#### **ABSTRACT**

This "communication lexicon,' a new source of information in the field of language and area studies, describes how selected themes such as family, society, work, and entertainment are perceived and understood by members of the Mexican, Colombian, and United States cultures. It identifies broad trends of perceptions and evaluations through analysis of related themes. The awareness it provides of differences in perceptual and motivational dispositions can be applied to educational and training tasks which require cultural sensitivity and interpersonal skills. Information is based on Mexican and United States student samples tested in Mexico City and Washington, D.C. A parallel presentation is based on a comparable Colombian sample. Introductory chapters discuss problems of cultural understanding and how research information can be used in communication strategies. Chapters 3-12 present Mexican and American images and meanings from themes of Family/Self, Friendship/Understanding, Community/Society, Love/Sex, Religion/Mortality, Education/Upbringing, Economy/Money, Work/Achievement, Government/Politics, and National/Ethnic Images. Graphs are used to show differences and similarities. General trends across several themes reflecting perceptual and motivational dispositions are discussed in chapter summaries. The original response lists arranged in semantically related clusters for each theme are provided in Appendix 1. The Associative Group Analysis method used to collect and interpret research data is discussed in Appendix 2. (FL)

#### ACKNOWLEDGEMENTS

The authors wish to express their personal appreciation and gratitude for the funds received from the Department of Education. Our special thanks go to the representatives of the Division of International Education and to our project monitor, Flora McKenzie, in the International Research and Studies Program who were very helpful in facilitating the successful completion of our task.

With regard to the data collection we are most grateful for the help of Jose Luis from the Universidad Nacional de Mexico who performed the administration of the Associative Group Analysis in Mexico City.

We are also sincerely indebted to John Dombrowski from Wake Forest University who reviewed the manuscript and offered numerous useful suggestions and comments. We would also like to thank Dr. Andres Inn from the Chinese University of Hong Kong for his valuable help in the development and adaptation of computer programs and graphics software.

From our staff Margot Lopez, Maria S. Lisabet, and Marilu Arcila receive our special thanks and recognition for assisting us with the data processing and translation tasks. We are also grateful to Eva Szalay who was responsible for the production of the graphical material.

The work upon which this publication is based was performed pursuant to Grant No. G008302219 with the Department of Education. However, the opinions expressed herein do not necessarily reflect the position or policy of the Department of Education, and no official endorsement by the Department of Education should be inferred.

#### **ABSTRACT**

In what important ways do Mexicans agree and differ from U.S. Americans in their way of thinking, in their images, and in their subjective view of the world? How wide, how deeply rooted, and how consistent are their differences?

Developed under the sponsorship of the U.S. Department of Education's Division of International Education, the Communication Lexicon offers extensive data on Mexican and U.S. American images and meanings encompassing dominant trends in perceptions and motivations. This information is based on the indepth study of U.S. and Mexican student samples tested in Mexico City and Washington, D.C. It shows in a comparative presentation important similarities and differences in perceptions and evaluations of a broad variety of key issues ranging from self to government, from sex to capitalism. While the main focus of attention is on the Mexican-U.S. comparison, a parallel presentation of results on a comparable Colombian sample offers an interesting opportunity to examine Mexican-Colombian-U.S. similarities and differences as well. The way these are distributed adds validity to the Mexican-U.S. results.

The introductory chapters discuss the problems of cultural understanding and the use of this information along a communication strategy built on the recognition that in order to reach people we have to address themes which are dominant in people's minds. Furthermore, in addressing the dominant themes we have to take reople's subjective understanding and cultural meanings into consideration. Chapters 3 through 12 of the volume present the Mexican and U.S. images and meanings of selected key themes from the following domains: Family and Self, Friendship and Understanding, Community and Society, Love and Sex, Religion and Morality, Education and Upbringing, Economy and Money, Work and Achievement, Government and Politics, and National/Ethnic Images. The main differences and similarities are shown in graphic visual presentation. To keep the main comparison simple the numerical data on all three groups are shown in Appendix I of the lexicon. General trends emerging across several themes and reflecting perceptual and motivational dispositions are discussed in the chapter summaries. They highlight differential Mexican and U.S. American psycho-cultural dispositions which affect interpersonal relations and communications.

While the Mexicans are the closest Latin American neighbor to the Americans, Colombians are frequently considered as representatives of the most characteristically Hispanic country of Latin America. Studies by Szalay on Hispanic Americans (Mexican Americans, Puerto Ricans, Cubans) tested in the United States and studies by Diaz-Guerrero on Mexicans, Mexican Americans, and Anglo Americans offer interesting comparisons and underscore the information value of these data, both internationally and domestically in various educational applications.

iii

#### PREFACE

The Communication Lexicon is a new concept; it is a new source of information in the field of language and area studies. Its focus is on people's way of thinking, their frame of reference, their characteristic outlook on life. Compared to the more traditional area studies, our main focus is not on history or religion or geography, not on tangible material realities of existence in a particular country, but rather on people's shared subjective views of those realities which are dominant in their minds.

The focus of the analysis is essentially psychological; it is centered on perceptions and motivations which influence people's choices and behavior. Compared to individual psychology, the information represented by this volume is psycho-cultural in \(\tau\). at it is centered on the shared perceptions and motivations which people with the same language, backgrounds, and experiences develop together into a shared cultural view or subjective representation of their universe.

The attention psycho-cultural factors are receiving these days follows from the growing realization that their influences are powerful and yet they occur without people's awareness.

Based on extensive empirical data produced through an analytic technique of indepth assessment, the Communication Lexicon presents the culturally characteristic system of meanings which members of a particular cultural community develop in construing their world.

At the level of specifics the lexicon describes how selected themes such as family, society, work, and entertainment are perceived and understood by members of three cultures: Mexicans, Colombians, and U.S. Americans. While the traditional bilingual lexicons give translation equivalent terms (e.g., "drug" in English and "droga" in Spanish). the communication lexicon describes how a particular group subjectively perceives and evaluates each theme (e.g., how members of two cultural collectives are predisposed to attach different subjective meanings to "drug" based on their different views, beliefs, cultural frames of reference).

At a more generic level the lexicon aims at the identification of broader trends of perceptions and evaluations. Through the analysis of related themes (e.g., drugs, marijuana, drug addiction, etc.) the results tend to show consistent trends for a particular group (e.g., a strong Spanish emphasis on harmful social consequences).

Thus, beyond differences in the meanings of single selected themes, the present lexicon informs on perceptual and motivational dispositions which are likely to interfere with the mutual understanding and communication between Mexicars and U.S. Americans in various domains of life from family to international relations. The information presented can help laymen and experts alike to develop better understanding and rapport by showing what the important differences in meanings are and

how they can be bridged by relying and expanding on what is shared. In this context the volume presents information in support of various educational and training tasks which require cultural sensitivity and interpersonal skills.

To serve these diverse objectives requires an imaginative, creative application of the cultural ir 'ormation along the principle that in order to be effective and successful in interpersonal relations and communication, one must be able to relate to the priorities, meanings, and frame of reference of those we wish to reach.

The information presented in this volume contains as yet uitharted similarities and differences between the views and frames of reference of Mexican and U.S. students. Simultaneously, the Mexican-Colombian comparison offers a unique opportunity to explore how much these two Hispanic/Latin American cultures share with each other, and how consistent are their differences from the U.S. Am rican.

The abundance of facts is only given full justice in the detailed charts in the Appendix I. There the punctilious reader may find reason to agree or disagree with the interpretations forwarded by the authors. The interpretations are often inspired by the results of other rigorous studies on Mexicans, Hispanic Americans and Anglo Americans, carried out previously or concomitantly by the authors. On the other hand, besides implicit adherence to the rules of the scientific method, it is important to stress from the beginning triat, philosophically, this is an international undertaking. There is a deep conviction that no nation or culture has as yet found anything resembling an optimal way of socializing its young for a full development of their constructive potentialities. It is felt that every nation or culture can learn a great deal from every other. Foremost for such learning to have a chance to take place is a better understanding of the cultural premises subjectively underlying the psychological functioning in different societies. No matter how conventional or formal or humorous may our mutual undertaking strike at times, the philosophical creed above is fundamental.

## TABLE OF CONTENTS

| Summary |     |  | 1   |
|---------|-----|--|-----|
| Chapter | 1.  | PSYCHO-CULTURAL FACTORS IN INTERNATIONAL RELATIONS AND EDUCATION | 15  |
| Chapter | 2.  | SUBJECTIVE IMAGES AND MEANINGS: ASSESSMENT AND USE               | 21  |
| Chapter | 3.  | FAMILY, SELF   | 41  |
|         |     | family, father, mother, husband, wife, me                        |     |
| Chapter | 4.  | FRIENDSHIP, UNDERSTANDING  | 61  |
|         |     | friendship, friends, help, understanding, togetherness, unity    |     |
| Chapter | 5.  | COMMUNITY, SOCIETY   | 77  |
|         |     | community, society, freedom, equality, law, justice              |     |
| Chapter | 6.  | LOVE, SEX  | 93  |
|         |     | love, sex, man, woman, marriage, divorce                         |     |
| Chapter | 7.  | RELIGION, MORALITY   | 109 |
|         |     | religion, God, morality, guilt, conscience, shame                |     |
| Chapter | 8.  | EDUCATION, UPBRINGING  | 125 |
|         |     | education, intelligence, knowledge, teacher, youth, science      |     |
| Chapter | 9.  | ECCNOMY, MONEY   | 145 |
|         |     | money, economy, unemployment, inflation, poverty                 |     |
| Chapter | 10. | WORK, ACHIEVEMENT  | 159 |
|         |     | work, employment, responsibility, security, progress, future     |     |

| Chapter 11. | GOVERNMENT, POLITICS   |     |  |  |  |  |  |
|-------------|--|-----|--|--|--|--|--|
|             | government, politics, authority, power, democracy, human rights                        |     |  |  |  |  |  |
| Chapter 12. | NATIONAL/ETHNIC IMAGES   | 191 |  |  |  |  |  |
|             | United States, Anglo Americans, Soviet Union, Puerto Ricans, Cubans, Mexican Americans |     |  |  |  |  |  |

APPENDIX II THE ASSOCIATIVE GROUP ANALYSIS (AGA) METHOD:

Data Collection, Analysis, and Main Categories of Inferences

#### UNDERSTANDING MEXICANS AND AMERICANS

A MEXICAN-U.S. COMMUNICATION LEXICON OF IMAGES, MEANINGS, AND CULTURAL FRAMES OF REFERENCE

#### Summary

While no one would think of summarizing a conventional dictionary, we have included a synopsis here to underscore the fact that the meanings presented are not conventional lexical meanings. The images and meanings contained in the communication lexicon reflect people's subjective perceptions and motivational dispositions which form a broad system of subjective representations that can be summarized parsimoniously if the main parameters of the system can be identified.

The word United States and the word capitalism are independent as words or lexical units. However, the subjective meanings of these words can be variously related depending on how people are predisposed to understand them. In their subjective representation of the world people of various backgrounds and persuasions develop their own subjective meanings of the United States and capitalism and other concepts as mosaic elements whose relationship depends on their perceptual and evaluative content.

Consistent emphasis on certain meaning elements offers unique opportunities to identify dominant perceptual and motivational trends on a solid empirical foundation. The subjective meanings of politics, government, and democracy for Mexicans reveal certain trends (e.g., emphasis on social values, conflicts of idealistic expectations with realities of corruption and incompetence), which represent the dominant parameters of the Mexicans' understanding of the domain of politics. Similarly, the subjective meanings of these and other political themes can be analyzed to identify dominant parameters in the subjective representation of the domain of politics for Americans (e.g., emphasis on the processes of Campaigning and voting, focus on free choice and the will of the majority).

The findings presented on Mexican and American and Colombian images and meanings show the large scale, systemic effects of cultural background on the contemporary views and frames of reference of the students tested. The results were derived by a method of in-depth assessment in which no direct questions are asked; their subjective images and meanings are reconstructed from hundreds of thousands of spontaneous free reactions elicited to selected issues and ideas.

#### FAMILY AND SELF FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Mexicans emphasize the parent-child relationship as the main axis of the family, a trend commonly observed in traditional cultures. While Americans emphasize the father-mother and husband-wife relationship as the main axis of the family, Mexicans place less emphasis on individual roles and more on affective ties.
- \*The main attention of the Mexicans is on the upbringing of the children, on their socialization based on certain traditional values of respect and obedience. These value trends support the literature suggesting the directive. authoritative nature of Mexican family relations.
- \* To Americans family relations are particularly important as a major source of emotional satisfaction: joy, happiness, good times. To Mexicans family relations are exceptionally affect laden, with a great emphasis on love, reflecting a strong emotional interdependence. While love is important in the American family as well it has a lower salience, and there is little indication of its use as an instrument of influence.
- \* The Mexican male images do not show more sex differentiation than the American male images; the Mexican female images show more emphasis on feminine attributes.
- \* The Mexican construes self as a person with certain social roles and qualities such as understanding and helpfulness. The dominant role characteristics reflect the idea of interdependence, the ideals of the unity and cohesion of the family above the individual. The American views self as an independent, self-reliant individual who has positive personal and social qualities and who makes his own decisions along his own interests. Family is a social setting important and highly valued yet of minimum interference with independence and autonomy of the individual.
- \* The Mexican images of family roles convey a view of the self and the family with an affect laden nurturing emphasis discussed in the literature as a source of strong social orientation and passive coping style. This stands in partial contrast to the more self oriented, individualistic, competitive American approach supported by family relations which encourage independence and autonomy.

#### FRIENDSHIP RELATIONS FROM AMERICAN AND MEXICAN PERSPECTIVES

- \* Friends and friendship in general have a stronger affect based foundation and a broader scope for Mexicans. To Americans riends and friendship have a narrower, stronger foundation on entertainment and leisure and convey generally more sexual undertones.
- \* Family appears to be a more important source of friendship for the Mexicans, and friendship entails more enduring, lasting relationships in line with the philosophies and life conditions of traditional societies. The American focus on friendship as a source of fun and emotional satisfaction suggests a more ad hoc, less permanent rapport promoted probably by the conditions of high mobility.
- \* For Mexicans friendship involves expectations of help, assistance, support, as has been observed in the context of developing societies where friendships provide an important network of support and cooperation in practically all domains of life, from health to business. For Americans friendships play a le 3 existential role; help may be provided when needed but not as a matter of social obligation or expectation, but as a spontaneous, free, individual action.
- \* The Mexican meaning of friendship emerges as a natural cultural product of more interdependent social relations and stronger social commitments and obligations, consistent with social personalistic interpersonal relations. The American meaning of friendship likewise follows from the conditions of a highly mobile, affluent, post-industrial society, in which friendships are a primarily psychological need of the individual, who is characterized in the literature as lonely and starving for emotionally satisfying interpersonal relations.
- \* In the Mexican cultural context friendship has a deeper and more selective meaning, involving rapport based on strong and lasting commitments and obligations with a selected few. In the American cultural context friendship is more a transient, situation-bound relationship which could develop with almost anyone, potentially the broad and impersonal category of people in general.
- \* In practically all the above main dimensions the Colombians were found to be closer to the Mexicans and more distant from the Americans.

#### COMMUNITY AND SOCIETY FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* From the Mexican angle a community can be small or large, as small as the family and as large as mankind. In all instances Mexicans see more group identification, more affective bonds between people. From the American angle a community is a group of people who happen to live in the same place at the same time and therefore share some common concerns and interests.
- \* Mexicans view society as a large social unit of interdependent persons with positive ties of helping and cooperation, characterized ideally by unity and union. Americans, on the other hand, view society as an aggregate of individuals whose freedom is likely to be restricted and constrained by the tige collective.
- \* The Mexicans' idealistic approach to community and society produces natural expectations that they will serve such positive goals and values as equality, justice, development, etc. The contrast between these expectations and the corruption, egoism, and injustice encountered in their world creates strong disappointments and frustrations. Americans approach large social units with skepticism, but they exhibit a practical, problem-solving orientation with focus on such issues as human rights, status of disadvantaged groups, racial problems, employment etc.
- \* In general, Americans show faith in the legal and constitutional processes, and emphasize law and rights. The Mexicans show a stronger disposition to think more in terms of human values and morality.
- \* Mexicans view themselves as parts of ocial units and express more identification with these units as well as higher expectations about the working of these units in solving common problems. In the face of unfulfilled expectations, they express bitter disappointment. Americans tend to think mainly in terms of individual people rather than large collectives and focus on the solution of given problems with little attention to broader principles or social philosophies.
- \* The Colombians show again in practically all of the above major dimensions closer similarity with the Mexican views.

#### LOVE AND MARRIAGE FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* To the Mexicans love is predominantly an affect, a sentiment which entails understanding, an attachment to someone in view of the intrinsic qualities, role and behavior of the person. To Americans love entails more affects associated with the fulfillment of personal needs by another individual through a mutually satisfactory meaningful relationship assuring joy, fun and happiness.
- \* Mexicans think predominantly of love in the context of family, family members, particularly children, parents, siblings, as well as a few close personal friends. In thinking of love American speak more intensively of sex and of the feelings associated with specific people who are thought to meet their individual expectations and desires.
- \* For Mexicans sex represents predominantly a set of human attributes associated with gender as involved in different sex roles. For Americans it represents more narrowly the sexual act and the personal attributes associated with the satisfaction of sexual needs and desires.
- \* Despite their highly differentiated approach toward the two sexes, the Mexicans' images of man and woman include strong emphasis on social qualities---love, friendship, goodness---and general human attributes involving the intellect and work. The Americans' images of the sexes focus particularly in the context of man on maleness, strength and power, and the polarity of maleness and femaleness.
- \* Although the Mexican view of the woman entails strong emphasis on feminine qualities and family related roles, the Mexicans think apparently less in terms of a male-female sexual polarity than of gender-based sex role differences. Also, they emphasize the human contrasted with the infrahuman or animal.
- \* While on most dimensions there is close agreement between Mexicans and Colombians, in the image of the woman the Colombians are preoccupied more with her appearance while Mexicans pay relatively more attention to her work and intelligence.

#### RELIGION AND MORALITY FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Mexicans view religion as faith and belief involving love and the social attitude of understanding with emphasis on the moral and affective dimensions of religion. Americans view religion as faith and belief more as a mutter of personal choice. They think of various denominations and religious objects and practices.
- \* To Mexicans religion means almost exclusively Catholicism, which entails values and moral precepts affecting personal and social life by a strong emotional identification with God and his teachings. To Americans the relationship with God is highly personal and has a less intensive emotional undertone. Americans think more of worship, prayer and other religious practices.
- \* Mexicans characterize God as a supreme being endowed with power and strength, and as a loving and understanding father.
- \* Morality represents to Americans making the proper choice between good and bad, right and wrong, considering both positive and negative alternatives. To Mexicans morality is predominantly positive virtues and ideals, a disposition to recognize them and to follow them more or less naturally.
- \* While the Mexicans stress high virtues and ideals with strong social implications, Americans focus on specific contexts and practical problems involving sex. issues of life and death, drugs etc.
- \* Americans see morality as a matter of choice and personal conscience which is at the very core of moral autonomy characteristic at an advanced stage of the autonomous individual. Mexicans, on the other hand, see morality more as a matter of pursuing ideals which have strong interpersonal and social implications rooted and reinforced by social norms and consensus.
- \* The American emphasis on alternatives, choices and conscience gives considerable support to Ruth Benedict's characterization of sciial control based on guilt. The stronger Mexican concern with social norms and implications presents a distinction reminiscent of more traditional cultures where avoiding shame is a dominant motivation.

#### EDUCATION AND UPBRINGING FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Mexicans as well as Colombians think of education in a broader sense akin in several ways to the American idea of upbringing. Americans think of education predominantly as a process of acquisition of knowledge and marketable skills through the attendance of selected schools.
- \* The Mexicans' broader view of education encompasses more concern with the role of the family and with the proper behavior of the student.
- \* While from the American angle education is expected to prepare the individual student for a productive and happy life, the Mexicans include beyond these individual objectives such social goals as progress and development.
- \* There is stronger American preoccupation with the specific knowledge, as well as with the variety of schools through which the desired knowledge can be obtained as a matter of individual interest and choice.
- \* There is stronger Mexican preoccupation with the personal and social impact of the educational process, a possible reflection of previously registered tendencies in Mexican society to shape the child to conform to certain moral ideals and social norms consistent with the views of interdependence.
- \* As a further reflection of these philosophies the Mexican image of teachers is also broader, with more emphasis on the teacher's personal and social qualities and on personal rapport. The American image of teachers is more practical, functional, and impersonal, narrowly focused on teaching, helping, and the school environment.
- \*The image of youth again reflects differences in perspectives. The Mexicans view youth with a great deal of affective identification involving love and friendship and representing life and health. Americans show more concern with age, clearly separating various age categories. Also, Americans place a high priority on youth as a desirable condition.
- \* Americans place a greater emphasis on intelligence and intellectual qualities as conditions of success, while Mexicans view education more in relationship to human behavior and culture in general.

### ECONOMY AND MONEY FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Mexicans view economy from the angle of the problems arising from their troubled, less developed economic status. They are preoccupied with the need for development and progress, needs rooted in poverty and crises.
- \* Americans view economy from the angle of the future, expressing concern with its unpredictable ups and downs. The problems mentioned involve specifically inflation, recession and depression.
- \* To Mexicans economy represents a large scale social and national issue which they see in close relationship to politics and the role of the government. To Americans economy is more related to personal business and finances, supply and demand, Wall Street and the stock market.
- \* While Americans see money in closer relationship to the economic situation, they also have more elaborate technical-financial views about money management. They see money in close relationship to jobs and careers. In contrast, Mexicans see money as something highly desirable and badly needed for food, clothing, housing, and travel.
- \* Mexicans associate unemployment with such extreme consequences as hunger, crises and death as well as theft, violence and crime in general. Americans think more of the financial consequences of unemployment: loss of salary, unemployment compensation as well as of its close relationship to the overall status of the economy in general and recession, inflation and depression in particular.
- \* For Americans poverty implies predominantly lack of money and hunger; it entails more extreme consequences of misery and death for the Mexicans.
- \* Mexicans see economic issues and problems in broader social contexts, more as national issues, and in closer relationship to the role of government and politics. Americans view economic problems as personal problems or problems associated with special disadvantaged groups, racial minorities, foreigners, or slums.
- \* In most instances again the Mexican and Colombian perspectives show relatively close correspondence. In connection with money and economy, however, the Colombians show more involvement with money management.

#### WORK AND ACHIEVEMENT FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Americans focus on the job, on the task to be performed. Hard work implies a virtue, a sense of performance which is a source of personal pride and satisfaction.
- \* Mexicans think of work more as a matter of necessity or obligation and as a means to attain something, to earn a living. Americans see work more as a goal in itself, a basis of achievement and success.
- \* Mexicans view work again more as inst umental to achieve certain large scale social and national objectives such as development and progress.
- \* While Americans think more of job as a task and its performance, Mexicans show more concern with the effort it takes and with employment and the setting in which the work is being performed.
- \* In thinking of responsibility Americans focus on work, individual achievement, while Mexicans pay considerable additional attention to social and national objectives such as progress and development.
- \* To Americans responsibility is more a personal attribute such as maturity or loyalty. To Mexicans it implies more a concern and caring for others, a quality of the person just like virtue or conscience, while Colombians view responsibility as a matter of duty, an obligation toward particular people or toward people in general.
- \* Americans show more preoccupation with financial security and to them security is also of concern in interpersonal relations. Mexicans express strong concern with economic security and well-being. Colombians show intensive preoccupation with their physical security threatened by violence and crime.
- \* Progress for Americans is particularly closely related to the field of science and technology. Mexicans express strong concern with problems related to economic progress. Colombians agree with Mexicans in their concern with development but pay less attention to the issue of progress in general.
- \* Beyond close agreement in most dimensions, this domain of work and achievement has shown a few differences between Mexican and Colombian perspectives.

