ABSTRACT

In the past management information systems (MIS) have focused on data relating to the internal operations of the institution (e.g., registration and space utilization). Recently, however, strategic planning as a means of establishing long-range goals is becoming increasingly dependent upon data external to the institution, such as demographics and social and economic factors. Strategic planning requires an MIS capable of monitoring social changes, assessing institutional strengths, and integrating internal and external data. The tools of strategic planning include needs assessment, trend analysis, environmental scanning, and market analysis. These tools may be used by institutions at various stages of development (i.e., emergence, growth, development, regeneration, and decline) and in a variety of operational modes (i.e., hierarchical, collegial, and collective bargaining). The purpose of the MIS function is to gain insights into which of several options an institution will choose over a several year period. Technology transfer is an excellent example of a public service function requiring strategic planning. In Ohio, the use of strategic planning in this area is illustrated by the efforts of the Ohio Technology Transfer Organization, an information/assistance network for small businesses and industries sponsored by Ohio State University and Ohio's two-year colleges. (Appendices provide data tables and survey instruments useful to strategic planning.) (Author/KL)

ABSTRACT

Management information systems in the past have tended to focus on data elements relating to internal operations of the institution such as registration, scheduling, class rosters, space utilization, grade reporting, student aid, payroll, budgeting, and other administrative applications. Strategic decision making as a part of the higher education planning process, however, is becoming increasingly more dependent upon data elements external to the institution.

Strategic planning is, essentially, a way to match an organization's resources to a changing environment. It requires a capability to monitor changes in society, assess the strengths of the institution, and a way to match the two. Tools to evaluate the needs of society include (1) needs assessment, (2) trend analysis, (3) environmental scanning, and (4) market analysis. These tools can be used in institutions at various stages of maturation (emergence, growth, development, regeneration, decline) and a variety of modes of operation (hierarchical, collegial, collective bargaining).

JC 810 646

Strategic Planning

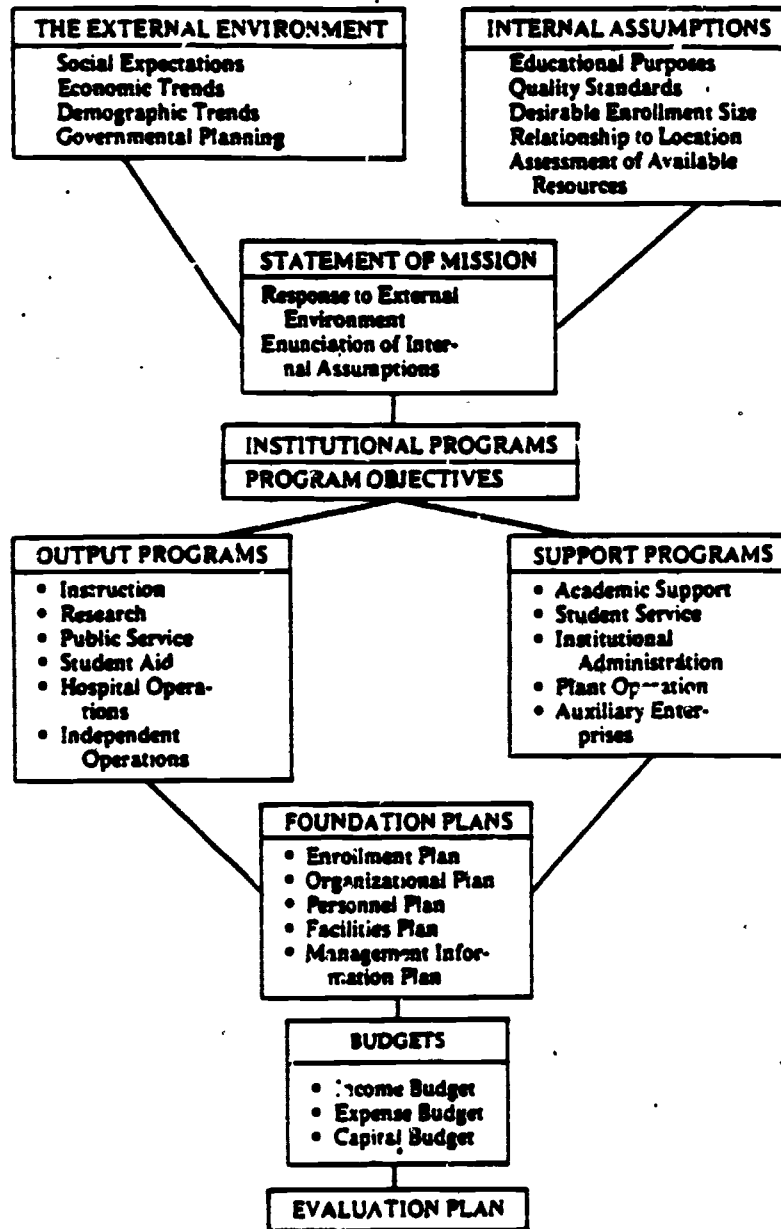

At the 1974 CAUSE Conference, John D. Millett, former Executive Vice President of the Academy for Educational Development and Chancellor Emeritus of the Ohio Board of Regents, stated that the largest single challenge facing higher education was that of planning. He stated:

Planning for the future is the largest challenge facing higher education today. It is a challenge that can only be met with the courage to innovate, the will to influence events rather than to surrender to them. But the courage to innovate and the will to change have some hope of achievement only if information analysis and assessment have preceded action.

