionally Disturbed) are excluded from this category.

◇ Incidence ◇

For the school year 1988-89, 377,295 children and youth with emotional or behavior disturbance were provided services in the public schools (Twelfth Annual Report to Congress U.S. Department of Education, 1990).

◇ Characteristics ◇

The causes of emotional disturbances have not been adequately determined. Although various factors such as heredity; brain disorder, diet, stress, and family functioning have been suggested as possible causes,

research has not shown any of these factors to be the direct cause of behavior problems. Some of the characteristics and behaviors seen in children who have emotional disturbances include:

- Hyperactivity (short attention span, impulsiveness);
- Aggression/self-injurious behavior (acting out, fighting);
- Withdrawal (failure to initiate interaction with others; retreat from exchanges of social interaction, excessive fear or anxiety);
- Immaturity (inappropriate crying, temper tantrums, poor coping skills); and
- Learning problems (academically performing below grade level).

Children with the most serious emotional disturbances exhibit distorted thinking, excessive anxiety, bizarre motor acts, and abnormal mood swings and are sometimes identified as children who have a severe psychosis or schizophrenia.

Many children who do not have emotional disturbances may display some of these same behaviors at various times during their development. However, when children have serious emotional disturbances, these behaviors continue over long periods of time. Their behavior thus signals that they are not coping with their environment or peers.

◇ Educational Implications ◇

The educational programs for children with behavioral and/or emotional problems as identified by the schools should include attention to mastering academics, developing social skills, and increasing self-control and self-esteem. Career education (both vocational and academic programs) is rapidly becoming a major part of the secondary education of these children. It is recommended that career education be considered as a part of every adolescent's Individualized Education Program (IEP).

Behavior modification, shaping behaviors with positive reinforcement, is one of the most widely used approaches to helping children with emotional/behavioral disorders. However, while students can learn to meet classroom expectations, questions have been raised about how much the learning transfers to other situations.

Hence, a number of schools are trying different strategies to help students take responsibility for their thoughts, feelings and actions. It is important for teachers to focus on academics and opportunities for their students to develop social skills, in addition to working on behavioral control.

Students eligible for special education services under the category Seriously Emotionally Disturbed often have IEPs which do not include psychological or counseling services. These are legitimate related services found in the law (Code of Federal Regulations CFR 300.13). Often it is suggested that families take their child to a mental health center for therapy. However, an increasing number of state education and mental health agencies have reported collaborative efforts to make mental health services (particularly school-based mental health services) more available to identified students. Sometimes these services include short term therapy; but more often they are defined as consultations with teachers, work with families, and availability at crisis time. Recognition that families with the most seriously troubled children need support, respite care, intensive case management services, and a multi-agency treatment plan is growing, largely through a federal program called CASSP (Child and Adolescent Service System Program). These efforts work best when school and mental health professionals work collaboratively.

◆ Other Considerations ◆

Families of children with emotional disturbances may need help in understanding their children's condition and in learning how to work effectively with them. Help is available from psychiatrists, psychologists or other mental health professionals in public or private mental health settings. Sometimes children may need an out-of-home placement. Children should be provided services based on their individual needs and all persons who are involved with these children should be aware of the care they are receiving. It is important to coordinate all services between home, school, and therapeutic community with open communication.

General Information About

EPILEPSY

◇ Definition ◇

According to the Epilepsy Foundation of America, epilepsy is a physical condition that occurs when there is a sudden, brief change in how the brain works. When brain cells are not working properly, a person's consciousness, movement, or actions may be altered for a short time. These physical changes are called epileptic seizures. Epilepsy is therefore sometimes called a seizure disorder. Epilepsy affects people in all nations and of all races.

Some people can experience a seizure and not have epilepsy. For example, many young children have convulsions from fevers. These febrile convulsions are one type of seizure. Other types of seizures not classified as epilepsy include those caused by an imbalance of body fluids or chemicals or by alcohol or drug withdrawal. A single seizure does not mean that the person has epilepsy.

◇ Incidence ◇

About two million Americans have epilepsy; of the 100,000 new cases that develop each year, three quarters of them are in children and adolescents.

◇ Characteristics ◇

Although the symptoms listed below are not necessarily indicators of epilepsy, it is wise to consult a doctor if you or a member of your family experiences one or more of them:

- "Blackouts" or periods of confused memory;

- Episodes of staring or unexplained periods of unresponsiveness;
- Involuntary movement of arms and legs;
- "Fainting spells" with incontinence or followed by excessive fatigue; or
- Odd sounds, distorted perceptions, episodic feelings of fear that cannot be explained.

Seizures can be generalized, meaning that all brain cells are involved. One type of generalized seizure consists of a convulsion with a complete loss of consciousness. Another type looks like a brief period of fixed staring.

Seizures are partial when those brain cells not working properly are limited to one part of the brain. Such partial seizures may cause periods of "automatic behavior" and altered consciousness. This is typified by purposeful-looking behavior, such as buttoning or unbuttoning a shirt. Such behavior, however, is unconscious, may be repetitive, and is usually not recalled.

◇ Educational Implications ◇

Students with epilepsy or seizure disorders are eligible for special education and related services under the Individuals with Disabilities Education Act (IDEA), formerly the Education of the Handicapped Act (Public Law 94-142). Epilepsy is classified as "other health impaired" and an Individualized Education Program (IEP) would be developed to specify appropriate services. Some students may have additional conditions such as learning disabilities along with the seizure disorders.

BEST COPY AVAILABLE

Seizures may interfere with the child's ability to learn. If the student has the type of seizure characterized by a brief period of fixed staring, he or she may be missing parts of what the teacher is saying. It is important that the teacher observe and document these episodes and report them promptly to parents and to school nurses.

Depending on the type of seizure or how often they occur, some children may need additional assistance to help them keep up with classmates. Assistance can include adaptations in classroom instruction, first aid instruction on seizure management to the student's teachers, and counseling, all of which should be written in the IEP.

It is important that the teachers and school staff be informed about the child's condition, possible effects of medication, and what to do in case a seizure occurs at school. Most parents find that a friendly conversation with the teacher(s) at the beginning of the school year is the best way to handle the situation. Even if a child has seizures that are largely controlled by medication, it is still best to notify the school staff about the condition.

School personnel and the family should work together to monitor the effectiveness of medication as well as any side effects. If a child's physical or intellectual skills seem to change, it is important to tell the doctor. There may also be associated hearing or perception problems caused by the brain changes. Written observations of both the family and school staff will be helpful in discussions with the child's doctor.

Children and youth with epilepsy must also deal with the psychological and social aspects of the condition. These include public misperceptions and fear of seizures, uncertain occurrence, loss of self control during the seizure episode, and compliance with medications. To help children feel more confident about themselves and accept their epilepsy, the school can

assist by providing epilepsy education programs for staff and students, including information on seizure recognition and first aid.

Students can benefit the most when both the family and school are working together. There are many materials available for families and teachers so that they can understand how to work most effectively as a team.

General Information About LEARNING DISABILITIES

◇ Definition ◇

The regulations for Public Law (P.L.) 101-476, the Individuals with Disabilities Education Act (IDEA), formerly P.L. 94-142, the Education of the Handicapped Act (EHA), define a learning disability as a "disorder in one or more of the basic psychological processes involved in understanding or in using spoken or written language, which may manifest itself in an imperfect ability to listen, think, speak, read, write, spell or to do mathematical calculations."

The Federal definition further states that learning disabilities include "such conditions as perceptual handicaps, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia." According to the law, learning disabilities do not include learning problems that are primarily the result of visual, hearing, or motor disabilities; mental retardation; or environmental, cultural, or economic disadvantage. Definitions of learning disabilities also vary among states.

Having a single term to describe this category of children with disabilities reduces some of the confusion, but there are many conflicting theories about what causes learning disabilities and how many there are. The label "learning disabilities" is all-embracing; it describes a syndrome, not a specific child with specific problems. The definition assists in classifying children, not teaching them. Parents and teachers need to concentrate on the individual child. They need to observe both how and how well the child performs, to assess strengths and weaknesses, and invent ways to help each child learn. It is important to remember that there is a high degree of interrelationship and overlapping among the areas of learning. Therefore, children with learning disabilities may exhibit a combination of characteristics.

These problems may mildly, moderately, or severely impair the learning process.

BEST COPY AVAILABLE

◇ Incidence ◇

Many different estimates of the number of children with learning disabilities have appeared in the literature (ranging from 1% to 30% of the general population). In 1987, the Interagency Committee on Learning Disabilities concluded that 5% to 10% is a reasonable estimate of the percentage of persons affected by learning disabilities. The U.S. Department of Education (1991) reported that 4.66% of all school aged children received special education services for learning disabilities and that in the 1989-90 school year over 2 million children with learning disabilities were served. Differences in estimates perhaps reflect variations in the definition.

◇ Characteristics ◇

Learning disabilities are characterized by a significant difference in the child's achievement in some areas, as compared to his or her overall intelligence.

Students who have learning disabilities may exhibit a wide range of traits, including problems with reading comprehension, spoken language, writing, or reasoning ability. Hyperactivity, inattention, and perceptual coordination problems may also be associated with learning disabilities. Other traits that may be present include a variety of symptoms, such as uneven and unpredictable test performance, perceptual impairments, motor disorders, and behaviors such as impulsiveness, low tolerance for frustration, and problems in handling day-to-day social interactions and situations.

Learning disabilities may occur in the following academic areas:

1. Spoken language: Delays, disorders, or discrepancies in listening and speaking;
2. Written language: Difficulties with reading, writing, and spelling;
3. Arithmetic: Difficulty in performing arithmetic functions or in comprehending basic concepts;

4. Reasoning: Difficulty in organizing and integrating thoughts; and
5. Organization skills: Difficulty in organizing all facets of learning.

◇ Educational Implications ◇

Because learning disabilities are manifested in a variety of behavior patterns, the Individual Education Program (IEP) must be designed carefully. A team approach is important for educating the child with a learning disability, beginning with the assessment process and continuing through the development of the IEP. Close collaboration among special class teachers, parents, resource room teachers, regular class teachers and others, will facilitate the overall development of a child with learning disabilities.

Some teachers report that the following strategies have been effective with some students who have learning disabilities:

- Capitalize on student's strengths;
- High structure and clear expectations;
- Using short sentences and a simple vocabulary;
- Opportunities for success in a supportive atmosphere to help build self-esteem;
- Flexibility in classroom procedures (e.g., allowing the use of tape recorders for note-taking and test-taking when students have trouble with written language);
- Self-correcting materials, which provide immediate feedback without embarrassment;
- Using computers for drill and practice and teaching word processing;
- Positive reinforcement of appropriate social skills at school and home; and
- Recognizing that students with learning disabilities can greatly benefit from the gift of time to grow and mature.

General Information About MENTAL RETARDATION

◇ Definition ◇

People with mental retardation are those who develop at a below average rate and experience difficulty in learning and social adjustment. The regulations for the Individuals with Disabilities Education Act (IDEA), formerly the Education of the Handicapped Act (Public Law 94-142), provide the following technical definition for mental retardation:

"Mentally retarded means significantly subaverage general intellectual functioning existing concurrently with deficits in adaptive behavior and manifested during the developmental period, which adversely affects a child's educational performance."

"General intellectual functioning" refers to a score obtained on an intelligence test. Persons with mental retardation usually score 70 or below. "Adaptive behavior" refers to a person's adjustment to everyday life. Difficulties may occur in learning, communication, social, academic, vocational, and independent living skills.

Mental retardation is not a disease, nor should it be confused with mental illness. Children with mental retardation become adults; they do not remain "eternal children." They do learn, but slowly, and with difficulty.

Probably the greatest number of children with mental retardation have chromosome abnormalities. Other biological factors include (but are not limited to): asphyxia (lack of oxygen); blood incompatibilities between the mother and fetus; and maternal infections, such as rubella or

herpes. Certain drugs have also been linked to problems in fetal development.

◇ Incidence ◇

Some studies suggest that approximately 1% of the general population has mental retardation (when both intelligence and adaptive behavior measures are used). According to data reported to the U.S. Department of Education by the states, in the 1989-90 school year, 564,666 students ages 6-21 were classified as having mental retardation and were provided services by the public schools. This figure represents approximately 1.7% of the total school enrollment for that year. It does not include students reported as having multiple handicaps or those in non-categorical special education pre-school programs who may also have mental retardation.

◇ Characteristics ◇

Many authorities agree that people with mental retardation develop in the same way as people with out mental retardation, but at a slower rate. Others suggest that persons with mental retardation have difficulties in particular areas of basic thinking and learning such as attention, perception, or memory. Depending on the extent of the impairment—mild, moderate, severe, or profound—individuals with mental retardation will develop differently in academic, social, and vocational skills.

◇ Educational Implications ◇

Persons with mental retardation have the capacity to learn, to develop, and to grow. The great majority of these citizens can become

productive and full participants in society.