#### GOVERNMENT AND POLITICS FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Americans construe politics very much as a process involving campaigning, competition, and voting, which provides representation of the will of the majority. Mexicans pay little attention to the process; they show more concern with the welfare and the future of people, society, the country at large.
- \* Americans are somewhat skeptical and cynical about the human weaknesses which interfere with the effective, smooth functioning of the political process. Mexicans, on the other hand, consider politics in idealistic terms as an important ke of the resolution of their individual and social problems, but they are intensely distressed by the actual corruption, injustice, incompetence they see in the world.
- \* Like politics government is viewed by Americans as an institution providing leadership in agreement with the will of the majority. In view of corruption and other defects, Americans express again a benevolent skepticism. Mexicans consider government, also like politics, of great national importance, and again they show strong signs of dissatisfaction and frustration based on its actual performance.
- \* Americans think of political power predominantly in the context of the leading world powers and their competition, although they also express concern with the misuse of power and corruption domestically. Mexicans think of power more in domestic contexts of social relations and politics and express strong concerns with its abuse: exploitation, oppression, injustice, etc.
- \* Democracy represents for Americans again a process which provides for the representation of the will of the majority based on free competition of ideas, parties and candidates.
- \* Compared to most other developing countries Mexicans pay more attention to the democratic process, together with those social values and ideals they would expect democracy to represent. They express again dissatisfaction with its actual working.
- \* While both Americans and Colombians characterize their own country as democratic, Mexicans do so only to a surprisingly limited extent.

#### NATIONAL AND ETHNIC IMAGES FROM MEXICAN AND AMERICAN PERSPECTIVES

- \* Mexicans place heavy emphasis on the power and strength of the United States: military, economic and financial. On the positive side technology, development, and progress show high salience; on the negative side Mexicans are concerned about war, capitalism, exploitation and imperialism. Their references to human and cultural characteristics of Americans are modest, including liberty, intelligence and justice as well as lack of understanding and racism.
- \* The collective image of Americans as perceived by Mexicans shows close agreement with their image of the United States, with heavy emphasis on wealth, money, power and on negative elements of the "capitalism, exploitation, imperialism" syndrome. From the positive human qualities intelligence is followed by ambition, creativity and goodness.
- \* The Mexicans identify the Soviet Union both with communism and socialism. Although they recognize its power and military potential they pay less attention to them, and are less critical of the Soviet Union than they are of the United States. Negative characteristics such as repression and control are balanced by such positive attributes as equality and justice. Development, work and technology show also considerable recognition and salience.
- \* U.S. Americans think of Mexican Americans more in terms of Spanish language and appearance (e.g., dark complexion). Mexicans think of them more as friends and brothers but also as betrayers and traitors, describing them as dependent and indifferent.
- \* The Americans' image of the Cubans is based to a large extent on Cuban immigrants, while the Mexicans' view is shaped mainly by the country of Cuba and its leader Fidel Castro. Mexicans see Cubans as people with dark complexion and positive social attributes: goodness, liberty, equality, freedom and joyfulness.
- \* Interestingly, the Mexicans' image of Puerto Ricans is more uniformly positive and reflects their tendency to focus on the human dimension, especially on attributes of social relevance: good, joyful, sympathetic. Americans think predominantly of Spanish language and customs and products (rice, rum).
- \* While in general Mexicans emphasize mostly positive human and social qualities, their image of Americans is more critical.

#### **GENERAL TRENDS**

The above results, consistent with the findings of our recent report, "World Problems from Mexican and American Perspectives," (Szalay, Vilov, and Strohl, 1985), are conclusive in showing the following general trends.

- a. The data obtained on Mexican and American images and meanings offer new insights into their basic perceptions and evaluations. These emerge as the products of shared background, experiences, beliefs, and frames of reference which are deeply rooted, collectively nurtured, and relatively stable. These are the basic units, the mosaic pieces, by which Mexicans and Americans understand their world, identify their problems, and make decisions. Whether the Mexican image of the United States, for example, corresponds with contemporary realities, or whether their views are objective or biased is beside the point. What matters from the angle of our capability to reach Mexicans and to help them is our familiarity with and sensitivity to their cultural frame of reference, that is, the culturally specific way in which they view and understand their problems.
- b. The perceptual and motivational trends which emerged from the Mexicans' dominant images and meanings identify the main perspectives of their subjective representation of their world. Again, this is the only world they know, the only world through which we can build better mutual understanding and greater cooperation. As long as we ignore the Mexican image of the United States, even the most unselfish programs of foreign aid run the risk of being interpreted as attempts at exploitation and imperialism.
- c. What Mexicans can and cannot do, and what they are predisposed to do or not do, in the economic and social fields is much more deeply and intrinsically determined by their subjective system of representation than is generally recognized. Our data from Korea over a decade ago clearly showed the Koreans' exceptionally strong aspirations for the mobilization of national resources, construction, and development. These motivational dispositions helped build Korea over the last decade into the fastest growing country in the Third World-Similarly, data from our Iranian study clearly showed the strong religious/moral underpinnings of the Iranian way of chinking about politics. Again, these are psycho-cultural dispositions which can explain a great deal about Khomeni's influence and skillful exploitation of Iranian political precepts which are thoroughly mixed with the ideals of Shiite fundamentalism.

The main thrust of future developments in Mexico is likely to be similarly dependent on the dominant perceptual and motivational dispositions of the population. Some of the dominant dispositions have become apparent from the findings of this study.

d. Finally, the data go beyond revealing the dominant perceptual and motivational depositions. A careful analysis of these dispositions can also reveal opportunities for reaching people through meaningful communications and programs. However, such applications are numerous and would go beyond the scope of the present report.

As the results of a recently completed study show (Szalay, Vilov, and Struhl, 1985), in most instances cultural background (e.g., Mexican and American cultural upbringing) is a richer source of differences in views and values than differences in attitudes. Actually, Mexicans with negative attitudes and Mexicans with positive attitudes were found to be more similar in their perceptions of the twelve themes examined than Mexicans and Americans of the same attitudes.

The results suggest that opinion surveys which ignore that the subjects examined may not mean the same thing abroad as they do in the U.S. are bound to make some serious mistakes. It is impossible to avoid such mistakes unless overseas opinion surveys are accompanied by a parallel assessment which can show independently how the public actually understands the specific issues addressed.

Beyond the specific differences identified, the findings show the nature and scope of differences between Mexican and American public perceptions. An awareness of these differences is essential to effectively reaching foreign populations whether it be through international education, economic assistance, or information programs. Effective educational and policy applications of the information presented in this report will naturally require relating and adapting the accumulated information to the specific tasks or programs at hand.

#### CHAPTER 1

#### PSYCHO-CULTURAL FACTORS IN INTERNATIONAL RELATIONS AND EDUCATION

Progress in the physical and technological dimensions of communication has been phenomenal. It is rather common to speak of a communication revolution. This revolution is often spearheaded by U.S. communication technology and the performance of U.S. communication industries.

As the co-author of this report observed in his recent testimony before the Committee on Foreign Relations of the U.S. Senate (Szalay, 1981) this success of the United States in the technological and commercial domains of communications is most impressive; unfortunately, it does not carry over readily into the field of international and intercultural communications as shown, for instance, by such spectacular debacles as have been experienced in the context of Iran.

...Considering its communication technology and communications industries, the United States is undoubtedly the most advanced communicator in the world. There is no doubt that U.S. communications in such domains as journalism, the film industry, commercial advertisement, etc. are most successful. Yet, indepth studies of foreign peoples conducted tyour Institute show that Americans and the United States are broadly misunderstood and misperceived in several critical respects. These severely affect the capability of the United States to lead the world toward a safer and better future. (Szalay, 1981, p. 105)

There are several factors responsible for this situation. Some people claim that the relative neglect of this dimension is rooted in our contemporary system of education. Based on an extensive review of educational resources and performance, the President's Commission on Foreign Language and International Studies (1979) concluded that:

...the increasingly hazardous international military, political and economic environment is making unprecedented demands on America's resources, intellectual capacity and public sensitivity... At a time when the resurgent forces of nationalism and of ethnic and linguistic consciousness so directly affect global realities, the United States requires far more reliable capacities to communicate with its allies, analyze the behavior of potential adversaries, and earn the trust and the sympathies of the uncommitted. Yet, there is a widening gap between these needs and the American competence to understand and deal successfully with other peoples in a world in flux (p. 1).

#### Culture---An Invisible Stumbling Block

Several leading experts commenting on U.S. performance in international communication agree that the critical stumbling block is culture. Probably because of the wealth, size, power, and intensive technological-material orientation of the United States, there seems to be little appreciation for the pervasive fact that people whose background. life conditions, and collective experiences are different from those of mainstream Americans tend to see the world differently; they do not follow the American rationale, the American common sense. Although this is recognized in principle and it receives full moral approval along the J.S. commitment to the ideals of pluralism, psycho-cultural dispositions are largely overlooked in their practical implications, domestic as well as foreign. Much less insistence is given to the probability, or even possibility, that the U.S. can learn from other cultures, that its manifold health and social problems may find proper solution in changes of upbringing and education of its young or in therapies suggested by ways of socializing and education in other cultures.

Cultural anthropologists have done extensive work in studying and describing vast numbers of cultures, focusing primarily on remote tribes, exotic populations, their folkways, artifacts, and life styles. While much of this has become popular reading, E. T. Hall, a noted anthropologist and author of <u>Silent Language</u>, observes that the recognition of culture as a hidden but powerful psychological reality progresses slowly. It is still little understood that culture shapes psychological dispositions, that it influences our own views and behavior as much as it does those of other peoples. As Hall (1959) puts it:

Culture is not an exotic notion studied by a select group of anthropologists in the South Seas. It is a mold in which we are all cast, and it controls our daily lives in many unsuspected ways...many of which are outside our awareness and therefore beyond conscious control of the individual.

Hall (1966), along with many others in his field, underlines the importance of culture in creating these strong dispositions to see and understand the world in particular ways:

People from different cultures not only speak different languages, they inhabit different sensory worlds. Selective screening of sensory data admits some things while filtering out others. This means that experience as it is perceived through one set of culturally patterned sensory screens is quite different from experience perceived through another.

Cultural understanding presents under such conditions a complex and demanding task. As Robert Hanvey (n.d.) observes, the task goes beyond learning group apply or demographic information:

It is one thing to have some knowledge of world conditions. The air is saturated with that kind of information. It is another thing to comprehend and accept the consequences of the basic human capacity for creating unique cultures—with the resultant profound differences in outlook and practice manifested among societies. These differences are widely known at the level of myth, prejudice, and tourist impression. But they are not deeply and truly known—in spite of the well—worn exhortation to "understand others." Such a fundamental acceptance seems to be resisted by powerful forces in the human psychosocial system. Attainment of cross-cultural awareness and empathy at a significant level will require methods that circumvent or otherwise counter those resisting forces.

Although people with a different cultural frame of reference frequently share some of the same concerns about common human problems such as health or education, they often approach them quite differently. Yow a newly implemented program is received by different cultural groups is rarely a matter of its purely objective merits. As numerous examples show, the success of programs requiring people's participation depends greatly on their intangible psycho-cultural dispositions. Whether a program aims at domestic or at overseas culture groups, whether it involves health services, elementary education, drug counseling or job training, its success depends frequently more on people's perceptions of the program than on its actual penerits.

In the practical context of training Americans for overseas assignments Foster (1969) has emphasized the need to acquire a deeper understanding of culture and its influence on human behavior.

The most significant differences are not customs or the more overt characteristics such as dress, forms of greeting, or food, since these are generally readily visible and quickly learned, and since adherence may not be expected of foreigners. Far more significant are the more subtle and commonly shared attitudes, values, assumptions, and styles of thinking that become part of every person as he grows up in his social environment. Because they are so much a part of him, he has little reason to question them or to be conscious of how much they determine his behavior.

<sup>17</sup>25

#### Education for Better Understanding and Performance

According to an American Council on Education report (1975), the lack of cultural awareness and knowledge is both a domestic and an international problem with serious implications:

...the American educational system...is woefully backward in helping to prepare the nation's people for effective coping in a thoroughly interdependent world. Unless this condition changes, America will lack both informed leadership and an active citizenry capable of negotiating the troubled and dangerous waters of the future.

The report of the President's Commission on Foreign Language and International Studies (1979) stated that "the need to inform the American public of the role that other languages and cultures play in our lives has never been more crucial" (p. 47):

...The Commission views as a priority concern the failure of schools and colleges to teach languages so that students can communicate in them....Paralleling our professional language needs, foreign language instruction at any level should be a humanistic pursuit intended to sensitize students to other cultures, to the relativity of values, to appreciation of similarities among peoples and respect for the differences among them (p. 28).

Margaret Mead (1951) placed the problem of culture into global perspectives when she said:

A primary task of mid-twentieth century is the increasing of understanding, understanding of our own culture and of that of other countries. On our capacity to develop new forms of such understanding may well depend the survival of our civilization, which has placed its faith in science and reason but has not yet succeeded in developing a science of human behavior which gives men a decent measure of control over their own fate.

Leading anthropologists such as Margaret Mead (1945) and Edward T. Hall (1959) and psychologists such as George Miller (1967), Charles Osgood (1957), and Roger Brown (1958) have acknowledged that psycho-cultural meanings and intercultural communication constitute a particularly important but evasive field of inquiry which Hall (1959) has cogently labelled the "hidden dimension": "Culture hides more than it reveals, and strangely enough, it hides most effectively from its own participants."

Early conscious of the crucial importance of culture in the development of personality, D'\_-Guerrero, co-author of this report, has in the last twenty years created what amounts to an ethnopsychology of the Mexican. Departing from another subjective dimension that he called the socio-cultural premise (Diaz-Guerrero, 1963), which in time became factorial scales of socio-cultural premises (e.g., Diaz-Guerrero, 1972, 1973), he has shown that scores on those subjective cultural variables related significantly and consistently with personality, cognitive and even social and economic dimensions (Diaz-Guerrero, 1976, 1977, 1980, 1984; Diaz Guerrero and Castillo Vales, 1981).

#### New Insights Through New Data

The present volume, as a result of an in-depth comparative study of Mexican and U.S. American samples of matching sociodemographic composition, aims to promote the recognition of the role of psycho-cultural factors in general and to promote mutual understanding between Mexicans and U.S. Americans in particular. The communication lexicon is designed to serve as a tool of international education and intercultural communication by making the hidden but presented psychological reality of culture accessible, identifiable, and ceachable.

By showing how particular culture groups vary in their perceptions and evaluations of dominant themes and issues the lexicon informs on the subjective perceptual and motivational trends which are characteristically evasive to empirical assessment. By identifying consistent perceptual and motivational trends across broad domains of perceptual-semantic representations, the lexicon informs about the culturally dominant psychological dispositions. It promotes the understanding of culture as a hidden framework of psychological organization which predisposes what people see, how they see it, and what they may do.

By providing parallel findings on the Mexican, Colombian, and U.S. perceptions and meanings, the lexicon offers new and timely insights into the cultural frames of reference of these groups compared on important domains which influence their relationship, rapport, and future interactions.

In the main body of this lexicon (Chapters 3 to 12) we present comparative findings on Mexican, Colombian, and U.S. American images, meanings, and broader perceptual and motivational dispositions which are likely to influence communications and other types of behavior as well as international relations and cooperation. To piece these findings in proper perspective, the next chapter will give a short summary account of the major characteristics of the data, the samples, the approach, and other details relevant to the sarious applied uses of the information.

#### CHAPTER 2

#### SUBJECTIVE IMAGES AND MEANINGS: ASSESSMENT AND USE

In view of the novelty of the information produced by the Associative Group Analysis (AGA) method used in the study reported here, it is of particular importance to examine its origin and the characteristics which bear closely on its utilization. Following a brief description of the method will be a discussion of those characteristics of the information which set it apart from the main sources of knowledge the reader is familiar with. A review of these characteristics offers a natural opportunity to dis use potential contributions and limitations.

#### THE SAMPLES AND DATA COLLECTION

This volume is based on a comparative study of student samples of the same age and educational levels who were tested in Mexico City, Mexico and in the Washington, D.C. area of the United States. Both samples included 100 students with an equal number of males and females. The majority of the U.S. samples were undergraduates from a broad variety of fields of study at the University of Maryland. The majority of the Mexican sample were also undergraduates from a variety of major fields of study at the National University of Mexico in Mexico City. As previously mentioned, a comparable sample of Colombian students from the University Javeriana in Bogota, Colombia were also used in this comparison.

There are, of course, wide regional, social class, and ethnic variations both among people in the United States and in Mexico. A hundred students tested in the capital cities cannot be considered statistically representative of the entire population. In which particular ways the sampling is likely to affect the generalizability of the findings will be addressed later. It is important to recognize that our focus is on how the groups view and understand a particular issue, and on the scope and nature of intercultural variations in their perceptual and notivational dispositions. (The amount of intracultural variation within the United States has been explored by several of our past studies; the amount of intracultural variation within Mexico, between students, urban industrial workers, and rural workers, will be presented in our next report which is now under preparation).

The data collection was organized in Mexico by Dr. Rogelio Diaz-Guerrero from the National University of Mexi a. in Colombia by Professor Eloise Vasco and Professor Antoine Kattah, and in the United

States by Lorand B. Szalay, project director. The first phase of the data collection involved the selection of stimulus themes that would represent the highest priority domains and themes for both cultures. In the second phase the administration of the Associative Group Analysis using 120 selected stimulus themes to the U.S., Mexican and Colombian samples produced the data presented in this volume.

THE METHOD: ASSOCIATIVE GROUP ANALYSIS

The Associative Group Analysis (AGA) is a nondirective analytic technique developed for empirically assessing dominant perceptual and motivational trends characteristic of groups of different social and cultural backgrounds. It relies on the analysis of thousands of spontaneous free associations produced by medium sized samples (N=100) to systematically selected stimulus themes in unstructured multiple response tasks. This special use of word associations follows the theoretical orientation initiated by the pioneering work of Noble (1952) and Deese (1962). As described in the monograph Subjective Meaning and Culture (Szalay and Deese, 1978), the Associative Group Analysis reconstructs the subjective images and meanings of selected themes (e.g., United States) as seen by a particular social or cultural group from the distribution of their free associations. AGA has been extensively tested and used in a variety of investigations over the last twenty years (see list of publications in Appendix II).

In agreement with the theoretical position of Charles Osgood (1957), images and meanings are conceived as "multicomponential." In simple language we may say that an individual's mental image of the UNITED STATES goes beyond its lexical denotation or referent (i.e., a country of 240 million inhabitants occupying the central part of the North American Continent); it includes other important elements such as form of government, level of wealth, power and development and other subjective reactions which vary from person to person or from group to group and which generally elude logical inquiry. A Mexican and an American will have different psychological images of the United States based on their different experiences and cultural frames of reference.

In a pre-test the U.S. American and Mexican students were instructed to list 15 important domains of life and then to write as many associative responses as possible to each of the items on their lists. The tasks were performed in Spanish by the Mexican students and in English by the U.S. American students. The high frequency responses from each group served as the basis for selecting the 120 stimulus themes used in the main data collection phase.

<u>Elicitation of Spontaneous, Free Reactions</u>. Free associations are elicited from the selected samples usually in group sessions. The task is administered in the respondent's native language. Each respondent receives a pile of randomly sorted cards each of which contains a word

theme (e.g., United States) listed several times and followed by blank lines. In the free association task the respondents are given one minute to respond to each particular theme with as many related ideas or issues as they can think of. The association task produces a large quantity of responses; on the average, six to seven associations were produced by the subjects to each stimulus word. Scores were assigned to these associations on the basis of frequency and rank in the individual response sequence. As shown in Figure 2.1 the respondents' numerous reactions are tallied into group response lists.

#### UNITED STATES

Formation of Group Response Lists from Individual Associations

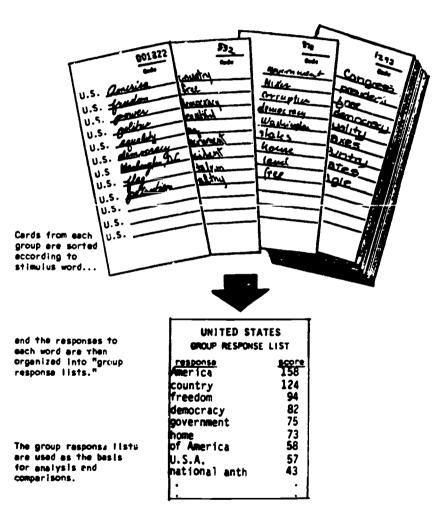

Figure 2.1 Response cards and group response lists.

The responses obtained from U.S., Mexican, and Colombian student groups to the stimulus theme "United States" reveal some significant similarities as well as differences, none of which are accidental or ephemeral. As illustrated by the group response lists shown in Table 2.1, the top few responses indicate agreements on the United States being a country, with each group stressing different attributes: the Americans emphasize freedom and democracy, the Mexicans stress power and capitalism, and the Colombians place emphasis on power and development. The lengthy response lists provide a rather exhaustive inventory of mosaic elements which make up each group's image f a particular theme.

| wealth         | 22         | big, large           | 23         | blonde                 | 28         |
| president      | 20         | good                 | 20         | help                   | 28         |
| rich, es       | 19         | destruction          | 17         | capitalism             | 28         |
| army           | 19         | advance              | _17        | vankees                | _27_       |

These are not just accidental, volatile ideas, but as extensive studies conducted on this subject have demonstrated, they inform on stable and representative elements of the groups' subjective views. In the group response lists each response is accompanied by a response score which indicates how important, or how salient this mosaic element is in the group's image of the United States. These reveal some highly subjective perceptions and evaluations of the United States as seen by each group. In their totality, the distribution of all the responses obtained to a particular theme or issue offer for each group a detailed and faithful description not only of what is salient in people's minds but also of what is not. These rather lengthy response lists are

particularly informative in revealing what a particular group feels is important, what they pay attention to, what they feel sensitive about, and what they are collectively predisposed to overlook and ignore.

Since the number and diversity of responses make a quick identification of the dominant response trends difficult, several analytic procedures have been developed to extract the relevant information and to reconstruct each group's subjective views, beliefs, and main dimensions of their cultural frame of reference. Some of these analyses involve measurements along dimensions (e.g. psycho-cultural distance) on which empirical measures are otherwise unavailable. The main types of analysis used with the AGA method are described in more detail in Appendix II.

Identification of Salient Perceptions and Evaluations. The analytic method most widely used in the present research involves a content analysis which serves to identify the most salient perceptual and evaluative components of the group's subjective meaning or image. This process is carried out by analysts representing the groups compared they are instructed to consider all the responses produced to a particular theme and to place them into relevant main clusters or content categories (see Appendix II, pp. 5-7).

Figure 2.2 presents a few of the main clusters of responses the analysts identified in grouping all the responses obtained to United States. References to freedom, justice, liberty, for example, were placed together in a cluster. Another cluster of responses involved characteristics like power and big. Generally the highest scoring responses are used to label each cluster. The total scores accumulated by the responses in each category indicates the level of subjective attention or salience given to that component by the groups compared.

|   |            |          |    |   | important       | importante |    | 10       | 5                             |                         |     |     |     |
|   |            |          |    |   | help            | avuda      | 4  | •        | 2ě                            |                         |     |     |     |

For example, the total scores for responses in the cluster labelled "Progress, Development" indicate that the Mexicans and Colombians place a great deal of emphasis on these factors in their image of the United States while they hardly occur to the Americans. The responses dealing with power, potency, size and strength show how much attention each group pays to the might of the United States. It would be difficult if not impossible to obtain these insights through traditional surveys; as for some of these characteristics, it would even be strange to ask questions. This is particularly true about plychologically deeper issues involving identification, complexes, and national sensitivities.

As these examples illustrate, the response distributions tell us in detail and in the respondents' own terms what is salient in their subjective images and how they construe realities in their own frequently highly subjective ways. The reader interested in a detailed description can review the specific reactions. The reader who wants to get a general idea of the perceptual and attitudinal composition of the groups' subjective images and meanings may use the summary percentage tables like the one shown below in Table 2.2.