Higher education management needs information. And then higher education management needs the capacity to know how to use information as the basis for trying to achieve a desirable tomorrow. Just as human intelligence is our product, so also is human intelligence our only hope for the future of higher education itself.¹

During the post World War II years institutional planning had a focus on acquiring more resources and building facilities for the increased number of students resulting from the equal right demand for access to postsecondary education. Planning in postsecondary education during the 1960s was undertaken in response to immediate needs with minimum regard to the future. During the 1970s the influx of traditional 18 to 22 year old students began to stabilize. Many private and public senior institutions began to experience the impact of a broad range of demographic, social, political, and economic forces. As a result, organizations such as The Council for the Advancement of Small Colleges (now The Council of Independent Colleges), the Academy for Educational Development and the American Association of State Colleges and Universities launched programs relating to comprehensive institutional planning. The planning process model developed as a result of the AED project is displayed in FIGURE 1.² These projects and others like it all stressed the need to assess the external environment. The literature began to reflect descriptions of institutional planning processes including some way to assess the external environment.³

THE PLANNING PROCESS IN HIGHER EDUCATION

John D. Millett, Higher Education Planning: A Report of Experience and a Forecast of Strategies for Change (Washington, D.C.: Academy for Educational Development, 1978).

The literature also began to reflect articles intended to clarify the concept of strategic planning. The term "strategy" is used to refer to long-term intentions transcending annual or biannual operations planning. Ellison states:

It is within the framework of strategy that annual budget planning and preparation take place. Alfred D. Chandler, in his business history Strategy and Structure, defined strategy as "determination of the basic long-term goals and objectives of an enterprise, and the adoption of courses of action and the allocation of resources necessary for carrying out these goals." Strategic decision-making is concerned with the long-term health of an organization rather than with day-to-day operations. Also, a strategy is not in force until an institution has made a resource commitment to support carrying out the strategy.⁴

Peters states:

Strategic planning is a process that directs an organization's attention to the future, thereby enabling the organization to adapt more readily to change.

The major contribution of the planning process to good management is the rationality it imposes on an organization's efforts to anticipate its future.

Creative organizations are able to examine the basic assumptions under which they operate and to adapt them to new situations. Creativity is a basic tool for good planning and not some poetic appendage to the process.⁵

Thieme states:

Real strategic planning does not start with assumptions about institutional mission. Mission can only be realistically set after a careful assessment of the external environment and the internal strengths and weaknesses of the institution and after identification of practical options.⁶

Ross states:

Planning is no more than a conscious, rational process of deciding upon a desired future state and committing resources to achieve it. When speaking about planning, it is necessary to differentiate between informal planning, which everyone does, and formal strategic planning. Even the most unsophisticated manager gathers and organizes data, makes assumptions about the specific universe, establishes goals and objectives, and sets priorities for activity. Informal planning differs from formal planning in that in the first case the manager makes the decisions

alone. The informal plan lacks a multi-disciplinary perspective, and has no rigorous methodology.⁷

Collier indicates there are five essential elements in the strategic planning concept:

1. Strategic planning involves the explicit consideration of a set of decisions which determine the future of the entire organizational entity.
2. The total strategic planning process is comprised of the initial strategy formulation process (in which the set of strategic decisions are made) and the implementation/budgeting process (in which the initial strategy is reformulated and an emergent strategy evolves).
3. One of the primary criteria used in making strategic decisions is the achievement of a simultaneous match among (1) the organization's resources, (2) its proximate environment, and (3) certain inherent characteristics of the organization.
4. Strategic planning encourages organizations to take the initiative in creating their own future and to consider the future they are creating for themselves.
5. The set of strategic decisions should be synergistic and they should increase organizational flexibility.⁸

Thieme suggests there are seven key objectives of the strategic planning process:

1. Challenge the prevailing assumptions about the role and purpose of the institution.
2. Identify service area needs that are not adequately met.
3. Develop a plan that recognizes both external and internal realities.
4. Achieve consensus among key organization members on future strategies.
5. Favorable influence the perspective of internal and external constituent groups.
6. Link strategic planning to operational management.
7. Educate key people as to the external and internal realities as well as to the values and aspirations of key groups.⁹

Shirley and Caruthers specify five major dimensions of an organization as (1) the environmental dimension, (2) the strategic dimension, (3) the structural dimension, (4) the behavioral dimension, and (5) the program dimension.¹⁰

Their conceptualization is displayed in FIGURE 2.