Appropriate educational services that begin in infancy and continue throughout the developmental period and beyond will enable children with mental retardation to develop to their fullest potential.

As with all education, modifying instruction to meet individual needs is the starting point for successful learning. Throughout their child's education, parents should be an integral part of the planning and teaching team.

In teaching persons with mental retardation, it is important to:

- Use concrete materials that are interesting, age-appropriate and relevant to the students;
- Present information and instructions in small, sequential steps and review each step frequently;
- Provide prompt and consistent feedback;
- Teach these children, whenever possible, in the same school they would attend if they were not mentally retarded;
- Stress success;
- Teach tasks or skills that students will use frequently in such a way that students can apply the tasks or skills in settings outside of school; and
- Remember that tasks that many people learn without instruction may need to be structured, or broken down into small steps or segments, with each step being carefully taught.

Children and adults with mental retardation need the same basic services that all people need for normal development. These include education, vocational preparation, health services, recreational opportunities, and many more. In addition, many persons with mental retardation need specialized services for special needs. Such services include diagnostic and evaluation centers; special early education opportunities, beginning with infant stimulation programs and continuing through preschool; and educational programs that include age-appropriate activities, functional academics, transition training, and opportuni-

ties for independent living and competitive employment to the maximum extent possible.

General Information About

PHYSICAL DISABILITIES AND SPECIAL HEALTH PROBLEMS

◇ Definition ◇

Orthopedic or physical disabilities describe medical or structural conditions which may be serious enough to disrupt the child's development and require special attention in school. Typical examples of orthopedic or physical problems include disabilities present at birth (such as missing limbs, spina bifida, etc.), as well as physical problems resulting from other causes (such as contractures caused by burns or fractures, etc.). In addition, neurological problems, such as cerebral palsy, may be included in this category.

Health impairments may result in limited strength, vitality and/or alertness. Asthma, cardiac conditions, sickle cell anemia, epilepsy, and leukemia are examples of health impairments that could interfere with a child's education.

◇ Incidence ◇

One half of one percent (.5%) is the figure usually cited in estimates of school aged children with physical or health impairments. Cerebral palsy accounts for a large part of this percentage, followed by spina bifida.

◇ Characteristics ◇

Physical disabilities can produce a variety of characteristics. Children may experience a wide range of restrictions on their activity, from little or none to a complete restructuring of daily life. The most severely affected children may require intensive medical and educational help.

Physical problems may interfere with children's motor functioning, communication, learning skills, or social development.

◇ Educational Implications ◇

The contributions of such related services as physical, occupational, and speech and language therapy are often central to the education of children with

physical disabilities. The greatest progress is achieved when therapy suggestions are consistently applied in the child's home as well as in school. This carryover strengthens appropriate feeding, positioning, and language stimulation patterns.

Architectural factors must be considered. Section 504 of the Rehabilitation Act of 1973 requires that programs receiving Federal funds make their programs accessible. This could mean structural changes (for example, adding elevators or ramps) or schedule or location changes (for example, offering a course on the ground floor).

Sometimes the nature of the child's disability requires changes in school equipment or curriculum. In the same way a student's placement should be the least restrictive one appropriate for him or her, the day-to-day school pattern also should be as "normal" as possible.

Physical disabilities can have profound effects on children's emotional and social development. To promote growth, parents and teachers should avoid overprotection and encourage children to take risks within limits of safety and health. Teachers and classmates should also understand that, although children with physical disabilities and health impairments may be physically disabled, they are more like their classmates than different from them.

Technology holds great promise for making the life of a child with a disability more "normal." Computerized devices, for example, can help nonvocal, severely physically involved children communicate, perhaps for the first time.

Students who require recurring or longterm hospital care for their condition may need special services such as tutoring or homebound instruction to keep up with their class. Depending upon the nature and severity of the condition, counseling for the entire family may be helpful.

General Information About SEVERE AND/OR MULTIPLE DISABILITIES

◇ Definition ◇

People with severe disabilities are those who traditionally have been labeled as having severe or profound mental retardation. These people require ongoing extensive support in more than one major life activity in order to participate in integrated community settings and enjoy the quality of life available to people with fewer or no disabilities; they frequently have additional disabilities, including movement difficulties, sensory losses and behavior problems.

◇ Incidence ◇

In the 1986-1987 school year, the states reported to the U.S. Department of Education that they were providing services to 98,965 students with multiple disabilities. This number represents .14 percent of the school enrollment.

◇ Characteristics ◇

People with severe or multiple disabilities may exhibit a wide range of characteristics, depending on the combination and severity of disabilities, and the person's age. There are, however, some traits they may share, including:

- Limited speech or communication;
- Difficulty in basic physical mobility;
- Tendency to forget skills through disuse;
- Trouble generalizing skills from one situation to another; and
- A need for support in major life activities, e.g., domestic, leisure, community use, vocational.

◇ Medical Implications ◇

A variety of medical problems may accompany severe disabilities. Examples include seizures, cerebral palsy, sensory loss, hydrocephalus, and scoliosis. These conditions should be considered when establishing services. A multi-disciplinary team consisting of the student's parents, educational specialists and medical specialists in the areas in which the individual demonstrates problems should work together to plan and coordinate necessary services.

◇ Educational Implications ◇

In the past, students with severe and/or multiple disabilities were routinely excluded from public schools. Since the implementation of Public Law 94-142, (The Education of the Handicapped Act), public schools now serve large numbers of students with severe and/or multiple disabilities. Educational programming is likely to begin as early as infancy. At that time, as well as later on, the primary focus is upon increasing the child's independence.

In order to be effective, educational programs need to incorporate a variety of components to meet the considerable needs of individuals with severe and/or multiple disabilities. Programs should access needs in four major areas: domestic, leisure/recreational, community and vocational. These assessments enable the identification of functional objectives (objectives which will result in the learner's increased skill and independence in dealing with the routine activities of his/her life). Instruction should include: Expression of choice; communication; functional skill development; and age-appropriate social skills training.

Related services are of great importance, and the multidisciplinary approach is crucial. Appropriate people such as speech and language therapists, physical and occupational therapists, and medical specialists need to work closely with classroom teachers and parents. Because of problems with skill generalization, related services are best offered during the natural routine in the school and community rather than removing a student from class for isolated therapy.

Frequently, classroom arrangements must take into consideration students' needs for medications, special diets, or special equipment. Adaptive aids and equipment enable students to increase their range of functioning. For example, in recent years computers have become effective communication devices. Other aides include: wheelchairs, typewriters, headsticks (head gear), clamps, modified handles on cups and silverware, and communication boards. Computerized communication equipment and specially built vocational equipment also play important roles in adapting working environments for people with serious movement limitations.

Integration with nondisabled peers is another important component of the educational setting. Attending the same school and participating in the same activities as their nondisabled peers is crucial to the development of social skills and friendships for people with severe disabilities. Integration also benefits nondisabled peers and professionals through positive attitude change.

Beginning as early as the elementary school years, community-based instruction is an important characteristic of educational programming. In order to increase the student's ability to generalize (transfer) skills to appropriate situations, this type of instruction takes place in the actual setting where the skills will be used. As students grow older, increasing time is spent in the community; high school students may spend as much as 90 percent of their day there. Programs should draw on existing adult services in the community, including group homes, vocational programs and recreational settings.

In light of the current Vocational Rehabilitation Act and the practice of supported employment, schools are now using school-to-work transition planning and working toward job placement in integrated, competitive settings rather than sheltered employment and day activity centers.

General Information About SPEECH AND LANGUAGE DISORDERS

◇ Definition ◇

Speech and language disorders refer to problems in communication and related areas such as oral motor function. These delays and disorders range from simple sound substitutions to the inability to understand or use language or use the oral-motor mechanism for functional speech and feeding. Some causes of speech and language disorders include hearing loss, neurological disorders, brain injury, mental retardation, drug abuse, physical impairments such as cleft lip or palate, and vocal abuse or misuse. Frequently, however, the cause is unknown.

◇ Incidence ◇

One quarter of the students served in the public schools' special education programs (almost 1 million children in the 1988-89 school year) were categorized as speech or language impaired. This estimate does not include children who have speech/language problems secondary to other conditions such as deafness. Language disorders may be related to other disabilities such as mental retardation, autism or cerebral palsy. It is estimated that communication disorders (including speech, language and hearing disorders) affect one of every 10 people in the United States.

◇ Characteristics ◇

A child's communication is considered delayed when the child is noticeably behind his or her peers in the acquisition of speech and/or language skills. Sometimes a child will have greater receptive (understanding) than expressive (speaking) language skills, but this is not always the case.

Speech disorders refer to difficulties producing speech sounds or problems with voice quality. They might be characterized by an interruption in the

flow or rhythm of speech, such as stuttering, which is called dysfluency. Speech disorders may be problems with the way sounds are formed, called articulation or phonological disorders, or they may be difficulties with the pitch, volume or quality of the voice. There may be a combination of several problems. People with speech disorders have trouble using some speech sounds, which can also be a symptom of a delay. They may say "see" when they mean "ski" or they may have trouble using other sounds like "l" or "r". Listeners may have trouble understanding what someone with a speech disorder is trying to say. People with voice disorders may have trouble with the way their voices sound.

A language disorder is an impairment in the ability to understand and/or use words in context, both verbally and nonverbally. Some characteristics of language disorders include improper use of words and their meanings, inability to express ideas, inappropriate grammatical patterns, reduced vocabulary and inability to follow directions. One or a combination of these characteristics may occur in children who are affected by language learning disabilities or developmental language delay. Children may hear or see a word but not be able to understand its meaning. They may have trouble getting others to understand what they are trying to communicate.

◇ Educational Implications ◇

Because all communication disorders carry the potential to isolate individuals from their social and educational surroundings, it is essential to find appropriate timely intervention. While many speech and language patterns can be called "baby talk" and are part of a young child's normal development, they can become problems if they are not outgrown as expected. In this way an initial delay in speech and language or an initial speech pattern can become a disorder which can cause difficulties in

learning. Because of the way the brain develops, it is easier to learn language and communication skills before the age of 5. When children have muscular disorders, hearing problems or developmental delays, their acquisition of speech, language and related skills is often affected.

Speech-language pathologists assist children who have communication disorders in various ways. They provide individual therapy for the child; consult with the child's teacher about the most effective ways to facilitate the child's communication in the class setting; and work closely with the family to develop goals and techniques for effective therapy in class and at home. Technology can help children whose physical conditions make communication difficult. The use of electronic communication systems allow nonspeaking people and people with severe physical disabilities to engage in the give and take of shared thought.

Vocabulary and concept growth continues during the years children are in school. Reading and writing are taught and, as students get older, the understanding and use of language becomes more complex. Communication skills are at the heart of the education experience. Speech and/or language therapy may continue throughout a student's school year either in the form of direct therapy or on a consultant basis. The speech-language pathologist may assist vocational teachers and counselors in establishing communication goals related to the work experiences of students and suggest strategies that are effective for the important transition from school to employment and adult life.

Communication has many components. All serve to increase the way people learn about the world around them, utilize knowledge and skills, and interact with colleagues, family and friends.

General Information About SPINA BIFIDA

◇ Definition ◇

Spina Bifida means cleft spine, which is an incomplete closure in the spinal column. In general, the three types of spina bifida (from mild to severe) are:

1. **Spina Bifida Occulta:** There is an opening in one or more of the vertebrae (bones) of the spinal column without apparent damage to the spinal cord.
2. **Meningocele:** The meninges, or protective covering around the spinal cord, has pushed out through the opening in the vertebrae in a sac called the "meningocele." However, the spinal cord remains intact. This form can be repaired with little or no damage to the nerve pathways.
3. **Myelomeningocele:** This is the most severe form of spina bifida, in which a portion of the spinal cord itself protrudes through the back. In some cases, sacs are covered with skin; in others, tissue and nerves are exposed. Generally, people use the terms "spina bifida" and "myelomeningocele" interchangeably.

◇ Incidence ◇

Approximately 40% of all Americans may have spina bifida occulta, but because they experience little or no symptoms, very few of them ever know that they have it. The other two types of spina bifida, meningocele and myelomeningocele, are known collectively as "spina bifida manifesta," and occur in approximately one out of every thousand births. Of these infants born with "spina bifida manifesta," about 4% have the meningocele form, while about 96% have myelomeningocele form.

◇ Characteristics ◇

The effects of myelomeningocele, the most serious form of spina bifida, may include muscle weakness or paralysis below the area of the spine where the incomplete closure (or cleft) occurs, loss of sensation below the cleft, and loss of bowel and bladder control. In addition, fluid may build up and cause an accumulation of fluid in the brain (a condition known as hydrocephalus). A large percentage (70%-90%) of children born with myelomeningocele have hydrocephalus. Hydrocephalus is controlled by a surgical procedure called "shunting," which relieves the fluid buildup in the brain. Hydrocephalus may occur without spina bifida, but the two conditions often occur together. If a drain (shunt) is not implanted, the pressure buildup can cause brain damage, seizures or blindness.