Table 2.2

As elaborated in more detail in Appendix II, the content analysis performed on the lengthy response lists does entail some subjective decisions. This occurs in grouping the clusters of related responses in such a way that the reader can receive a simple summary representation of a rich and complex composite of perceptual and evaluative elements. Naturally, each attempt at simplification entails dangers of misrepresentation and distortion. For this reason the reader with deeper and more specialized interest is encouraged to review the actual responser rather than to rely merely on the clusters identified through the content analysis.

To convey the results of this analysis (as presented in Table 2.2) in a simple visual form, we use "semantographs" (as illustrated in Figure 2.3). The semantograph is a graphical presentation showing the differential salience of the main perceptual and evaluative components of the groups' subjective image. Each bar represents a different main component; the length of the bar is proportionate with the measured salience of that component for the groups compared. The hard contoured bar shows the American salience, the shaded bar the Mexican salience, and the overlapping portion conveys their relative agreement. The semantograph is used to convey a global composite through a simple visual presentation.

Figure 2.3

The Semantograph

#### UNITED STATES

Perceptions and Evaluations

- by Americans - by Mexicans

The semantographs offer a simple graphical representation of the relative salience of the main components by using bars in a circular arrangement. This visual presentation helps in comparing the two culture groups by giving a quick summary impression of how the two culture groups compare in their perceptions. The bars with the greater amount of overlap indicate elements of meaning on which there is close agreement. Conversely, the bars with substantial differences in length indicate components on which the two culture groups differ in their perceptions.

The semantographs are used to convey to the reader how the U.S. and other culture groups compare on the dominant components of perception and evaluation of the selected themes. The reader may then turn to the descriptive text which summarizes the main similarities and differences in their perceptions. The data underlying these discussions are usually presented in an appendix (Appendix I). The reader interested in some particular detail then may refer to the app ndix to see the specific responses given by each group. In some instances the salience of a particular component may appear to be about equal for the two groups in the semantograph but the detailed response lists often reveal clear group differences within the component. In the analysis of the cultural frames of reference we focus on patterns and trends which emerge with consistency across related issues and themes.

Assessment of Subjective Importance or Dominance. From a practical psychological angle there is an important difference between issues and subjects which are dominant in people's minds to such an extent that they are likely to influence their choices and actions on the one hand, and those issues and ideas which they do not really care about. In other words, it is important to know what has high priority and subjective importance to other people. The themes having high subjective importance are identified by using a well established theme selection procedure described in <u>Current anthropology</u> (Szalay and Maday, 1973). Independently from this procedure the dominance scores show the relative importance of selected themes to the groups compared.

A measure specifically focused on the subjective importance of the themes studied is the "dominance score," which is based on the relative total number of associations. The dominance score takes advantage of a well established potential of word associations (Noble, 1952) to reveal how meaningful or subjectively important a theme is to a particular group by the number of responses produced within a certain time (e.g., one minute). As previous studies have shown, the number of reactions is a valid measure of the importance of a particular theme to a particular group. Its calculation is discussed in Appendix II and the numerical values are shown in Appendix I.

Appendix II also includes a discussion of other measures useful in reconstructing the organization and important parameters of the perceptual/motivational system of a particular group as well as in measuring

distance in meaning among groups. It also contains reliability and validity data on the different measures, a discussion of findings from various domestic and overseas studies, and a list of publications reporting on AGA-based analytic findings. Research based on the AGA method has been published in monographs and professional journals representing several social and behavioral science disciplines (e.g., Journal of Personality and Social Psychology, Journal of Communication, American Political Science Review, American Anthropologist).

Psychocultural Distance tetween Populations. Scientists and philosophers alike have been intrigued for quite some time by the question just how similar or different are the views of people of different cultural backgrounds. Since these views are highly subjective and private, their similarities and differences appeared unmeasurable.

The group response lists to specific themes (e.g., United States), offer an opportunity to assess the extent these groups agree or disagree in their subjective image of that theme. One measure useful in expressing the similarity of response distributions is the coefficient of psychocultural similarity or distance (described in detail in the Appendix II). This measure relies on Pearson's product-moment correlation and is based on the assumption that the more two groups agree in producing the same high frequency responses and in producing the same low frequency responses, the more similar are their subjective images of a particular theme. Therefore, the larger the similarity coefficient, the greater the similarity between two groups; and similarly, the smaller the similarity coefficient, the greater the psychocultural distance between two groups.

The following distance measures were produced by adopting this measure and applying it to five ethnic/cultural samples, three from the United States (Anglo Americans, Black Americans, and Hispanic Americans) and two from Latin/South America (Mexicans and Colombians). The two additional U.S. samples (Black Americans and Hispanic Americans) were included here to provide a broader basis for the comparison.

Table 2.3

# Cultural Images of the **United States**Distances Between Five Ethnic/National Samples

|                    |   |   |   |   |    |   | Americ<br>Blacks Hisp |   |   |    |   |   | Amer |     |     |
|--------------------|---|---|---|---|----|---|-----------------------|---|---|----|---|---|------|-----|-----|
| Anglo Americans    |   |   |   |   |    |   | <b>.8</b> 8           |   |   | .7 | 1 |   |      | .28 | .52 |
| Black Americans    | • | • | • | • | t, | • |                       | • | • | .6 | 5 |   |      | .30 | .43 |
| Hispanic Americans |   |   |   |   |    |   |                       |   |   |    |   |   |      |     | .66 |
| Mexicans           | • | • | • | • | •  | • |                       | • | • | •  |   | • | •    |     | 71  |

As the above similarity coefficients indicate, Anglo Americans and Black Americans show the greatest degree of similarity in their subjective image of the United States (.88). The Mexican and Colombian groups also show a great deal of similarity in their image of the U.S. (.71). The greatest amount of psychocultural distance exists between the Anglo American group and the Mexican group, as indicated by the low similarity coefficient (.29).

As discussed in more detail in Appendix II, this distance measure which is applied here to a single word, can also be applied to broad semantic domains as well as to the entire cultural frame of reference by using a large number of systematically selected themes which include the dominant cultural priorities of the samples compared. Such a strategy has been described in articles in <u>Current Anthropology</u> and <u>American Anthropologist</u>.

The extension of quantification in the domain of psychocultural distance has several important implications, one of which involves the opportunity to provide empirical results on questions related to the generalizability of findings obtained by the AGA method on various cultural samples. Another particularly important application of this measure is to provide empirical results showing the importance of cultural background in shaping images a meanings, compared to demographic variables such as sex, age, etc.

MAIN CATEGORIES OF FINDINGS RELEVANT TO INTERCULTURAL UNDERSTANDING AND EFFECTIVE COMMUNICATION

The information included in this volume has been organized to help U.S. Americans understand Mexicans and to help Mexicans understand U.S. Americans in the various contexts of their interactions. The Lexicon provides information along three dimensions relevant to communication.

What is important. It needs little documentation that the attention a particular message receives will depend essentially on the communicator's ability to relate to the main interests and expectations of his audience. In other words, it is important to know what has high priority and subjective importance to other people. It is apparent from the findings of the present study that Mexicans do have different concerns and expectations than U.S. Americans. The themes having high subjective importance are identified by using a well established theme selection procedure described in Current Anthropology (Szalay and Maday, 1973). Independently from this procedure the dominance scores show the relative importance of selected themes to the groups compared (see Appendix I). In the present context the dominance scores, or total scores, show the subjective importance given by the groups to the themes studied; they provide insights into subjective priorities which the group itself might not estimate correctly if directly questioned.

How Is It Understood. A second key to effective communication is the speaker's ability to relate to the dominant concerns of others in a way which makes good sense to them. When the communicator discusses a particular subject with such different groups of people as Mexicans and Americans, the effectiveness of his communication will depend critically on familiarity with his audience's subjective meanings and with his ability to adapt to those meanings. The information presented in the following chapters regarding selected key communication themes will help one to recognize the important ways in which the subjective meanings of Mexicans and U.S. Americans differ. Components which show higher salience for the U.S. Americans than for Mexicans would be given greater accention by Americans, but less by people in Mexico. The potential of the communicator to promote mutual understanding depends on his ability to use the priorities and meanings of a particular group as the realistic point of departure.

Earlier studies (Szalay, Lysne, and Bryson, 1972) have shown that associative data reflecting salient cultural perceptions and dispositions of a particular group can be used to produce effective and meaningful communication. The principle for using this information on culturally salient perceptual and attitudinal components is simple. The more we capitalize on components that are salient for that particular group, the greater is the chance of producing communications which are relevant to members of that group.

How is It Integrated Into People's Frame of Reference. The cultural data presented in the following chapters reveal broad general characteristics of the cultural frame of reference. These characteristics emerge from consistent trends observed across themes and reflect shared psychocultural dispositions frequently labelled culture traits. Such traits have particular importance in communications as well as in interpersonal relations.

The consistency observed in the salience of certain perceptual and attitudinal components shows that cultural meanings are not discrete, independent entities. They are actually mosaic elements of a representation system influenced by the shared experiences of the cultural collective. These perspectives and priorities set dominant patterns by which people organize their life experiences and cope with their external world. These perspectives have their own intrinsic logic or rationale. Once they have been incorporated into people's subjective view of the world, they exert continuous control over their choices and behavior without their conscious awareness. Since these trends and patterns are the products of the same internal logic and perspectives, once they have been identified, it is not difficult to observe them without being engulfed in endless details.

THREE MAIN AREAS OF APPLICATION: POTENTIAL CONTRIBUTIONS AND LIMITATIONS

To put the Communication Lexicon to effective use the user must be aware of its potential and natural limitations. Since the information is new, it is particularly desirable to understand in what important ways it differs from conventional resources with which the reader is familiar, such as traditional bilingual dictionaries, foreign area guides and handbooks, and survey research.

### 1. Language Instruction: Emphasis on Communication

A convenient form of presentation of this new information, for use in language instruction, is the "communication lexicon". By using the word "lexicon," probably the first question to address is how it differs from the dictionaries and lexica presently being used in language training.

The most important difference is that our "communication lexicons" describe different types of meanings. Conventional dictionaries focus on the denotative meanings or lexical meanings; the communication lexicon focuses on the subjective psychological meanings of the words we use to communicate. Linguists and lexicographers tend to dismiss subjective meanings as irrelevant to their discipline. Yet, from the angle of effective communication the role of psychological meanings is important. Communications which do not take subjective meanings into consideration have a lesser chance of being understood.

The content of the present volume is a rich source of information on the subjective meanings of the U.S. and Mexican groups studied. The scope and nature of the differences are helpful in understanding the deep foundation of cultural meanings, the culturally shared subjective perspectives which influence our views and priorities without our conscious awareness.

The traditional bilingual dictionaries show which Spanish word corresponds to which English word on the basis of having the same referent. Such English and Spanish word pairs are treated then as identical in meaning. By showing that words which are considered to be translation equivalent frequently have different subjective meanings, the Communication Lexicon introduces valuable new information into the field of language instruction. Although language teachers are generally aware of these differences, they lack systematic, up-to-date information.

The report of the U.S. Presidential Commission on language and area studies places heavy emphasis on the need for better understanding and better communication. While these new data are recognized for their potential in this respect, their broader use requires new textbooks and curriculum to integrate this information into the language teaching process.

## 2. Foreign Area Studies: Emphasis on Psycho-cultural Population Characteristics

"Foreign area studies"\* provide a detailed description of a particular country's climate, geography, history, religions, economic conditions, social stratification, political organization, etc. Compared to the abundance of top quality information in these concrete areas of life, information on the relevant psycho-culturalcharacteristics of the population is frequently scarce, stereotypical, and biased. The somewhat uncertain status of information on humar population characteristics in the field of foreign area studies is due largely to the hidden psychological nature of these human dispositions and their evasiveness to direct observation and empirical assessment. foreign area specialists have a professional background in a specific scientific field or discipline and they prefer to deal with directly observable hard facts. Few of them would question that international relations and effective communication depend heavily on certain deeply ingrained dispositions of particular groups, their cultural bac experiences, shared beliefs, etc. Yet, as important as these dispositions may be, there is a natural tendency to avoid them, at least as long as the information available is predominantly speculative and unverifiable.

The present approach to map cultural meanings and compare psychocultural dispositions may help to improve on this situation. Indeed, it becomes eminently apparent from this volume how frequently Americans, Mexicans, and Colombians diverge in their perceptions of certain realities, how they differ in their perceptions of themselves and others, in their perceptions of politics, economics, etc. The systematic nature and the consistency of the observed trends helps us to realize that in most instances, cultural meanings depend little on purely lexical linguistic variables, but reflect predominantly the group's deep seated perceptual and motivational dispositions. The results also reveal the naivete of the bias which assumes that our perceptions are try compared to the "misperceptions" of others. The purpose of this new information is not to decide whose perceptions are accurate or distorted. The main purpose is to provide new insights and information about these "invisible" perceptual dispositions as they are shared within a particular culture and as they frequently separate people of different cultural background. What underscores the importance of the information on perceptual and motivational dispositions is their potential to interfere with our capability to deal with the concrete facts and realities of life, including those about ourselves and others.

<sup>\*</sup>An outstanding example of this type of resource is the area handbooks produced by the Foreign Area Studies organization of the American University in Washington, D.C.

### 3. Survey Research: Emphasis on an In-Depth Analysis

A third major field of application of this information is in policy research. The most important source of policy information is opinion research. Opinion research is interested in people's attitudes and opinions on such political issues as the president's treatment of the Middle East crisis, the legalization of abortion or the use of marijuana. The percentage of the population in agreement, in disagreement, or undecided on a particular issue is the focus of interest. On issues like the popularity of the president, the capability of the polls to trace the changing mood of the people with accuracy is the main contribution rather than to do an in-depth analysis of their views or broader belief systems.

Just about the opposite is true about the AGA-based assessments. This approach does not ask narrowly focused questions or elicit rational judgments or opinion statements. Our primary interest is in the main perceptual and motivational trends which predispose people to approach complex social and political realities in certain predetermined ways. These tendencies are deep and relatively enduring and therefore do not require monthly tracking but a rather infrequent in-depth assessment.

Structured opinion surveys focused on single issues chosen along the investigator's priorities or interests call for personal judg ents (i.e., do you agree with..., do you approve of...). The unstructured AGA method seeks to reconstruct people's belief system or subjective representation of their world along their dominant priorities and natural parameters of organization. The main focus here is on how people are predisposed to view a particular subject by providing ample opportunity for people's natural perspectives to energe.

As these differences suggest, the two approaches are complementary in nature. This complementary relationship has several practical implications. While opinion surveys have their classical stretch in providing sensitive tools for tracing the changing mood of peace by calling on their judgment, the AGA approach offers new opportunities for the in-depth analysis of subjective meanings and beliefs along parameters of which people are themselves frequently unaware. Opinion surveys are quick, straightforward and economical in domestic applications where the main alternatives of people's opinions are well known, and the main question then is to determine the actual distribution.

Experts on overseas surveys are well aware of the problem that people in different countries have different meanings of the key notions involved. Our findings have shown, for instance, that socialism denotes to some a democratic system with strong social legislation such as represented by Sweden or England; in other countries socialism is by and large synonymous with communism, the system of the Soviet Union or the People's Republic of China. Survey questions which ignore these differences in meanings are naturally bound to produce distorted results.

#### GENERALIZABILITY OF THE FINDINGS

In survey research the generalizability of the results depends on the use of statistically representative samples. Since psycho-cultural characteristics are more widely shared and more evenly distributed throughout the population, their representative sampling poses less stringent requirements. In a culture character zed by strong sex role differentiation, for example, it is not necessary to go through the demanding task of statistically representative sampling of the entire population to arrive at the culturally characteristic male role model or family organization. This does not mean that there are no individual or class variations, but in an inter-cultural comparison these variations are only of secondary importance. To control them it is helpful to use a strategy of matching samples, that is, to compare samples of similar socio-demographic composition: samples of the same age and sex composition, educational level, etc. In this way we are eliminating differences which could be attributable to the most important socio-demographic variables and approximate a situation in which the critical difference between the groups is cultural background. The differences found between such samples can be safely attributed then to culture.

This approach of concentration on cultural differences between culture groups of matching socio-demographic composition naturally does not deny the importance of differences within subcultures, social strata, age groups, etc. In the context of the present Lexicon it is important to recognize the considerable intracultural, intrasocietal diversity not only within the United States but also in Mexico and Colombia where there are large social and economic class differences, sharp rural-urban and regional differences in life conditions. Frequently, populations contain groups of thoroughly different cultural background like the Indians. Where funding permits, several groups are used from major population strata, e.g., college students, farmers, urban workers, etc. When the financial situation permits the use of only one pair of matching samples, as in the case of the present study, we consider this merely the first critical step in approaching a complex situation. Indeed, in our studies of several other countries, e.g., Korea and Jordan, our first comparative bicultural comparisons have been followed up by scholars from these countries who were interested in extending the comparison to several additional domestic sub-populations.

Based on the results of these intrasocietal comparisons, our present strategy of focusing first on the intercultural comparison and considering the intracultural differences as somewhat secondary at this point seems to be well justified. In all instances examined up to this point, the psycho-cultural differences within a particular national/cultural sample (e.g., between low and high income groups) were found to be substantially smaller than the differences between two comparable cultural samples (e.g., Hispanic Americans and Anglo Americans) (Szalay et al., 1976). Similar results were obtained in a larger cross-cultural study of American and Korean students, workers, and farmers (Szalay and

Maday, 1983) and on Anglo, Hispanic, and Latin Americans (Szalay and Diaz-Guerrero, 1984).

The findings of these studies consistently show that psychocultural variables, such as perceptions, meanings, and value orientations, are distinctly larger than the intrasccietal/intracultural Our previous work using matching Anglo and Hispanic American samples and a recent in-depth study of several Puerto Rican, Cuban, and Mexican American samples allow to place the findings on cultural differences into proper perspectives. As the distance data presented in Figure 2.4 show, the level of income is a source of lesser perceptual/motivational difference than the cultural background, e.g., being Anglo American or Puerto Rican (Szalay et al., 1982). results of our comparative study, obtained across a broad variety of Hispanic and Anglo American culture groups, support the rationale of this approach. Figure 2.5 presents distance data on a broad variety of Hispania/Latin American and Anglo American culture groups. As these findings demonstrate, cultural background (including the effects of acculturation) was found to be the single most critical factor responsible for perceptual/motivational distance and variation. The distances between the Anglo Americans and the Hispanic/Latin American cultures (e.g., Mexicans and Colombians) are particularly wide. The distances of the various domestic Hispanic American groups (e.g., Cubans, Puerto Ricans, Mexican Americans) show a gradual decrease due clearly to their progressive acculturation to the U.S. American culture (Szalay and Diaz-Guerrero, 1984).

The results presented in Figures 2.4 and 2.5 come from three comparative studies. The comparative study of Hispanic Americans within the United States was sponsored by the National Institute of Mental This study included seven samples (N=100): Mexican Americans from Los Angeles and from El Paso, Puerto Ricans from New York and from San Juan, Cubans from Miami, and Anglo Americans from New York and from Los Angeles. These groups were drawn from users of the social and educational services of mental health centers (n=25) and their friends and relatives (n=75) selected to match in sex and age distribution (50 males and 50 females; 50 between the ages of 16 and 26, 50 between 26 and 50), income level, etc. The comparisons using the Colombians and the Mexicans involve the samples discussed in the present lexicon. The extensive empirical data emerging from several broad national and international comparisons suggest that instead of statistical represertativeness, more attention should be paid to cultural representativeness.

In a statistical sense it is legitimate to reason that none of these groups is representative. Neither the Mexican sample is representative of Mexico nor the Colombian sample is representative of Colombia. Yet, as shown throughout this entire volume, their huge distances from the U.S. Americans contrasted with their generally striking similarities demonstrate that by using cultural samples of

| Variables and Groups Compared |  | Distances Measured |    |          |    |    |       |    |  |
|-------------------------------|--|--------------------|----|----------|----|----|-------|----|--|
|                               |  | 5                  | 16 | 15       | 70 | 25 | 30    | 35 |  |
| Income                        | Anglo High  Mex.An. High  Puerto Rican High  |                    |    |          |    |    | ,<br> |    | Anglo Low .07 Mex.Am. Low .12 Puerto Rican Low .15   |
| Culture                       | Anglo Low  Mex.An. Low  Anglo Low  Anglo High  Mex.An. High  Anglo High            |                    |    | <b>→</b> |    | •  |       |    | Mex.Am. The distances are calculated by usin, Pearson's product moment correlation (r) bused on ca. 20,000 pairs of observations made in the context of a total of 120 stimulus themes used in the representation of ten domains. The results are based on mean coefficients calculated by using 2 transformation.

which was found to vary around the value of 1

comparable socioeconomic background, a great deal of generalizable cultural insights can be obtained. Unfortunately, these special requirements of cultural comparisons have frequently been ignored in the past; there is a tendency to over emphasize the requirements of statistical representativeness by those who lack the understanding of the very nature of cultural differences.

While the Mexicans are not statistically representative of Hispanics, they can be considered culturally representative. Indeed, as the numerous details on Mexican perceptual and semantic dispositions indicate, the Mexicans show similar trends and patterns to those observed with the Puerto Ricans and Mexican Americans. The major distinction is that compared to the Hispanic groups living in the United States, the Mexicans exhibit more distinct, more articulate cultural trends. This may be seen as an asset in an educational context where the clarity of trends and patterns offers didactic advantages.

The more empirical data become available, the more it will be possible to move simultaneously in two seemingly opposite directions—to enhance knowledge on important specifics (e.g., on particular populations, on psycho-cultural dispositions) and to develop a better grasp of such general issues as "how much we share, how much we differ culturally" (Szalay, 1982).

#### CHAPTER 3

### FAMILY, SELF

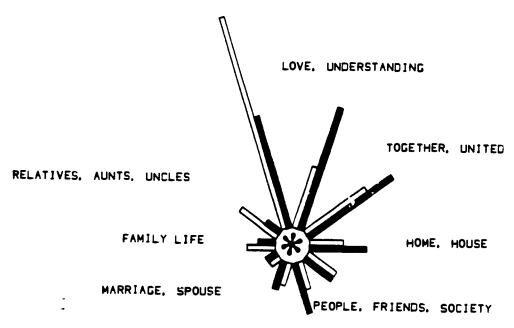

The literature on the Hispanic/Latin American family is rich, and the main sources of available information range from anthropology to cross-cultural psychology. The psychological effects of the family environment on the development of the various personality characteristics or culture traits constitute a particularly complex and delicate subject area since it involves human attributes like individualism or submissiveness which are difficult to measure and which have often been used to reinforce shallow, ethnocentric stereotypes. Based on the literature on comparative Mexican and American cultural dispositions, the following dimensions are of special interest:

- a. Competitive vs. affiliative approach to interpersonal relations. The pioneering studies conducted with Mexican and American children by Kagan and Madsen (1971), Diaz-Guerrero (1973), Holtzman, Diaz-Guerrero, and Swartz (1975), Diaz-Guerrero and Holtz (1980), and Diaz-Guerrero (1982) have shown significant and consist. differences between the competitive orientation of American children and the stronger affiliation, social harmony orientation of Mexican children.
- b. Active vs. passive croing style. Literature on the Hispanic/Latin American family indicates that Hispanic parents stress parenta? authority, respect, obedience, affective interdependence and discipline in their children, while American parents tend to stress independence, detachment and personal initiative (Heller, 1966; Diaz-Guerrero, 1955, 1967; Ramirez, 1976; Szapocznik, 1978). These differences are frequently interpreted as the roots for developing a rore active coping style by Americans and a more passive, fatalistic approach toward problems by Mexicans.
- c. Individualism vs. social personalism. The comparative studies conducted with various Hispanic/Latin American and U.S. American population samples in the United States, in Colombia, and in Mexico by Szalay and his associates (Szalay, Ruiz, Bryson, Lopez, and Turbyville, 1978; Szalay, Diaz-Royo, Miranda, Yudin, and Brena, 1983; Szalay, Vasco, and Brena, 1983) converged on the conclusion that the diverse psychologically relevant dimensions such as competitive vs. affiliative orientation, active vs. passive coping styles, independence vs. social interdependence may have a common root in an inner-directed individualistic orientation as characteristic of Americans and a personalistic social orientation as characteristic of Hispanic/Latin Americans.