Cope states that "Strategic planning assumes an open system in which organizations are dynamic and constantly changing as they integrate information from turbulent environments. Strategic planning focuses on the external environment, on qualitative information and intuitive decisions regarding resource commitments, and on integrated, participatory involvement."¹¹

The Management Information System

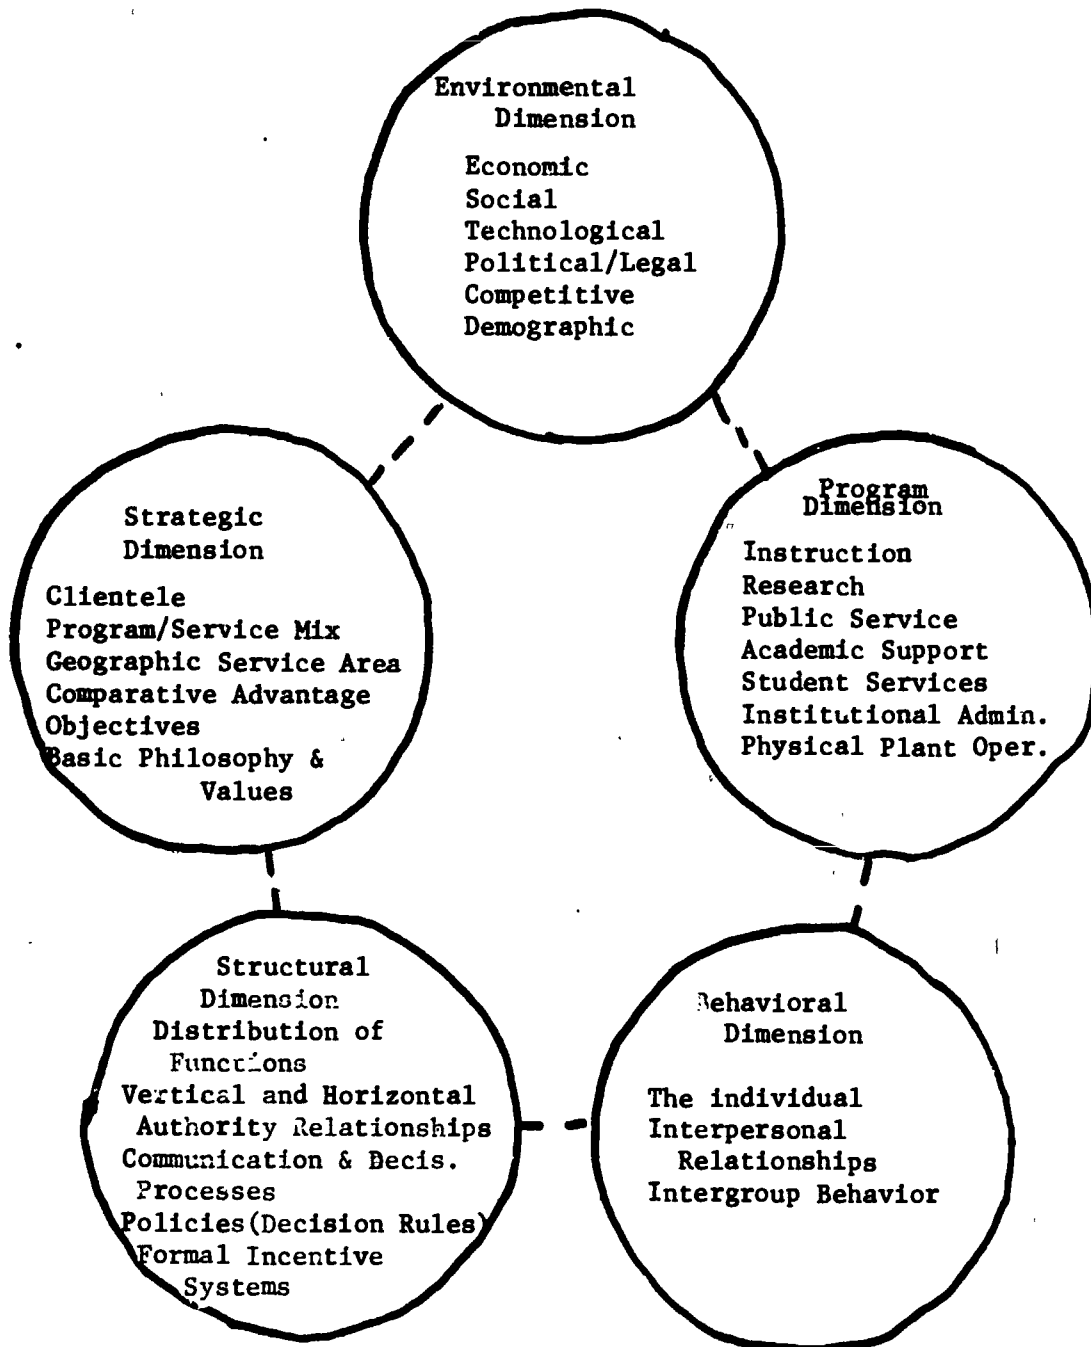

Planning, however defined, has a focus on designing and shaping the future as opposed to merely changing. Strategic planning must consider a critical analysis of forces, trends, and their effects and must be firmly based on demographics, social, political, and economic data sets. Integral to planning are methodologies for (1) generating goal statements and standards; (2) sorting, categorizing and prioritizing goals; (3) refining goals, noting interrelationships among them; and (4) specifying the relevance of goals to the support base.

Data are the foundation upon which to build the multi-year institution/system Plan, a document containing a grand design representing intelligent anticipation of activities, events, and experimental observations carefully specified in advance to move from one point to another. Data are needed (1) about environmental assumptions upon which to base planning; (2) about potential clients and unmet societal needs growing out of a needs assessment or market analysis/market segmentation process; and (3) for managing institutional areas as specified above. Probably most important, however, the data analysis process must strive to produce meaning as it relates to efficiency and effectiveness of relating dollars to institutional goals and objectives.

