Methodology

ABSTRACT

This study is concerned with the importance of historical method in library and information science research. The research conducted in this study specifically examined library and information science doctoral dissertations written between 1984-1999. The study of the "Digital Dissertations" database found that only eight to seventeen percent of all library and information science dissertations were written using historical method. This was a slight decline in the number of historical dissertations that have been written prior to 1984. This study also looked closely at a selected sample of 259 historical dissertation citations found in three bibliographic sources in order to find any patterns that were evident. The majority of historical dissertations were written in 1996, which was the peak year of library history, and following 1996, the number of historical dissertations declined rapidly into 1999. It was also discovered that more females than males have written historical dissertations, but there was still a significant number of males who wrote historical dissertations. Texas Woman's University and the University of Pittsburgh are just two of the schools that produced the most historical dissertations. Overall, this study shows that library history is still evident and researched in library and information science programs, but unfortunately, few students choose to write dissertations using historical method. Further research, such as a survey of library students or a closer examination of the "Digital Dissertations" database, may give a clearer answer to the importance of library history research in library and information science. Appendixes include: the "Libraries and Culture" Historical Method Coding Sheet; the American Library Association's Library History Roundtable (LHRT) Citations Historical Method Coding Sheet; Arthur Young Citations Historical Method Coding Sheet; and Statistical Package for the Social Sciences (SPSS) Historical Method Data and Results. CHAPTER I.

INTRODUCTION

"A generation which ignores history has no past and no future." (Heinlen 1978)

Historical method is an important tool in library and information science research that can help us learn about the past as well as the future of library issues. In the 1960s and 1970s, library students often used historical method for their master's theses and doctoral dissertations. However, the popularity of library history research began to decline in the early 1980s. According to professor Orvin Lee Shifflet, "History is a major research methodology in library and information science as measured by the amount written, but its popularity has dramatically decreased in recent years" (Shifflet 1984, 387). Library professionals have debated over the relevance of historical research to their field for many years, and this debate continues today. Some professionals in library science do not see historical research as significant or necessary to the field. According to Michael H. Harris and Stanley Hannah from the University of Kentucky's College of Library and Information Science:

The critics appear to be persuaded that historical scholarship is *irrelevant* to the field of library and information science. That is, the discussion is no longer directed at improving the quality of historical scholarship, but instead, at eliminating it once and for all. And thus, we are faced with the quite incredible prospect of a significant number of elite voices in library and information science declaring a virtual "end to (library) history" (Harris and Hannah 1992, 124).

On the other hand, organizations like The American Library Association's Library History Roundtable (LHRT) continue to support and promote the study of history in library and information science education. In a statement on their online site, LHRT "strongly advocates that history and historical methodology be fully incorporated into the curriculum of all programs of library and information science education" (Statement on History in Education for Library

and Information Science 1989). Current opinions on the need for historical research in library and information science are clearly divided.

Purpose of the Study

As the debate over the worth of historical research in library and information science continues, one wonders how this has been reflected in the doctoral dissertations of future library professionals. The purpose of this study is to find out if the opinions of library professionals and researchers have affected the status of historical research in library and information science programs. Foremost, it is necessary to find out how much of all library and information science research is completed using historical method to decide if there are any trends evident. For example, what percentage of library and information science doctoral dissertations have been written using historical method? Are historical dissertations prevalent in library and information science research, or has library history research continued to decline? What types of historical papers are written? Are there more graduate students writing about specific special, public, academic, or school library history; or are there more general library history papers being written? Are there more male or female library students using historical method in their dissertations? Which particular library and information science programs are producing the most historical dissertations? This study will attempt to answer all of these questions to determine the status of historical method in library and information science research.

Definition of Terms

Historical method: The organized collection and evaluation of historical primary and secondary sources in order to learn about the past as well as to discover trends that can help explain present and future events. This paper will specifically look at the historical method used in library and information science doctoral dissertations.

Historical research: There are six types of historical research.

- (1) Biographical research—related to the history of a specific librarian or famous library advocate.
- (2) Histories of institutions and organizations—related to specific local or national libraries.
- (3) The investigation of sources and influences related to library history.
- (4) Editing and translating historical documents from libraries.
- (5) Studying the history of ideas related to libraries, and
- (6) The compilation of library history bibliographies (Powell 1999, 167).