The following comparative analysis of Mexican and American images and meanings aims to identify dominant trends in perceptions and evaluations in the domain of Family and Self as they bear on the main dimensions of American and Mexican psycho-cultural dispositions prevalually identified.

#### FAMILY/FAMILIA

The U.S. Americans think of family predominantly in terms of such key roles as mother, father, brothers, sisters, and a variety of other To the Mexicans the roles involving the parent-child relationship are also important but are less salient. This is also true about the other relatives. The explicit attention given to female roles is relatively low, but this is due mainly to the language. In Spanish a masculine noun in plural can indicate both "male" and a group of males and females. The fact that the Mexicans and Colombians do not mention sisters (hermanas) shows that here the term hermanos is used in its more generic sense. When seen in this perspective, an interesting trend emerges. Americans tend to identify the individuals in a specific role---father, mother, sister, brother, etc.---whereas Mexicans focus on generic roles---e.g., padres (parents); hijos ("sons" and also "children"); hermanos (siblings), etc. Compared to the collateral ties, in the Mexican view of family the vertical ones, particularly the parent-child (padre-hijo) relationship, shows distinct dominance. The Mexicans place particularly heavy emphasis on affective ties such as love (amor) and understanding (comprension), conveying a strong preoccupation with interpersonal rapport.

All three groups emphasize the cohesive character of the family, but the Hispanic focus is stronger than the American. Americans think mainly of "togetherness" in the sense of individual people living together. The Mexicans spoke primarily of union (union) and unity (unidad), which to them suggests a closer bond, a certain subordination of the individual's priorities and interests to those of the group---in this case, the family. In a study reported by Diaz-Guerrero (1967, p. 198-199), the following forced choice item was administered to 300 college students in Mexico and in the United States: a) One should protest when the rights of the family are threatened; b) One should protest when the rights of the individual are threatened. Only around 20% of the Anglo American subjects chose to protest when the rights of the family were threatened contrasting with 65% of the Mexican subjects. The Mexicans are similar to other traditional cultures in their tendency to view family in relation to society and community.

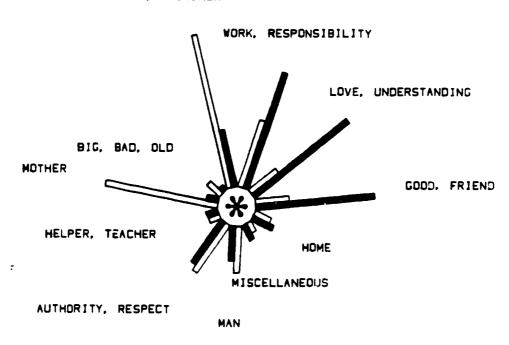

In an individually applied paired comparison study Diaz-Guerrero (1967) found that above and beyond social class 153 Mexican fathers selected as top motivations for working: "I work to sustain my family" and "I work to give my children an education." Of the ten different motivations the one in 9th place, "I work to show my personal abilities," was only selected over "I work because there is no other alternative."

From the Americans' perspective family life as the source of affective ties and personal satisfaction deserves special recognition. Its importance is underscored by the psychological needs of the individual seeking meaningful and emotionally satisfying rapport in a social environment which is mobile and largely impersonal. A comparison of the Mexicans with the Colombians shows remarkably close similarities in their images of family.

## FATHER

### FAMILY, CHILDREN

## Perceptions and Evaluations - by Americans - by Maxicans

For more information please turn to Appendix I, page 2.

#### FATHER/PADRE

Americans view the role of father as most saliently interconnected with the mother; in the case of the Mexicans, the roles, particularly the collateral ones (husband-wife) have lesser salience. The most attention is given to the human characteristics of the father. (amor) and understanding (comprension) are more strongly attributed to father by both Mexicans and Colombians than by Americans. The Mexicans and the Colombians also stress the father's role as friend (amigo) and companion (companers) and emphasize his good (bueno), affectionate (carino), and responsible (responsable) character. While these qualities differ from the Hispanic "macho" stereotype, Mexicans do stress somewhat more authority (autoridad) and respect (respeto) and characterize father as both chief (jefe) and superior (superior). It is interesting to observe that the rather heavy Mexican emphasis on authority and respect does not preclude even heavier references to friend, companion, and other similar qualities which would appear incomparible with subordination. Americans, on the other hand, pay more explicit attention to the sexual identity of father as "man" and "male."

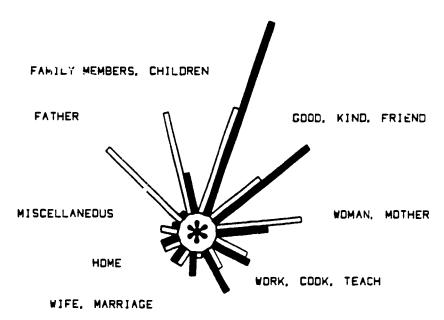

Mexicans also pay more attention to the role of father as a worker (trabajo) and as a provider or source of support (apoyo), although the father's activities involving work, earning money, protecting and carrying responsibilities are recognized by all groups.

Colombians agree in most respects with the Mexicans in their image of father. One small difference is that the Colombians make more references to God and priests, which may be explained by the fact that Colombians are strongly Catholic (the same in Mexico). Since a part of our Colombian sample came from a Jesuit University, it is questionable whether the same differences would have emerged if they had been from a secular school. The Mexicans, however, do not show this trend probably due to their more secular orientation. Mexican history after all includes the separation of Church and State by Benito Juarez and among other things, the anticlerical Mexican Revolution of 1910.

## MOTHER

LOVE, UNDERSTANDING

SACRIFICE, FROTECTION

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 3.

### MOTHER/MADRE

The primary American concern, far surpassing all others, is with the roles of the other family members. Their attention is fixed mainly on the relationship of mother and father; the father-mother axis has emerged consistently in our comparative cultural studies as the pivotal relationship which provides the foundation of the American family. Emphasis on this relationship follows naturally from the American cultural practice by which people marry if they love each other, regardless of other social considerations, and readily divorce when the love-based ties cease to exist.

Mexicans view mother first and foremost as a source of love and understanding. Like people in most other traditional cultures, they stress the mother's relationship with the children rather than with the father or husband. This suggests that their heavy references to love and understanding bear predominantly on the affective ties between mother and children. This finding is consistent with the observation that Mexicans also stress the mother's role of helping (ayuda), protection (proteccion), and sacrifice (sacrificio). Her most salient personality characteristics are her goodness (buena, bondadosa) and tenderness (ternura). Mexicans also mention her beauty (bella, linda). These results are strongly supported by the Diaz-Guerrero et al. study (1979) on alienation from the mother in Mexico which found that when the mother fails, Mexicans appear strongly predisposed to all types of psychopathology including delinquency. No wonder that a common association to mother for the Mex can and Colombians, but not the Anglo Americans, is "life." She is the source of all good physical and mental life.

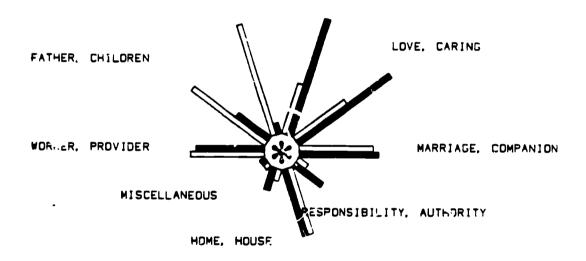

All three groups give similar attention to the mother's role as housewife--e.g., work (trabajo), cooking---and to her sexual identity---woman (mujer), female. This is consistent with the broadly observed special respect given to mothers. A widely used proverb states "Madre hay una sola" (a person only has one mother) which emphasizes the value of motherhood. Also, the theme of motherhood, especially that of sadness at losing her, is very prevalent in popular songs. In Mexico City there is a popular and large stone monument to the mother. The Colombian image of the mother is closely similar to the Mexican. In comparison, the Mexicans place more emphasis on love and respect than the Colombians. The main religious symbol in Mexico is not Jesus but the Virgin of Guadalupe, the mother of all Mexicans.

The results on the differences between the meaning of mother for Mexicans and Americans through the AGA are strongly supported by Semantic Differential responses to the stimulus mother by adolescents in Urbana, Illinois and Mexico City. For the Mexicans the mother is a better, more powerful and active, more meaningful figure; their familiarity with the concept is larger and their agreement on the concept is greater than for the Americans. Sweeping differences indeed! (Diaz-Guerrero, unpublished)

## HUSBAND

WIFE, WOMAN, MOTHER GOOD, UNDERSTANDING

MAN, JUSB JU

## Perceptions and Evaluations LD - by Americans - by Mexicans

For more information please turn to Appendix I, page 4.

### HUSBAND/ESPOSO

All the groups, especially the Americans, relate the image of husband to that of father. Compared to the Americans, the Mexicans make here relatively few references to wife (esposa). This could be taken as an indication that Mexicans pay little attention to the wife, if we would not find that they also pay little attention to husband in the conte of wife. To it merely confirms previous observations that the husband-wife axis of the family is less salient to the Mexicans than to Americans.

Both culture groups see the husband in the role of worker but Anglo Americans underscore more the idea of husband as provider and breadwinner. As in the case of father, Americans emphasize strength, while Maxicans emphasize responsibility (responsabilidad) and to a lesser extent respect (respeto) and authority (autoridad). The groups pay about the same attention to the sexual identity of the husband, man (hombre). The Mexicans' reference to spouse (conyugue) conveys the idea of marriage partnership, which goes together with their characterization of husband as companion (companero) and friend (amigo). The term companero/a, which had a high score here, can be ambiguous. It means "companion" in the American sense but it is also the term used to denote unmarried live-in partners. Due to the laws governing marriage and divorce in Colombia (see Chapter 6) this arrangement is quite prevalent, especially lately.

These role characteristics do fit with the personality characteristics which emerge as dominant in the Mexican image of the husband as good (bueno) and loyal (fiel) and a source of love (amor), understanding (comprension), and help (ayuda). The Mexicans place even more emphasis on personality characteristics than the Colombians. These personality characteristics are closely similar to those which were found characteristic of the Mexican image of wife.

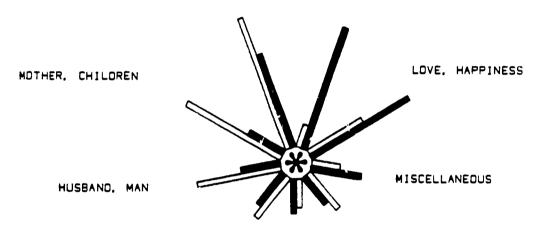

It is rather remarkable and somewhat contrary to expectations that d lite the frequent characterizations of the Hispanic frame of reference as s list and male-dominated, the Mexicans' image of husband provides little empirical evidence that their male role images are more sexually oriented and sex differentiated than the Americans. Compared to Mexicans, the Colombians place more emphasis on the husband being affectionate and understanding. There is independent evidence (roltzman, Diaz-Guerrero and Swartz, 1972; Laosa, Swartz and Diaz-Guerrero, 1974; Diaz-Guerrero and Lara Tapia, 1972), however, that strong sex role differentiation does occur in the Mexican setting producing a large number of sex differences in in'ellectual performance and in response to many personality tests and questionnaires, more often than not, favoring the male. On the other hand, Diaz-Guerrero and Peck (1963) found that Mexican women of all ages received more respect, according to male university students in Mexico City than in Austin, Texas. In Diaz-Guerrero's opinion (1975, 1982) this is to the fact that love and power are differently distributed for the sexes in Mexico. Women are high in love, affection and sentiment and men are high in power.

## WIFE

MARRIAGE, COMPANION

GOOD, LOVING, HELPFUL

WOMAN, FEMALE

HOUSEWORK, CAREER HOME, HOUSE

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 5.

#### WIFE/ESPOSA

The role of wife (esposa) as mother (madre) receives similar attention from the Anglo Americans and Mexicans, but again the Americans place much more emphasis on her relationship with her husband than do the Mexicans. This confirms previous observations that the primary relationship in the American view of the family is husband and wife. For the Americans the most salient ideas are the marriage partnership and sexual relations. Mexicans do not emphasize the sexual relationship; for them the central idea is companionship (compania). As previously indicated in the context of husband the companion term is somewhat ambiguous. In Latin America it is used in reference to partner out of wedlock but not so in Mexico.

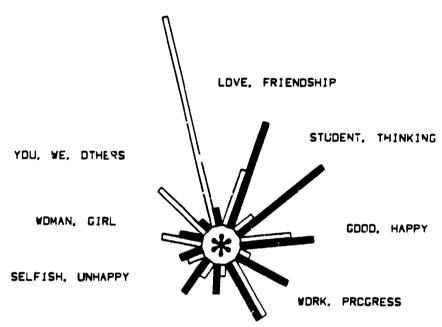

Furthermore, the Mexicans attribute to the wife such socially relevant personal qualities as understanding (comprension), helping (ayuda), loyalty (lealtad), goodness (bondad), and tenderness (ternura), qualities similar to those emphasized in relationship to mother. The Mexicans' single most heavy reaction to wife (esposa) is love (amor), although its salience is lower than observed in the context of mother (madre).

In general, the Mexicans' image of wife (esposa) conveys the same main cultural trends as their image of mother (madre); the few differences follow from the shift in perspective to the wife-husband relationship. Despite this shift, the Mexicans place relatively little emphasis on the wife-husband interdependence. Love and feminine qualities seem to be stressed more together with the idea of partnership as already observed in the context of mother. Although there are references to loyalty (fiel) and fidelity (fidelidad), there is little indication of a subordinate role relationship; there is considerable emphasis on positive qualities suggesting high recognition and esteem.

The Colombians' image of the wife shows a close correspondence with the Mexicans', but the Colombians were found to pay note attention to affection and understanding. These views, however, of educated Colombian and Mexican youth may be too idealistic. While the students are in the proper role when associating to terms such as family, father, and mother, regarding the concept wife or husband they are not. A more realistic subjective appraisal of the roles of husband and wife in the three cultures could be obtained by studying husbands and wives.

## I. MYSELF ME

MISCELLANEDL BEING, LIVING PERSON, INDIVIDUAL

## Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix I, page 6.

The self image, examined here through the subjective meaning of me, is generally recognized as a key to understanding how people of a particular cultural background perceive themselves and how they relate to others, family members, friends, and people in general. The most salient U.S. response category shows the intensity of the American preoccupation with self. As observed in previous studies, a strong ego-centered self image is characteristic of an individualistic orientation. Another indication of an individualistic focus is to see the self in juxtaposition to others, and this is conveyed by the second most salient U.S. response category ("You, We, They"). This marked separation of the self and its counterposition to individual others is at the core of the American individualism and competitive spirit characterized by Riesman (1950), Hsu (1970), Slater (1970), and others and confirmed by Kagan and Madsen (1971, 1972) and Holtzman, Diaz-Guerrero and Swartz (1975).

The Mexicans' central notion is me as a person (persona), one who is a unique human being but who does not feel ' parated from others. Their references to love (amor) and relationships with friends reflects their affect laden rapport with others. Among the personality characteristics the socially relevant attributes receive the most attention from Mexicans: gcod, sympathetic, loyal. In terms of role and role characteristics, the Mexicans identify themselves as students (estudiantes) and stress intellectual qualities——intelligent (inteligente), thinking (pensar).

Although in most contexts Colombians show close similarity with Mexicans, Colombians emphasize their existence---to be (ser) and life (vida). The Mexicans stress activities such as work (trabajo), effort (esfuerzo), education (educacion), and development (desarrollo).

Marin and Triandis (1984) have made an effort to systematize this individualistic vs. "collectivistic" approaches to life, presenting a review of previous evidence and several of their own studies which clearly indicate that Hisparics and Latins tend to be collectivistic or allocentrically minded and non-Latins individualistic or idiocentric. This data on me/yo, with the techniques of free word association, further substantiates this consistent difference. The self devaluation of the Mexican previously noted provided highly significant differences when the stimulus was "I, myself" in the Semantic Differential. Again, Mexican adolescent high schoolers scored lower on evaluation, potency and activity of their selver, equally in familiarity, much lower in meaningfulness but also much lower in agreement on such concept of the self than the Americans. A few Mexican adolescents are not willing to undertake the average dismal self devaluation and impotency of their peers (Diaz-Guerrero, unpublished).

#### SUMMARY

The main family roles examined suggest certain differential trends in the Mexicans' and Americans' views of the family. To both groups family is of paramount importance, yet there are some substantial differences in why it is so and how it interferes with what people do. Several authors characterize he Hispanic world view as familistic (Madsen, 1972; Magaffey and Barnett, 1962; Mead, 1953; Mintz, 1956) to underscore the exceptional importance of family in the life of Hispanic Americans. This importance follows from a world view in which family is the framework of existence, the center of the universe for all family members. This world is built around the upbringing, nurturing and raising of children. In reflection of the central role that children play in the eyes of the Mexicans and Colombians, we observed a strong and consistent trend to conceive family as built around the parent-child relationship. From this perspective, characteristic of most traditional societies, the importance of family follows from its role in providing children with everything they need, raising and shaping them to become mature human beings, persons of dignity and respect.

It would probably be wrong to argue that family is less important to Americans, but it seems to be important in a different way. This importance follows from the role of ramily as the main source of affective-emotional satisfaction. In the American approach the existence of family depends primarily on the love-based relationship of husband and wife. As the high divorce rate shows, marriage and family cannot survive unless there is love and understanding between husband and wife.

Some of the differences observed here between Americans and Mexicans and Colombians show considerable agreement with previous studies comparing Americans with Middle Eastern and Far Eastern groups (Arab. Szalay et al., 1978b; Iranian: Szalay, Mir-Djālali, Moftakhar, and Strohl, 1979; Korean: Szalay, Moon, and Bryson, 1971, 1973; Filipino: Szalay and Bryson, 1977). Representatives of these other cultures conveyed similarly an image of family as a large social institution which involves usually an extended network of role-relationships with little emphasis on personal choice or affective ties. In contrast, the Americans' image of the family conveys that of a small, personal, affect-laden unit.

While the contrast between the small American and the large traditional family appeared to be a generalizable distinction, the image of family emerging from the Mexican reactions presents a basic deviation from the traditional pattern in the important dimension of affect. Compared to the lesser Korean, Jordanian, and Slovenian emphasis on love, the Mexican and the Colombian images of family were found to be even more affect-laden than the U.S. American. At the same time 1. 3y

maintain a predominantly traditional family view in their emphasis on the parent-child relationship, more connection between family and society, and less emphasis on the self, on ego-centered individualism.

How do we explain, then, that although the Mexicans and the Colombians place less emphasis on the husband-wife relationship, their family image is more affect-lader than the U.S. American image? A careful examination of the Mexican responses---bringing up (educacion), teaching (ensenar), helping (ayuda), responsibility (responsabilidad)---suggests a strong concern with nurturing and caring. The emotional foundation of the Mexican family has at least two main sources: the husband-wife type love relationship and the parent-child relationship. The Mexican parent-child relationship is intensively affect-based and emotional, more so than in the case of the Arabs or Koreans. Attributes like understanding (comprension), friendship (amistad), and goodness (bondad), which are particularly salient in the Mexicans' images of both father and mother, further indicate that the cultural images of these roles are based on qualities important not only in the marriage partnership but also in the parent-child relationship.

The attributes of father (padre), mother (madre), husband (esposo), and wife (esposa) emphasized by the Mexicans are rather informative on several accounts. For one thing, the male and female roles are less sex differentiated than one would anticipate on the basis of the sexist macho male image. At least in the eyes of the Hispanic beholders, the male and female roles show considerable similarities. The traditional authority orientations, as broadly elaborated in the literature, promote some erroneous expectations. One would expect that the roles of father and husband would be viewed as the personification of prestige and authority in an elevated social position superior to women and children. While such trends were indeed observed in other traditional cultures---Koreans, Egyptian, Jordanian---the Mexican reactions offered little to support such expectations. Father and husband are viewed very much in egalitarian terms as friends and companions. Although such characterizations as boss (jefe), superior (superior), and respect (respeto) were given with marked weight, they are clearly counterbalanced by references to understanding (comprension) and friendship (amistad), which had greater salience. This dual characteristic of authority in Mexico was early recognized by Diaz-Guerrero. A factor of obedience commonly found in his questionnaires of sociocultural premises was baptized as Affiliative Obedience.

While the Mexicans' perceptions of male roles show little conformity with sexist and authoritarian stereotypes, they do stress certain feminine characteristics in the roles of mother and wife: beautiful (hermosa), pretty (bonita), understanding (comprension), tender (ternura), amiable (amable), sweet (dulce), and loyal (fiel). All these come naturally in addition to the particularly heavy Mexican references to love. In the U.S. American image of the family related sex roles there are more heavy and direct references to sex: female, sexy, lover,

mate, etc. That the attention given to children in the context of all family roles examined is heavier by Colombians than by U.S. Americans has already been observed at the outset. Thus, at least during youth, the sexist stereotype appears to be more a problem of Anglo Americans than Latin Americans. In adulthood it may be the opposite.

While the present analysis has a focus on family roles, other family related subjects, such as love (amor), sex (sexo), and marriage (matrimonio), will be examined in later chapters. Similarly, how the family related role perceptions and value considerations influence interpersonal relations in other social contexts, such as dealing with friends, other people, and society at large, will be topics discussed later.

In the context of the present chapter the discussion of the self-image relied on reactions to ME. In previous studies conducted with Hispanic samples we also included SELF. In general, the response trends observed in these various contexts are consistent with those observed here.

The U.S. Americans show a very strong emphasis on "I" as their central point of reference. They describe themselves positively as good, happy, loving, caring, helpful, etc. Nevertheless, there were several instances expressing self-doubt. Their responses convey a self-view influenced by what assumptions others may make. Implicit also in their reaction is the belief that the person can somehow step cutside the self and perceive oneself in a similar manner as another would do it.

Mexicans, on the other hand, tend to regard "me" as a person with certain social attributes (understanding, helpful), roles (man, son), and functions (work). Their reactions seem to be connected to a "moral" way of being in the world. Life is a task of craftsmanchip in attempting to live according to a set of values, which are espentially traditional.

The above differences observed between the Mexican and American views of family show close correspondence with independent research findings which discuss differences in childrearing. As suggested by recent literature, Hispanic parents adopt a directive but also affiliative style of upbringing; they stress parental authority, respect, obedience, affective interdependence and discipline in raising their children, compared to U.S. American parents who are inclined to stress independence, detachment, and autonomy (Heller, 1966; Diaz-Guerrero, 1955, 1967; Peck and Diaz-Guerrero, 1967; Holtzman, Diaz-Guerrero, and Swartz, 1975; Ramirez, 1976; Szapoczaik, 1978).

Mexican children in the Holtzman et al. study (1975) tended to develop more slowly, on the average, in terms of their cognitive skills and mental ability than was generally true for the Anglo American

63 <sub>56</sub>

counterparts. Anglo American six-year-olds showed a greater degree of complexity in their cognitive functioning, as corroborated by the fact that more factors were necessary to explain intercorrelations among cognitive tests for the Anglo Americans. The evidence, as it has been seen previously, strongly indicates that the differences in level and pattern of cognitive development among Mexican and Anglo American children are due primarily to differences in the sociocultural premises and environmental milieu in the two societies.

The strong Mexican emphasis on unity and cohesion and nurturing, childrearing functions do reflect a strong family emphasis by Mexicans compared to the American emphasis on the individual. Unlike for most Anglo Americans, families in Mexico tend to stretch out in a network of relatives and compadres that often run into scores of individuals. Mexicans tend to see themselves achieving by standing on the shoulders of their father and mother or other family members, while Anglo Americans see themselves as achieving primarily by virtue of their own independent efforts. Some of the most striking evidence favoring this hypothesis come from Diaz-Guerrero's studies with the Filosofia de Vida Questionnaire. For example, one bipolar item consists of the following pair of statements: (a) One must fight when the rights of the family are threatened, or (b) One must fight when the rights of the individual are threatened. The great majority of Anglo Americans selected the individual-centered alternative while just the reverse occurred for the Mexicans.