Planning, then, is critical analysis and requires the development of an analytical capability to collect, array, and analyze a large number of variables in an effort to portray a system of relationships, causality in some cases. The

FIGURE 2

FIVE MAJOR DIMENSIONS OF AN ORGANIZATION*

* Robert C. Shirley and J. Kent Caruthers, "Strategic Planning for Higher Education," presented at the annual meeting of the American Association of State Colleges and Universities, November 20, 1979.

latter is the primary function of the Management Information System.

Management information systems in the past have tended to focus on data elements relating to the internal operations of the institution such as registration, scheduling, class rosters, space utilization, grade reporting, student aid, payroll, budgeting, and other administrative applications. Data have been collected and grouped in files labeled student, personnel, financial, and space. Sometimes the data elements are similar for various reporting agencies and occasionally the independent files can be integrated to produce meaningful reports on topics such as program cost analysis and student longitudinal studies. Occasionally independent file reports or integrated file reports are synchronized with decision points in the annual planning/budgeting cycle but usually stop short of strategic planning. Management information systems of the future must include the integration of internal and external data sets as displayed in FIGURE 3.

Strategic Planning In Differing Contexts

Organizations pass through various stages of development and have different characteristics of organizational functioning. Stages of organizational development were listed as emergence, growth, development, regeneration, and decline.¹² Types of organizational functioning can be listed as hierarchical, Theory X; collegial, Theory Y; and political, collective bargaining.¹³ In addition, tools of strategic planning can be labeled needs assessment, trend analysis, environmental scanning, and market analysis. These three dimensions form a model to help assist institutions to diagnose where they are in the evolutionary process. (See FIGURE 4) The challenge to postsecondary institutions is to diagnose where they are with regard to the first two dimensions and develop elements of strategic planning appropriate for their context.