◇ Educational Implications ◇

Although spina bifida is relatively common, until recently most children born with a myelomeningocele died shortly after birth. Now that surgery to drain spinal fluid and protect children against hydrocephalus can be performed in the first 48 hours of life, children with myelomeningocele are much more likely to live. Quite often, however, they must have a series of operations throughout their childhood. School programs should be flexible to accommodate these special needs.

Many children with myelomeningocele need training to learn to manage their bowel and bladder functions. Some require catheterization, or the insertion of a tube to permit passage of urine.

BEST COPY AVAILABLE

The courts have held that clean, intermittent catheterization is necessary to help the child benefit from and have access to special education and related services. Many children learn to catheterize themselves at a very early age.

A successful bladder management program can be incorporated into the regular school day.

In some cases, children with spina bifida who also have a history of hydrocephalus experience learning problems. They may have difficulty with paying attention, expressing or understanding language, and grasping reading and math. Early intervention with children who experience learning problems can help considerably to prepare them for school.

Mainstreaming, or successful integration of a child with spina bifida into a school attended by nondisabled young people, sometimes requires changes in school equipment or the curriculum. Although student placement should be in the least restrictive environment the day-to-day school pattern also should be as "normal" as possible. In adapting the school setting for the child with spina bifida, architectural factors should be considered. Section 504 of the Rehabilitation Act of 1973 requires that programs receiving federal funds make their facilities accessible. This can occur through structural changes (for example, adding elevators or ramps) or through schedule or location changes (for example, offering a course on the ground floor).

Children with myelomeningocele need to learn mobility skills, and often require the aid of crutches, braces, or wheelchairs. It is important that all members of the school team and the parents understand the child's physical capabilities and limitations. Physical disabilities like spina bifida can have profound effects on a child's emotional and social development. To promote personal growth, families and teachers should encourage children, within the limits of safety and health, to be independent and to participate in activities with their nondisabled classmates.

General Information About VISUAL IMPAIRMENTS

◆ Definition ◆

The terms partially sighted, low vision, legally blind and totally blind are used in the educational context to describe students with visual impairments. They are defined as follows:

- "Partially sighted" indicates some type of visual problem has resulted in a need for special education;
- "Low vision" generally refers to a severe visual impairment, not necessarily limited to distance vision. Low vision applies to all individuals with sight who are unable to read the newspaper at a normal viewing distance, even with the aid of eyeglasses or contact lenses. They use a combination of vision and other senses to learn, although they may require adaptations in lighting or the size of print, and, sometimes, braille;
- "Legally blind" indicates that a person has less than 20/200 vision in the better eye or a very limited field of vision (20 degrees at its widest point); and
- Totally blind students learn via braille or other non-visual media.

Visual impairment is the consequence of a functional loss of vision, rather than the eye disorder itself. Eye disorders which can lead to visual impairments can include retinal degeneration, albinism, cataracts, glaucoma, muscular problems that result in visual disturbances, corneal disorders, diabetic retinopathy, congenital disorders and infection.

◆ Incidence ◆

The rate at which visual impairments occur in individuals under the age of 18 is 12.2 per 1,000. Severe visual impairments, (legally or totally blind) occur at a rate of .06 per 1,000.

◆ Characteristics ◆

The effect of visual problems on a child's development depends on the severity, type of loss, age at which the condition appears, and overall functioning level of the

child. Many children who have multiple handicaps may also have visual impairments resulting in motor, cognitive and/or social developmental delays.

A young child with visual handicaps has little reason to explore interesting objects in the environment, and thus may miss opportunities to have experiences and to learn. This lack of exploration may continue until learning becomes motivating or until intervention begins.

Because the child cannot see parents or peers, he or she may be unable to imitate social behavior or understand nonverbal cues. Visual handicaps can create obstacles to a growing child's independence.

◆ Educational Implications ◆

Children with visual impairments should be assessed early to benefit from early intervention programs, when applicable. Technology in the form of computers, low-vision optical and video aids enable many partially sighted, low vision and blind children to participate in regular class activities. Large print materials, books on tape and braille books are available.

Students with visual impairments may need additional help with special equipment and modifications in the regular curriculum to emphasize listening skills, communication, orientation and mobility, vocation/career options, and daily living skills. Students with low vision or who are legally blind may need help in using their residual vision more efficiently and in working with special aids and materials. Students who have visual handicaps combined with other types of disabilities have a greater need for an interdisciplinary approach and may require greater emphasis on self care and daily living skills.

Attention Deficit Disorder

by:
Mary Fowler

September, 1991

NICHCY

BRIEFING PAPER

National Information Center for Children
and Youth with Disabilities
P.O. Box 1492
Washington, D.C. 20013-1492

Every year the National Information Center for Children and Youth with Disabilities (NICHCY) receives hundreds of requests for information about the education and special needs of children and youth with Attention Deficit Disorder (ADD) or Attention Deficit Hyperactivity Disorder (ADHD). Over the past three years, ADD and ADHD have become a subject of increased attention from parents, professionals, and policy-makers across the country.

In response to the growing concern and interest in this disability, this *NICHCY Briefing Paper* was developed. It is designed to answer some of the most commonly asked questions regarding ADD and ADHD and to provide concerned individuals with other resources for information and support.

What is Attention Deficit Disorder?

Attention Deficit Disorder (ADD), also called Attention Deficit Hyperactivity Disorder (ADHD), is a developmental disability estimated to affect between 3-5% of all children (Barkley, 1990). The disorder is characterized by three predominant features: inattentiveness, impulsivity, and in many but not all cases, restlessness or hyperactivity. The disorder is most prevalent in children and is generally thought of as a childhood disorder. Recent studies, however, show that ADD can and does continue throughout the adult years. Current estimates suggest that approximately 50 to 65% of the children with ADD will have symptoms of the disorder as adolescents and adults (Barkley, 1990, p. 124).

What Causes ADD?

Scientists and medical experts do not know precisely what causes ADD. Scientific evidence suggests that the disorder is genetically transmitted in many

"Maybe you know my kid. He's the one who says the first thing that comes to mind. He's the youngster who can't remember a simple request. When he scrapes his knee, he screams so loud and long that the neighbors think I am beating him. He's the kid in school with ants in his pants who could do the work if he really tried. Or so his parents have been told over and over again."

Drawn from Mary Fowler's (1990) *Maybe you know my kid: A parent's guide to identifying, understanding, and helping your child with ADHD*. Used with permission.

cases, and is caused by a chemical imbalance or deficiency in certain neurotransmitters (chemicals that regulate the efficiency with which the brain controls behavior). Results from a landmark study conducted by Alan Zametkin, M.D., and his colleagues at the National Institute of Mental Health showed that the rate at which the brain uses glucose, its main energy source, is lower in subjects with ADD than in subjects without ADD (Zametkin et al., 1990). Even though the exact cause of ADD remains unknown, we do know that ADD is a neurologically-based medical problem and is not caused by poor parenting or diet.

What Are The Signs of ADD?

Inattention. A child with ADD is usually described as having a short attention span and as being distractible. The child will have difficulty concentrating (particularly on tasks that are routine or boring), listening, beginning or finishing tasks, and following directions (especially when three or more steps are given at one time). The child may appear to hear but not listen. Parents and teachers find that they often have to repeat directions and redirect the child to tasks such as getting ready for school, putting away toys or materials, complet-

ing worksheets, or finishing meals. Some children with ADD wander about, while others appear to daydream.

Attention is a skill that can be applied or directed in a variety of ways. The inattentiveness of a child with ADD, then, can take several forms. The child may have difficulty with selective attention (figuring out where his or her attention needs to be), focusing attention (the child knows where attention needs to be, but has difficulty zeroing in on the relevant task), sustaining attention (difficulty in maintaining attention through distractions), and/or dividing attention (difficulty doing two or more tasks at the same time). The child can have difficulty with one or all of these attention skills.

Impulsivity. A child with ADD often acts without thinking, and has great difficulty waiting for his or her turn. The child may rush through assignments, shift excessively from one task to another, or frequently call out or ask irrelevant questions in class. This child will often interrupt others and have outbursts of inappropriate responses such as silliness or anger. When this child gets a case of "the giggles" or flies into a temper tantrum, he or she has great difficulty regaining emotional control.

BEST COPY AVAILABLE

Impulsivity often leads the child into physical danger and disapproval. He or she may engage in what looks like risk-taking behavior, such as running across a street without looking, climbing on or jumping from roof tops or tall trees, shooting a rubber band at a classmate, and so on. This child is not really a risk-taker but, rather, a child who has great difficulty controlling impulse. Often, the child is surprised to discover that he or she has gotten into a dangerous situation and has no idea how the situation developed or why.

Hyperactivity (Poor Motor Control). Many (but not all) children with ADD are hyperactive. A hyperactive child is often described as "always on the go" or "motor driven." This child runs or climbs excessively, has difficulty sitting still, fidgets, and engages in physical activity not related to the task, such as frequent pencil sharpening, falling out of his or her chair, finger tapping, or fiddling with objects. The child may also make excessive vocalizations, noises, or talk in a loud voice. It is important to realize, however, that some children are more hyperactive than others, and that a hyperactive child may have periods of calm as well.

In contrast to children who have ADD with hyperactivity, some children with ADD are underactive and often called "lazy" or "spacey." Children with ADD—those with hyperactivity and those without—are often "accident prone."

Disorganization. Inattentiveness and impulsivity often cause the child with ADD to be very disorganized. This child frequently forgets needed materials or assignments, loses his or her place, and has difficulty following sequences, such as directions with three or more steps. When given multiple worksheets or directions, the child often does not know where to begin or overlooks part of the assignment.

Social Skill Deficits. The child with ADD is often described as immature, lacking in self-awareness and sensitivity, and demanding of attention. The child may frustrate easily and be inconsiderate, overly sensitive, or emotionally overreactive. He or she may have difficulty expressing feelings, accepting responsibility for behavior, or get into frequent fights or arguments. This child often reacts to a social situation without first determining what behavior is desirable; for example, he or she may inter-

rupt a game in progress or crack a "joke" during a serious moment. Though this child has social problems, it is important to understand that the social skills deficits stem from the disorder. This child wants to be liked and accepted, but usually goes about it with an inappropriate style.

Don't All Children Show These Signs Occasionally?

From time to time all children will be inattentive, impulsive, and exhibit high energy levels. But, in the case of ADD, these behaviors are the rule, not the exception. This child is often described as experiencing difficulty "getting with the program" at home, in school, or with peers. Keep in mind, however, that the degree of difficulty varies with each child.

Many parents spend years wondering why their child is difficult to manage. They may blame themselves, thinking they are "bad" parents or feeling guilty and ashamed of the way they respond to the child. As the child grows older, the "out of step" behavior is often misunderstood as a deliberate choice to be non-compliant, and the child is blamed. When the child enters school and experiences difficulty in that environment, teachers with knowledge of this disability may recognize the behaviors as possible indicators of ADD. Teachers without knowledge of ADD may blame the child, the parents, or both.

How Do I Know For Sure If My Child Has ADD?

There is a big difference between suspecting your child has ADD and knowing for certain. Parents are cautioned against diagnosing this disorder by themselves. ADD is a disability that, without proper identification and treatment, can have serious and long-term complications.

Unfortunately, there is no simple test, such as a blood test or urinalysis, which will determine if a child has this disorder. Diagnosing ADD is complicated and much like putting together a puzzle. An accurate diagnosis requires an assessment conducted by a well-trained professional, usually a developmental pediatrician, child psychologist, child psychiatrist, or pediatric neurologist.

What Does an ADD Assessment Involve?

The evaluation for diagnosing ADD usually includes the following elements:

1. A thorough medical and family history
2. A physical examination
3. Interviews with the parents, child, and child's teacher
4. Behavior rating scales
5. Observation of the child
6. Psychological tests which measure I.Q. and social and emotional adjustment, as well as screen for learning disabilities.

Sophisticated medical tests such as EEGs (to measure the brain's electrical activity) or MRIs (an X-ray that gives a picture of the brain's anatomy) are *NOT* part of the routine assessment. Such tests are usually given only when the diagnostician suspects another problem, and those cases are rare. Positron emission tomography (PET Scan) has recently been used for research purposes but is not part of the diagnostic evaluation.

The professional evaluating your child will look at all the information collected and decide whether or not your child has ADD. This professional will base this decision in part upon whether your child exhibits at least eight of the behaviors (called criteria) listed in the American Psychiatric Association's (APA) *Diagnostic and Statistical Manual (DSM)*. These criteria are presented in Table 1.