As a consequence of this emphasis on family and the social group as indicated by research findings, Mexicans tend to be more cooperative in interpersonal activities, while Anglo Americans are more competitive (Diaz-Guerrero, 1982). In two of the items of the Filosofia de Vida, a test developed by Diaz-Guerrero (1973), cooperation and competition are contrasted as ways of dealing with problems set by the environment. As Diaz-Guerrero's (1982) findings show, Mexicans select in a highly significantly greater number the cooperative alternative while Anglo Americans select the competitive. Experimental studies comparing Mexican and Anglo American children by Kagan and Madsen (1971) bear directly upon this broad dimension. Mexican children tend to be highly cooperative in experimental games while Anglo Americans are highly competitive, even when such competition may be disfunctional.

The previously observed Mexican emphasis on values of understanding, cooperation, and harmony come naturally from attitudes transmitted by parents, from values imparted by upbringing. A primary scale from the parent-attitude survey (Holtzman et al., 1975) completed by the mothers in the two cultures deals with internal versus external locus of control. In general, Mexican mothers tended to appear more pessimistic while the Anglo Americans were more optimistic in their outlook on life. These differences are quite understandable in view of the general tendency of Anglo American society to be full of hope for the future, at least until very recently, and the social turmoil in

Mexico where the social ecosystem would be more likely to induce a pessimistic-fatalistic outlook on lif, especially among the lower class. However, there is some evidence in the literature that an internal mode of coping, particularly a Mexicanized internal coping style, is commoner in Mexican youth than in present Anglo American youth.

How these parental attitudes affect the values of children are also clearly shown by the Holtzman study (Holtzman, Diaz-Guerrero and Swartz, 1975, p. 332). Four hundred 14-year-old Mexican children of two social classes were compared with equivalent 400 American children in Austin and Chicago and 400 English children in London. The samples were composed of equal numbers of lower and middle class children and of males and females. The results show a strong difference in affiliative obedience favoring the Mexican children over those in Austin. Austin children were less different but still significantly more affiliative obedient than those in Chicago and these in turn more affiliative obedient than London's children. While lower class children, particularly those in Mexico, were more affiliative obedient than middle and upper class children, on the average the cultural difference was significantly larger than the class or the sex differences.

The Mexicans, together with Colombians and other Hispanic American cultures, view the world with a more group-oriented frame of reference. They view the person as part of a family or other social organization such as community or society. A happy, harmonious existence requires a willingness to respect and adapt to others---that is, social harmony (Burma, 1970), field dependency or field sensitivity (Ramirez, 1976), personalism (Diaz-Royo, 1974), alocentrism (Triandis, 1983), or social personalism (Szalay et al., 1978a). Diaz-Guerrero (1963, 1967, 1975) and Holtzman, Diaz-Guerrero and Swartz (1975) conceived this difference in terms of a different coping style also commanded by the culture. Thus, in what was called the active sociocultures (the model being the American), the best, the proper, even the virtuous way for the individual or group to cope with problems would be by modifying the physical, interpersonal or social environment in order to nullify the source of stress. In what was labeled the passive or self modifying sociocultures (the model being the Mexican), the individual or the group would consider the proper and virtuous way of coping to modify not the physical, interpersonal, or social environments, but themselves, in order to cancel the source of stress. Thus, while the first type of coping style is oriented to serve the self, the individual, the other is oriented to serve the family, the group or the society. distinction between the two orientations, the American individualistic orientation compared to the Mexican social person or group orientation, emerged with consistency from various parts of this study.

Most directly it emerged from the self image data elicited in this study in the context of "Me," but also in some of our other U.S.-Hispanic studies in the context of "Self" and responses given to the

respondent's own name. Since a plausible explanation of the heavy American emphasis on the self or ego, its needs and interests, compared to the stronger Hispanic/Latin American emphasis on the social unit and social qualities could be largely language-based differences, we have conducted several studies to explore the actual sources of these differences.

Broade comparisons of groups who use the same language--e.g., Black and White Americans (Szalay and Maday, in press)--- as well as the consistency of findings obtained with different Hispanic groups over a variety of related themes (Szalay, Williams, Bryson, and West, 1976; Szalay et al., 1978a) show that these particular trends depend on perceptual dispositions somewhat independently of language.

There are several themes throughout this study (TOGETHERNESS, UNITY, PERSON, etc.) which offer relevant information on the self image, with special regard to the relationship of self to others. Findings on these themes support a dichotomy between two types of frames of reference. The U.S. Americans show a strong disposition to view the world, other people, and themselves from the perspective of the individual, with personal needs and aspirations representing the central reference point. This frame of reference leads to personality characteristics described by various authors as individualistic (Hsu, 1970), inner-directed (Rotter, 1966), or autonomous (Riesman, 1950), or idiocentric (Triandis, 1983). The actual scope and important aspects of these distinctions, which in this study we have labelled individualism versus social personalism, will become increasingly apparent in the following chapters.

As a last point in the context of the present family-related findings it should be mentioned that this distinction deserves special attention for more than one reason. First, it appears to be fundamental to most other traits or psycho-cultural dispositions, from the differential American and Mexican approaches to family and upbringing to the different approaches to interpersonal relations (competitive vs. affiliative orientations) and problem solving (active solution-oriented vs. passive enduring posture toward various problems of life and existence).

Second, these differences stem rather obviously from the style and cultural philosophy of upbringing, suggesting that some of the differences in the Mexican and American cultural frames of reference have deep roots. This does not mean that they could not be bridged but rather that mutual understanding and cooperation are only possible by taking the different cultural perspectives into consideration.

Third, in several ways the Mexican student reactions represent a deviation from the traditional images and family roles. This may be explained, at least tentatively, by what might be characterized as a

stage of transition from a traditional, extended family type, to a modern, nuclear family type.

The Mexican sample, as has been mentioned, belongs to an urban setting, and to a middle class socio-economic level. This type of family has evolved from a trad tional, patriarchal, extended family structure and retains many of its characteristics while acquiring some modern features. Thus, while the father still is the "boss" and the main "provider" in most cases, the mother is more and more assuming the role of "provider" together with the father. This means that in many cases she works outside the home and earns a salary. Her explicit economic contribution to the household gives her a new status regarding authority and decision-making. At the same time, she still retains some features of her traditional role, which emphasizes her "feminine" qualities of tenderness and sweetness and her position as the affective center of the family.

It is true that, even in this complex transitional family, the interpersonal relationships tend to center heavily on the children and on assuring their education and welfare. When children perceive "union" and "love" as important components of family relations, they reflect the fact that the family is still the main point of reference for the self in terms of identity and of affective and economic security.

### CHAPTER 4

### FRIENDSHIP, UNDERSTANDING

In a recent study of Hispanic and Anglo American cultural differences (Szalay et al., 1978a) we concluded that interpersonal relations is probably the most important and most characteristic domain shaped by cultural factors. It is also one of the least understood domains plagued by considerable ambiguities and apparent contradictions. On certain specifics there is considerable consensus; for instance, Hispanic Americans are broadly recognized as being gregarious people enjoying and cultivating a life of rich interpersonal relations (Gil, 1976; Rogler, 1940; Wolf, 1966). There is also a consensus that Hispanic Americans have little interest in being alone or even in the idea of privacy, while mutual aid and cooperation have broad popular appeal (Kagan and Madsen, 1971; Kagan, 1977; Buitrago, In contrast to an assertive, competitive posture dominated by self interest. Gillin (1965) observes that Hispanic social relations are inspired by such values as respect for inner worth and dignity of others. Since Margaret Mead's observation (1951) that Hispanic Americans value interdependence and modesty rather than assuming an aggressive, competitive posture, similar observations have been made again and again.

Diaz-Guerrero observes that the meaning of privacy varies depending on social class and age in both cultures: for example, older Anglo Americans join in a multitude of social clubs and organizations where they enjoy close personal contacts; older Mexicans are often known for their penchant for social withdrawal and privacy as seen by the large stone walls quarding the homer of the well to do. While these differences in lifestyle may indicate a reversal, such a conclusion may be justified only if we are able to go behind the observables. An intensive social life is compatible with the individual's need for rapport and entertainment. As Hsu observes, high fencing is used in the Orient to stress the cohesion of the family.

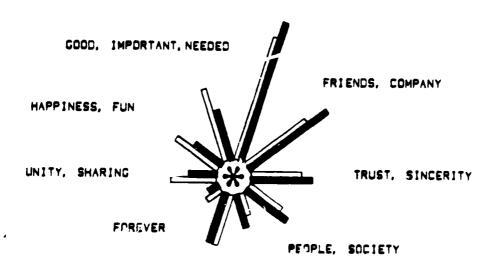

Differences regarding the ideals and norms shaping interpersonal relations may partially explain why even friendship does not seem to mean the same to Hispanic Americans as it does to U.S. Americans. Our comparative cultural study of Puerto Rican and Anglo American students (Szalay and Bryson, 1975) has shown that samples representing these two populations were particularly far apart in the domain of friendship.

In the context of the present study we examine such questions as: What personal qualities do Mexicans consider desirable in a friend? Do friend-ships meet the same needs and serve the same psychological and material objectives in Mexico as they do in the U.S.? What are the characteristic differences? How do friendship ties interface with family ties? How do they relate to social values and role expectations? Do friendships serve mainly an entertainment function, or do they have a broader existential foundation as well?

## FRIENDSHIP

LOVE, UNDERSTANDING

MISCELLANEOUS HELP COOPERATION

## Perceptions and Evaluations - by Americans - by Mexicans

#### FRIENDSHIP/AMISTAD

As we also found in the context of friends (amigos), the affectiveemotional aspect of the relationship receives especially heavy attention, particularly from the Mexicans. For both groups love (amor) is the most central affect. Americans also speak of caring, and both love and understanding (comprension) receive special attention from Mexicans. The ideas of help (ayuda) and support (apoyo) are also very strong in the case of the Mexicans, conveying that friendship has important implications of commitment. In the U.S. American view friendship has a narrower focus on entertainment, as reflected by the emphasis on fun and laughter. The Mexican view is more rominiscent of the Jordanian, Korean, and other culture groups for whom friendship has a broader role and serves as a foundation for all types of activities, including work and business. Yet, the U.S. Americans stress here as they did previously that friendship is important and needed. The sources of this intensively felt need are obviously not economic or material but predominantly psychological. As discussed in the context of the self concept, the materially and economically self reliant Americans, parallel to their autonomy and individualism, do feel a need to maintain meaningful interpersonal ties. From this angle, trust appears to be of special importance; Mexicans value such qualities as sincerity (sinceridad) and loyalty (lealtad).

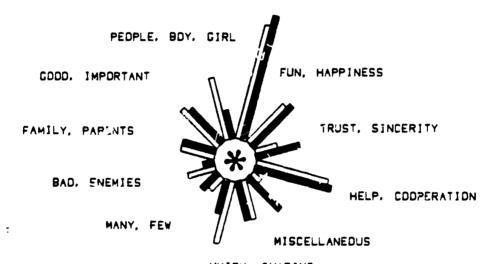

Both the Colombians and the Mexicans emphasize friends compared to the stronger Anglo American emphasis on company---in the sense of entertainment and being "together." The heavier references to friends (amigos) and to unity (unidad) and sharing (compartir) convev that the Mexicans have a strong predispo ition to view friendship (amistad) as a deeper, existentially more consequential relationship which represents an important source of help (ayuda) and support (apoyo). This may be a reason for the growing interest in support systems based on family and friends. These community and culture based support systems were found to play an important role in helping to maintain physical and mental health for these groups.

### FRIENDS/AMIGOS

Friends (amigos) constitute an important group of select people, both to Mexicans and to U.S. Americans. Each group, however, has distinct ways of selecting friends and different reasons for considering them important. Nor are the differences found between our U.S. and Mexican respondents accidental. To the Mexicans the relationship has apparently a broader and richer affective foundation: friendship (amistad), love (amor), understanding (comprension). Love and caring are important attitudes to the U.S. Americans as well, but love conveys more sexual connotations, while Mexicans stress more asexual affection. With regard to the sources of affection and emotional attachment, the characteristics receiving attention offer some relevant insights. To Mexicans such qualities as sincerity (sinceridad) and loyalty (lealtad) are important in friends, and friendships (amistad) require intensive involvement, help (ayuda) and support (apoyo). To Americans trust and confidence in friends are also important. reactions indicating that friends are needed, necessary, good, and important According to leading U.S. all express a social or psychological need. culturologists like Riesman (1950) and Slater (1970), this need stems from individualism and highly mobile life conditions which create a natural feeling of loneliness and a hunger for meaningful interpersonal ties. In traditional societies such ties are readily provided by family and a more stable social milieu. This explanation receives empirical support from findings that family is indeed a more important source of friendship for the Mexicans and that friendship represents a much more select group implying a more stable partnership for Mexicans. To U.S. Americans friends include a much wider group of people encompassing casual acquaintances, men, women, peers, potentially everybody. Also Americans see friends in a more limited role, in activities restricted largely to entertainment and leisure.

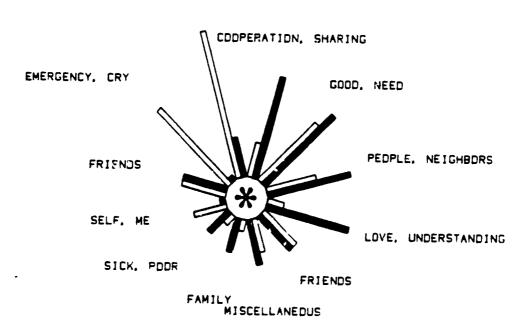

While Colombians show a great deal of similarity with the Mexicans, they place more emphasis on certain affective ties such as understanding; they also place more emphasis on such human qualities as sincerity and loyalty.

Diaz-Guerrero thinks that different cultures satisfy emotional needs differently both qualitatively and quantitatively. Holtzman, Diaz-Guerrero and Swartz (1975) completed a large cross-cultural longitudinal study of school children in Mexico and the U.S. Among many other tests, several replicated annually from age 6 to age 18, they applied Jackson's Personality Research Form to more than 700 school children ages 12, 15, and 18. The 350 children in each culture were about equally divided by sex and social class. When a closely matched subsample was studied they found uniformly significant differences (Holtzman et al., 1975, p. 303): The Mexicans had greater need for neatness and order and for independence. These needs, Diaz-Guerrero interprets, are duly satisfied in the Anglo American culture. The Anglo Americans had greater need to do things just for fun and greater need to seek out others. These needs, it is interpreted, are satisfied in the Mexican culture.

## HELP

### AID. ASSISTANCE

# Perceptions and Evaluations - by Americans - by Maxicans

for more information please turn to Appendix I, page 9.

#### HELP/AYUDAR

Assisting, aiding, and supporting (apoyo) convey the central idea shared by both groups. However, the nature, role, and purpose of the help are apparently different because of the different experiences and frames of reference of the two groups. It is hardly accidental that Americans and Mexicans have different types of helping in mind. In the foreground of interest for Mexicans are collaboration (colaboracion), cooperation (cooperacion), sharing (compartir), giving (dar) and receiving (recibir) help---that is, activities involving reciprocity and mutuality. The nature and salience of the Mexican reactions indicate that helping is a natural everyday activity. In comparison, U.S. references to rescuing and saving suggest special actions necessitated by special situations. There is also a stable group of U.S. reactions addressing emergency situations, such as fire and drowning. This suggests that for Anglo Americans helping is often associated with extraordinary (e.g., life threatening) circumstances such as accidents, illness, or crime. To underscore this point, the Anglo Americans mention crying, screaming, and yelling---that is, they vividly have in mind those circumstances in which people in darger call for help as well as the feelings of the individual who seeks help. This emphasis on extreme situations is a likely result of an attitude of self reliance, which under normal conditions obviates the need for help. Along with an individualistic self reliance, the first source of help is "self" or "me". If outside help is needed, the main sources suggested by the U.S. reactions are such specialists as doctors or police.

The Mexican comphasis is somewhat different. The main sources of help are people with the closest personal ties. The Mexican group has primarily friends (amigos), family (familia), parents (padres), and neighbors (vecinos) in mind and more greatly emphasize love (amor) and friendship. For them help (ayuda) clearly involves both giving and receiving. This is fundamentally consistent with previous observations that to Mexicans helping is very much a part of the overall relationship with family members and friends.

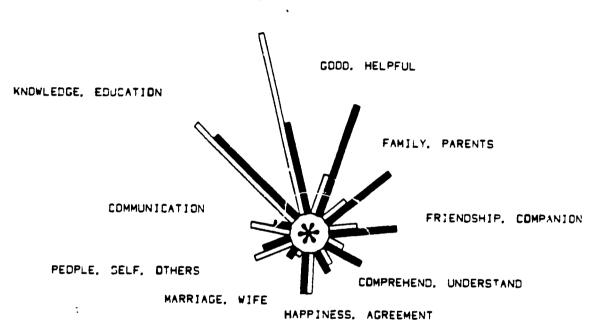

In most respects the Colombians show the same general trends as the Mexicans, yet they place stronger emphasis on affective relationships such as friendship and understanding. They also place a great deal of emphasis on sharing and cooperation.

Recently Diaz-Guerrero (in press) found in 60 properly sampled Mexican mothers in Monterrey, Mexico, that higher scores on "happiness in giving" correlated significantly (.40) with higher scores on a reliable questionnaire measuring the quality of life. No such relationship was found in 60 Mexican-American mothers in San Antonio, Texas. The cultural context and rationale for giving, as indicated above, is certainly different.

### UNDERSTANDING/COMPRENSION

Although the verb "to understand" (comprender) literally refers to intellectual performance, understanding (comprension) used in a social context refers to a human attitude with strong emotional content. Love (amor) is the most central idea for both the U.S. and Mexican culture groups. It emerges here with caring, sympathy, trust and other social attitudes from U.S. Americans. Mexicans think of understanding mainly in the context of friendships and family, while U.S. Americans tend to think of people in general and of themseless. As in the family domain where Mexicans showed a particularly strong emphasis on understanding, in the Mexicans' subjective meaning of understanding (comprension), family (familia) and marriage (matrimonio) have high salience with special emphasis on the parents (padres), particularly the mother (madre). Again, the cornerstone for the Mexicans' psychological development is the mother, whose role is frequently seen as the epitomy of self sacrifice. Her example is used as the antithesis to reject selfish tendencies considered harmful to the family as a whole or to particular family members. Along this same intrinsic rationale, Mexicans see an especially close tie between understanding and helping (ayuda) or assistance. This is consistent with the previously observed Mexican disposition to view family and friends as the main sources of helo and assistance.

Parallel to the meaning of understanding as a sympathetic, affectionate social attitude, the U.S. Americans also place considerable emphasis on a second meaning related to knowledge and learning, to intellectual performance in general. A consistent trend observed in the context of friends (amigos) and friendship (amistad) as well is that U.S. Americans pay considerable attention to talking, advising, listening, and communication in general. This trend is particularly noticeable here in the context of understanding; Mexicans observe this dimension as well but to a lesser extent.

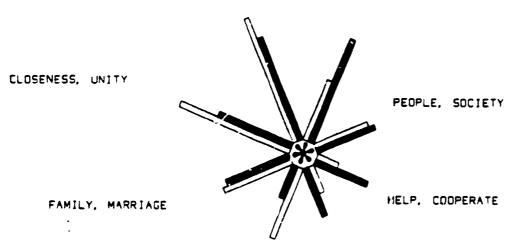

Beyond close agreement with the Mexicans, the Colombians place more emphasis on the role of the family, particularly the father and brother; they also place considerable emphasis on help.

### TOGETHERNESS/CONFRATERNIDAD

The U.S. Americans think of togetherness as the framework of desired interaction and intimacy with others. For this reason togetherness is considered to be a personal matter involving one's choice of particular people with whom to share experiences and enjoy close bonds. Happiness, security, and escaping the sense of aloneness are seen as the primary benefits of togetherness, and marriage, family life, and friendship are considered the most likely sources of such intimate attachment. For them togetherness implies a desired state founded primarily on personal needs rather than on some social values or collectivistic philosophies. This explains why the needs associated with togetherness are highly personal and selective. They can be met only through specific people who meet one's personal taste and other criteria and who show responsiveness indispensable for understanding. Impersonal or supraindividual social organizations have in this context no appeal.

For the Mexicans the meaning of togetherness (juntos) is rather similar. Family (familia) and friends (amigos) are the main representatives of togetherness for Mexicans as well but in a somewhat different way than for U.S. Americans. The main emphasis here is not on close personal ties but rather or the cohesiveness of these social units. This distinction is evident in their references to large social organizations——e.g., society (sociedad), country (pais)——and to the supernational community of everyone (todos). In contrast to the U.S. focus on close person—to—person rapport as a source of individual happiness and security, the Mexicans show a stronger tendency to conceive togetherness in the context of groups and organizations, from family to society.

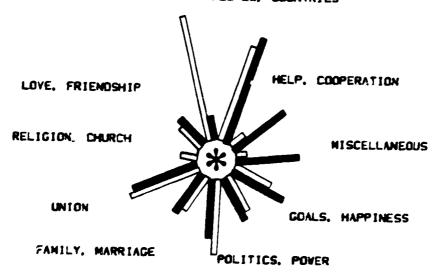

The Colombians' view of togetherness is similar to the Mexicans', although they place considerably more emphasis on cohesive forces such as unity (unidad) and sharing (compartir).

# UNITY

## TOGETHER

PEOPLE, COUNTRIES

# ONENESS. UNIQUE

Perceptions and Evaluations

- by Americans - by Mexicans

For nore information please turn to Appendix I, page 12.

### UNITY/UNIDAD

The single most pervasive idea for U.S. Americans is being together and doing things together. This is seen by both groups as a desirable or necessary goal. To U.S. Americans unity is an intermediary objective which can further other desired goals. U.S. Americans show more awareness that unity comes about through joining forces and brings a sense of cohesiveness, strength, happiness, and peace. This instrumental value of unity is further conveyed by its political connotations for the U.S. group in relationship to party politics, nationalism, U.S., as well as to ethnic/racial groups (Blacks, Whites).

The Spanish word "unidad" may not have been the best translation-equivalent since it refers to an issue which is ess popular, less important to Mexicans than the salient notion of social fusion). "Unidad" also denotes "unit". This may be the reason for Mexicans emphasizing the concepts of uniqueness (solo, unico). The word "union" would have been highly preferable. Yet the Mexicans reveal some of the same general dispositions. Unity (unidad) is less instrumental but more affect laden; love (amor) is more dominant. While for both groups the unity of family has about the same importance, the unity of larger social units such as community and society is a concern which ranks nigher for the Mexican group. This stronger social focus by Mexicans emerges also in partial contrast to the stronger political connotation of unity for the U.S. respondents.

To the Colombians unity conveys more affective ties such as leve and understanding than to the Mexicans. They also stress union and view unity more in the context of family.

SUMMARY

In the domain of friendship the comparison of U.S. and Mexican samples has produced findings in fundamental agreement with previous Puerto Rican and Hispanic American studies (Szalay and Bryson, 1975; Szalay et al., 1978a), although on certain relevant details we found some distinct differences as well.

Several outstanding scholars, such as Linton, Mead, and Riesman, have observed that self image plays a particularly important role in shaping interpersonal relations. The U.S. American view of friendship represents a case in point. In the context of most themes examined in this domain, the U.S. group placed consistently heavy emphasis on self (me, ego, etc.). While this emphasis is, in itself, a manifestation of an individualistic social philosophy, an analysis of the cultural meanings of such ego-related themes as "me" as shown in the previous chapter yields new and relevant details particularly on the subject of individualism as characteristic of U.S. Americans. As the results of the present chapter show, in the subjective world of this group almost all social interactions emerge as self-anchored, dyadic relationships: me-you, me-others. In this ego-centered perspective, the psychological importance of friendship grows into strong psychic needs. Friendships are pursued in response to an internal need to have meaningful and emotionally satisfying interpersonal relations, a need for fun and entertainment, a need not to be alone as an isolated individual. In this respect the ready availability of suitable friends is the central motive. The main context of friendship is companionship, leisure and entertainment; permanence is not a major requirement. Their functional view of friendship provides a unique capability to form dependable temporary ties which work effectively for a short duration (e.g., voluntary participation in a PTA committee) and which are inseparable from the experience of social mobility and social change.