FIGURE 3

THE INTEGRATED INTERNAL-EXTERNAL MANAGEMENT INFORMATION SYSTEM

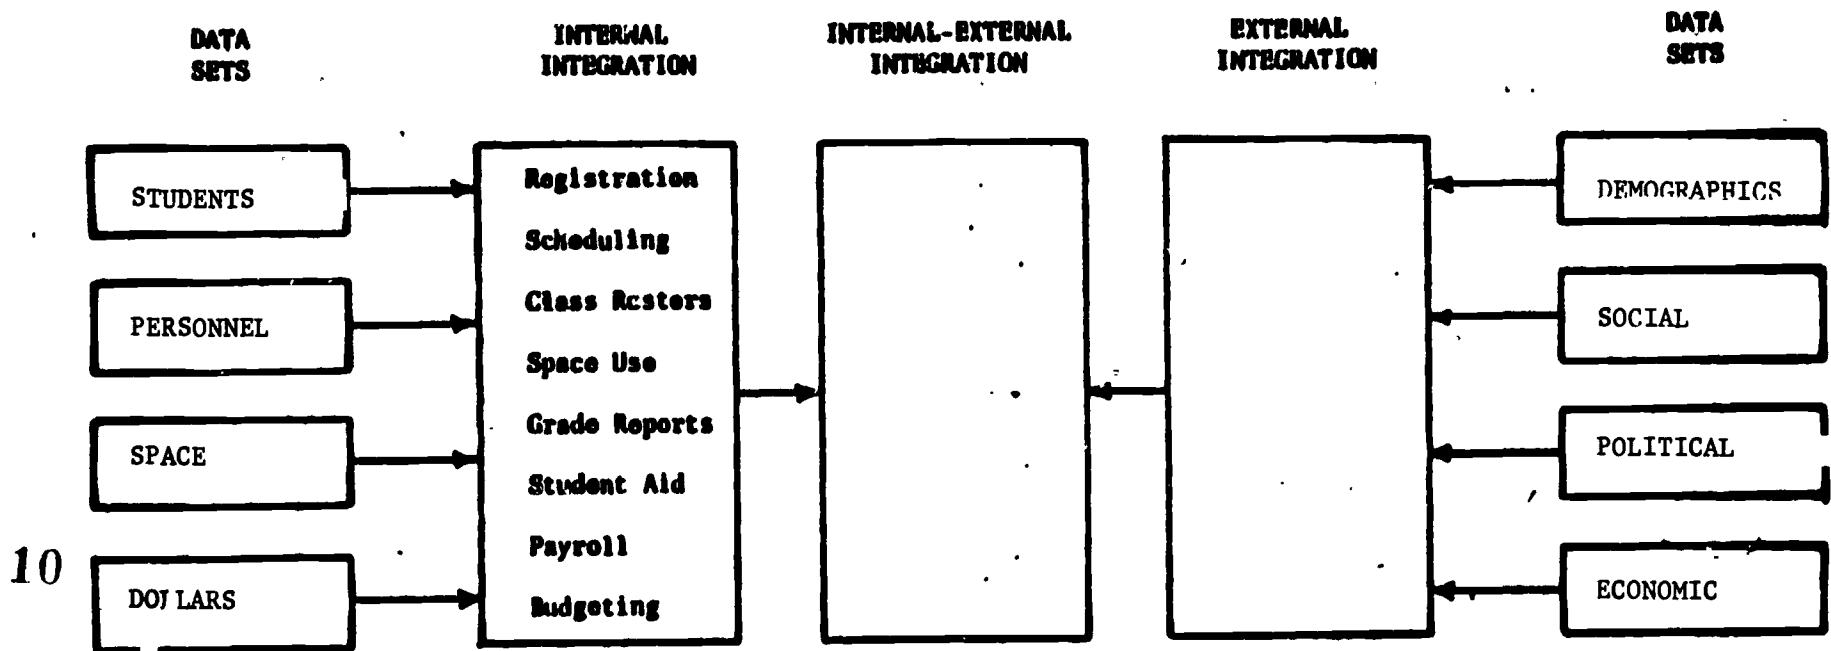

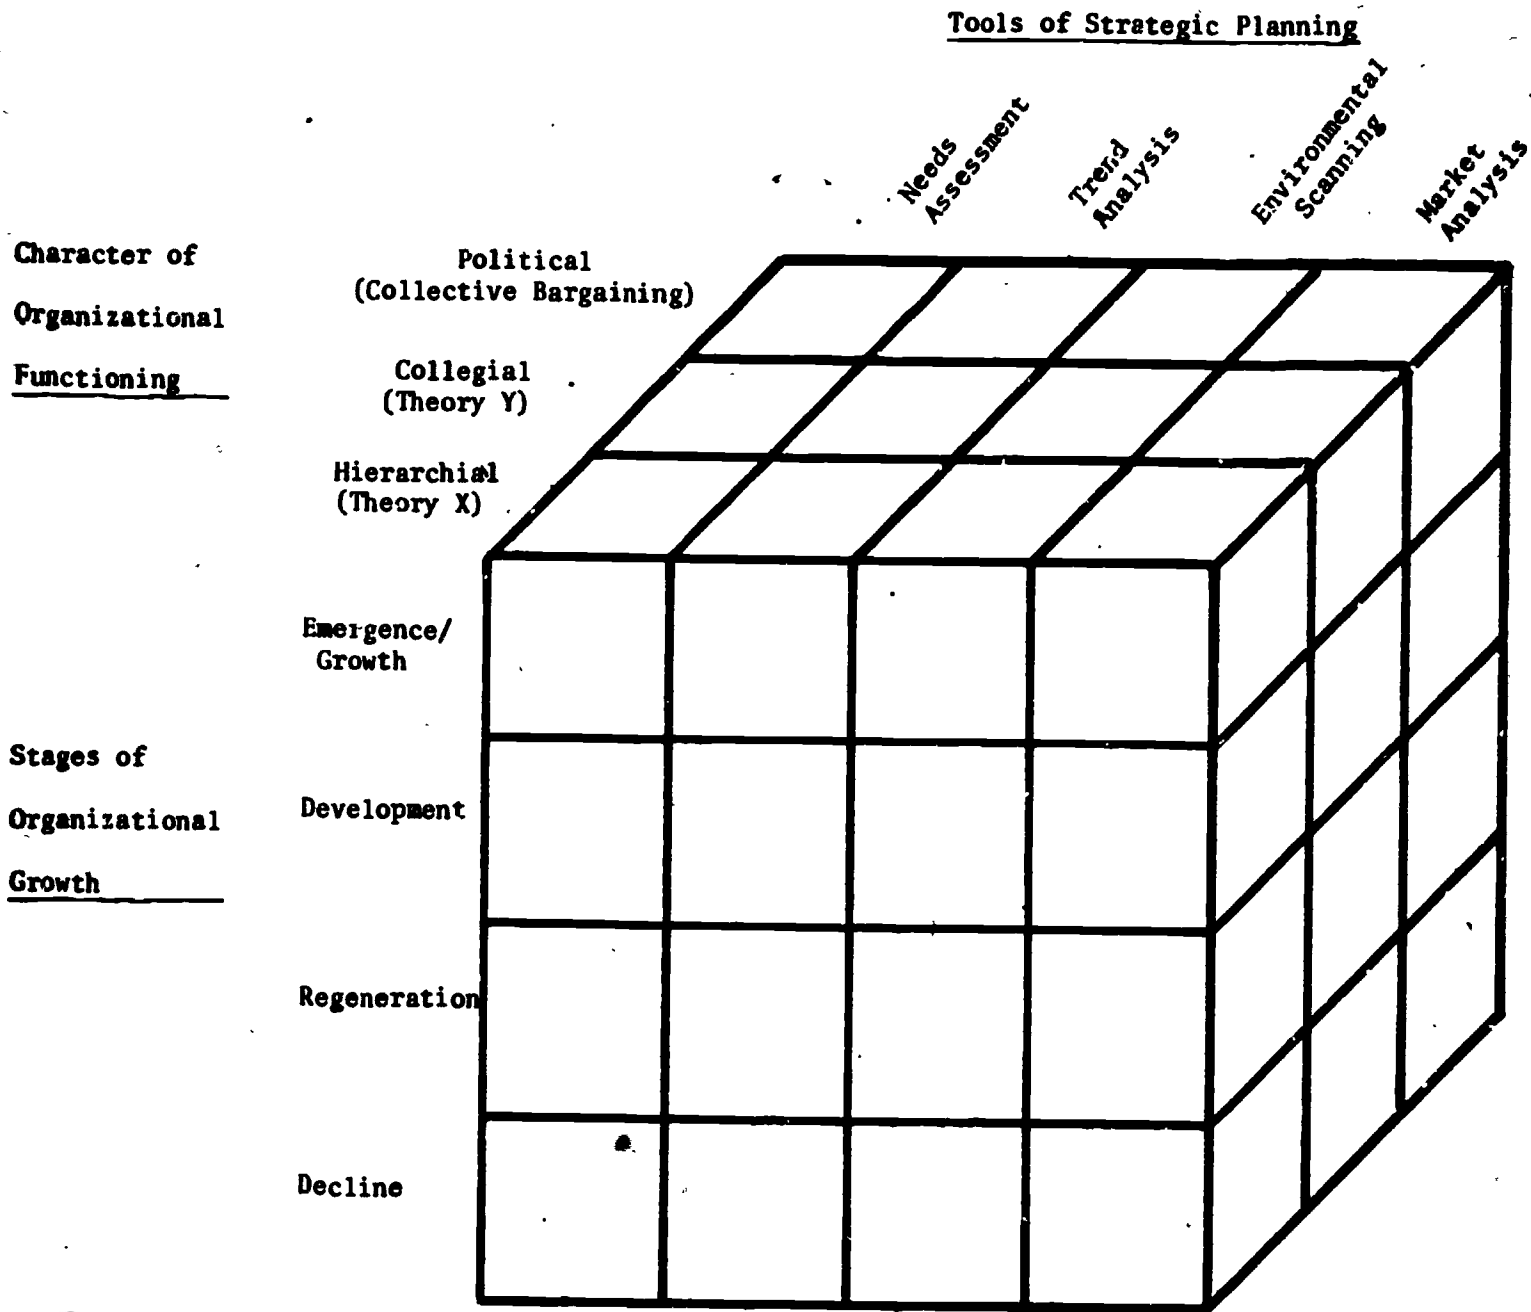

FIGURE 4
MODEL FOR CATEGORIZING DIMENSIONS OF STRATEGIC PLANNING
BY STAGE OF ORGANIZATIONAL GROWTH AND CHARACTER OF ORGANIZATIONAL FUNCTIONING

Ahmann indicates that needs assessment is a generic term to describe a process "for determining the discrepancy between existing and desired levels of attainment with respect to specific educational goals,"¹⁴ He describes types of needs assessment and the state of the art which has shifted from informal, to formal, systematic efforts beginning in the early 1970s attributable primarily to the accountability movement stimulated by federal legislation. Vlahos traces several changes in needs assessment techniques including its application to perceptions of the community and business and industry.¹⁵

Trend analysis consists of the systematic review of comparable data over time in order to determine direction. Harris and Grede present two examples of change in the labor force in the United States.¹⁶ (See FIGURES 5 and 6 in Appendix A) Frances and Warmbrod present data about changing enrollments.¹⁷ (See FIGURES 7 through 10 in Appendix A) Wattenbarger and Bibby, Conroy, and Chambers present data about financing education.¹⁸ (See FIGURES 11 through 13 in Appendix A)

Environmental scanning consists of periodic sampling of data which may ultimately form the foundation of trends. An example of such a scan is the College Entrance Examination Board study indicating that 36 percent of the population between the ages of 16 and 65, more than 40 million Americans, are in a career transition status.¹⁹ Research by the College Board, however, indicates that only about $\frac{1}{4}$ of the 58,400,000 persons in postsecondary education are enrolled in colleges and universities. (See FIGURE 14, in Appendix B) Other examples of scanning include The Ohio Board of Regent's survey of business/industry training programs and the Health Planning and Development Council's survey of employee health promotion programs sponsored by business and industry. (See Appendix B)