It is useful to know that in recent years the description of ADD in the DSM has been revised as a result of research and the opinions of experts in the field. While prior editions of the DSM referred to the disorder as "ADD with hyperactivity" and "ADD without hyperactivity," the latest edition (called the DSM-III-R) uses the acronym ADHD, which stands for Attention Deficit Hyperactivity Disorder. This change in terminology shows the predominance of hyperactivity as one characteristic of the disability. Yet, many children with attention deficit disorders are not hyperactive. The DSM-III-R acknowledges this fact by stating that "signs of impulsiveness and hyperactivity are not present in **Undifferentiated Attention-deficit Disorder**" (p. 52). Thus, while professionals may assess a child according to

Table 1
Diagnostic Criteria for ADHD,
as Listed in the DSM-III-R*

Note: A criterion is met only if the behavior occurs more frequently in a child being assessed than in most people of the same mental age.

A. At least eight of the following behaviors must be present, for at least six months:

- often fidgets with hands or feet, or squirms in seat (in adolescents, may be limited to subjective feelings of restlessness)
- has difficulty remaining seated when required to do so
- is easily distracted by extraneous stimuli
- has difficulty awaiting turn in games or group situations
- often blurts out answers to questions before they have been completed
- has difficulty following through on instructions from others (not due to oppositional behavior or failure to comprehend directions), e.g., fails to complete chores
- has difficulty sustaining attention in tasks or play activities
- often shifts from one uncompleted activity to another
- has difficulty playing quietly
- often talks excessively
- often interrupts or intrudes on others, e.g., butts into other children's games
- often does not seem to listen to what is being said to him or her
- often loses things necessary for tasks or activities at school or at home (e.g., toys, pencils, books, assignments)
- often engages in physically dangerous activities without considering possible consequences (not for the purpose of thrill-seeking), e.g., runs into street without looking

B. These behaviors begin before the age of seven.

* Drawn from the American Psychiatric Association's (1987), *Diagnostic and Statistical Manual of Mental Disorders* (3rd edition-revised), pp. 52-53.

the criteria listed in the DSM-III-R, they will take into consideration that hyperactive or impulsive behavior may not necessarily be present in all children with ADD.

In general, then, for a child to be diagnosed as having ADD, the behavioral signs listed in Table 1 must be evident in early childhood (prior to age seven), inappropriate for the child's age, and present for at least six months.

All children with ADD do not have the disorder to the same degree or intensity. ADD can be mild with the child exhibiting few symptoms in perhaps only the home or school environment. Other children may have moderate to severe

degrees of ADD and experience difficulty in all areas of their lives.

How Do I Get My Child Evaluated For ADD?

If your child is an infant or toddler, and you suspect an attention or hyperactivity problem, you may want to investigate what early intervention services are available in your state through the Part H program of the Individuals with Disabilities Education Act (IDEA). You can find out about the availability of these services in your state by contacting the State Department of Education, contacting your local education agency,

asking your pediatrician, or contacting the nursery or child care department in your local hospital.

While your state may not specifically list ADD as a disability to be addressed through the Part H program, most states have a category such as "atypical children" or "other" under which an ADD assessment might be made.

Preschoolers (children aged 3-5) may be eligible for services under Part B of the Individuals with Disabilities Education Act. If your child is a preschooler, you may wish to contact the State Department of Education, local education agency, ask your pediatrician, or talk with local day care providers about how to access services under Part B in order to have your child assessed.

If your child is school-aged, and you suspect that ADD may be adversely affecting his or her educational performance, you can ask your local school district to conduct an evaluation. With the exception of the physical examination, the assessment can be conducted by the child study team, provided they have been trained in the assessment of Attention Deficit Disorder. If not, the district may need to utilize an outside professional consultant trained in the assessment of ADD. This person must know what to look for during child observation, be competent to conduct structured interviews with the parent, teacher, and child, be able to interpret the interview results, and know how to administer and interpret behavior rating scales.

Parents may also choose to have their child assessed privately. In selecting a professional to perform an assessment for ADD, parents should consider the clinician's training and experience with the disorder, and his or her availability to coordinate the various treatment approaches. Parents can consult their child's pediatrician, community mental health center, university mental health clinics, or hospital child evaluation units. Most ADD parent support groups have a list of clinicians trained to evaluate and treat children with ADD.

How is ADD Treated?

There is no cure or "quick fix" when treating ADD. Widely publicized "cures" such as special diets have, for the most part, proven ineffective.

Effective treatment of ADD generally requires these basic components: education about the disorder, training in the use of behavior management, medication when indicated, and an appropriate educational program.

(1) *Education about the Disorder.* Parents and teachers need to be aware of the symptoms of ADD and how those symptoms impact the child's ability to function at home, in school, and in social situations. Once the adults in the child's life understand that the child cannot help many of his or her problematic behaviors, they will be able to structure situations to enable the child to behave appropriately and achieve success. Remember, the child who has difficulty with attention, impulse control, and in regulating physical activity needs help and encouragement to overcome these problems.

(2) *Behavior Management.* Children with ADD respond well to rewards and structure. The child does best in an organized environment where rules and expectations are clear and consistent, and when consequences for meeting the demands of a given situation are set forth ahead of time and delivered immediately. Thus, the child's environment needs to be ordered and predictable. Frequent and consistent praise and rewards for appropriate behavior such as completing tasks on time or being polite and courteous encourage the child to repeat such desirable behavior.

The main principle behind all behavior management strategies is to increase the child's appropriate behavior and decrease inappropriate behavior through the use of consequences. The best way to influence any behavior is to pay attention to it. The best way to increase a desirable behavior is to reward it. Ignoring an undesirable behavior will decrease its frequency.

There are many books on behavior management written for the lay person. Below are some guidelines for behavior management.

Guideline 1, Behavior Modification Charts: Children with ADD usually require a formal program for managing their behavior. Most often, such a program centers around behavior modification charts. Parents, teachers, and other important adults in the child's life will need training in how to implement and use these charts effectively.

Charts are designed to provide the child with a clear picture of what behav-

iors are expected. The child then has the choice to meet those expectations. Parents or teachers provide feedback to the child about his or her choices by delivering consequences. Charts provide high motivation and enable the child to develop an internal sense of self-control — specifically, that he or she can behave appropriately.

There are two basic types of chart programs. (1) *Token Economy* - Here, the child earns tokens (chips, stickers, stars) for appropriate behavior. Tokens can be exchanged for various rewards. (2) *Response Cost* - In this chart program, the child is given tokens for free. Tokens are withdrawn for inappropriate behavior (e.g., out of seat, off-task, etc.).

The most effective programs use both types of chart systems and work on a give and take basis. In this combination system, the child is given a token for behaving appropriately and loses a token when misbehaving.

When creating and implementing a behavior modification chart, you may wish to follow these suggestions:

- ✓ Make a list of problematic behaviors or ones that need improving.
- ✓ Select the behaviors to be modified. The parents (or teachers), with input from the child, review the list of problematic behaviors and select three, four, or five to work on at a given time. The behaviors charted should be ones that occur daily, such as going to bed on time, doing homework, or getting ready for school on time.
- ✓ Design a reward system (Token Economy, Response Cost, or a combination). The parents (or teachers) need to pay attention to the child's behavior throughout the course of a day and provide frequent rewards when the child behaves appropriately. At the end of the day, tokens can be exchanged for rewards, such as extended bed time, playing a game with Mom or Dad, or a favorite snack. Remember, a reward is only effective when it has value to the child. Rewards might have to be changed frequently.

Guideline 2, Punishment: Children with ADD respond best to motivation and positive reinforcement. It is best to avoid punishment. When punishment is necessary, use it sparingly and with sensitivity. It is important for parents and teachers to respond to this child's inappropriate behavior without anger and in

a matter-of-fact way. These children need to be taught to replace inappropriate behavior with appropriate behavior.

Guideline 3, Time-out: When the child is misbehaving or out of control, time-out is an effective way to manage the problem. Time-out means the child is sent to a predetermined location for a short period of time. A place out of the mainstream of activity is best; for example, one particular chair may be specified as the "time-out chair." The time-out location should not be a traumatic place, such as a closet or dark basement. The purpose of time-out is to provide the child with a cooling-off period wherein he or she can regain control.

An important aspect to time-out is that the child no longer has the privilege to choose where he or she would like to be and how time is spent. In general, the child stays in time-out and must be quiet for five minutes. Preschool-aged children are usually given two or three minutes in time-out. For toddlers, 30 seconds to a minute is appropriate.

(3) *Medication.* Medication has proven effective for many children with ADD. Most experts agree, however, that medication should never be the only treatment used. Stimulants are the medication most widely prescribed for ADD. These drugs (e.g. Ritalin, Dexedrine, Cylert) are believed to stimulate the action of the brain's neurotransmitters, which enables the brain to better regulate attention, impulse, and motor behavior. Ritalin is the most widely used stimulant medication. In most cases, Ritalin has few and mild side-effects. Anti-depressant medications are also used in children who cannot take stimulant drugs.

The parents' decision to place a child on medication is a personal one and should be made after a thorough evaluation of the child has taken place and after careful consideration by both the parents and the physician. The prescribing physician should explain the benefits and drawbacks of this form of treatment to the parents. Doses are generally administered gradually, so that the child receives the lowest dose needed to achieve the best therapeutic benefit. Parents should monitor closely how their child responds to the medication. Such monitoring generally includes feedback from the child's teacher(s). Parents should communicate with the physician as often as is necessary to determine when medication has reached the proper

level for the child, and to discuss any problems or questions.

(4) Appropriate Educational Program. Many children with ADD experience the greatest difficulty in school where demands for attention and impulse or motor control are virtual requirements for success. Though most children with ADD do not have a learning disability that interferes with the psychological process of learning, these children often are unable to perform to their level of ability in school. Their poor performance and academic failure usually result from uncompleted tasks, assignments completed but not handed in on time, disorganization, and not following directions. Behavioral difficulties such as hyperactivity, low frustration tolerance, and outbursts of temper also prevent many of these children from adapting to the classroom regimen. With help, these children can and do succeed in school. (Note: Some children with ADD, however, do have learning disabilities. Any evaluation should screen for the co-existence of learning disabilities or other disabilities and ADD.)

Children with ADD do best with a teacher who is knowledgeable about the disorder and willing to problem-solve to help the child overcome his or her difficulties. A classroom where activities are highly structured and where the teacher uses lots of motivation and hands-on instruction are similarly helpful to children with ADD. Teachers and parents need to communicate frequently.

There are numerous interventions which can be used effectively with the ADD child. Here are a few guidelines:

- ✓ The classroom environment needs to be structured and predictable, with rules, schedules, and assignments posted and clearly spelled out.
- ✓ It is best to seat the child close to the teacher, away from distractors.
- ✓ Directions should be clear, simple, and given a few at a time.
- ✓ The curriculum will need to be modified in accordance with the child's organizational skills and his or her ability to pay attention and concentrate. How tasks are approached may be modified in a number of ways. For example, tasks can be structured into easily completed parts; the length of assignments can also be shortened or the child can be given extra time to complete tasks. The child's progress during tasks can be monitored. Including organizational and study skills in the daily curriculum is another helpful modification, as is coordinating the amount of work between subject areas.
- ✓ Behavior management (e.g. positive reinforcement) is also necessary. Behavior charts, used in combination with other educational interventions, often produce positive results.

How Can I Help My Child Improve Self-Esteem?

Most undiagnosed and untreated children with ADD suffer from low self-esteem. Many will also show signs of being mildly depressed. These feelings stem from the child's sense of personal failure. For the child with ADD, the world is often an unkind place. Negative feedback in the form of punishment or blame tends to be a constant in this child's life. Early diagnosis and treatment help to stem the feelings of poor self-esteem.

To encourage a good sense of self, this child must be helped to recognize personal strengths and to develop them. Using many of the behavior management techniques described in this document will help. The child's self-esteem will improve when he or she feels competent. These are not children who can't, or won't. They can, and do. It's just that "can" and "do" come harder for them.

Does My Child Need Special Education?

Approximately one half of the children with ADD are able to learn satisfactorily and perform to their ability levels within a regular education classroom *when the disorder is recognized, understood, and when curriculum adjustments to the regular program of instruction are made.*

WAYS TO IMPROVE SELF-ESTEEM IN CHILDREN WHO HAVE ADD

Become Proactive. Knowledge is power. Gain enough knowledge about the disability so you understand why and how ADD affects the child at home, in school, in social situations, and the entire family system.

Change Your Belief System. Before the child can change his or her self-concept, the adults in the child's life have to change the way they view the child. Separate the child from the behavior, and then separate the child from the disability. These are not ADD children. They are children with ADD.

Act, Don't React. Emotional responses such as blame and anger will diminish when you stop, look, listen, and then respond. In other words, count to ten.

Nurture Yourself. Take time alone with your spouse, develop an interest or hobby, establish a regular exercise program - be good to yourself.

Catch The Child Being Good. Give your child lots of praise, encouragement, recognition, and positive attention. Reward the child for meeting expectations. Use punishment sparingly, and never ridicule the child.

Develop The Child's Sense of Competence and Responsibility.