In the Hispanic perspective, friendship (amistad) is much less a relationship that is constantly being developed and dispensed with according to the timely needs of the individual and to new situations or changing requirements. The Mex.can perceptions of interpersonal relations within and outside of the family are similar to those in other traditional societies, which place particularly heavy emphasis on friendship (Szalay et al., 1978b, 1979a, Szalay and Strohl, 1981). Friendships include relationships with members of the family as well as with members of the opposite sex in a social situation where friendship ties develop slowly, usually through family contacts, and are not readily dissolved or replaced. Friendship, once established, entails lasting obligations and commitments which tend to become institutionalized. This reciprocity, in turn, produces a force which

strengthens dominant social relations and social structures. An undoubted contributor to the greater permanence of Hispanic friendships is the fact that in their cultural environment not everybody is a potential candidate for friendship. Family and social class impose considerable selectivity and there is apparently a much stronger distinction between casual acquaintances and friends than there is for most U.S. Americans.

Differences found in such social values as help and understanding were also consistent with the above contrasts in cultural orientation. Mexicans as well as Colombians emphasized strong emotional ties which add to the relative stability of friendships, while the U.S. Americans emphasized individual satisfaction on a situation by situation basis. Thus, it is not accidental that U.S. Americans emphasize togetherness and being together with friends and Mexicans and Colombians associate friendship (amistad) with unity (unidad) or union (union). reactions imply more than being together with another individual physically or intellectually; they suggest a sort of fusion, a transcendance of individual boundaries. While to Americans togetherness, being together, is important in itself, to Mexicans and Colombians as well as to groups from the Middle East and Far East sharing, assistance, and helping are of greater salience. Such conclusions are supported by findings in several contexts (friends, help, family), which show that these traditional groups stress the importance of cooperation and working together. While help means to Americans assistance given mainly in emergency situations, to Mexicans and Colombians, together with other more traditional groups, it involves continuous reliance on a small circle of family members and friends. Also for them helping (ayuda) implies mutual cooperation (cooperacion) and assistance.

Although some of the above Mexican and Colombian perceptions and attitudes about friendship were also found to be characteristic of most people from developing countries, there are here a few attributes which appear to be distinctively applicable to Hispanic/Latin Americans. Their focus on understanding (comprension) appears to be an equivalent to the Middle Eastern groups' emphasis on truth, faith, and faithfulness. In this context Iranians come the closest when they speak of the intellectual foundation of friendship, meeting of minds, mutual thinking, thinking alike. There are also two dimensions along which Hispanic and Latin Americans appear to be closer to U.S. Americans than to some of the other traditional groups. This may be because our samples were composed predominantly of students of urban background. Compared to Middle Eastern and Far Eastern groups, Mexicans and Colombians do not show a particularly strong preoccupation with the lasting or permanent nature of friendship ties. While they may take a certain stability for granted, this would only explain why they do not express concern with instability or unreliability; but neither do they stress fidelity or loyalty as the Arabs do. Furthermore, while Mexicans and Colombians convey that much of the intrafamily relations involve friendship (amistad), friendship appears to be less overlapping with

family ties than is the case with most of the traditional cultures we have studied.

The trends observed in the context of friendship and related social values convey a fairly consistent picture of the U.S. American and Hispanic/Latin American approaches to interpersonal relations. They confirm previous observations that it is the individual's needs, affects, and motives which are particularly critical in U.S. American social relations, while in the Mexican and Colombian contexts there is more emphasis on allects, on the maintenance of social relations, and on the fulfillment of obligations and commitments. Regardless of the difference, in both the U.S. and Mexico or Colombia, these strong affective needs and their satisfaction—in the way prescribed in each culture—appear as indispensable requirements for an emotionally balanced development and for a good quality of life.

### CHAPTER 5

## COMPUNITY, SOCIETY

The information available on Hispanic psycho-cultural dispositions is based mainly on Hispanic Americans——Puerto Ricans, Mexican Americans, Cubans——living in the United States or in Puerto Rico; comparative studies based on population samples from Latin America or Mexico are relatively rare. According to recent reviews of the literature (Lisansky, 1981), certain domains such as childrearing and work attitudes have been extensively studied in secent years, but there is little information on how Hispanic Americans perceive and relate to large social units such as community or society. A singular exception is a largely unpublished study carried out with the Semantic Differential of the Spanish Language (Diaz-Guerrero and Salas, 1975) and with an inventory of need satisfaction by Diaz-Guerrero and his coworkers. Among many others, they assessed concepts related to this theme on Mexican highschoolers in Mexico City. Relevant results will be discussed with the appropriate stimulus words and in the summary.

The relative lack of information may well illustrate a coint frequently made by scholars of Hispanic background who are critical or the selective and biased nature of social science information available on Hispanic Americans. Their main criticism is that Hispanics are characterized and evaluated by Anglo-American social norms and values (Hernandez, 1970; Rivera, 1970; Wagner and Haug, 1971). Furthermore, Hispanic scholars object that U.S. American researchers, by selecting research topics along their own interests and priorities, tend to leave Hispanic priorities unintentionally out of consideration.

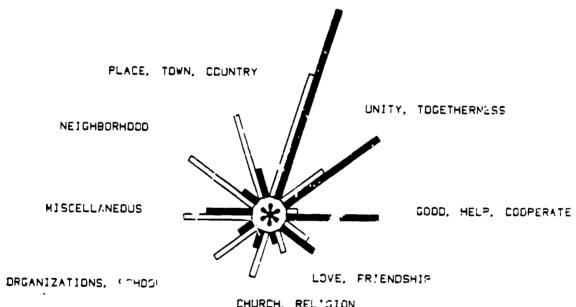

Our own findings on Puerto Ricars from Puerto Rico (Szalay and Bryson, 1975) and on a diverse Hispanic group tested in Washington, D.C. (Szalay et al., 1978a) suggest that large social units play an important role in the Hispanic frame of reference. The preceding chapters also indicate that while the U.S. emphasis is on individual people and their voluntary associations, Hispanic Americans pay considerable attention to large-scale social units like community (comunidad) and society (sociedad). The following analysis will examine how Mexicans and U.S. Americans relate to society and to people in general. How do they percaive and evaluate larger social units like community and society? What importance and meaning do they attach to such social values as equality (igualdad), freedom (libertad), and justice (justicia)?

In view of the results just presented on American and Mexican interpersonal relations in the family and among friends, it is particularly relevant to explore questions related to the perspectives of U.S. American individualism and Hispanic social personalism.

# COMMUNITY

SOCIETY, FEDRLE

CHURCH, REL'SION

JORK, ACTION, PROGRESS

# Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix 1, page 13.

### COMMUNITY/COMUNIDAD

In the Mexican view community can be both small like a family (familia) and large, encompassing members of a society (sociedad), country (pais), nation (nacion), and potentially all human beings in the sense of mankind. Their main emphasis on large aggregates of people (pueblo), particularly on society, apparently does not prevent them from viewing community as a framework for helping (ayuda), cooperation (cooperacion), progress (progreso), and development (desarrollo). Love (amor), friendship (amistad), and understanding (comprender) are emphasized as cohesive forces. The strong Mexican emphasis on unity (unidad), union (union), and reunion (reunion) further underscores this apparent Mexican duality. Strong affective ties with a small number of people like family and friends make sense based on the American cultural experience but the idea of love as the connecting link between members of such large social aggregates as society or mankind is hard for Americans to conceive.

To Americans community refers primarily to smaller social groups, finily and friends, has nothing to do with love, and shows minimal f, ngation in affect-based interpersonal relationships. It is rather a group which at a particular time happens to live in a particular physical location---town, suburb, neighborhood, village---and thus develops similar concerns and shared interests in organizations (schools, centers, clubs, pools) and activities, developments, services, and other projects. This presents a strong contrast to the large-scale, affect-laden, idealistic Mexican conceptualization of community. The Mexicans' stronger affective ties with society and community does not mean, however, that they are better prepared to work together on concrete community projects. Joint actions materialize more readily in crisis situations and rarely do they outlive the crisis itself. It might be suggested that the strong positive overtones of the Mexical perception of society and community reflect, in practice, a type of group identification which starts with family. Given that the family is so important in terms of identity and of affective and economic security for the individual, it is the family which in reality becomes the point of reference in their perceptions of society and community.

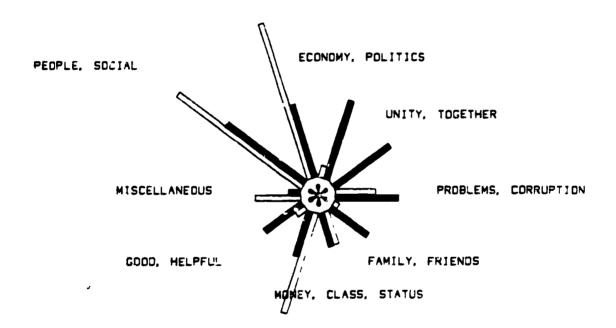

Compared to the Mexicans, the Colombians place more emphasis on the cohesive forces of love and friendship and think more of religion or religious communities.

Diaz-Guerrero (in press) presents evidence that Mexicans and Mexican-Americans anticipate help from varied persons in the community, from religious symbols and practices and from cultural beliefs when facing emotional crisis. Earlier Valle (1974) had spoken of the "Amistad-Compadrazgo" indigenous webwor' of the Mexican-American and compared it to the Mental 'Health Network. There is reason to believe that Mexicans and many Hispanics still prefer help from a community or society perceived as united by love and friendship to help from the institutional network of health facilities which is perceived as cold and impersonal.

### SOCIETY/SOCIEDAD

Mexicans and Americans view society as a large aggregate of people encompassing the population of a particular country or nation. To Mexicans society is primarily a large community (comunidad) with which they fundamentally identify themselves. This personal identification is not free from elements of misgivings and criticisms producing a certain degree of ambivalence. In the view of Mexicans society is made up of family (familia) and friends (amigos), forming a community (comunidad), or country (pais). The most elementary units of this large collective are persons (personas) or "Persona" refers to people or individuals who have to population (pueblo). be recognized for their personal uniqueness but who maintain a strong identification with family. Diaz-Guerrero (1982) made a comparison of the Semantic Differential meaning of the self for Mexican adolescents of Mexico City and for adolescents of 19 other language cultures. Mexicans evaluated "I Myself" lowest (except for the Hindi) among the 20 language cultures, which included nations from the Third World. Because concepts like father, mother and family received very high evaluation and potency ratings the authors hypothesize that the low self evaluation plays the role of relatively magnifying the other concepts. When the individual identifies with the family, the institution, the society, he suddenly experiences a great satisfaction. The data from AGA confirm that Mexicans do identify strongly with many gregariour concepts. Society is conceived as a framework for helping (ayuda) and co eration (cooperacion), progress (progreso), economic development (desa rollo, economico). Criticisms of corruption (corrupcion), selfishnes (egoismo), exploitation (explotacion), and injustice (injusticia) suggest that some of their high ideals and expectations remain unfulfilled. This also seems to show that Mexicans tend to identify "sociedad" with an existing social order they consider somewhat uniust.

To U.S. Americans, society is predominantly an aggregate of people representing independent individuals distinguished by status differences. Society represents then from the angle of the independent individual a framework of rules and regulations and standards which are recognized as more or less necessary sources of mestrictions and constraints. society is recognized as a source of shared values and culture, from the angle of the individual it is sometimes resented as presenting demands for conformity. Americans do seem, in contrast to Hispanics, to stress the restrictions posed by society. Part of Ronald Reagan's success can be attributed to his insistence on reducing the controls of Federa' Government. He is appealing to the facts discovered by AGA and to an .ven greater individualism with all its possible consequences. The perspectives of the two culture groups illustrate two differen' approaches to the social environment. To U.S. Americans societ is a large collective formed of individual people and groups controlled by invisible forces. Mexicans and Colombians it is a simple extension of their immediate environment of family, (familia) and community (comunidad) into a large social unit which they fundamentally identify with, although in many respects it is beyond the realm of their direct experiences.

# FREEDOM

### FREEDOM/LIBERTAD

As the sizable differences in the total scores indicate, freedom has a higher subjective dominance for the U.S. American student group. In line with the libertarian democratic tradition, U.S. Americans place a particularly strong emphasis on human rights (e.g., constitution, Bill of Rights). Freedom of expression and communication (speech, press)—rights frequently invoked. Liberty is a leading ideal which stresses exercising the rights of the individual. Americans view the United States as the personification of freedom; as their reactions show, it is the single most salient characteristic of their country; freedom is one of the very few themes which has a more politically oriented meaning for Americans than for Mexicans. This is underscored by freedom's close relationship to democracy, its association with fight ng and revolution, and its contrast to slavery and oppression.

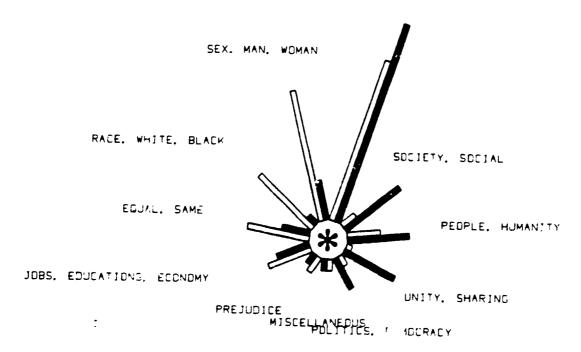

From the Mexican perspective, freedom (libertad) is a human quality or condition associated with love (amor), peace (paz), understanding (comprender), trust (confianza) joy (alegria), happiness (feliz), tranquility (tranquilicad), security (seguridad), responsibility (responsabilidad), order (orden), etc. These reactions suggest a strong Mexican concern with freedom which transcends the subjective individual interest and encompasses broader social and economic concerns as well. While the U.S. Americans emphasize re the subjective, personal, individual perspectives, the Mexicans think of general human and social aspects, with more emphasis on such broader social goals as progress and development and with particular emphasis on needs and necessity. is relatively little difference between the Mexicans and the Colombians except that the Colombians rhow somewhat more concern with issues associated with limitations of freedom: oppression (opresion), jail (carcel), and freedom fighters (luchadores).

There is little doubt that the American Revolution was followed by much better economic ages than the French Revolution. It is important in this context, however, to point out that while the first only stressed freedom and equality, the second underlined freedom, equality and <u>fraternity</u>. Once more the American student group emphasizes individual rights, while Mexicans highlight the social, the group interests considering fraternity (love, understanding) a sinequanon ingredient of freedom. This conceptual difference is the more striking in view of what follows. No difference in evaluation, potency, activity or total meaningfulness was found by Diaz-Guerrero and his team for the concept of freedom in highschoolers answering the pancultural (0.900d, May and Miron, 1975) Semantic Differential. In contrast the more individualistic concept of "Free Will" was clearly scored as better, more potent, more active and more meaningful by the American than the Mexican highschoolers in the same population.

# EQUALITY

RIGHTS. FAIR. GODD

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 16.

# EQUALITY/IGUALDAD

The substantially higher total score values of the U.S. group reflects a greater emphasis on equality by the Americans. The recognition of equality as a matter of human rights (derechos), justice (justicia), and fairness (justa) is most salient both from Mexican and U.S. American perspectives. The U.S. focus is more on legal and constitutional considerations. The Mexicans stress again such general human values as equity (equidad), justice (justicia), peace (paz), and liberty (libertad). Similarly, both groups give distinct attention to equality (equidad) as implying sameness, levelling, equilibrium (equilibrio), although the U.S. American emphasis on this dimension is more dominant.

Both groups express concern with the lack of equality, with discrimination, prejudice, inequality, etc. With regard to specific areas of life where equality is lacking, the focus of attention is quite different. The most salicit U.S. American concern appeared at this point in time to be the question of sexual equality, the unequal relationship between men and women. The attention given by Mexicans to this matter was about one-quarter of the U.S. American. Racial equality emerged as the second most salient U.S. concern with primary focus on Blacks and on minorities in general. A third area involved jobs, education, and economic conditions. While the U.S. Americans think primarily in terms of jobs and employment, the Mexicans have more economic (economica) differences in mind, particularly the status of the poor.

The Mexicans show more concern with the social dimension of equality compared to the U.S. focus on the individual. Their reactions such as society and social are rather sizable and explicit. They are accompanied by references to classes, politics, socialism, democracy, communism, and ideology reflecting a more politically oriented frame of reference. They also emphasize such social values as friendship (amistad), love (amor), and understanding. On these social and political dimensions, the Mexicans are even more emphatic than the Colombians.

Ball-Rokeach, Rokeach and Grube (1984) report that Americans (across the nation) typically rank freedom very high, third among 18 important values but equality much lower, twelfth among 18. They ask the crucial question: Is the average American much more interested in his own freedom than in the freedom of others? Again the social versus the individual concern has appeared strongly.

Diaz-Guerrero and his team found that White American highschoolers rated the concepts of Black, Red and Yellow races significantly less good, potent, active and meaningful than did the Mexican.

# LAW

POLICE, ENFORCEMENT

CRIME, PUNISHMENT

UNJUST, DPPRESSION

LAWYER, ATTORNEY

OBEY. RESPECT

SCHOOL, STUDY

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 17.

# LAW/LEY

From the Mexican point of view the central idea behind law (ley) is the notion of order (orden), which involves justice (justicia) and rights (derechos) and which has to be maintained and if necessary mandated by reliance on power (poder) and authority (autoridad). From the Mexican perspective law is an intrinsic order with its internal norms which become sources of duty (deber) and obligation (obligacion). The formal framework is provided by the government (gobierno), the president (presidente), the political leadership or organization of the country or nation. From this perspective the specific organs of law enforcement—the police (policia), the courts, judges (jueces), lawyers (abogado)—receive comparatively little attention.

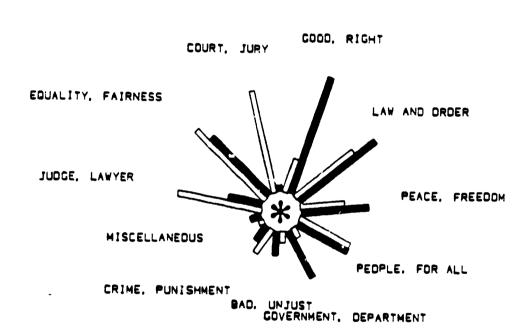

From the U.S. American perspective the priorities are somewhat different. Law is seen as a system of rules and regulations built on the principles of justice, order, and fairness. As an important function those who break the law and commit crimes have to be dealt with, punished, jailed, etc. The U.S. Americans focus on the function of lawyers, judges, and the courts in the interpretation and application of the law. Also, law is a field of knowledge which requires specialized schooling. Mexicans do not associate "ley" with specialized knowledge or schooling because in Spanish the field of law is not "ley" but "derecho"---thus, escuela de derecho (law school).

Mexicans also stress more that law is good (bueno), important (importante), and a necessity (necessidad), and that it should be fair (justa). At the same time they express rather distinct concern and dissatisfaction with unfair (injusta) and unjust (injusticia) conditions, with corruption (corrupcion) and the lack or nonexistence of law. Compared to the Colombians, the Mexican students think more of rules and code and less of order (orden), obligation (obligacion), and duty (deber).

Probably the differences reflect again different perspectives rather than disagreement with the humanistic core of the concept. The American students conceptualize law from a confident and satisfied outlook while Mexicans and Colombians wrestle with unsatisfied needs and possible ways to have the idealized concept of law actually work over injustice and corruption.

# JUSTICE

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I. page 18

## JUSTICE/JUSTICIA

As the much higher dominance score indicates, justice is a more dominant theme to U.S. Americans. Fairness and equality are the two leading ideals that are particularly salient to Americans, although equality (igualdad) receives considerable attention from Mexicans as well. Beyond the ideals and principles the primary interest of U.S. Americans is on law and its practical implementation. Fair implementation is seen as a function of courts of various types and of trial procedures, the role of judges, lawyers, as well as the police and to some extent the government.

Compared to these more practical, legal procedural considerations, the Mexicans' idea of justice is more social and while they do recognize the role of judges (juez) and lawyers (abogados), they pay less attention to their importance. They show less interest in details of administering justice except for those details related to law enforcement and retribution. From the angle of the Mexicans and U.S. Americans, certain human and interpersonal values and attitudes such as peace (paz), liberty (libertad), harmony (armonia), help (ayuda), love (amor), and duty (deber) received about similar attention. At the same time the Mexicans look at 'ustice more from a social and political angle n (hombre), society (sociedad), and social and stress the role of Also they emphasize more the role of considerations in general. politics (politica), government (gobierno), and constitution (constitucion). One possible explanation of the differences may be the broadly observed Mexican tendency to emphasize human attitudes and moral principles. They may consider these social values and attitudes as human preconditions indispensable for justice and its effective implementation.

Again the American students seem to perceive a highly organized and efficient structure dispensing justice, and their attention falls upon fairness and its practical implementation by the individuals involved. The Mexicans are hungry for justice. A questionnaire to measure degree of satisfaction of 21 important personal needs was applied by Diaz-Guerrero to more than 200 highschoolers in Mexico City. The need for justice was least satisfied of all the 21. The needs for love and friendship were the most satisfied. In the Semantic Differential study the concept of justice was significantly better, more powerful and more meaningful to the American than the Mexican highschoolers.

### SUMMARY

The social units here explored (community, society) should be considered together with those (self, family, etc.) analyzed in the context of other domains. In general, the Mexicans view social units as more than a loose aggregate of people. They place considerably more importance than do U.S. Americans on the larger collectives such as community and society. These units represent forces of cohesion and identification which provide the background for their social environment, and they view themselves as integral parts of them. The frequently observed Hispanic tendency to emphasize social attributes and consequences apparently is part of this social orientation. Mexicans take a predominantly positive attitude toward community and society which they see as natural frameworks for mutual help and cooperation.

That the Mexican perception of a loving and cohesive society is valid, at least after disaster hits some of its members, is beautifully illustrated by the recent holocaust in San Juan Ixtahuacan and the reaction of the inhabitants of Mexico City. By the third day after the disaster it was necessary to publicize by all the mass communication channels to please stop sending food, garments and money to the victims and their families because the saturation point had been surpassed. The donors included neighbors as poor as the victims and all social classes of the city. This in spite of the horrid economic crisis of Mexico and rampant inflation.

As a partial contrast, U.S. Americans are less favorably disposed toward large social units; they give them less attention, are more critical and skeptical about them, and view them with a quite different frame of mind. Community is a more meaningful and popular idea than society, but in contrast to the Hispanic emphasis on the interpersonal human dimension, community is thought of more as a place for meeting individual or social needs; that is, it appears to be more a source of practical benefits than of affective identification.

The contrast is even more articulate in their images of society. For U.S. Americans society is somehow "out there." It represents an aggregate of individuals. The concept implies an impersonal structure and organization which is abstracted from the ordinary lives of people. This structure is viewed as differentiated by class (high and low' and economic strata (rich and poor). Furthermore, it is seen as being regulated and concrolled by such invisible forces as rules, laws, standards, and morality. The undertone of many of the U.S. American reactions suggests a critical and skeptical posture apparently fed by feelings of doubt or outright rejection of society because of its impersonal authority. A second U.S. American meaning involves "high society," the fortunate and wealthy who are seen on the "social" pages of the newspapers.

For the Mexican, society is more immediate and experiential, pertaining to one's own environment and activities as a member of a particular family, community, club, city, culture, or national collective. Society is revealed in human interaction. For U.S. Americans society is made up of individuals bound and controlled by invisible forces, but for Hispanics society is a huge collective interwoven with forces of positive identification, unity, and practical necessity. Yet just like the U.S. Americans, Mexicans are also critical about certain aspects of society (bad, corrupt).