Market analysis consists of obtaining detailed information about markets or market segments served or unserved by the institution. Market analysis is an organized effort to identify the relationship between specific wants

(a) Reported by M. M. Chambers of Illinois State University as state tax funds appropriated for operating expenses and scholarship programs for higher education. Amount of appropriations may be reduced later in some states because of shortfalls in revenues. Not included are appropriations for capital outlay or sums from sources other than state taxes, such as student fees. Included are appropriations for annual operating expenses even if appropriated to some other agency of the state for ultimate allocation to institutions of higher education. Pre-allocated state taxes whose proceeds are dedicated to any institution of higher education are included even though periodic appropriation by the legislature may be bypassed. Also included are state tax funds appropriated for scholarships and statewide governing or coordinating boards.

(b) State appropriations divided by the U. S. Census Bureau's final population count for 1980.
 (c) State appropriations divided by personal income, in thousands of dollars, reported by the U. S. Commerce Department for 1980.
 (d) Increase in appropriations for 1981-82 over 1979-80, as reported by M.M. Chambers.
 (e) Increase in appropriations for 1981-82 over 1971-72, as reported by M.M. Chambers.
 (f) Two-year increase in appropriations adjusted for inflation of 25.3 per cent, as indicated by the Labor Department's Consumer Price Index for June, 1981, compared with June, 1979.
 (g) Ten-year increase in appropriations adjusted for inflation of 123.4 per cent, as indicated by the Labor Department's Consumer Price Index for June, 1981, compared with June, 1971.