This study will look for the six types of historical research in library and information science dissertations using citation analysis to see if there are any trends evident.

Library History: The use of historical method to study the history of individual libraries, famous librarians, library advocates, and/or themes related to the history of issues in libraries.

Dissertations: For this study, a dissertation will be an essay written by a library and information science graduate student that leads to a doctoral degree. There will be a limited sample of dissertations in this study, and only those written in the library and information science field will be studied.

Big History: Research that looks at events in the history of libraries in a larger context.

According to Shifflett, it offers a point of focus that could give the history of one library meaning in a larger context and thus rectify the too pervasive failure of library history to go beyond the immediate facts of the local historical record (Shifflett 1984, 396).

3

Little History: The history of local institutions or geographic regions that is limited in scope and is unrelated to the uses and needs of library history in a larger context. The general library community cannot use this type of antiquarian history to associate it with current library trends and issues (Shifflett 1984).

Library professionals: Any professor, scholar, or librarian that holds an M.L.S. or Ph.D. in Library and Information Science, and has spoken out for or against the use of historical methodology in their field.

Library History Round Table (LHRT): Unit of the American Library Association that encourages research and publication on library history, and promotes awareness and discussion of historical issues in librarianship (American Library Association 1996).

Truncation/Wild Cards: By using a "?" at the end of a word as a wildcard in a database search, one can find variations and plurals of that word. Truncation is also useful if you are unsure of the spelling of a word or name (UMI ProQuest 1999).

SPSS (Statistical Package for the Social Sciences): A comprehensive, relatively easy to use computer program for statistical analysis, report writing, tabulation, and general-purpose data management (Powell 1997, 200).

Limitations of the Study

This study will be limited to the examination of doctoral dissertations written by library and information science students from universities and colleges in the United States. There may be some dissertations written related to library history that were written by graduate students in other major disciplines, but these will not be covered in the study. It is important that only library history papers written by library students be considered because this study is attempting to find trends in historical method directly related to the field of library and information science.

This study will be completed in two parts. A sample of dissertations on all topics in library and information science will be gathered using *Digital Dissertations* online via OhioLink. This sample will help to determine the percentage of dissertations written using historical method. The sample taken is limited because it may not be the best representation of all library science dissertations written. The second half of the study will make an effort to gather as many historical dissertations as possible to evaluate the importance of historical method in library and information science research. The citations from the biennial articles in *Libraries and Culture* and bibliographic lists from Arthur Young's book and the LHRT will be consulted and included in the study. Unfortunately, it is possible that many historical dissertations written may be left out due to the fact that the resources used to gather the dissertations may not cover or list all papers written using historical method. However, this study will attempt to cover the majority of historical dissertations written in the last fifteen years. In addition, the resources used will only provide bibliographic citations and a few abstracts. This study will look for patterns based purely on the information provided in bibliographic citations.

CHAPTER II.

REVIEW OF THE LITERATURE

Several authors and library professionals have written about the importance or the insignificance of library history in library and information science research. Ronald R. Powell argued, "Historical research has much to contribute to librarianship, just as do other predominantly qualitative methods" (Powell 1999, 165). Powell confirmed that historical research could help us understand past events and learn from events that occurred in library history. Library history can also help library professionals learn from the past in order to avoid making the same mistakes. Powell goes on to explain the different types of historical research, the sources to use, and the basic rules behind conducting historical library research. Powell concluded that "there is a continuing need for genuine historical research in librarianship, and the better its presentation, the more impact it is likely to have" (Powell 1999, 177).

The American Library Association's Library History Round Table (LHRT) called attention to the value of history in library and information science education programs. In an article on their website, LHRT maintained that "a knowledge of history and an understanding of historical methodology are indispensable elements in the education of library and information professionals" (Statement on History in Education for Library and Information Science 1989).

LHRT considers history as essential to library and information science education because current issues in libraries, such as intellectual freedom, fees for service, and the role of minorities and women in the profession can only be understood by studying historical events in library science.