- Identify the child's strengths and weaknesses.
- Develop realistic expectations of the child.
- Play to the child's strengths by building opportunities for success in the environment. Remember, you may have to structure situations carefully to make success achievable.
 - Assign special jobs (feeding the family pet, mowing the lawn, decorating the house for holidays).
 - Cultivate the child's special interests (help start a card or doll collection, take trips to museums).
 - Enroll the child in extra-curricular activities (sports, performing arts). Finding an activity best suited to your child may require trial and error. Encourage the child by attending practices and performances.
 - Play with your child. Let the child choose and direct the game or activity and, if not too obvious, let the child win.

"I think I can. I think I can," said the little red engine. And he could.

BEST COPY AVAILABLE

The other half of the children with ADD will require special education services, most of which can be provided within the regular education classroom or the resource room. Such services might include teaching of organization techniques, behavior modification programs, daily or weekly report cards, training in self-monitoring, self-evaluation, and self-instruction methods, and the coordination of efforts among the different teachers working with the child.

Some children — approximately 15% — will need a more intensive program, particularly those children who have other disabilities in addition to ADD. A series of steps is typically necessary in order for a child to be placed into a special education program. First, the child is referred to the local school district's evaluation team. An evaluation is then made to determine what effect the child's disability is having on his or her ability to perform educationally. Once a child is determined to be eligible for special education and related services, the parents collaborate with the school in developing an individualized educational plan (IEP). The IEP is designed to address the child's specific problems and unique learning needs. Strategies to improve social and behavioral problems are also addressed in the IEP.

What Are My Child's Legal Rights For Special Education?

Numerous sources are available to provide information about your child's right to receive special education and related services. For an in-depth expla-

"I am one of the lucky mothers. I now understand why my son behaves the way he does. I know now that the disturbing behaviors which appeared at various stages of his development were neither of his own doing or my fault. If you are the parent of a child with ADD, I want you to know that children with ADD aren't really pain in the neck kids with lousy parents. Know when and where to go for help and support. Understand that they are the children who have ADD."

nation of the laws governing the rights of children, contact the National Information Center for Children and Youth With Disabilities (NICHCY). Request a copy of NICHCY's *NEWS DIGEST* entitled *The Education of Children and Youth with Special Needs: What Do the Laws Say?* (Volume I, Number 1, 1991).

Where Can I Find a Parent Support Group?

There are numerous ADD parent support groups located throughout the country. For information about a group in your location, contact CH.A.D.D. (Children with Attention Deficit Disorders) at 499 NW 70th Avenue, Suite 308, Plantation, FL 33317. You can also call CH.A.D.D. at (305) 587-3700. If there is no parent support group in your area, the CH.A.D.D. staff can give you guidance in how to start a group in your area.

U.S. Department of Education Issues ADD Policy Clarification...

A Policy Clarification Memorandum on Attention Deficit Disorder has been issued jointly by three offices within the Department of Education. It has been jointly signed by Robert R. Davila, Assistant Secretary for the Office of Special Education and Rehabilitative Services, Michael L. Williams, Assistant Secretary for the Office for Civil Rights, and John T. MacDonald, Assistant Secretary for the Office of Elementary and Secondary Education.

The Memorandum does three things. It clarifies the circumstances under which children with ADD are eligible for special education services under Part B of the Individuals with Disabilities Education Act (IDEA), as well as the Part B requirements for evaluation of such

children's unique educational needs. It also clarifies the responsibility of State and local educational agencies to provide special education and related services to eligible children with ADD under Part B. Finally, this policy clarifies the responsibility of Local Education Agencies (LEAs) to provide regular or special education and related aids and services to those children with ADD who are not eligible under Part B, but who fall within the definition of "handicapped persons" under Section 504 of the Rehabilitation Act of 1973.

A copy of this Policy Memorandum is available by writing or calling NICHCY.

DEAFNESS: A FACT SHEET

This fact sheet was written cooperatively by the National Information Center on Deafness and the National Association of the Deaf.

Introduction

An estimated 21 million Americans have some degree of hearing impairment. Hearing impairments affect individuals of all ages, and may occur at any time from infancy through old age. The degree of loss may range from mild to severe. This variability in age at onset and degree of loss plus the fact that each individual adjusts differently to a loss of hearing makes it impossible to define uniformly the consequences of a loss.

Although the National Center for Health Statistics through its Health Interview Survey has been able to estimate the number of people with hearing impairments, there have been no recent national surveys which can be used to estimate the number of people who are deaf. As a result, estimates for the number of deaf people range anywhere from 350,000 to two million.

Audiological/Medical Information

There are four types of hearing loss, each of which can result in different problems and different possibilities for medical and nonmedical remediation.

Conductive hearing losses are caused by diseases or obstructions in the outer or middle ear (the conduction pathways for sound to reach the inner ear). Conductive hearing losses usually affect evenly all frequencies of hearing and do not result in severe losses. A person with a conductive hearing loss usually is able to use a hearing aid well, or can be helped medically or surgically.

Sensorineural hearing losses result from damage to the delicate sensory hair cells of the inner ear or the nerves which supply it. These hearing losses can range from mild to profound. They often affect certain frequencies more than others. Thus, even with amplification to increase the sound level, the hearing impaired person perceives distorted sounds. This

distortion accompanying some forms of sensorineural hearing loss is so severe that successful use of a hearing aid is impossible.

Mixed hearing losses are those in which the problem occurs both in the outer or middle and the inner ear.

A **central hearing loss** results from damage or impairment to the nerves or nuclei of the central nervous system, either in the pathways to the brain or in the brain itself.

Among the causes of deafness are heredity, accident, and illness. An unborn child can inherit hearing loss from its parents. In about 50 percent of all cases of deafness, genetic factors are a probable cause of deafness. Environmental factors (accident, illness, ototoxic drugs, etc.) are responsible for deafness in the remaining cases. Rubella or other viral infections contracted by the pregnant mother may deafen an unborn child. Hazards associated with the birth process (for example, a cut-off in the oxygen supply), may affect hearing. Illness or infection may cause deafness in young children. Constant high noise levels can cause progressive and eventually severe sensorineural hearing loss, as can tumors, exposure to explosive sounds, heavy medication, injury to the skull or ear, or a combination of these factors.

Central hearing loss may result from congenital brain abnormalities, tumors or lesions of the central nervous system, strokes, or some medications that specifically harm the ear.

The detection and diagnosis of hearing impairment have come a long way in the last few years. It is now possible to detect the presence of hearing loss and evaluate its severity in a newborn child. While medical and surgical techniques of correcting conductive hearing losses have also improved, medical correction for sensorineural hearing loss has been more elusive. Current research on a cochlear implant which provides electrical stimulation to the inner ear may lead to important improvements in the ability to medically correct profound sensorineural hearing loss.

Educational Implications

Deafness itself does not affect a person's intellectual capacity or ability to learn. Yet, deaf children generally require some form of special schooling in order to gain an adequate education.

Deaf children have unique communication needs. Unable to hear the continuous, repeated flow of language interchange around them, deaf children are not automatically exposed to the enormous amounts of language stimulation experienced by hearing children during their early years. For deaf children, early, consistent, and conscious use of visible communication modes (such as sign language, fingerspelling, and Cued Speech) and/or amplification and aural/oral training can help reduce this language delay. Without such assistance from infancy, problems in the use of English typically persist throughout the deaf child's school years. With such assistance, the language learning task is easier but by no means easy.

This problem of English language acquisition affects content areas as well. While the academic lag may be small during the primary grades, it tends to be cumulative. A deaf adolescent may be a number of grade levels behind hearing peers. However, the extent to which hearing impairment affects school achievement depends on many factors—the degree and type of hearing loss, the age at which it occurred, the presence of additional handicaps, the quality of the child's schooling, and the support available both at home and at school.

Many deaf children now begin their education between ages one to three years in a clinical program with heavy parental involvement. Since the great majority of deaf children—over 90 percent—are born to hearing parents, these programs provide instruction for parents on implications of deafness within the family. By age four or five, most deaf children are enrolled in school on a full-day basis. Approximately one-third of school-age deaf children attend private or public residential schools. Some attend as day students and the rest usually travel home on weekends. Two-thirds attend day programs in schools for the deaf or special day classes located in regular schools, or are mainstreamed into regular school programs. Some mainstreamed deaf children do most or all of their schoolwork in regular classes, occasionally with the help of an interpreter, while others are mainstreamed only for special activities or for one or two classes.

In addition to regular school subjects, most programs do special work on communication and language development. Class size is often limited to approximately eight children to give more attention to the children's language and communication needs.

At the secondary school level, students may work toward a vocational objective or follow a more academic course of study aimed at postsecondary education at a regular college, a special college program for deaf students (such as Gallaudet University or the National Technical Institute for the Deaf) or one of the 100 or more community colleges and technical schools that have special provisions for deaf students.

Communication: Some Choices

Communication is an important component of everyone's life. The possible choices for communication involve a variety of symbol systems. For example, you may communicate in English through speaking and writing. Despite your skills, you probably cannot communicate with someone whose only language is Chinese, even though that person also speaks, reads, and writes quite fluently.

In the United States, deaf people also use a variety of communication systems. They may choose among speaking, speechreading, writing, and manual communication. Manual communication is a generic term referring to the use of manual signs and fingerspelling.

American Sign Language

American Sign Language (ASL) is a language whose medium is visible rather than aural. Like any other language, ASL has its own vocabulary, idioms, grammar, and syntax—*different from English*. The elements of this language (the individual signs) consist of the handshape, position, movement, and orientation of the hands to the body and each other. ASL also uses space, direction and speed of movements, and facial expression to help convey meaning.

Fingerspelling

When you spell with your fingers, you are in effect "writing in the air." Instead of using an alphabet written on paper, you are using a manual alphabet, that is, one with handshapes and positions corresponding to each of the letters of the written alphabet.

Conversations can be entirely fingerspelled. Among deaf people, however, fingerspelling is more typically used to augment American Sign Language. Proper names and terms for which there are no signs are usually fingerspelled. In the educational setting, the use of fingerspelling as the primary mode of communication in combination with spoken English is known as the Rochester method.

Manual English

When the vocabulary of the American Sign Language and fingerspelled words are presented in English word order, a 'pidgin' results. Pidgin Sign En-

glish (PSE) is neither strictly English nor ASL, but combines elements of both.

A number of systems have recently been devised to assist deaf children in learning English. These systems supplement some ASL signs with invented signs that correspond to elements of English words (plurals, prefixes, and suffixes, for example). There is usually a set of rules for word (sign) formation within the particular system. These systems are generically known as manually coded English or manual English systems. The two most commonly used today are Signing Exact English and Signed English. While each of these systems was devised primarily for use by parents and teachers in the educational setting, many of the invented and initialized signs from their lexicons are filtering into the vocabulary of the general deaf community.

Oral Communication

This term denotes the use of speech, residual hearing, and speechreading as the primary means of communication for deaf people.

The application of research findings and technological advances through the years has led to refinements in the rationale for and approach to teaching speech to deaf children. Several findings are pertinent here. Deaf children may actually have functional residual hearing. The speech signal is redundant. Since it carries excess information, it is not necessary to hear every sound to understand a message. For language learning to be successful with deaf children (no matter what the educational approach), programs of early intervention must take place during the critical language-learning years of birth through 6. Hearing screening procedures that accurately detect hearing impairments in very young children make it possible to fit hearing aids and other amplification devices and to introduce auditory and language training programs as soon as the problem is detected.

Almost all auditory approaches today rely heavily on the training of residual hearing. The traditional auditory/oral approach trains the hearing impaired child to acquire language through speechreading (lipreading), augmented by the use of residual hearing, and sometimes vibro-tactile cues. The auditory/verbal approach (also called unisensory or acoupedic method) teaches children to process language through amplified residual hearing, so that language is learned through auditory channels.

Speechreading

Recognizing spoken words by watching the speaker's lips, face, and gestures is a daily challenge for all deaf people. Speechreading is the least consistently visible of the communication choices available to deaf people; only about 30 percent of English sounds are visible on the lips, and 50 percent are homophonous, that is, they look like something else. Try it for yourself. Look in a mirror and 'say' without

voice the words 'kite,' 'height,' 'night.' You'll see almost no changes on your lips to distinguish among those three words. Then say the following three words—'maybe,' 'baby,' 'pay me.' They look exactly alike on the lips.

Some deaf people become skilled speechreaders, especially if they can supplement what they see with some hearing. Many do not develop great skill at speechreading, but most deaf people do speechread to some extent. Because speechreading requires guesswork, very few deaf people rely on speechreading alone for exchanges of important information.

Cued Speech

Cued Speech is a system of communication in which eight hand shapes in four possible positions supplement the information visible on the lips. The hand "cue" signals a visual difference between sounds that look alike on the lips—such as /p/, /b/, /m/. These cues enable the hearing impaired person to see the phonetic equivalent of what others hear. It is a speech-based method of communication aimed at taking the guesswork out of speechreading.

Simultaneous Communication

This term denotes the combined use of speech, signs, and fingerspelling. Simultaneous communication offers the benefit of seeing two forms of a message at the same time. The deaf individual speechreads what is being spoken and simultaneously reads the signs and fingerspelling of the speaker.