U.S. Americans are inclined to think mainly in terms of individual people rather than large collectives. They prefer to view people free of social-organizational constraints, as individuals who can be engaged, dealt with, worked with, and enjoyed on a strictly personal-individual basis and on the basis of common needs and shared interests. They show a strong desire to interact with people, to establish rapport, and to develop affective ties on a one-to-one basis.

The findings on social values—equality, freedom, justice, law—are consistent with the general cultural trends observed in the context of the U.S. American and Mexican images and meanings of community, society, and other social units. Again, the main U.S. emphasis is on the individual and the individual's interests and rights. U.S. Americans pay more attention to freedom and equality and leave no doubt that their concern is with unrestricted, equal rights granted to all people. Justice is viewed by them with special emphasis on fairness. For U.S. Americans enforcement of law and the implementation of justice are naturally inseparable from a certain amount of power and authority.

While the values of freedom and equality are directly related to the rights of the individual for U.S. Americans, the Mexicans consider these values more intensively in the context of their broad social implications. In their views of law and justice, Mexicans assign an important role to order, authority, and government. They stress the idea that power is needed for the implementation and enforcement of law, and the look to the government as the source of that power. In connection with justice, they attribute a bigger role to the government. This is probably the consequence of the Mexicans' disposition to see law and justice more as social issues, emphasizing their social dimensions and consequences. For the U.S. Americans primary interest is in the practical implementation of law and justice, with heavy emphasis on the roles (police, judges) and institutions (court, jail) involved in the administration of justice. In the Mexican perspective crime and punishment attract less attention, while justice and order, go-One vernment and country, power and authority assume greater importance. could even observe that, considering the economic conditions and the distribution of the wealth in Mexico, the emphasis placed on equality by Mexicans is rather moderate. In contrast, the problems of justice and injustice, which are little discussed in the literature, seem to be a relatively more dominant concern to Mexicans.

In general, the social units and values explored convey different philosophies reflecting characteristic differences in the individual's relationship to the social environment. In the case of the U.S. Americans we find characteristic manifestations of individualism such as the emphasis on relationships with people as individuals and on personal ties which are dyadic and have the self as the main point of anchorage.

In the case of the Mexican large collectives such as community and society play a greater role. They are the important reference points for social thinking and social orientation. The Mexicans see themselves as persons who do not stand alone but who are an important part of a social unit. Although they show certain dissatisfaction with the prevailing social conditions particularly from the angle of equity and justice, they still show a high regard for community and society at least at a level of abstractions and ideals.

While several authors (Clark, 1959; Madsen, 1972; Mintz, 1966) stress the importance of social stratification and hierarchical social organization with regard to various Hispanic groups, the data analyzed in the context of this study give little indication that Mexicans have a structural view of society which reflects strong social stratification.

9j

#### CHAPTER C

## LOVE. SEX

Motives and affects are powerful driving forces of human behavior. They are highly subjective and the least accessible to empirical analysis and assessment. Our present focus is on love and sex, how they are viewed by Americans and Mexicans.

While love and sex are universally human, the anthropological literature is rich and colorful in presenting cultural variations. Culture shapes, institutionalizes, promotes, curtails, idealizes or vilifies certain patterns of affective and sexual relations. A less explored aspect of these cultural variations is the culture-dependent nature of the concepts themselves. Few of us realize, for instance, how much our concept of sex is a product of our own culture. This is true to such an extent that we encounter considerable difficulty translating this concept into other languages. Even after adapting sex to "sexo" in Spanish, rather different meanings are conveyed.

Most of the literature discussing Hispanic American sex roles agree that Hispanic Americans differentiate intensively between male and female roles and view sex as an important source of differences (Madsen, 1972; Wolf, 1972; Wells, 1969). In this characterization special emphasis is placed on the domineering macho male role and the subordinate role of the woman. Other authors like Fitzpatrick (1971) and Safa (1980) suggest that Hispanic women may have their own subtle but effective ways of exerting their influence. The previously explored family domain showed relatively little sex differentiation by the Mexicans, at least when compared with U.S. Americans. Against this background it is interesting to explore how the U.S. and Mexican images associated with man and woman compare.

# LOVE

### LOVE/AMOR

Although love suggests dominantly positive feelings, affects, and emotions for both groups, the Americans think more of caring, while feeling and sentiment are particularly central for the Mexicans. Compared to the American emphasis on trust, there is more emphasis from the Mexicans on understanding, which refers more to an attitude of empathy and acceptance than an intellectual process. Beyond this essential agreement in the affective, emotional content of love, there are considerable differences in the specific contexts---people, relationships---considered by the American and Mexican students. In gereral, the Mexicans think more of family (familia), parents (padres), and siblings (hermanos), and in the context of marriage, the bride (novia) and groom (novio). They think also of friends, suggesting more concern with lasting and stable interpersonal rela^ionships. At the same time there is more U.S. American emphasis on a person's emotional needs: happiness, peace, and security. They convey a more optimistic view of love meaning necessarily happiness, security and peace. For the Mexicans this is not necessarily so. Mexican songs and poetry, more so than the American, frequently stress unhappiness, insecurity and conflict linked with love. As the high divorce rate indicates, love in the U.S. is not free of problems either. With a stronger focus on the sexual connotation, when problems arise Americans are probably inclined to view them as indicative not of love but a lack of it.

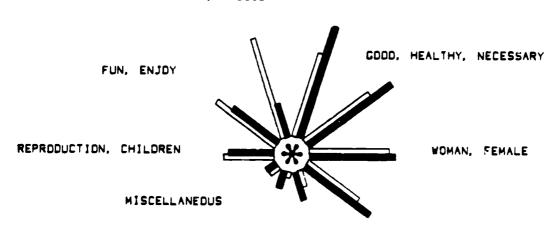

The U.S. American emphasis on love and on positive interpersonal relations is also strong, but it suggests a different orientation. Here love may have a stronger foundation in the person's own need to establish a meaningful relationship than in the affects invested in the other person for his or her own sake. For U.S. Americans love apparently provides a much needed affective bond for the individual to interrelate with others which is probably the reason that love is considered the main source of happiness. This more idiocentric view of love is reflected by the American disposition to think in terms of the contrast of love and hate.

A sizable component of the U.S. meaning of love is sex. A sex oriented interpretation of love naturally supports the importance of individual needs as the motivational source of love. Additionally, while there is more U.S. emphasis on need and want, the Mexicans show stronger tendencies to idealize love for its own sake, as something good and beautiful. The Mexicans are closer to the Colombians in emphasizing the role of friends, or friendship and understanding.

# SEX

LOVE, UNDERSTAND, RELATION.

TABU, BAD MAN, MALE DIFFERENCE, GENDER

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 20  $\,$ 

## SEX/SEXO

From the Mexican point of view the meaning of sex is dominated by differences in gender, by the contrast between males and females. While this distinction is important to U.S. Americans as well, their view is dominated by the idea of sex as the act of intercourse and its resulting pleasure. In Spanish, "relacion" is also used to denote intercourse. Thus, "to have sex" in Mexico is "tener relaciones" or "tener relaciones sexuales."

The U.S. references to fun and enjoyment as components of sex convey idiocentric, entertainment oriented views. Love is of similarly high salience to both culture groups, but as shown in its context, this has originally rather strong sexual connotations for the U.S. Americans. Both U.S. Americans and Mexicans characterize sex as good and healthy and produce practically no critical reactions. Similarly, both groups give consideration to the dimension of reproduction and children. In this context the idea of marriage (matrimonio) shows low salience with both groups.

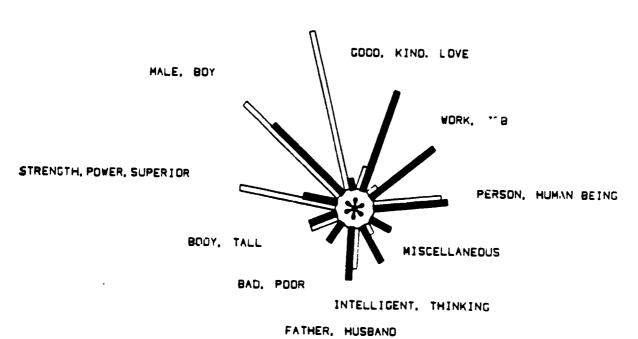

In general, there is considerable agreement between Colombians and U.S. Americans that sex involves differences in gender; but while gender differences represent most of the Colombian meaning of sex, the American meaning of sex is centered primarily on intercourse as a source of need-satisfaction and entertainment. The Mexican view stands closer in practically all respects to the Colombian than to the U.S. American. The only exception is a more emphatic Mexican appraisal of sex as good, natural and necessary.

Definitely "sex" has acquired a different meaning in Mexico and the U.S. This may be due to a freer expression on matters of sex, implying sexual relations, in the U.S. According to Osgood's Semantic Differential data obtained in the sixties from samples of U.S. and Mexican 14 to 16 year old high school students, "sex" is significantly more meaningful and has higher evaluation, potency and activity in the U.S. than in Mexico. The difference has appeared at even the common dictionary level. In Mexico and the U.S. the first and second connotations are related to gender. In the U.S. the third and fourth connotation of sex refer to sexual intercourse; in the Mexico the third connotation is "sex organs" and there is no connotation of sexual intercourse.

# MAN

## WOMAN

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 21.

## MAN/HOMBRE

In thinking of man, the most pervasive idea dominating the U.S. image is that of the male identity. This becomes apparent not only from the number of direct references to maleness and other elements of the sexual image, but even more so from the contrasting or complementary relationship to woman. The Mexican image of man (hombre) also includes male characteristics: masculine (masculino), macho (macho), but somewhat surprisingly the explicit emphasis on maleness and the virile characteristics is greater by the U.S. Americans than by the Mexicans. In the Mexican image of man the human being (humano) and person (persona) are dominant. This is due in part to the fact that the word "hombre" means both "man" (as opposed to woman) and "human being" (as opposed to animals), emphasizing the idea of rationality. While "man" in English has both of these referents as well, the idea of maleness is apparently more salient.

The importance of this perspective is furthermore apparent from the considerable attention the Mexicans pay to the family role and social qualities of man and his relationships to the community and society. In this context the notion of man as a social being with social qualities and responsibilities is furthered. Diaz-Guerrero has frequently pointed out in lectures that the Mexican and Latin "machismo" is far more androgynous than the American. In effect the Latin "macho" far oftener than its American counterpart, combines power, strength and even violence with very feminine psychological traits such as poetry, singing, music and romance: expressiveness rather than instrumentality, affiliative interdependence rather than autonomy.

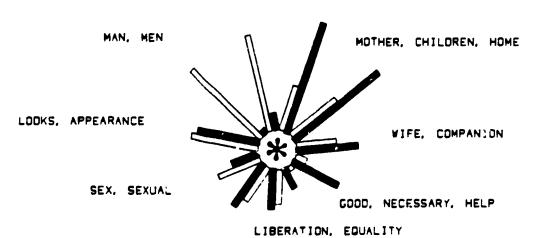

A set of related characteristics show the Mexican view of man in terms of his work (trabajo) and intallect. While U.S. Americans stress here strength and power, the salient Mexican attributes involve reason (razon), rationality (racional), thought (pensar), and intelligence (inteligente). These are accompanied by social qualities such as love (amor), responsibility (responsable), friendship (amistad), and goodness (bondad) counterbalanced by some negative characterizations as bad and destructive. Among the masculine roles, father and husband receive primary attention; among the affective roles, love (amor) and friendship (amistad) are salient.

Finally, there is an interesting cluster of Mexican reactions dealing with being, existence and development, totally unparalleled by the U.S. group. These reactions support the oft-quoted observation of Kluckhohn and Strodtbeck (1961) that the U.S. action orientation which stresses doing and achieving stands in vivid contrast to most traditional critures which emphasize being and existence. The present findings bear on this important but subtle distinction, which involves dispositions not readily accessible to empirical assessment. The Mexican image of man again shows a close congruence with the Colombian.

# WDMAN

LO/E, UNDERSTANDING FEMALE, LADY

WORK, STRONG, INTELLIGENT

ME. PERSON

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 22.

# WOMAN/MUJER

The American image of woman is dominated again by the male-female contrast. As was previously observed in the context of man, the relationship to the opposite sex receives special attention. Again, in the case of woman this is accompanied by a heavy U.S. American emphasis on sex.

In the Mexican image the most salient attributes include such human and social qualities as love (amor), being good (buena), understanding (comprension), and sincerity (sincera). Mexicans also give salient attention to the role of woman in the context of family, as mother and caretaker of children. This role is salient in the eyes of U.S. Americans as well, but to a lesser extent than is the case with the Mexicans.

Both groups think intensively of marriage but pay somewhat different attention to the various attributes and characteristics of women. Work and intellect, which were salient attributes of man in the eyes of the Mexicans, are given considerable attention in the case of woman. There is here a particularly interesting difference compared to the Colombians who paid little attention to these qualities  $p_{\tilde{c}}$  ticularly compared to the attention giver to appearance: beauty (belleza) and pretty (linda) representing particularly salient reactions. The issues of women's rights, liberation, and ERA received relatively little attention from the Mexicans.

A case can be made that the social personalism vs. individualism dimension, with its expressions of idiocentrism vs. alocentrism and active vs. passive styles of coping, is fundamental in explaining the frames of reference of Anglo and Latin Americans, which affect the sex roles as well. To establish substantial correlations between these dimensions and the trends across concepts will verify this assumption. Interest in and concern for others, the concern for society and humanity that social personalism imples, may have considerable advantages in interpersonal relations and in the relation of the sexes. At the same time individualism provides a strong force for economic development and technological achievements. On the other hand, the tight interpersonal relationships among Mexicans (and other Hispanic groups) may result in heavy influences by parents, male family members, and other authority figures leading to dependence and even to corruption (Diaz-Loving and Andrade, in press).

It may be considered proper to hypothesize that some differences between Colombians and Mexicans will be due to the greater modernization of the Mexicans. Again a measure of traditionalism or modernization included in further studies will permit to test this hypothesis. There may also be differences as a result of imperfect comparability in the two samples. There may have been a stronger church influence on the Colombian sample or those students may have come from a higher socioeconomic level. Mexican students, more than any other Latin Americans with the exception of Cubans, and possibly Brazilians, Chileans, and Argentines, come predominantly from working class families.

# MARRIAGE

GOOD, FOREVER, LIF : DIVORCE, PROBLEMS RELIGION, CHURCH

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 23.

### MARRIAGE/MATRIMONIO

There is little difference in the essentials. Both Mexicans and U.S. Americans agree that marriage is a union between man and woman, husband and wife. In terms of what designation the marriage partners receive, U.S. Americans think more of husband and, particularly, wife, while Mexicans and Colombians speak more of man and woman; this is probably just a matter of labelling, although the generally stronger U.S. emphasis on the husband-wife relationship was a constant pattern throughout the domain of family (Chapter 3). With regard to the affective content of the relationship, it may be worth mentioning, however, that love and sex are the dominant ideas for U.S. Americans, while in addition to love, union and understanding are the dominant ideas for Mexicans. Some of the relevant differences, such as the U.S. emphasis on togetherness and the Mexican emphasis on union, are discussed in Chapter 4. It is suggested that the U.S. notion of togetherness reflects a view of interpersonal relations in which the individuality of the partners is retained and emphasized. At the same time union implies a fusion of two persons without stressing their separate idenlities.

It is probably a reflection of the lower divorce rate that Mexicans show only a small fraction of concern with divorce as a possible future development, while this possibility looms large in the case of the U.S. Americans. The idea of children appears to be more dominant to Mexicans than to the U.S. Americans. We had found previously that, considering family and intramarital relations, Mexicans have consistently emphasized the parent-child relationship.

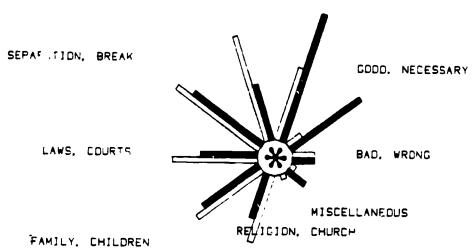

Based on the elaborate Mexican wedding celebrations it comes somewhat as a surprise that Mexicans give less thought to the wedding ceremony than U.S. Americans. The Colombians and Mexicans show close agreement except that the Mexicans place less emphasis on religion, but even more on family and children.

### DIVORCE

MARITAL PROBLEMS

MARRIAGE, HUSBAND, WIFE

PAIN. SADNESS. HURT

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix 1, page 24

#### DIVORCE/DIVORCIO

While both culture groups emphasize separation, ending the marriage relationship, the various aspects of this process receive different attention. The Mexicans show more intensive preoccupation with the various causes of divorce. Among these, lack of understanding (incomprension) is in first place, followed by lack of love (desamor). From the U.S. American angle, hatred, adultery, and fighting appear to be similarly prevalent causes. The American group is particularly aware of the negative effects suffered by the family, especially the children. The human, emotional consequences are described more vividiy and with more explicit compassion by the U.S. group; their most frequent reactions were sadness, pain, hurt, unhappiness.

The U.S. group is also more emphatic in its attention to the legal process involved in divorce. The court, the roles of the lawyers and judges, the alimony, the expenses, and the settlement are vividly in their minds. While some of these associations may come vicariously from television and other mass media exposures, other elements may have their origin in direct personal experience. The Mexicans mention most of these elements of the divorce process as well, although the overall attention they give them is markedly less. Interestingly, alimony, which ranks high in the U.S. interest, was not mentioned at all by Mexicans. While both groups show similar concern with the negative consequences of divorce, the U.S. reactions suggest a more direct involvement, more first-hand experience with the problem. One likely explanation is the lower divorce rate in Mexico.

Compared to the Colombians, the Mexicans stress more the necessity of divorce and characterize it also more as desirable. This is consistent with their stronger preoccupation with marital problems and greater modernization.

#### SUMMARY

Beyond the essentially common core the Mexicans and U.S. Americans show some characteristic differences in their views and feelings about love and sex, differences which in light of the previous results do not appear accidental. Love is naturally of high personal importance to both groups; to both it involves warm personal feelings, strong affective attachment primarily to family members and representatives of the opposite sex. The differences between Mexicans and U.S. Americans lie in the actual nature of affective attachment, its level of differentiation, and its application to particular people and groups. The findings provide new insights into how people feel about and relate to each other in two different cultural environments.

In its American conceptualization love is an emotional tie for which the individual feels a strong need or desire. When this personal desire is met, when the individual is loved, this is considered as the peak of satisfaction and happiness. From this perspective sex is a major component of love, if not its very root or core in a sense reminiscent of Sigmund Freud. To the Mexicans love is not only more affect-laden but it is more externally anchored and is characterized primarily by understanding which involves a readiness for empathy and acceptance.

While sex represents predominantly gender to Mexicans, it is more intimately related to love for U.S. Americans. Similarly, it is a source of fun and enjoyment, a scurce of pleasure and satisfaction to the U.S. group.

The images the two culture groups have of man and woman convey essentially similar trends about the culturally characteristic relationships between the two sexes. We found that U.S. Americans more frequently emphasize sexual identification and perceive a stronger contrast between the two sexes. They pay more attention to physical differences and are more inclined to see man in the role of husband and woman in the role of wife. They also capitalize more on attributes which differentiate man from woman: they see the man as leader and head and woman as a housewife, soft, warm, etc. Finally, the U.S. Americans tend to identify themselves more in terms of their sexual identity.

The Mexicans are, of course, also aware of sex differences but their approach shows some interesting contrasts. First of all, it is important to recognize that for Latin Americans sex means gender to a large extent. They think of people as feminine or masculine. These appelations correlate closely with sex but they refer primarily to personality attributes rather than to sex in a narrow sense. Mexicans are also more inclined to think in terms of parental roles (father-

mother) rather than those of marriage partners. As already observed in the family domain, Mexicans show stronger concern with the parent-child relationship. They pay more attention to characteristics common to both man and woman and see both as good or bad as far as social moral qualities are concerned.

While the U.S. Americans see man primarily in contrast to woman, to the Mexicans the humanness in contrast to animal is the main dimension. Far beyond his maleness Mexicans view man in terms of his intellectual qualities, his rationality, and his work. Along humanness the central idea is that of the "person", one who is a part of such larger social units as community, society, and the world in the sense of mankind. The Mexican concept of person differs in several important and characteristic ways from the U.S. American concept of the individual. These differences bear closely on those discussed with regard to the culturally dominant patterns of interpersonal relations, including the somewhat different interpretation of love and friendship.

To U.S. Americans companionship is a close synonym for marriage. Fundamentally, they see in marriage a partnership between two people. Consistent with the findings on family and family roles, U.S. Americans emphasize the emotional ties (love, sex) in marriage and companionship substantially more than do the Mexicans. Again, for U.S. Americans husband and wife roles are more important while the Mexicans are preoccupied with the parent-child relationship and with father-mother roles, with special regard for the home and its important function as a social unit for nurturing and upbringing. Accordingly, perspective of the Mexicans marriage constitutes a union, and results in a unit, with child care and upbringing as a central function. With the U.S. Americans' emphasis on togetherness and the relationship of the two marriage partners, the affective ties naturally acquire vital importance. To the extent affects are frequently unstable or transient, an individualistic emphasis on affective ties between the marriage partners makes the stability of the marriage and the probability of divorce a function of the partners' success in maintaining mutually satisfactory affective ties. Indeed, U.S. Americans do see a much closer potential relationship between marriage and divorce. Since they view marriage as providing warmth, security, and sharing (i.e., an emotionally satisfying togetherness), divorce is not a welcome option for U.S. Americans, but it follows from their view of marriage that this alternative has to be taken seriously into consideration.

As an interesting and new insight the results suggest that along the dominantly individualistic (U.S. American) and social personalistic (Mexican) approaches to interpersonal relations, love appears in two main modalities. The love contingent on predominantly individualistic social relations as characteristic of U.S. society seems to have its primary roots in the autonomous self-anchored individual, his needs to develop and maintain positive and meaningful relations with others. Just as this situation creates a need for friendship, it creates a need for

love. Since the satisfaction of this need is only possible under conditions of mutuality, since it requires a give-and-take relationship, it results in a search for external satisfaction. The object of this search is another individual with whom love can be mutually shared. With some simplification, in this individualistic paradigm love becomes essentially an instrument of internal need calling for external satisfaction.

The second paradigm, which appears predominant in the case of the Mexicans and particularly the Colombians, is characteristic of the person who invests love in others for their sake or for the sake of some common goals---family, children. This is not propelled by internal needs but by sentiments and interests anchored in the other person or in shared superordinate goals. Such an approach is consistent with the view of the other-directed personality.

#### CHAPTER 7

#### RELIGION, MORALITY

The gods and spirits of old mythologies as well as the spiritual and moral precepts of the world's contemporary religions naturally have a close relationship to people's world views and frames of reference. Since a person's relationship to the transcendental and supernatural is characteristically abstract, religions and ethical systems are particularly important sources of cultural differences.

The influences of Catholicism and Protestantism on the Hispanic and Anglo American cultures have received considerable attention from theologians, historians, and philosophers of culture and religion. The following analysis is neither historical nor philosophical but represents an attempt to find some empirical answers on how U.S. Americans' and Mexicans' views of religion compare. Our primary interest is naturally in some of the salient characteristics of their overall religious/moral frames of reference with direct bearing on personality organization and the dominant patterns of interpersonal relations.

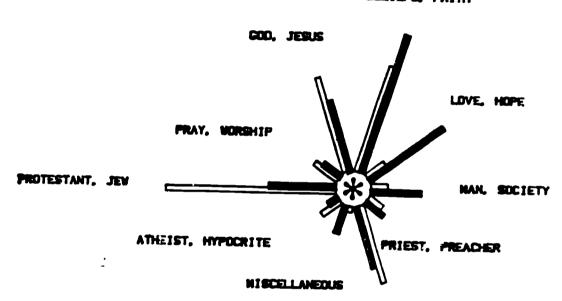

Several leading psycho-cultural theories identify moral precepts like conscience and guilt as playing a central role in creating different personality types and in shaping people's social behavior. Rotter (1966) makes a distinction between inner-directed and outer-directed personality types. Mead (1953), Heller (1966), and Szapocznik (1978) have discussed analogous U.S. vs. Hispanic differences in terms of field dependence or independence.