LHRT also listed five recommendations for schools of library and information science to follow that proves the value of history to the curriculum. For example, it is suggested that history should be part of all library and information science curriculums—more classes related to library

history should be taught, and professors should discuss the importance of historical methodology in order to encourage students to investigate and study library history (*Statement on History in Education for Library and Information Science* 1989).

Wayne Wiegand, professor of library and information science, discussed the proportion of library history research in the United States (Wiegand 1990). Wiegand wrote, "The literature of library history produced in the United States is growing and improving" (Wiegand 1990, 105). However, Wiegand observed that library students are not required to take courses in library history, and library schools rarely look to hire professors with history as their teaching and research background. According to Wayne Wiegand, "Students have generally not looked upon a critically honed historical perspective of their profession as a necessary component of their formal library education" (Wiegand 1990, 107). Furthermore, he wrote that library history is not popular with members of the professional community, which may explain why library students are not often exposed to historical research in library and information science. Wiegand concluded that library history is significant to the library science field, and that library professionals need to continue to promote library history.

K.C. Harrison also wrote about the importance of library history but also how there are many critics who do not see historical method as a reliable form of research (Harrison 1994). He discussed how library schools no longer seem to be concerned with library history, and how advances in technology have led professors to believe that courses in library history are no longer necessary so they should be dropped. Harrison affirmed that history in general has never been in favor, but people know that we can and must learn from it. Harrison concluded that library history is important and more historical research needs to be done in the field. Harrison

imagined that in the twenty-first century, library history would again play a major role in library schools (Harrison 1994).

Professor R.C. Alston declared that library history as a core course in library and information science education disappeared years ago (Alston 1991). However, he believed that library professionals were too concerned with new library technology, and were ignoring the fact that history is still important to the field. According to Alston, "In all disciplines, including notably medicine, it all started a long time ago, and we ignore that fact at our peril" (Alston 1991, 37). In other words, library history is needed to learn from the past and it can be related to the future. Alston considered library history as significant and necessary in all library education curriculums.

Professor James V. Carmichael, Jr. confirmed that library history is often neglected and looked down upon by library professionals. Carmichael stated that "relatively few graduates of LIS (library and information science) programs seem impressed with the need for library history or with the applicability of that history to present concerns" (Carmichael 1995, 310). Students often do not see a need to use historical method in their research because the professional world also does not find library history as important to the field. Carmichael found this out first hand in his own work. Carmichael writes:

When I finished my historical dissertation and turned it over to the university publisher at hand, it was apparently so unimportant that it remained in the editor's office for a year, unread and forgotten, until it was finally returned with a note that made no mention of the quality of the content but rather speculated on probable sales figures and declined further consideration" (Carmichael 1995, 311).

He concluded that library history is not often valued but the discipline will continue to broaden if students use historical method and if more publications in the field promote library history.

Authors Michael H. Harris and Stanley Hannah expressed that many critics believe library history is not needed in the field (Harris and Hannah 1992). However, they argued that these library professionals who challenge library history are mistaken. Harris and Hannah stated, "We doubt that we are witnessing the end of library history, and perhaps it is time to abandon this notion and turn to the more important task at hand…" (Harris and Hannah 1992, 129). Library professionals should not deny the existence of library history, but instead they should pay more attention to the significance of history to the field.

Several library science bibliographies have been published to compile all works written in the field, and include citations of library history dissertations. Gail A. Schlachter and Dennis Thomison compiled a bibliography of 1,000 library science dissertations written between 1973-1981 (Schlachter and Thomison, 1982). The dissertation entries in this book were gathered using several sources—Canadian Theses, Dissertation Abstracts International, Library Literature, Library Quarterly, Doctoral Students Memo, and by consulting the library schools with doctoral programs (Schlachter and Thomison 1982, 10). Each dissertation entry is listed in chronological order based on the date the dissertation was accepted. Schlachter and Thomison also attempted to state the purpose, procedure, findings, and conclusions of each dissertation entry. In compiling the dissertations, Schlachter and Thomison confirmed that library history dissertations constituted only a small percent of the total number of library science dissertations written (Schlachter and Thomison 1982, 376). Overall, this bibliography attempted to cover every library science dissertations written over an eight-year period, but it is possible that some may have been left out.