Total Communication

Total Communication is a philosophy which implies acceptance and use of all possible methods of communication to assist the deaf child in acquiring language and the deaf person in understanding.

Historically, proponents of particular systems have often been at odds with proponents of other systems or modes. There is increasing consensus that whatever system or systems work best for the individual should be used to allow the hearing impaired person access to clear and understandable communication.

Deaf Adults in Today's Society

The deaf adult population in the United States is composed both of individuals deaf since early childhood and individuals who lost their hearing later in life. People who were deafened as adults, or after the age of 18, are sometimes called post-vocationally deaf. Having already embarked on their careers, these people may have serious problems both personally and professionally adjusting to their hearing loss. People who were deafened prior to age 18 may have problems not only with English language skills, but also, because of fewer opportunities for interaction with hearing people in pre-work settings, they may be less well prepared for interpersonal relationships they encounter in the job market.

Discrimination is a common problem for minority groups. Deaf people as members of a minority group, experience their share of discrimination. Deaf people as a group are underemployed. Together with members of other minority and disabled groups, deaf people are working to change attitudes which have given them jobs but inadequate advancement opportunities.

In the United States, deaf people work in almost every occupational field. Some have become doctors, dentists, lawyers, and members of the clergy. A number of deaf people enter careers within the field of deafness. Thirteen hundred teachers of deaf students in the United States are themselves hearing impaired individuals. In addition, there are deaf administrators, psychologists, social workers, counselors, and vocational rehabilitation specialists. Deaf people drive cars and hold noncommercial pilot's licenses and pursue the same leisure time interests as everyone else.

Many deaf young people have attended school with deaf classmates. This educational pattern, coupled

with ease of communication and compatibility encouraged by shared experiences as deaf individuals, leads to socializing with other deaf individuals in maturity. Many deaf people (80 percent) tend to marry other deaf people; most of their children (approximately 90 percent) are hearing.

The Deaf Community

Because the problem in dealing with the hearing world is one of communication, deaf people tend to socialize together more than do people with other disabilities. However, members of the deaf community have contacts with other people, too. Some are active members of organizations of hearing people. Some deaf people move freely between hearing and deaf groups, while other deaf people may have almost no social contact with hearing people. A few deaf people may choose to socialize only with hearing people.

While it is possible to find deaf individuals in every section of the United States, there are major concentrations of deaf people in the larger metropolitan areas of the East and West coasts.

Organizations of and for Deaf People

Clubs and organizations of deaf people range in purpose from those with social motives (watching captioned films, for example) to those with charitable aims. Organizations offer deaf people the opportunity to pursue a hobby (athletics, drama) or civic commitment (political action) on the local, regional or national level. Local or state associations of deaf people may be affiliated with the National Association of the Deaf. The Oral Deaf Adults Section of the Alexander Graham Bell Association for the Deaf has local chapters that provide social opportunities for deaf people who favor oral communication. The National Fraternal Society of the Deaf provides insurance and supports social and charitable functions. It has 120 divisions throughout the United States and Canada.

A few of the more than 20 national organizations of and for deaf people in the United States are briefly described in the following list. Many of these organizations publish newsletters, magazines, or journals. Add to these the publications developed by clubs and schools for the deaf (for students and alumni) and it is possible to identify 400 publications aimed at a readership within the deaf community.

Alexander Graham Bell Association for the Deaf
3417 Volta Place, NW
Washington, DC 20007
(202) 227-5220 (V/TDD)

A private, nonprofit organization serving as an information resource, advocate, publisher, and conference organizer, the Alexander Graham Bell Association is committed to finding more effective ways of teaching deaf and hard of hearing people to communicate orally. Sections within the organization focus on the

needs of deaf adults (Oral Deaf Adults Section) and parents (International Parent Organization).

American Deafness and Rehabilitation Association
P.O. Box 55369
Little Rock, AR 77225
(501) 663-4617 (V/TDD)

An interdisciplinary organization for professional and lay persons concerned with services to adult deaf people, ADARA sponsors workshops for state rehabilitation coordinators.

American Society for Deaf Children
814 Thayer Avenue
Silver Spring, MD 20910
(301) 585-5400 (V/TDD)

Composed of parents and concerned professionals, ASDC provides information, organizes conventions, and offers training to parents and families with children who are hearing impaired.

National Association of the Deaf
814 Thayer Avenue
Silver Spring, MD 20910
(301) 587-1788 (V/TDD)

With 50 state association affiliates and an aggregate membership exceeding 20,000, the NAD is a consumer advocate organization concerned about and involved with every area of interest affecting life opportunities for deaf people. It serves as a clearinghouse of information on deafness, offers for sale over 200 books on various aspects of deafness, and works cooperatively with other organizations representing both deafness and other disabilities on matters of common concern.

Educational Institutions

Schools for deaf students have traditionally played an important role in advancing the welfare of deaf people through education of deaf students and public information efforts about the capabilities and accomplishments of deaf people. Two national institutions each have enrollments of over 1,000 deaf students.

Special Devices for Deaf People

Technology and inventiveness have led to a number of devices which aid deaf people and increase convenience in their daily lives. Many of these devices are commercially available under different trade names.

Telecommunications Devices for Deaf People (TDDs) are mechanical/electronic devices which enable people to type phone messages over the telephone network. The term TDD is generic and replaces the earlier term TTY which refers specifically to teletypewriter machines. Telecaption adapters, sometimes called decoders, are devices which are either added to existing television sets or built into certain new sets to enable viewers to read dialogue and narrative as captions (subtitles) on the TV screen. These captions are not visible without such adapters.

Signalling Devices which add a flashing and/or vibrating signal to the existing auditory signal are popular with hearing impaired users. Among devices using flashing light signals are door "bells," telephone ring signalers, baby-cry signals (which alert the parent that the baby is crying), and smoke alarm systems. Alarm clocks may feature either the flash-light or vibrating signal.

Some Special Services

Numerous social service agencies extend their program services to deaf clients. In addition, various agencies and organizations—either related to deafness or to disability in general—provide specific services to deaf people. Among these special services are the following:

Captioned Films for the Deaf

A loan service of theatrical and educational films captioned for deaf viewers. Captioned Films for the Deaf is one of the projects funded by the Captioning and Adaptations Branch of the U.S. Department of Education to promote the education and welfare of deaf people through the use of media. This branch also provides funds for closed-captioned television programs, including the live-captioned ABC-TV news.

Registry of Interpreters for the Deaf, Inc.

A professional organization, RID maintains a national listing of individuals skilled in the use of American Sign Language and other sign systems and provides information on interpreting and evaluation and certification of interpreters for deaf people.

State Departments of Vocational Rehabilitation

Each state has specific provisions for the type and extent of vocational rehabilitation service, but all provide vocational evaluation, financial assistance for education and training, and job placement help.

Telecommunications for the Deaf, Inc.

TDI publishes an international telephone directory of individuals and organizations who own and maintain TDDs (telecommunications devices for deaf people) for personal or business use.

Reading and Learning Disabilities: A Resource Guide

April, 1992

The National Information Center for Children and Youth with Disabilities (NICHCY) is pleased to respond to your request for information about the problems many children, youth, and adults experience with learning—in particular, with learning to read.

Having difficulty with reading is by no means unusual. Millions of people in the United States have trouble reading. Some may not be able to read at all, while others have basic reading skills but might be considered “slow readers.” It is useful to know that problems with reading are often accompanied by problems with writing, listening, or speaking. Each person having trouble in any or all of these areas should know that *help is available*.

There are many reasons why a person might have difficulty in developing reading skills. One of the most common reasons is that the person has what is known as a *learning disability*. Dyslexia is one such learning disability. There are also many other types of learning disabilities that can cause problems with learning to read or learning in general. These are described later in this guide.

Not all troubles with reading are caused by learning disabilities. It is important to determine what is causing the problem. Some causes other than learning disabilities are poor vision or hearing, emotional disturbance, or mental retardation. A person having trouble with reading should talk with specialists in the reading field and receive a thorough assessment. Through assessment, the nature of the reading problem can be determined. Then action can be taken to help the person overcome his or her specific problem.

This information brief has been developed with two major purposes in mind. These are:

- to describe some of the most common learning disabilities that can cause reading problems; and
- to put you in touch with organizations that can provide you with help to fit your needs.

This document has four sections:

- (1) a look at learning disabilities in children and youth;
- (2) suggestions for parents in how to help their school-age children learn;
- (3) considerations for adults with reading and learning problems, including a description of the diagnostic process for adults; and
- (4) book and organizational resources for: parents of school-age children with learning disabilities; adults with learning disabilities; and educators or other service providers who work with individuals with reading problems and/or learning disabilities.

We hope that you will take advantage of the expertise and assistance offered by the many excellent organizations we have listed throughout this document. They can help you to work with and overcome your reading problems. If you find you have need of additional information or assistance, please feel free to contact NICHCY again.

A Look at Learning Disabilities in Children and Youth

by Larry B. Silver, M.D.

Reprinted with permission from the Learning Disability Association of Montgomery County, Inc. in Maryland

Children and adolescents perform poorly in school for various reasons. Some have emotional or family problems; for others, the source of trouble is the community, the school, or peers; and some are simply below average intellectually. But 10 to 20 percent have a neurologically-based disorder of the type called a *learning disability*. According to the definition used by the federal government, these children are of at least average intelligence (many are far above average), and their academic problems are not caused by an emotional disturbance, by social or cultural conditions, or by a primary visual, hearing, or motor disability. Instead, the reason for their learning problems seems to be that their brains are "wired" in a way slightly different from the average person's. About 20 percent of children with learning disabilities also have a related problem, attention deficit disorder (ADD) or attention deficit hyperactivity disorder (ADHD). Its symptoms include hyperactivity, distractibility, and impulsiveness. ADD or ADHD must be evaluated and treated separately from the learning disability.

Learning disabilities are lifelong conditions that may require special understanding and help throughout grade school, high school, and beyond. They are also life disabilities that have important effects outside of the classroom, interfering not only with academic work but also with children's games, daily activities, and even friendships. Therefore, help for these children means more than classroom special education.

Types of Learning Disabilities

By the late 1960s, the present model of learning disabilities was established. This model distinguishes four stages of information processing used in learning: input, integration, memory, and output. *Input* is the process of recording in the brain information that comes from the senses. *Integration* is the process of interpreting this information. *Memory* is its storage for later retrieval. *Output* of information is achieved through lan-

guage or motor (muscular) activity. Learning disabilities can be classified by their effects at one or more of these stages. Each child has individual strengths and weaknesses at each stage.

Input. The first major type of problem at the input stage is a visual perception disability. Some students have difficulty in recognizing the position and shape of what they see. Letters may be reversed or rotated; for example, the letters d, b, p, q, and g might be confused. The child might also have difficulty distinguishing a significant form from its background. People with this disability often have reading problems. They may jump over words, read the same line twice, or skip lines. Other students have poor depth perception or poor distance judgement. They might bump into things, fall over chairs, or knock over drinks.

The other major input disability is in auditory perception. Students may have difficulty understanding because they do not distinguish subtle differences in sounds. They confuse words and phrases that sound alike — for example, "blue" with "blow" or "ball" with "bell." Some children find it hard to pick out an auditory figure from its background; they may not respond to the sound of a parent's or teacher's voice, and it may seem that they are not listening or paying attention. Others process sound slowly and therefore cannot keep up with the flow of conversation, inside or outside the classroom. Suppose a parent says, "It's getting late. Go upstairs, wash your face, and get into your pajamas. Then come back down for a snack." A child with this disability might hear only the first part and stay upstairs.

Integration. Integration disabilities take several forms, corresponding to the three stages of sequencing, abstraction, and organization.

A student with a sequencing disability might recount a story by starting in the middle, going to the beginning, and then proceeding to the end. The child might also reverse the order of letters in words, seeing "dog" and reading "god." Such children are often un-

able to use single units of a memorized sequence correctly. If asked what comes after Wednesday, they have to start counting from Sunday to get the answer. In using a dictionary, they must start with "A" each time.

The second type of integration disability involves abstraction. Students with this problem have difficulty in inferring meaning. They may read a story but not be able to generalize from it. They may confuse different meanings of the same word used in different ways. They find it difficult to understand jokes, puns, or idioms.

Once recorded, sequenced, and understood, information must be organized — integrated into a constant flow and related to what has previously been learned. Students with an organization disability find it difficult to make bits of information cohere into concepts. They may learn a series of facts without being able to answer general questions that require the use of these facts. Their lives in and outside of the classroom reflect this disorganization.

Memory. Disabilities also develop at the third stage of information processing, memory. Short-term memory retains information briefly while we attend to it or concentrate upon it. For example, most of us can retain the 10 digits of a long distance telephone number long enough to dial, but we forget it if we are interrupted. When information is repeated often enough, it enters long-term memory, where it is stored and can be retrieved later. Most memory disabilities affect short-term memory only; students with these disabilities need many more repetitions than usual to retain information.