EMPLOYEE HEALTH PROMOTION SERVICES

This questionnaire is being distributed to selected employers in the counties of: Ashland, Carroll, Crawford, Holmes, Richland, Stark, Tuscarawas, and Wayne. The purpose of the questionnaire is to provide a measure of the interest which exists in the subject of employee health promotion services. If sufficient interest is expressed by area employers, then we intend to develop a workshop or provide educational material to assist employers in this area. This questionnaire is being distributed by the Health Planning and Development Council of Wooster, Ohio.

Name of Corporation

Mailing Address

1. Does your firm currently provide services which are designed to promote improved health among your employees? Such services as hypertension screening, cancer screening, health education, smoking cessation, physical exercise, stress management training, nutrition, weight control and alcoholism control are included within the definition of employee health promotion.

yes no not certain

If yes, please provide a brief description of these services.

2. Do you feel that health promotion services are or could be of benefit to your organization and your employees?

yes no not certain

3. Do you feel that health promotion services could be designed to help address the problems of:

- | | | | |
|-----------------------------|------------------------------|-----------------------------|--------------------------------------|
| Employee Morale: | <input type="checkbox"/> yes | <input type="checkbox"/> no | <input type="checkbox"/> not certain |
| Employee Absenteeism: | <input type="checkbox"/> yes | <input type="checkbox"/> no | <input type="checkbox"/> not certain |
| Workers Compensation Costs: | <input type="checkbox"/> yes | <input type="checkbox"/> no | <input type="checkbox"/> not certain |
| Early Retirement: | <input type="checkbox"/> yes | <input type="checkbox"/> no | <input type="checkbox"/> not certain |
| Accidents: | <input type="checkbox"/> yes | <input type="checkbox"/> no | <input type="checkbox"/> not certain |
| Improved Productivity: | <input type="checkbox"/> yes | <input type="checkbox"/> no | <input type="checkbox"/> not certain |

4. Would you like to receive additional information about the concepts of employee health promotion?

- yes no

5. If yes, which types of information would be most helpful?

- Examples of the types of services which might be included in an employee wellness program.
- Examples of successful employee wellness programs elsewhere.
- The potential benefits of health promotion services.
- The cost of employee illness.
- Other (please specify):

6. Would you or a representative be available to attend a one day conference on the subject of employee wellness if one were offered near you.

- yes no not certain

7. Would you or a representative be available to provide assistance and advice in developing efforts in the community to promote the development of disease prevention/health promotion programs?

- yes no not certain

8. Please identify the name and address of the person in your organization who is the most appropriate for us to communicate with on this subject in the future.

9. Please offer any additional comments, suggestions or questions which you may have on the subject of disease prevention/health promotion.

and needs of people and the ways the institution meets or could meet them. Market analysis is, in its simplest description, a more coherent way to plan institutional responses to conditions within the College's service area.

Ihlanfeldt suggests a framework for the gathering and use of data. He states:

There appear to be three basic components in the marketing of higher education: research, strategy and communication.

Research involves discovering what people think of a given school and then developing a profile of the type of person who would be likely to enroll.

Such an analysis of the potential student is necessary before a recruitment strategy can be developed, because that plan should answer the question: how can we contact the largest number of potential applicants in the most effective manner? If no research has been conducted, a school has only a vague notion of who its probable enrollees might be; this, of course, leaves success in recruiting to chance.

Deciding on the type of communications to be used in recruitment is thus dependent on a college's strategy, which is, in turn, based on research. Communications should include not only the admissions office personnel, but also students, faculty, and alumni, all publications, and in general, any segment of the college with which potential students might have contact.²⁰

Most postsecondary education was created to be responsive to the higher education needs of students immediately out of high school who would complete their education in an uninterrupted manner. Therefore, most colleges began their marketing efforts (research, strategy, and communications) with demographic data as it relates to secondary school systems. As the societal expectations of "equal educational opportunity" and "right to work" moved from concept to operational reality, colleges began to modify their marketing efforts to include categories of data beyond "traditional" high school graduates. As governmental and regulatory agencies began to legislate continuing education, colleges developed more specialized market segmentation efforts.²¹ These efforts are now being extended to a broad range of agencies and organizations. (See Appendix C)

Diagnosis Precedes Development

The purpose of the data gathering and analysis function is the gain insights into which of several options an institution will choose in charting a course of action over the next several years. Data from one source indicate that change in the number of high school graduates between 1979 and 1995 will range from a decline of 59% in Washington D.C. to an increase of 58% in Utah. Eleven states will experience a decline of more than 30% in the number of high school graduates during that period. Bowen indicates that colleges experienced enrollment declines in 1934, 1944, and 1952 and suggests four options: (1) redirect resources toward higher quality, (2) redirect resources toward research and public service, (3) redirect resources toward new student clientele, and (4) retrenchment.²²

Standards and protocol for options 1 and 3 will differ widely and, therefore shall not be discussed in this paper. Frances lists twelve different strategies for increasing enrollment in colleges as follows:

- Increased high-school-graduation rates of students who would otherwise drop out
- Increased credentialing by testing of high school dropouts
- Increased enrollment of low- and middle-income students
- Increased enrollment of minority youths
- Increased enrollment of traditional college-age students
- Increased retention of current students
- Increased enrollment of adults
- Increased enrollment of women 20-34
- Increased enrollment of men 35-64
- Increased enrollment of graduate students
- Increased enrollment of persons currently being served by industry
- Increased enrollment of foreign students²³

Redirecting resources toward research and public service deserves special comment because it represents an extraordinary challenge in strategic planning.