Arthur P. Young assembled an annotated bibliography of 1,174 citations for library and information science theses and dissertations (Young 1988). This resource illustrates the

importance of historical research in library and information science prior to 1986. It is the most recent bibliography published related to library history, and thus establishes the need for a current study—to find out if library history is still a significant part of library and information science education.

In addition to the writings associated with library history issues, there have also been a few in-depth studies that analyzed the use of historical method in library and information science research. David Kaser conducted a study in which he analyzed the number and content of dissertations written from 1965 to 1976. Kaser concluded that there were seventeen library school doctoral dissertations concerned with library history that were written between 1965 and 1970; and from 1971 to 1976, the number increased to forty-seven dissertations concerning history (Kaser 1978). Kaser also concluded that despite the fact library schools steadily reduced the library history curriculum, library students continued to be interested in library history. In his eleven-year study, Kaser found that the total enrollment in history courses increased by a significant amount, from 13,173 in the first six years, to 13,597 in the remaining years of the study (Kaser 1978, 184). The remainder of Kaser's study looked at the different topics covered by students using historical method. He found that many dissertations analyzed the history of large university libraries, there were many studies of individual public libraries and librarians, and some dissertations were written concerning library associations and education for librarianship. On the whole, Kaser's study established the importance of historical research in library and information science.

Orvin Lee Shifflett studied the methodologies of library research used by library and information science graduate students (Shifflett 1984). By using Schlachter and Thomison's library science dissertation bibliography to compile data, Shifflett found that historical research

constituted 33.2 percent of all methodologies used as an approach to doctoral research for the period covering 1925-1972. From 1973 until the end of the study in 1981, historical method accounted for a mere 15.6 percent of the efforts of library science research (Schlachter and Thomison 1982). The results of Shifflett's study showed that the use of historical method in library and information science research had declined rapidly though the years. Despite this decline, Shifflett argued that library history should not be overlooked because "It is only through understanding history that we can begin to make sense of the environment in which we work" (Shifflett 1984, 390).

Shifflett concluded his study with a discussion of the importance of historical research in library and information science. Shifflett stated that historical method should be combined with other methodologies in order to enhance library and information science research. He argued that historical research is significant to the field but he also stated that "history can never aspire to be a primary methodology in library and information science research" (Shifflett 1984, 386). He summarized that local library history ("Little History") and broader more general library histories ("Big History") are essential to the field but they must provide more than basic general historical facts. Library history researchers need to illustrate how their library history studies can relate to the field today. Shifflett concluded that library history is essential to library and information science research but it is not always recognized as so by library professionals.

CHAPTER III.

METHODOLOGY

In an attempt to continue where Shifflett's research left off, an analysis of library science dissertations written in the last fifteen years from 1984 to 1999 was completed. Several sources were used to locate library and information science historical dissertations. In the first step of research, *Digital Dissertations* online was utilized because it provides the bibliographic citations and abstracts of dissertations (UMI ProQuest 1999). *Digital Dissertations* database was somewhat of a challenge to use because advanced searching techniques needed to be practiced to locate all library and information science dissertations, including the papers written using historical method. The researcher searched for keywords and subjects to perform searches in the online database. Initially, this study took a sample of dissertations to find what percentage was written using historical method.

After finding the percentage of historical library and information science dissertations, the researcher closely examined the historical dissertations from the bibliographic lists. The dissertation citations were studied to compare, contrast, and make some conclusions about the concepts and ideas presented. First of all, a biennial essay on American library history published in *Libraries and Culture* was utilized (Wiegand, Goedeken, and Passet 1988-1998). This essay lists the dissertations completed and accepted in the current years of each essay. This source is limited because it only provided the citations of each historical dissertation, and it did not include any abstracts. This study also used a library history bibliography and its supplements that are provided on the LHRT website (Goedeken 1990-1999). Several of the citations in this bibliography were historical dissertations written by library science students. Finally, Arthur Young's *American Library History—A Bibliography of Dissertations and Theses* was utilized to

find further trends related to historical methodology. It was hoped that by using several different bibliographic sources, the most comprehensive list of library science historical dissertations would be available for analysis in the study.