Output. At the fourth stage, output, there are both language and motor disabilities. Language disabilities almost always involve what is called "demand language" rather than spontaneous language. Spontaneous language occurs when we initiate speaking — select the subject, organize our thoughts, and find the correct words before opening our mouths. Demand language occurs when someone else creates the circumstances

in which communication is required. A question is asked, and we must simultaneously organize our thoughts, find the right words, and answer. A child with a language disability may speak normally when initiating conversation but respond hesitantly in demand situations — pause, ask for the question to be repeated, give a confused answer, or fail to find the right words.

Motor disabilities are of two types: poor coordination of large muscle groups, which is called gross motor disability; and poor coordination of small muscle groups, which is called fine motor disability. Gross motor disabilities make children clumsy. They stumble, fall, and bump into things; they may have difficulty in running, climbing, riding a bicycle, buttoning shirts, or tying shoelaces. The most common type of fine motor disability is difficulty in coordinating the muscles needed for writing. Children with this problem write slowly, and their handwriting is often unreadable. They may also make spelling, grammar, and punctuation errors.

Detecting a Learning Disability in Children

There are several early clues to the presence of a learning disability. In preschool children we look for failure to use language in communication by age three, or inadequate motor skills (buttoning, tying, climbing) by age five. In school-age children, we observe whether they are learning the skills appropriate to their grade. Schools and families should always consider the possibility of a learning disability before assuming that a child who has been doing poorly in school is lazy or emotionally disturbed. The Individuals with Disabilities Education Act (IDEA), Public Law (P.L.) 102-119 — formerly known as the Education for All Handicapped Children Act (EHA), P.L. 94-142 — requires public school systems to evaluate children who are at risk for a learning disability. Evaluations can also be performed by professionals in private practice, beginning with family doctors. Attention deficit disorder (ADD), attention deficit hyperactivity disorder (ADHD), and other problems should

always be considered as well and evaluated by qualified professionals with expertise with these conditions. It is important to distinguish between emotional, social, and family problems that are causes and those that are consequences of academic difficulties, because they require different treatments.

The psychological assessment may include a neuropsychological or a clinical psychological evaluation. The intelligence of the child should be determined to learn whether the child is performing below potential. Discrepancies in performance between different sections of the IQ (intelligence quotient) test will help to clarify learning strengths and weaknesses. Other tests may be used to assess perception, cognition, memory, and language abilities. Current academic skills are judged by achievement tests. Both IQ and achievement tests help to clarify discrepancies between potential and actual ability. There are also specific tests that help to uncover learning disabilities. A speech pathologist, occupational therapist, or other professional may contribute further information, as can parents.

Treatment of Learning Disabilities in Children

Special education is the treatment of choice for learning disabilities in school. The Individuals with Disabilities Education Act requires that the school, in conjunction with the parents and relevant professionals, develop an individualized education plan (IEP) for each student with learning disabilities. This plan is revised every year to take into account each eligible student's present skills and learning disabilities and abilities. The specific instruction students receive will vary depending upon their needs and capabilities. Some students attend special education classes full time. Others spend most of their time in a regular class and go to a resource room for part of each day, or spend most of the day in special education and the rest in a regular class. The regular classroom teacher must build on the child's strengths while helping to compensate for weaknesses. The special education teacher consults with the classroom teacher and provides specific

interventions, called academic therapy, to overcome or compensate for learning disabilities. Some children need remedial work to learn basic skills such as reading, writing, and arithmetic. Others also need special intervention to fill gaps; for example, students might have difficulty writing a composition in high school because they did not learn punctuation in an earlier grade. Strategies for learning appropriate to a given student's strengths and weaknesses can be taught. Some children need specific related services: a notetaker (for a student with a fine motor disability), word processors, laptop computers, books on tape, or extra time for tests. The IDEA requires schools to provide these special education and related services at no cost to families.

Parents must also try to understand the nature of their children's problems. Like classroom teachers, they must build on the child's strengths while compensating for or adjusting to the weaknesses without exposing them unnecessarily. A child with a visual motor disability, for example, might find it hard to load a dishwasher but could carry out the trash. The same child might have difficulty catching or throwing a ball, but no trouble swimming. Parents must think ahead about these matters to minimize their child's stress and to maximize his or her chance to experience success, make friends, and develop self-esteem. Treatment that affects only school work will not succeed, because learning disabilities are life disabilities.

It is essential to recognize learning disabilities and related problems as early as possible. Without recognition and help, children may become increasingly frustrated and distressed as they persistently fail. By the time they reach high school, they may give up. On the other hand, children whose problems are recognized early and treated appropriately can overcome or learn to compensate for their disabilities:

NICHCY thanks Dr. Larry Silver and the Learning Disability Association of Montgomery County, Inc., for permission to reprint Dr. Silver's article, which appeared in their November 1991 newsletter. The Learning Disability Association of Montgomery County, Inc., is a local chapter of the Learning Disabilities Association of America! You can contact LDAMC, Inc. by writing P.O. Box 623, Rockville, MD 20848-0623.

Helping Your Child Learn: Some Suggestions for Parents

If you suspect that your child is having trouble learning to read, or trouble with learning in general, there is help available. *For parents of school-age children, the first source of help should be the public school serving your area.* Contact your child's school principal, express your concerns, and ask to have your child evaluated. The school system is required by federal and state law to evaluate your child at no cost to you or your family.

The results of the evaluation will show whether or not your child has a problem with reading or learning and, if so, the nature of the problem. You may be told that your child has dyslexia or another type of learning disability. If the evaluation shows that your child *does* have a learning disability, the school is required by federal and state law to provide special education for your child — also at no cost to you or your family.

Suppose, however, that the results of the evaluation show that your child *does not* have a disability. In this case, there are a number of actions you can take. If you think that the school's evaluation of your child was not appropriate — for example, only one test was administered or the evaluation was based solely upon observation of your child — you can ask the school system to pay for what is known as an Independent Educational Evaluation (IEE). There are usually strict guidelines for obtaining an IEE at the school's expense. Ask the school about its IEE policy. Of course, you can always have your child evaluated independently and pay for the evaluation yourself. Whether the school pays for the IEE or whether you do, the results of this second evaluation must be taken into account in determining whether or not your child has a disability and, thus, is eligible for special education services through the school.

If evaluation results still indicate that your child's problems in learning to read are not caused by a disability, your child will not be eligible for special education services through the public school. However, most schools have services available for students who are having reading. Your child may be

enrolled in a remedial reading program or work with a reading resource teacher to improve his or her skills. You may also wish to contact some of the organizations dealing with literacy (see Organizational Resources, page 11).

Suppose, however, that the results of testing show that your child *does* have a learning disability. In this case, your child will be eligible to receive special education services. Parents and school personnel then meet to discuss the results of the evaluation and to develop what is known as an Individualized Education Program (IEP). The IEP will describe the level at which your child is currently performing, as well as identify the specific services or instruction your child will receive to address his or her specific needs. (More information about special education and the IEP process is available by contacting NICHCY.) Classroom accommodations are also possible and can help a student compensate for his or her learning disability. Accommodations can include:

- Taped textbooks available through Recording for the Blind (see the description on page 11);
- Extended time on tests;
- Tutoring;
- Use of a notetaker, for students who have trouble listening in class and taking notes;
- Use of a scribe during test taking, for students who have trouble writing but who can express their answers verbally to the scribe, who writes down the responses;
- Use of a reader during test taking, for students who have trouble reading test questions;
- Tape recording of class lectures; and
- Testing in a quiet place, for students who are easily distracted.

The suggestions presented in the remainder of this article focus upon what parents can do to help a child with a learning disability learn and function within the home.

- *Learn more about learning disabilities.* This information can help you understand that your child does not learn in the same way as other people do. Find out as much as you can

about the problems your child has with learning, what types of learning tasks will be hard for your child, what sources of help are available, and what you can do to make life and learning easier for your child. You can find the information you need by reading many of the publications listed at the end of this document, or by contacting the national organizations that are listed.

- *Become an unobtrusive detective.* Look for clues that can tell you how your child learns best. Does he or she learn best through looking, listening, or touching? What is your child's weakest approach to learning? Also pay attention to your child's interests, talents, and skills. All this information can be of great help in motivating and fostering your child's learning.

- *Teach through your child's areas of strength.* For example, he or she may have great difficulty reading for information but readily understand when listening. Take advantage of that strength. Rather than force reading, which will present your child with a "failure" situation, let your child learn new information by listening to a book on tape or watching a videotape.

- *Respect and challenge your child's natural intelligence.* He or she may have trouble reading or writing, but that doesn't mean learning can't take place in many other ways. Most children with learning disabilities have average or above average intelligence that can be engaged and challenged through using a multisensory approach. Taste, touch, seeing, hearing, and moving are valuable ways of gathering information.

- *Remember that mistakes don't equal failure.* Your child will have the tendency to see his or her mistakes as huge failures. You can model, through good-humored acceptance of your own mistakes, that mistakes can be useful. They can lead to new solutions. They are not the end of

the world. When your child sees you taking this approach to mistakes — your own and the mistakes of others — he or she can learn to view his or her mistakes in the same light.

- *Recognize that there may be some things your child won't be able to do or will have lifelong trouble doing.* Help your child to understand that this doesn't mean he or she is a failure. After all, everyone has something they can't do. Capitalize on the things your child *can* do.
- *Be aware that struggling with your child over reading, writing, and homework can draw you into an adversarial position with your child.* The two of you will end up angry and frustrated with each other, which sends the message to your child that, yet again, he or she has failed. You can contribute posi-

tively to your child's schooling by participating actively in the development of your child's Individualized Education Program (IEP) and by sharing with the school the special insights about your child that only you as a parent have.

- *Use television creatively.* Television, or videos, can be a good medium for learning. If the child is helped to use it properly, it is not a waste of time. For example, your child can learn to focus, sustain attention, listen carefully, increase vocabulary, and see how the parts fit together to make a whole. You can augment learning by asking questions about what was seen. What happened first? Then what happened? How did the story end? Such questions encourage learning of sequence, an area that causes trouble for many LD children. Be

patient, though. Because your child does not see or interpret the world in the same way you do, progress may be slow.

- *Make sure books are at your child's reading level.* Most children with learning disabilities will be reading below grade level. To experience success at reading, then, it's important that they have books to read that are on their reading level (rather than their age level). Foster reading by finding books on topics of interest to your child or by reading to him. Also let your child choose his or her own books to read.
- *Encourage your child to develop his or her special talent.* What is your child good at? What does he or she especially enjoy? Encouraging your child to pursue areas of talent lets him or her experience success and discover a place to shine.

Adults With Reading or Learning Problems

Adults who have trouble reading or learning usually have had these problems since they were children. Their problems may stem from having a learning disability that went undetected or untreated as a child. If an adult has a learning disability, he or she will experience many of the difficulties described in Dr. Larry Silver's article about learning disabilities in children (see page 2). The difference for adults who have learning problems is that they no longer spend their day in school and cannot turn to the public school system for evaluation and special instruction. They may not know why they have trouble learning, and don't know where to go to find out.

Help is available. It's important, however, to know what is causing the adult's problem with reading or learning. Knowing the reason makes it possible for the individual to get the kind of help he or she needs. The problem may arise because the person has a learning disability. If so, then the person needs to work with instructors who know about learning disabilities. He or she needs to receive instruction designed for indi-

viduals with learning disabilities. But not all reading or learning problems are caused by learning disabilities. Perhaps as a child the person did not get enough basic instruction to build the foundation that leads to skilled reading and learning. Becoming involved in a literacy program might meet this person's needs.

The first step, then, is to find out if the learning problems are caused by the

presence of a learning disability. A thorough assessment can give clues as to whether or not a learning disability exists and can pinpoint areas of strength and difficulty. An overview of the diagnostic process is given on the next page. This overview is adapted from the HEATH Resource Center's publication called *Resources for Adults with Learning Disabilities*.

"The child with learning disabilities feels isolated from the parent's culture and learns to hide her "shameful secret." And, of course, as the child carries this secret into adulthood and begins to face adult responsibilities, the burden of it grows and grows. Surprisingly, when the secret is finally revealed, it turns out not to be shameful at all. Once a person openly acknowledges having a learning disability, she finds it possible to relax and request help and support. Only after openly acknowledging the learning disability is the person free to work on improving her ability to learn."

NICHY thanks Sally L. Smith for her permission to reprint this quote from her (1991) book *Succeeding Against the Odds: Strategies and Insights from the Learning Disabled* (p.20). Information on how to obtain this excellent book can be found at the top of page 8 in this guide.

Adults with Learning Disabilities: Assessing the Problem

Adapted with permission from the HEATH Resource Center

When adults suspect they may have a learning disability, they often begin a search for solutions. They may have difficulty in locating resources to diagnose the disability. For many individuals, obtaining a diagnosis can involve locating one or more professionals to select, perform, and interpret diagnostic tests.