Strategic Planning and the Public Service Function

Technology transfer as a public service function for postsecondary education is an excellent example requiring strategic planning. Ultimate purposes of technology transfer include increased productivity, revitalization of the

economy, and job creation.

Any discussion about technology transfer must begin with a definition of technology. Bugliarello offers a biosocial view of technology. He states:

Technology is a process, it is a social process which generates and combines know-how and people in order to extend the physical range of man. The range, if you like, and power over muscles, over the brain, and over organs. Thus, technology is a people process; it's done by people and it enhances people.

But it is also a biological process, because in enhancing people, it continues to be carried on outside of our bodies. And by now, really, to a growing extent, with pacemakers and artificial organs, also inside our bodies. It continues to carry out the process of evolution. Both as a people process and as a biological process, technology has been with us from the very beginning of our species some two million years ago. Thus, technology was born with people, technology has been developed by people and technology has affected people.²⁴

Young says, "Technology is all the techniques, knowledge, lore, methods and tools that have helped society survive and improve its life."²⁵ Branscomb states, "Many people tend to think of technology as being embodied in the machines that we invent and use, but technology is certainly not machines. Technology is what people do with what they know."²⁶

Ohio is a highly-industrialized state that is a national leader in fabricated metals, rubber, plastics, stone, clay and non-electrical machinery. The state, however, faces important economic challenges that include obsolescence in manufacturing facilities, decline in productivity, and below average growth in high technology and service industries. In order to meet these challenges and to provide a climate for business and industry which is supportive and conducive to expansion, the Ohio Board of Regents proposed and the Ohio Legislature funded the Ohio Technology Transfer Organization beginning with the 1979-1981 biennium. This state-wide network consisting of The Ohio State University and two-year institutions working with state and federal agencies is intended to provide small business and industry access to information, advice, and services that

are essential to economic development and job growth.

To accomplish this purpose, a full-time technology transfer agent is located on each of eleven two-year college campuses and The Ohio State University. The primary function of the OTTO agent is to assume an active role providing technological assistance to constituents within a geographic region of the state. (See FIGURE 15) The OTTO agent, whose services are free, acts as a user broker in providing direct access to member colleges and OSU or to alternative sources of assistance. Typical cases might include obtaining information about plastics, corrosion, resource recovery, solar energy, or management assistance in areas such as inventory control, business record keeping, and general management. OTTO agents have access to computerized data bases which can be searched for recently published articles on almost any topic. Plans for the 1981-1983 biennium call for the addition of four institutions to the network and technical assistance on university campuses.

Major providers of research and development include the more than 200 Federal R & D laboratories and centers representing 11 Federal agencies in the Federal Laboratory consortium. (See FIGURE 16) If the intent is to reduce the lag between production of R & D and its application, it seems logical to bring together consumer and providers to discuss needs and products and then discuss brokering and networking. Such a program could be conducted on a national, regional, state, or local service area. If conducted on a large scale, consumers could specify the technological problems to be solved on the training programs that must be conducted to deal with such projects as the B-1 bomber, the Stealth bomber, the MX missile, the F-16 fighter, or the ELF communications system. Using the format displayed in FIGURE 17, diagnosis and specification of technological problems and training needs would be followed by presentations by R & D resource providers and that, in turn, by broker plans for networking. The model would also be applicable at the local level on a

smaller scale. These deliberations should result in clearer delineation of the continuum extending from "pure" research through its application, the needs of a variety of types of consumers, and the unique role that different types of postsecondary education institutions can play in increasing productivity, revitalization of the economy and job creation, (See FIGURE 18) These deliberations would have tremendous implications for the way in which we structure our organizations, the use of advisory committees,²⁷ and such functions as institutional research.²⁸

In conclusion, the future of postsecondary education rests on the degree to which it meets the needs of the society in which it exists. As society changes, so must postsecondary education change. The way in which a specific college or a statewide system meets the challenge of being responsive to societal needs is a function, for the most part, of its sophistication in planning. Whatever our course of action, a statement from Three Thousand Futures is most appropriate:

The future holds many unknowns. It also holds a range of already known choices that can be made by those making decisions about higher education.... External, particularly market, pressures will not alone lead to the best results. Internal thought, resolution, and determination are needed to assure that higher education as a whole and institutions individually reach 2000 with capacity to perform undiminished or minimally diminished by the demographic depression. The surrounding environment in the next 20 years will create some special problems that we can already see. It does not, however, determine in advance how well these problems will be solved or how inadequately human choice, or absence of choice, will settle that. A downward drift in quality, balance, integrity, dynamism, diversity, private initiative, research capability is not only possible--it is quite likely. But it is not required by external events. It is a matter of choice and not just of fate. The emphasis should be on "managing of excellence."²⁹