Bibliographic entries were examined to learn what subjects and issues were covered in historical library research. The three sources mentioned above were used to determine the following criteria: the year the dissertation was accepted, from which school the library student came from, the gender of the author, the type of history written about, the approximate time period covered, and if any other patterns were evident from the citations and/or abstracts available. This study attempted to determine whether more library students have written "Little History" or "Big History." For example, an analysis was done to determine if the dissertations written were concerned with specific public, special, academic, or school library issues, or if the papers written were more focused on a particular library or librarian in history. The criteria was then recorded on a coding sheet to keep track of any concepts that surfaced related to the importance or insignificance of historical research in library and information science. By using citation analysis, the goal of this study was to provide the current status of historical method in library and information science research. This study also attempted to disprove the critics who feel that library history is unimportant to the library and information science field; it attempted to show whether or not library students are still interested in library history, and if the decline of historical method in library science research has continued.

CHAPTER IV.

ANALYSIS OF DATA

For the first part of this study, a search for library and information science historical dissertations was conducted utilizing the *ProQuest Digital Dissertations* database available through OhioLink. This database contains over 1.6 million dissertation and theses entries, and covers materials dating from 1861 to the most current papers submitted (UMI ProQuest 1999). An attempt was made using this database to determine what percentage of library science dissertations completed between 1984 and 1999 have used historical method.

For the first phase of research, some basic searches were conducted using only keyword search terms such as "library history," "history of libraries," and "library science." These simple searches produced various numbers of matching citations. This method of locating library science dissertations was not very precise because it was impossible to find out if these searches were producing all of the available library science dissertations. The search results also would not have produced an accurate percentage of historical dissertations within the whole group of library science dissertations. It is likely that from this method of searching many valid library dissertations were left out. This method of research could not produce a specific percentage of historical dissertations, so it became necessary to change the method of locating dissertations.

For the second stage of research, the browse feature of *Digital Dissertations* was used to look through the dissertations by subject. The "Library Science" subject, located under the "Humanities and Social Sciences: Communications and the Arts" heading, contained 3,712 titles dating from 1861 to the present that would need to be analyzed. This large number of available citations would be impossible to carefully examine, but this number was reduced by using the "advanced" search techniques in the database. The 3,712 titles were first reduced by selecting

only the titles that were written between the dates of this current study. A search of the library science dissertations submitted to the database between 1984 and 1999 produced 1,676 citations. This was a significant decline from the original 3,712 titles, but was still too great of a number to carefully analyze and locate the historical dissertations within. The search was narrowed further by limiting the titles by type of degree. Unfortunately, there were still 1,155 Ph.D. library science titles submitted between 1984 and 1999 to *Digital Dissertations*. This sample of titles was still too large to browse, and it would have taken a tremendous amount of time and effort to locate the most accurate percentage of historical library science dissertations written in the last fifteen years.

It was important in this investigation to find the percentage of historical library science dissertations, but it only represents a small fraction of the study. In order to keep the study moving forward, it was necessary to come up with a close estimate of the percentage of historical library science dissertations. This led to the next phase of searching within *Digital Dissertations*. Once again using the advanced search method, the Ph.D. library science dissertations submitted between 1984 and 1999 were limited by using the keyword wildcard search "hist?" in order to find variations and plural forms of the word "history." A second search using the same criteria was conducted but instead of a keyword search, a subject search of the word "history" was used.

The keyword and subject searches of the library and information science dissertations resulted in two different percentages. With the keyword search, it was determined that 191 of the 1,155 titles or seventeen percent of the library science dissertations contained a word or words in the citation having to do with the truncated term "hist." The subject search of "history" resulted in 89 of the 1,155 library science dissertations having to do with history, which was a mere eight percent of the total number of citations (See Table 1).

Table 1.