Why is Diagnostic Testing Necessary?

These tests are needed because:

- Obtaining accurate diagnostics is the first step in overcoming the effects of a learning disability.
- Learning with a learning disability requires different learning strategies.

What is the Diagnostic Process for Adults?

The diagnostic process for adults with learning disabilities is different from diagnosis and testing for children. While diagnosis for children and youth is tied to the education process, diagnosis for adults is more directly related to problems in employment, life situations, and education. An adult will need to find a diagnostician experienced in working with adults and who is oriented to adult school- and work-related learning needs. The assessment process will include a diagnosis and an evaluation to decide on possible choices for treatment.

The diagnosis identifies the type of specific learning disability by showing strengths and weaknesses in the way an individual learns and uses information. Both informal and formal activities are used in this process. For example, information may be collected about the person's life and academic history and why there is a need for the testing. More formal activities would include measuring learning/work style, such as visual memory or memory for numbers.

An evaluation can then be offered, suggesting ways to overcome some of effects of the disability. This may

include strengthening skills by working with someone who takes into account the way the individual learns best.

Until recently, it was not widely recognized that learning disabilities have influenced the lives of adults, especially those whose conditions were not diagnosed during school years. It is now clear that adults should be evaluated in a manner related to their age, experience, and career objectives.

How Do You Find Someone to Perform the Testing?

You may be wondering how to find a professional qualified to conduct adult assessments. Several local agencies can either perform the tests or refer you to diagnosticians for adults within the community. Agencies to contact for information include:

- The public school system - Ask about Adult Education programs conducted through the school system and the availability of testing;
- Adult Literacy Programs or Literacy Councils - These may be listed in your local telephone book. If not, call the national literacy organizations listed under Organizational Resources on page 11 and ask what programs are available in your community;
- Learning Disability Association in your area, often listed in the telephone book with the name of the city or county first;
- Counseling or Study Skills Centers at a local community college;
- Guidance Counselors in high school;
- Orton Dyslexia Society (see description on page 11);
- Special Education Programs at a local public school or university; and
- Vocational Rehabilitation Agency in your state or county.

These organizations or individuals may also be able to put you in touch with an educational therapist or learning specialist in private practice who can perform and interpret the tests you need.

Questions to Ask Evaluators

- Have you tested many adults with learning disabilities?
- What is the cost of the testing? What does this cost cover?
- Can insurance cover the costs? Are there other funding sources? Can a payment program be worked out?
- How long does the testing take?
- Will there be a written report of the assessment? Will I be able to meet with you to discuss the results?
- Will our discussion give me information regarding why I am having trouble with my school, job, or life at home?
- Will you also give me ideas on how to improve (remediate) my areas of disability and how to get around (compensate for) my disabilities?
- Will the report make recommendations about where to go for immediate help?
- If there are additional questions, are you available for more consultation? If so, what are the charges?

This overview of the diagnostic process has been adapted from the HEATH Resource Center's publication called *Resources for Adults with Learning Disabilities* (1989; 1991). You can obtain a free copy of this publication by contacting the HEATH Resource Center, American Council on Education, One Dupont Circle, Suite 800, Washington, DC 20036-1192. NICHCY thanks Rhona Hartman, Director of HEATH, for her permission to adapt and reprint this material.

FYI: Information Resources from NICHCY's Database

The following information was selected from numerous resources abstracted in NICHCY's database. If you know of a group which provides information about reading problems or learning disabilities to families, professionals, or the general public, or which develops materials in this area, please send this information to NICHCY for our resource collection and database. We will appreciate this information and will share it with others who request it.

You may be able to obtain many of the documents listed below through your local library. Whenever possible, we have included the publisher's address in case the publication is not available in your area. Please note that the prices of materials and the addresses of publishers and organizations are subject to change without prior notice. *If you are interested in obtaining a resource listed in this document, it is a good idea to contact the publisher or organization and obtain information on ordering, payment procedures, and shipping and handling charges.*

Additional publications and information are also available from the clearinghouses and national organizations listed. If you experience difficulty in locating these documents or organizations, or if you would like additional assistance, please contact NICHCY. Finally, you may find NICHCY's *State Resource Sheet* for your state or territory helpful in contacting other resources of information.

For information about how to qualify to borrow the book on tape, see the description of "Recording for the Blind" in the Organizational Resources below.)

Ungerleider, D.F. (1985). *Reading, writing, and rage: The terrible price paid by victims of school failure*. Rolling Hills Estates, CA: B.L. Winch. (Available from B.L. Winch/Jalmar Press, 45 Hitching Post Drive, Building 24B, Rolling Hills Estates, CA 90274. Telephone: 1-800-662-9662, or (310) 547-1240. Price: \$16.95.)

Organizational Resources

This section lists organizations that can be of help to parents who have a child with a reading problem or learning disability, to adults who would like to improve their reading or learning skills, and to educators and other professionals who work with students who are having difficulty learning. Some organizations provide information and referral that is best suited for parents. Others work primarily with adults with learning disabilities. Still others provide information targeted for teachers and other service providers. Under each name and address, you will see the line "Resource Useful To," followed by the groups (parents, adults, or educators) who will find this organization most helpful.

NATIONAL CLEARINGHOUSES AND GOVERNMENT AND STATE AGENCIES

Clearinghouse on Adult Education and Literacy
Division of Adult Education and Literacy
U.S. Department of Education
400 Maryland Avenue S.W.
Washington, DC 20202-7240
Telephone: (202) 732-2270

Resource Useful To: Adults; Educators (working with adults)

This Clearinghouse can provide the adult education community with resources in adult education, including putting adults in contact with the Office of Adult Education within their state. Fact sheets, bibliographies, directories, and other publications are available related to adults who have special learning needs.

ERIC Clearinghouse on Handicapped and Gifted Children
Council for Exceptional Children
1920 Association Drive
Reston, VA 22091-1589
Telephone: (703) 620-3660

Resource Useful To: Parents; Educators (of school-age children)

This ERIC Clearinghouse makes available the following publications on learning disabilities: *Digest on Learning Disabilities* (Digest Number E407) and an annotated bibliography called *Digest on Readings about Learning Disabilities* (Digest Number E465). Both of these publications are provided free of charge. Other information on learning disabilities is also available.

ERIC Clearinghouse on Reading and
Communication Skills (ERIC/RCS)
Indiana University, Smith Research Center
2805 East 10th Street, Suite 150
Bloomington, Indiana 47408-2698
Telephone: (812) 855-5847

Resource Useful To: Parents; Adults; Educators

The Clearinghouse is concerned with the acquisition of functional competence in reading, writing, speaking, and listening at all educational levels and in all social contexts. The Clearinghouse makes available bibliographies on a variety of reading topics, including learning disabilities and reading. An offshoot of the Clearinghouse is the Family Literacy Center, whose purpose is to encourage parents to participate in their children's academic development while simultaneously improving their own literacy. A monthly "audio journal" called *Parents and Children Together* is available from the Family Literacy Center. Subscriptions are \$75.00 a year for 12 issues. Each issue is filled with suggestions for involving children in reading, practical reading activities that parents can do with their children, recommendations for books to read and, of course, a read-along story accompanied by a cassette tape. A free sample of this material is available upon request.

HEATH Resource Center
One Dupont Circle, Suite 800
Washington, DC 20036-1193

Resource Useful To: Parents (of young LD adults); Adults

HEATH is a national clearinghouse on postsecondary education for individuals with disabilities. HEATH distributes a publication called *Resources for Adults with Learning Disabilities* and has information on how and where adults with learning disabilities can get training after high school. This includes information about vocational preparation programs, adult education, and college.

National Clearinghouse on Literacy Education (NCLE)
Center for Applied Linguistics
1118 22nd Street N.W.
Washington, DC 20037
Telephone: (202) 429-9292

Resource Useful To: Educators (of adults with limited English proficiency)

NCLE is the only national clearinghouse for adult English as a second language (ESL) and literacy information. NCLE collects, analyzes, and abstracts documents on literacy education for adults with limited English proficiency (LEP) and out-of-school youth. Included are research reports, instructional and assessment materials, program descriptions and evaluations, and teacher/tutor training guides. Educators can call to find out resources available for working with LEP adults and out-of-school youth with literacy problems. NCLE maintains a resource center that includes a database of over 5,000 individuals and literacy programs working with LEP adults.

National Information Center for Children and
Youth with Disabilities (NICHCY)
P.O. Box 1492
Washington, DC 20013-1492
Telephone: 1-800-999-5599; (703) 893-6061 (Local); (703) 893-8614 (TDD)

Resource Useful To: Parents; Educators

NICHCY can provide parents with information about special education and the rights children and youth with disabilities have under the law. NICHCY can also provide parents and others with a *State Resource Sheet*, useful for identifying resources within their state. This includes names, addresses, and telephone numbers of state agencies, disability organizations, and parent groups serving individuals with disabilities and their families. A variety of other publications on disability issues is available free of charge. A *Publications List* is available upon request.

BEST COPY AVAILABLE

National Library Service for the Blind
and Physically Handicapped (NLS)
Library of Congress
1291 Taylor Street N.W.
Washington, DC 20542
Telephone: (202) 707-5100

Resource Useful To: Parents; Adults

Many individuals with learning disabilities may be able to borrow "talking books" (books on tape) from NLS, but they must first establish their eligibility for the program. Call or write NLS and ask for an application form for reading disabilities and *Talking Books and Reading Disabilities*, a factsheet outlining the eligibility requirements for persons with learning disabilities. Once eligibility is established, the person can borrow, on tape, most of the same books that public libraries make available in print.

State Department of Education
Consult your local telephone directory for
the office in your state.

Resource Useful To: Adults; Educators

The State Department of Education in each state should have a department concerned with adult education or literacy. This office can usually refer adult callers to adult education or literacy programs within their community. Technical assistance, information, and referral may be available to educators working with school-age children with learning disabilities or with adults with literacy concerns.

Vocational Rehabilitation Office
Consult your local telephone directory
for the office in your vicinity.

Resource Useful To: Adults

Through the Vocational Rehabilitation system, adults with learning disabilities may be able to get information and referral. Services may also be available, such as literacy and job training.

NATIONAL LEARNING DISABILITIES ORGANIZATIONS

Council for Learning Disabilities (CLD)
P.O. Box 40303
Overland Park, KS 66204
Telephone: (913) 492-8755

Resource Useful To: Educators

The Council for Learning Disabilities provides services to professionals who work with individuals with learning disabilities. Members include educators, diagnosticians, psychologists, physicians, optometrists, and speech, occupational, and physical therapists. All members receive the *Learning Disability Quarterly*, as well as the *LD Forum*, a teacher-oriented newsletter.

Division for Learning Disabilities
Council for Exceptional Children
1920 Association Drive
Reston, VA 22091
Telephone: (703) 620-3660

Resource Useful To: Educators

The Division for Learning Disabilities is one of the many special organizations within the Council for Exceptional Children. DLD publishes its own journal (*Learning Disabilities Research and Practice*) and newsletter. Teachers and other service providers can contact DLD about learning disabilities, publications, and membership.

Learning Disabilities Association of America (LDA)
4156 Library Road
Pittsburgh, PA 15234
Telephone: (412) 341-1515 or (412) 341-8077

Useful Resource for: Parents; Adults; Educators

The Learning Disabilities Association of America (LDA) has 50 state affiliates with more than 775 local chapters. The national office has a resource center of over 500 publications for sale. It also operates a film rental service.

Publication topics cover the range of issues associated with learning disabilities. There are many publications available regarding the LD adolescent or young adult, behavior modification, children's books, dyslexia, early childhood, ADD or ADHD, and learning disabilities associated with auditory, fine motor, language, math, social perception, spelling, and/or visual problems. Many of LDA's publications are specifically written for parents. Call the national LDA office to receive a free information packet and referral to the nearest local chapter.

National Center for Learning Disabilities
99 Park Avenue
New York, NY 10016
Telephone: (212) 687-7211

Resource Useful To: Parents; Educators

The National Center for Learning Disabilities (NCLD) is a national, not-for-profit organization committed to improving the lives of millions of Americans affected by learning disabilities. Services include: raising public awareness and understanding; national information and referral; educational programs; and legislative advocacy. NCLD provides educational tools to heighten understanding of learning disabilities, including: the annual publication called *THEIR WORLD*; quarterly newsletters; informative articles; specific state-by-state resource listings (e.g., schools and diagnostic clinics); and a new, five-part video series entitled *We Can Learn*.

National Network of Learning Disabled Adults
P.O. Box 32611
Phoenix, AZ 85064-2611
Telephone: (602) 941-5112

Resource Useful To: Adults

The National Network of Learning Disabled Adults is a clearing-house that helps LD adults find and network with each other in their communities. A list of support groups around the country is available upon request. The organization also produces a quarterly newsletter called *National Networker*, which is full of valuable information for adults with learning disabilities.