Distribution of Library and Information Science Dissertations Found Using Digital

Dissertations

Criteria	Frequency	Percentage
Total Number of LIS	3712	N/A
Dissertations Number of LIS	1676	N/A
Dissertations 1984-1999 Number of LIS Ph.D.	1155	100%
Dissertations 1984-1999	<u></u>	
Number of Library History Citations found using keyword "hist?"	191	17%
Number of Library History Citations found using subject "history"	89	8%

It is difficult to determine the importance of historical method in library and information science based on the searches made using *Digital Dissertations* because the searches resulted in inconclusive data. In Orvin Lee Shifflett's research, he used Schlachter and Thomison's library science dissertation bibliography to compile data, and he concluded that nearly thirty-three percent of library science doctoral dissertations written between 1925 and 1972 used historical method. The number of historical dissertations in library science declined to approximately sixteen percent from 1973-1981 (Shifflett 1984). This current study discovered that between 1984 and 1999, historical method constituted approximately eight to seventeen percent of the library science doctoral dissertations written (See Table 2).

Table 2.

Percentage of LIS Dissertations Using Historical Method

The pie chart in Table 2. shows the percentage of dissertations written using historical method. The dark shaded area, or number one in the legend, represents all library science dissertations, and the white shaded area, or number two in the legend, represents the percentage of historical dissertations. This percentage does not give a clear answer to the importance of historical method in library and information science over the last fifteen years. It is possible that the percentage of library science dissertations written using historical method has stayed the same since Shifflett's study, but it is most likely that the use of historical method has continued to decline over the last fifteen years.

It is important to remember that using the *Digital Dissertations* database is not the most accurate or the only method available to determine the percentage of historical dissertations in library and information science. This database includes a large number of dissertation citations,

but it does not cover all library science dissertations ever written in the United States. It is possible that many historical dissertations are not cited in *Digital Dissertations*, so the resulting percentage from this study does not give the precise number of historical dissertations written over the last fifteen years. This resulting percentage may also be inaccurate due to the fact that the database included many dissertations written outside of the United States, and it is possible that the citations found using the keyword and subject searches may include some Ph.D. dissertations from other disciplines other than library science. The magnitude of the database search results did not allow time to closely examine each citation and abstract. However, using *Digital Dissertations* to estimate the percentage of library science dissertations that used historical method was the most straightforward method to use for this type of study.

After determining the percentage of historical dissertations, the research shifted to a concentration on specific historical method citations from three important library science historical bibliographies. The first source used was the biennial essay printed in *Libraries and Culture* (Wiegand, Goedeken, and Passet 1988-1998). This bibliographic list covered ninetynine historical dissertation citations written between 1984 and 1996. These citations were entered into an Excel table to better organize the data that needed to be analyzed (See Appendix A). Each citation included the title of the dissertation, the author's name, and five different criteria to investigate. The items needed for examination included the institution that the library student attended, the date the dissertation was submitted, the gender of the author, the subject scope of the paper (academic, biography, public, school, general, books & reading, associations, LIS education, or publishing), and the time period covered within the dissertation.

The second source used was the *Cumulative Bibliography of Library History* and the *Supplemental Bibliographies* available from the LHRT website (Goedeken 1990-1999). This

bibliographic list contained 149 citations of dissertations written from 1990-1999. These citations were also entered into an Excel table to organize the data, and the same five criteria were used to analyze the dissertations (See Appendix B). The third and final library history bibliography source used was the list found in Arthur Young's book (Young 1988).

Unfortunately, the majority of this bibliography included library history dissertations written from 1930-1985. This study could only use the eleven citations found that covered 1984 to 1985. These eleven dissertations were entered into a third Excel table in order to analyze the five criteria in the study (See Appendix C). After entering the citations from all three sources, the duplicate entries had to be deleted. There were fifty-seven citations that overlapped in the three historical bibliography lists, but these sources still produced 259 valid library history citations.

A problem with the 259 citations is that there may be some dissertations cited that are not from the library science field, but they cover library history in some way. Instead of spending too much time removing the few non-library science dissertations, these citations were left in to show that all fields of study recognize the importance of library history.

The next stage in this study of historical dissertations was to closely examine the five criteria—gender, institution, date, subject scope, and time period covered. An additional criteria, "type of history," was added to the original five criteria from the 259 Excel citations. This category attempted to express whether each citation represented "big history" or "little history." These six total criteria were then entered into SPSS in order to closely examine the historical dissertation and to determine some general findings.

This study of historical dissertations verified that 154 females and 99 males wrote the 259 dissertations recorded. There were also six other people who wrote dissertations, but their gender was inconclusive due to the unfamiliarity with their first names (See Table 3).

Table 3.

Gender Distribution of Library History Dissertation Students

Gender of Author

Female library science students wrote the majority of the library history dissertations recorded. However, the percentage of males who wrote historical dissertations is also fairly large and significant to the study. One who assumes that most library students are female can also presume that females also write most historical dissertations. Other than these basic results, few conclusions can be drawn based on the gender of the dissertation authors.

The second criterion for analysis was the type of institution where each dissertation was submitted. It was concluded that of the 259 citations, 77 total colleges and universities were represented. A school without a library science program, Columbia University, was the number one institution with twenty library history dissertation citations (See Table 4). Most of the institutions represented only produced one to five library history dissertations. However, there were thirteen schools that produced anywhere from six to eight dissertations—New York University, Rutgers University, State University of New York-Buffalo, University of California-Berkeley, University of California-Los Angeles, University of Illinois at Urbana-Champaign, University of North Carolina at Chapel Hill, University of Washington, University of Chicago, Florida State University, University of Maryland, University of Michigan, and the University of Minnesota.

The date of the dissertation is the third and most significant criteria for analysis of the historical dissertations (See Table 5). Based on this table, one can observe that the number of historical dissertations written between 1984-1990 stayed about the same and the number completed was very low. However from 1991-1996, the number of historical dissertations written greatly increased. From 1997-1999, the number of historical dissertations began to decline. The least number of historical dissertations were written in 1999 with five citations, but

Table 4.

Distribution of Top Five Institutions that Produced Library History Dissertations

Institution	Frequency	Percentage
Columbia University	20	7.7%
Indiana University	13	5.0%
Texas Woman's University	9	3.5%
University of Pittsburgh	11	4.2%
University of Wisconsin at Madison	12	4.6%

Table 5.

Distribution of Historical Dissertations Written 1984-1999

Date of Dissertation

the most recent data available did not include many citations for 1999. The results of this table do not indicate why there may have been an increase of historical dissertations written between 1991-1996.

The subject scope of each dissertation is another significant criterion for analysis of library history (See Table 6). Of the 259 citations, most of the dissertations written deal with the history of books and reading, or they are just general historical studies. The least number of dissertations written discussed the history of school libraries. This confirms the lack of interest of students in this type of library history. Library students also wrote many biographies of librarians or library advocates in history and some histories of academic libraries.

The time period covered within each historical dissertation is another important criterion for analysis (See Table 7). Unfortunately the time period covered was unknown in the majority of the dissertations cited. If this study were to go more in-depth, it would be necessary to look through abstracts and actual dissertations to come up with an estimated time period covered. The three sources used were limited because they did not include abstract or background information, which would indicate the time period covered in the dissertations. Based on the dates of coverage that were provided, a good number of dissertations written covered the period from 1751-1950 with thirty-seven citations. This was followed by twenty-eight citations covering the period 1751-1889, and twenty-seven citations covering 1951-1999. Some of the time periods are overlapping because many dissertations covered time periods that overlapped the noted eras.

Table 6.

Distribution of Subject Scope for Library History Dissertations

Subject Scope	Frequency	Percentage
Academic	27	10.4%
Associations	8	3.1%
Biography	30	11.6%
Books & Reading	48	18.5%
General	48	18.5%
LIS Education	9	3.5%
Publishing	35	13.5%
Public	26	10.0%
School	3	1.2%
Special	25	9.7%

Table 7.

Distribution of Time Periods Covered in Historical Dissertations

Years Covered

The final criterion for investigation was the type of history used in the dissertations (See Table 8).

Table 8.

Types of History Percentage

It was necessary to find out if the library dissertations generally had a broad scope ("Big History") or if they were more local and specific ("Little History"). This criterion is problematic due to the fact that it was difficult to assume or judge a dissertation's content based only on the citation information available. However, this study attempted to make the best possible guess as to which type of history was covered by each dissertation. According to Table 8, the white shaded area "1" indicates the frequency percentage of "Big History" dissertations and the gray shaded area "2" indicates the frequency percentage of "Little History" dissertations. It was determined that 42.9% of the dissertations were "Big History," and 57.1% were "Little History."

This shows that the type of history conducted was nearly split—it is unclear whether or not these numbers can prove which type of history is more significant. Overall, the above criteria can be used to determine the significance and importance of library history to library and information science.

CHAPTER V.

CONCLUSION

Many library professionals have written about the importance of library history to library and information science education. This study attempted to continue the examination where library history researchers had left off. Many studies were conducted in the late seventies and early eighties, which concluded that library history was significant to the library and information science field. The researcher's main interest in this study was initiated by the research that had previously been conducted, and by the article written by Orvin Lee Shifflett. This study attempted to draw a comparison between Shifflett's observations of a decline in library history research from 1973 to 1981, to the current study of trends in dissertations written in the last fifteen years. However, it was difficult to compare this current paper's results with the observations noted by Shifflett and other researchers, because this study used a different methodology than the other researchers of previous studies. Shifflett used a library science dissertation bibliography to estimate what percentage of library science dissertations used historical method. This current paper used both Digital Dissertations and several library history bibliographies to come up with an accurate percentage of library history dissertations written in the last fifteen years. Although the methodology used in this study may have been problematic, the results are still useful and show that the decline in library history dissertations has continued.

This study took a closer look at how library history has affected the library and information science field over the last fifteen years. The results primarily showed that the interest in library history has not increased, but instead has continued to slowly decline. Only 8-17% of library science dissertations submitted to the *Digital Dissertations* database dealt in some way with library history. According to the research conducted in this study, approximately

29

thirty-eight library history dissertations were written in 1996, but only five historical dissertations had been written within 1999. It is unclear as to why a significant number of dissertations were written between 1991 and 1996, or why fewer dissertations were written in the other years of the study. There still seems to be a noteworthy interest in library history, but it is unfortunate that historical method is not used as much as other methods in library and information science research. This may be due to the fact that library history is not looked upon highly by library schools and professionals. It is also possible that Ph.D. students do not write historical dissertations because it is more difficult to acquire a teaching position in a library science department with a historical degree.

The results of this study also confirm that many different historical topics have been written about, more females than males have written historical dissertations, and the popularity or interest in library history varied over the last fifteen years. Unfortunately, the research conducted did not result in any concrete conclusions into the importance of library history to students and other library professionals. Many assumptions had to be made by the researcher in order to deduct the scope and type of history covered in each dissertation. This paper was limited in many ways because the criteria studied was difficult to determine due to the fact that only the bibliographic citations of dissertations were available to study. The statistics and conclusions prepared in this study are not as accurate as they could be if more complete resources were available to the researcher. Additional research would definitely need to be conducted based on this study because the sources used were so limited.

In a future study, it would be necessary to look more closely at the citations provided in *Digital Dissertations*. A future researcher could go through the 1,155 Ph.D. library science dissertations submitted between 1984 and 1999 to find out what exact percentage of dissertations

were written using historical method. Spending more time analyzing the search results in the dissertation database could discover a more precise percentage of library history dissertations written. A future researcher could also study the abstracts or the actual dissertations to discover more trends and to confirm certain trends in library history research. It would also be beneficial to use another source such as *Dialog* to search for library history dissertations in the *Dissertation Abstracts* database. Since *Dialog* is a more powerful searching tool, a researcher might be able to come up with a more accurate percentage of library history dissertations written from 1984-1999.

Future researchers may also want to expand this study to include the interpretations of library history by students and library professionals. A survey could be conducted of people in the library science field to find out their opinions and thoughts on the importance or significance of library history to the field. It would also be interesting to see how library history affects the writing of library science dissertations in the future. A study will ultimately need to be conducted to find out the importance of library history from 1999 to the current time of the future study. In general, this study shows that library history has continued to play a role in the writings of doctoral students. While the number of historical dissertations written may continue to decline, it is necessary for library professionals to promote the importance of library history. Without history, it is not possible for library professionals to learn from the past.