An earlier comparison of Anglo American and Hispanic American culture groups (Szalay et al., 1978a) did produce similar empirical evidence which has underscored the distinction between inner- and outer-directedness. Since this distinction received considerable attention, the following analysis will seek some further clarification by including into our consideration such key notions as guilt, conscience, and morality. This analysis will also include an examination of how Mexicans compare to U.S. Americans and to what extent their meanings of concepts relevant to personality organization may reveal different patterns of organization.

# RELIGION

BELIEFS, FAITH

#### RELIGION/RELIGION

To U.S. Americans religion refers primarily to established denominations such as Catholics, Jews, Protestants, including a broad variety of cults and sects. This reflects a pluralistic religious philosophy and diverse cultural experiences. The amount of attention given to specific denominations is generally proportionate with the size or importance of particular religions in the United States. The U.S. Americans think also more intensively of such tangibles as church and Bible, places and forms of wo ip, and of the activity of worship and prayer in general. Americans also express more skeptical or critical attitudes, as conveyed by reactions such as "bad" and "crutch."

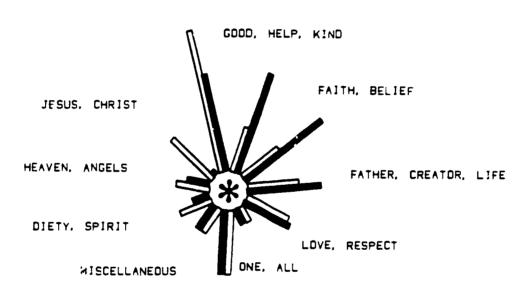

The Mexicans show a somewhat different focus of interest. In the minds of both groups similar weight is given to faith (fe) and belief (creencia) but the Mexicans place more weight on the moral and affective content of religion, love (amor), and understanding (comprension). This is quite consistent with our observation in the context of GOD that Mexicans place more emphasis on affective, personal rapport. From the Mexicans' perspective, religion appears less as a matter of personal choice or a matter of private decision regarding how to shape one's relationship with God. Instead it appears to be a broad existential involvement, which is both emotional and intellectual. It directly affects one's personal values and relations with others. The source of this socially oriented and moral view of religion probably stems from a Catholic tradition which does not separate church but encompasses religion as a part of the broad frame of reference affecting every aspect of human existence. The Colombians, like the Mexicans, think more of religion and God in the context of persons (personas), family (familia), society (sociedad); both groups show more affective, emotional involvement.

When highschoolers in Illinois and Mexico responded to the concept religion through Osgood's Semantic Differential, the affective meaning of religion appeared equally good and potent but the concept was significantly more dynamic for the Mexicans. The Mexicans also agreed more among themse'ves on its meaning than Americans, who as observed before, have a more diversified meaning of religion. Americans have revealed a more abstract and impersonal view of religion. For Mexicans religion has a meaning closer to life and existence.

### GOD

RELIGION, CHURCH

POWERFUL, SUPERIOR

# Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix I. page 26

#### GOD/DIOS

The differences which emerge between U.S. Americans and Mexicans in their subjective images of God may not be altogether surprising to those who are well acquainted with both cultures. Once these differences are identified they can be rather readily explained by the background and experiences of the two groups compared. The U.S. American image of God includes Jesus Christ, the Lord, a supreme being, a spirit who is in Heaven. Who is central in religion, in the Bible, and who is worshipped in church.

Most of these elements are present in the Mexicans' image of God as well, but their focus of attention is markedly different from the U.S. Mexicans perceive God as a superior and supreme (supremo) Americans. being endowed with power (power) and strength (fuerza), characteristics stressed more by the Mexicans than the U.S. Americans. God is viewed as the creator (creador) and the father\* (padre) of man, an omnipotent, omnipresent source of existence or being (ser). Parallel to these superhuman attributes, the Mexicans project strong human and social qualities into divinity. While both groups think of the goodness of God as a salient quality, Mexicans stress such additional qualities as helping (ayuda), understanding (comprension), fairness (justo), and being a friend (amigo). This conveys a sense of closeness combined with strong emotional identification, love (amor) and understanding (comprension). Love is also a salient element in the U.S. Americans' image of God, but compared to the Mexicans the affective elements are less dominant. While U.S. Americans tend to perceive a more private one-to-one relationship with God, for Mexicans God is characterized by human qualities with stronger interpersonal, social implications.

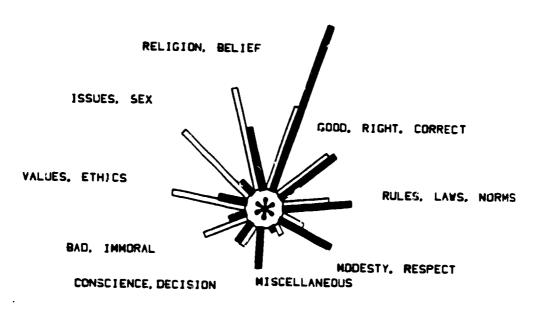

The subjective meaning of God through the Semantic Differential is very similar to Illinois and Mexico highschoolers. The affective synonyms of love, freedom and knowledge and the antonyms of sin, pain, and fatalism are identical. In this case the AGA technique has shown itself more discriminating than the Semantic Differential.

<sup>\*</sup>The Mexican references to father are somewhat ambiguous in the sense that some of our respondents may have had the Pope (Papa) rather than father (papa) in mind.

### MORALITY

SOCIETY, PEOPLE

EDUCATION

# Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix I, page 21.

#### MORALITY/MORALIDAD

From the U.S. American cultural perspective morality is essentially a matter of making a proper choice between good and bad, right and wrong, virtue and sin. While Americans give both positive and negative alternatives similar consideration, Mexicans emphasize nearly exclusively the positive ideals and virtues. Along a pragmatic, problem oriented approach Americans view morality in the context of practical problems which involve moral issues. Here sex is the main context; they mention problems of sexual mores, marriage, problems of life and death, drugs, etc.

Both U.S. Americans and Mexicans see a close connection between religion and morality, with strong U.S. emphasis on church and the more tangible elements of religion: e.g., the Bible. There is also an agreement by both groups on the central importance of ethical and moral standards, rules and principles.

Compared to the strong U.S. emphasis on practical moral issues and problems, to the Mexicans morality connotes more intensively virtues and high ideals. Particularly salient are those values and virtues with social implications, ones that require the denial of self and the recognition of others: e.g., trust (confianza), respect (respeto), honesty (honradez), respect (respeto), and responsibility (responsable). (In Spanish "honestidad" may mean both honesty and modesty and even chastity in its sexual connotation. Here we have translated "honradez" as honesty and "honestidad" as modesty. It should be mentioned, however, that these word choices are rather ambiguous.)

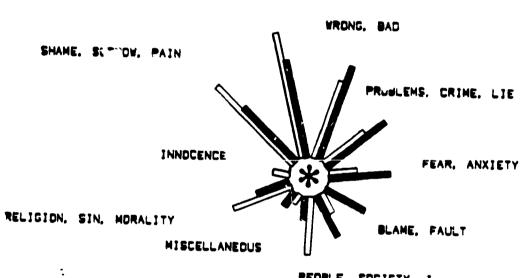

U.S. Americans tend to emphasize morality as a function of individual choice and conscience, while the Mexicans think of morality as the virtue of a social person who is considerate and understanding of others. Along with their emphasis on ideals guiding human behavior, Mexicars think more of morality as a matter of ethics (etica), education (educacion), and ethical conduct (conducta, comportamiento). To U.S. Americans with their emphasis on the inner-directed autonomous individual, morality is more a matter of individual conscience, standards and judgment. Even when compared with Colombians, the Mexicans stress society, family, friends more, concentrating their attention on the human and social dimensions.

As far as the intensity with which morality is adhered to, Mexicans appear close to Americans as shown in Osgood's (1971) "moral polarization scale." Where morality is exerted is different, but the strength of the concept is similar.

### GUILT

### CONSCIENCE. COMPLEX

PEOPLE, SOCIETY, 1 COURT, LAW, JAIL

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 28.

#### GUILT/CULPA

As the substantially higher dominance score indicates, guilt is a more dominant theme to U.S. Americans than to Mexicans. The U.S. group regards guilt much more as a legal matter, such as judgments passed by a court. The U.S. group's view of guilt is also more a matter of criminal behavior. As a consequence, the U.S. Americans also give intensive consideration to legal perspectives: court, punishment, and jail. Most of these differences follow from the predominantly individualistically based notion of guilt of U.S. Americans, which is shared only to a limited extent by Mexicans.

From the U.S. perspective guilt is predominantly an individual's subjective reaction to his own conscience. To Mexicans guilt is more a question of making a mistake (error), failing to meet responsibilities, which is followed by external blame and shame. To Americans guilt leads to internalized feelings of shame and remorse, resulting from a personal moral judgment of conscience, of being bad and wrong. Following this rationale, the most salient U.S. reactions deal with the negative feelings resulting from a sense of guilt, such as anxiety, fear, hurt, pain, as they accompany certain choices recognized internally as bad and wrong. Consistent with this view is the strong U.S. disposition to see guilt in relationship to sin and to associate it more intrinsically with religion.

There are two main areas of difference between the Mexicans and the Colombians. The Colombians show more preoccupation with the legal perspectives and consequences: judge (juez), law (ley), and jail (carcel). At the same time the Mexicans consider more the moral dimension: bad (mala), wickedness (maldad).

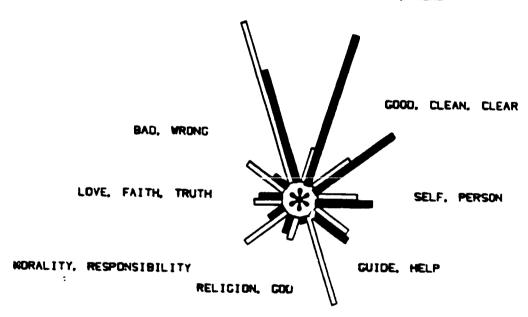

In agreement with the AGA results, the Semantic Differential results show the concept of guilt to be equally bad and dynamic but much less powerful in Mexico than in the U.S. While among the subjective synonyms for the Americans we find shame, for the Mexicans there is anger, clearly referring to some institution or person that should be blamed for being guilty. Among the antonyms for the Americans there is the self. They clearly do not want to harbor guilt. Other antonyms are love, courage and laughter. Antonyms for the Mexicans are: Devotic sympathy, love and happiness.

MIND. FEELINGS

AVARE, KNOVING, REAL

CUILT, WORRY

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 29.

#### CONSCIENCE/CONCIENCIA

Conscience is an internal guide as well as a quality of self awareness for both U.S. Americans and Mexicans. Yet there are some characteristic differences in their cultural views and conceptualizations of conscience which bear on its nature and functioning as a guiding mechanism.

In the case of the U.S. Americans this internal guide involves a duality, a juxtaposition of two main elements, one represented by the ego or self and the other by a guidance or control system which is reminiscent of the Freudian superego, or what is frequently referred to in more simple terms as guilt. In this view conscience has a judgmental function which tells the individual right from wrong. Inherent in this view is the rationale that the individual should pay close attention to his conscience, follow its lead and obey its voice. While it may not always be followed, conscience has the potential to exert various degrees of control over the individual's behavior. If disregarded, it is likely to be followed by feelings of guilt and worry, which receive special attention from Americans.

The Mexicans view conscience as a personal quality, a source of tranquility (tranquilidad) and peace (tranquildad). Conscience reflects the goodness of the person. The Mexicans'notions of a bad conscience and guilt are almost nonexistent when compared with the U.S. American group. Mexicans assume that conscience affects thinking (pensar), reasoning (razonamiento), and understanding (comprender); knowing (conocer) and understanding play a particularly important role. These qualities are overtly manifested and readily apparent in someone said to be a person of conscience. In this sense conscience is not a focal point or object of interaction with the self but rather an inner quality revealed by one's way of thinking in personal life and social interactions. Conscience implies responsibility to others.

In general, conscience appears to Mexicans as well as to Colombians more as a spiritual, even transcendental-religious quality of the person, while to U.S. Americans it is a psychological entity, a guiding mechanism involved in the personal decisions of the individual.

Social consciousness and conscientization are flags repeatedly waved by newspaper editorialists and particularly by leaders of syndicate; and student leaders in Mexico. That consciousness, beyond its more cognitive connotations, is often external to the individual can be seen even in the Spanish language. If a Mexican child breaks mama's favorate flower vase, he will say "se rompio"---it broke itself! No such idiomatic escape is available to the Anglo American.

#### SHAME/VERGUENZA

For both culture groups shame has a strong negative connotation, but the U.S. American reactions convey stronger moralistic undertones; Americans see shame in close connection with wrong and evil. Also, to Americans shame stands in close relationship to guilt and bad conscience; it appears as a natural consequence of wrongdoing, immorality, or sin. These contexts are recognized as sources of personal embarrassment and remorse.

For Mexicans shame has apparently little relationship to guilt and is less related to conscience than it is for U.S. Americans. Shame appears for them to stem from an event or condition beyond the person's control which pecomes a source of sadness (tristeza), sorrow (pena), fear (temor), and anguish (angustia). The specific sources of shame mentioned by Mexicans include rubbing and thievery. This may explain why the Mexicans mention sorrow and anguish and other psychological and emotional reactions accompanying shame. These consequences appear to be beyond the influence of the individual and their roots apparently have stronger foundation in the Mexicans' preoccupation with the social consequences rather than the individual's own conscience. "Es una verguenza"---It is a shame---often refers to happenings affecting the family, the society, or the nation.

These U.S. and Mexican differences are reminiscent of the distinction introduced some forty years ago by Ruth Benedict (1946), who has divided people into two main groups: shame cultures and guilt cultures. With little emphasis on conscience or the causes of guilt, the Mexicans are more preoccupied with the observable act (e.g., theft) which then becomes a source of personal pain and tribulation due to a predominantly social humiliation. The Colombians views are closely related to the Mexican, with more emphasis, however, on inner sorrow but less on the external manifestations of shame and embarrassment.

That "shame" is a different concept in Mexico and the U.S. is clearly shown by the Semantic Differential results in the previously mentioned highschoolers. They not only disagree more on its subjective meaning but to Mexicans it is less meaningful and less bad than for the Americans. the polarity becomes obvious is in the concept of pride, which was quite antonymic of shame for Americans while it was the closest synonym for Mexicans. To show pride or arrogance was the worst sin among the Aztec The Mexican Mestizo and Indian of today will still tend to insist that they are incapable and little to avoid the terrible, satanic sin of pride. Even distinguished Mexican scientists and professionals today may start their lectures minimizing their accomplishments. In Spanish (as in Chinese) one of the worst possible insults is for one person to tell another that he or (much worse) she has no sense of shame. To call someone a "sinverguenza" has about the force of "son-of-a-bitch" (and is occasionally translated that way). It implies that the person is no better than an animal and reflects on the honor of his parents. Shame was probably rated as less bad by Mexicans in the above study because having shame indicates that the individual is not wholly bad (i.e., sinverguenza, without shame).

#### SUMMARY

Our summary of Mexican and U.S. American subjective views of religion and morality focuses on three main subjects: (a) trends reflected by the cultural views of religious themes, (b) trends shown by moral themes, and (c) moral precepts and social control.

The U.S. American views emerging from the analysis reflect an approach to religion based on free choice and individual decision accompanied by an intensive awareness of religious pluralism. This underscores their private, individualistic relationship to religion in general and to God in particular. Whether due to a general trait of practical orientation or to an emphasis on personal decisions, U.S. Americans pay more attention to certain tangible manifestations of religion, i.e., specific denominations, churches, activities, and prayer. With regard to God, they stress denominations, Jesus, Bible, heaven, devil, and other details learned through religious instruction. A sizable element here is the recognition of deity and spirit with a supernatural but perhaps more erudite-intellectual note, at least compared to the Mexicans.

The Mexicans' approach is more affect-laden with more emphasis on love and understanding. They consistently stress faith and belief and convey a view of universality, Catholicism, with little attention given to alternatives. God appears from the Mexican perspective both as an almighty and supernatural being and as a loving father and friend. This more uniform, homogeneous view of religion by Mexicans who hardly mention choices and alternatives, is probably the consequence of the dominance of a single main denomination, Catholicism, in their cultural environment. In agreement with the Catholic view, there is also a strong Mexicans emphasis on the very human, social characteristics of God as the ultimate source of help and understanding.

The above differences in religious frame of reference tie in closely with the Anglo and Hispanic cultural views on conscience and morality. Conscience is a particularly central concept in the U.S. American view of morality. It is perceived by the U.S. American group as a guide, a voice which directs behavior by dictating choices between right and wrong. Decisions must be made according to one's moral and religious standards. If the choice or action is wrong, the conscience is filled with guilt, but in either case, the decision has been an individual one.

To have a conscience implies to Mexicans that one knows what is right and will do it. They make practically no reference to guilt or to the question of choice. Conscience for them is a personal disposition to do the right thing, even in the face of conflicting forces or pressures. This disposition is closely related in their mind to honor, faith, and virtue. It is founded in knowledge and conveys social consensus, experience, and moral principles.

There is a particularly close relationship between morality and conscience for the U.S. American group. The conscience is at the very center of both religious and moral considerations. This explains why morality carries a great deal of religious content for the U.S. American group. Morality, too, involves the judgmental process of deciding between good and bad, right and wrong. To the Mexicans morality is more a disposition to recognize and do what is good or more precisely what is recognized as such by others, i.e., their family, community, etc. For them, parents, society, and education are important resources for the development and maintenance of this disposition which is characteristically social. The resulting concept of morality is an essential part of the group's social frame of reference and is the main determinant of the Hispanic notion of responsibility in which there is a special emphasis on duty, obligation, and work. Probably few U.S. Americans would deny that morality is influenced by social learning, but it is interesting that their notion of morality brings out little sign of this awareness.

These differences in the cultural views of conscience and morality are supported by the differences observed in the Mexican and U.S. American meanings of shame and guilt or what may be identified as the culturally characteristic control mechanisms.

The U.S. control mechanism has been cnaracterized as a guilt based mechanism. Guilt is the sanction of the conscience of the autonomous individual who has been brought up to use certain principles and standards in deciding what action to take; guilt arises when the person decides to go against the internalized moral values, the norms dictated by conscience. The U.S. meaning of guilt gives considerable empirical support for this mechanism. U.S. Americans view guilt predominantly as a reaction of conscience to a wrong decision or action. It is a negative feeling of fear, anxiety, and worry accompanied by a personal sense of shame and remorse. To the Mexicans guilt is accompanied by internal remorse and external blame.

While the U.S. Americans attach heavy negative consequences to guilt, the Mexicans show an analogous but even heavier concern with negative consequences——i.e., sorrow, fear, anguish——in the context of shame. As another important difference, shame is mr e internal guilt and conscience related for U.S. Americans, while it is more external and social fault—blame oriented for the Mexicans.

As reviews of research on the comparative study of U.S. and Hispanic American psycho-cultural characteristics indicate (Wagner and Haug, 1971; Lisansky, 1981), there is a great deal of criticism that the comparisons are frequently stereotypical and value laden, and biased in favor of the U.S. American culture. Nevertheless, the above findings lend cubstantial empirical support to the distinctions made by several researchers who have addressed the question of Hispanic and Anglo American psycho-cultural similarities and differences. Some authors contrast the field independence of the U.S. Americans with the field dependence of Hispanic Americans (Ramirez, 1976; Szapocznik, 1978; Mead, 1953). In several replications

where the Individually Applied Witkin's Embedded Figures plates were given to school children, it was found that regardless of sex, age and socioeconomic class, Americans scored higher in field independence (Holtzman, Diaz-Guerrero and Swartz, 1975). Others stress the differences between individualistic U.S. American and collectivistic Hispanic value orientations (Kluckhohn and Strodtbeck, 1961; Heller, 1966). It is also quite common to contrast U.S. individualism with Hispanic personalism (Fitzpatrick, 1971; Diaz-Royo, 1974; Magaffey and Barnett, 1962).

Beyond supporting the reality of a dichotomy we prefer to label U.S. American individualism and Mexican Hispanic ersonalism, the findings offer new insights into how religious/moral precepts differ along this fundamental dichotomy. These differences also give insights into two main mechanisms of social control supporting a distinction introduced originally by Ruth Benedict (1946):

....Americans are members of a gui't culture; they foster a sense of individual responsibility---a need to follow one's own interests, beliefs, and standards. The point of reference here is entirely internal---the voice of one's own conscience. When personal decisions and actions do not conform with these internal norms and standards, the conscience produces feelings of guilt.

In "shame" cultures people use the shared norms, values, and interests of their reference group (family, clan, nation) rather than their own conscience as a guide to acceptable behavior. To them conscience and guilt have less meaning; the sanctions they try to avoid are public shame or losing face as a consequence of their failure to conform to the standards of the group.

The U.S. concept of guilt and the Mexican concept of shame support this distinction. But more importantly and conclusively, the findings show with considerable consistency how other critical concepts such as conscience, morality, and religion fit in with and support this distinction. Riesman's (1950) characterization of the inner-directedness of the U.S. Americans in contrast to the outer-directedness of traditional cultures or Rotter's (1966) distinction of "internal" versus "external" locus of control involve essentially the same duality in social control mechanisms. While our assessment does not tell how these different controls develop, the literature on child socialization is quite rich and conclusive on this point. Mead (1953), Ramirez (1976), Landy (1959), Triandis (1981) as well as several other researchers point out that U.S. American children are trained predominantly for competitiveness, self reliance, and self assertion while Hispanic children are taught the importance of warm interpersonal relations, harmony, cooperation, and sensitivity to the needs and feelings of others.

#### CHAPTER 8

#### EDUCATION, UPBRINGING

American cultural anthropologists like Kluckhohn and Strodtbeck (1961) and Mead (1953), together with scholars of Hispanic background such as Diaz-Royo (1974) and Landy (1959), agree about several important differences between the U.S. and Hispanic approaches to education and upbringing. Some of these variations come from different philosophies and principles about children and childrearing. The American view stresses the autonomous individuality of the child and regards upbringing as a process of promoting physical and intellectual development, being careful to avoid interfering with the individuality of the child or imposing constraints and restrictions which would affect his or her autoromy. The dominant Hispanic view of the child is that of a person in the process of development and limited in his or her capability to make independent decisions. Upbringing involves the use of external influences and discipline to shape the child into a mature human being to fit the norms and expectations of the community. This approach places a strong emphasis on upbringing as a process of inculcating ethical norms, social values, etc. While these divergent philosophies are broadly discussed in the literature, it remains uncertain how they affect personality development and to what extent they are applicable to our present U.S. and Mexican comparison.

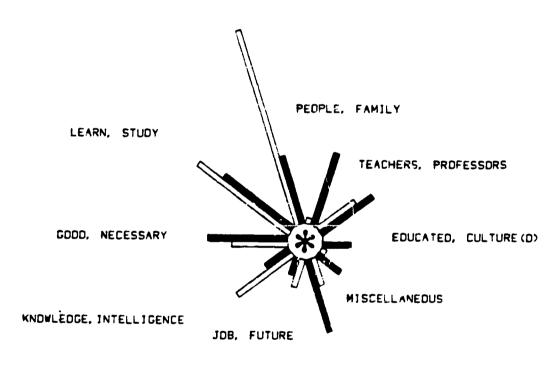

Previous investigations with Hispanic samples in the U.S. (Szalay and Brent, 1967; Szalay et al., 1976) have supported the observations of numerous Hispanic researchers that Hispanic Americans have a stronger interest in socializing the person along behavioral norms like politeness with strong emphasis on warm interpersonal relations.

U.S. Americans, on the other hand, view schooling mainly as the acquisition of knowledge and the development of marketable skills. Educational goals aiming at value socialization or the transmission and enforcement of norms are frequently questioned based on concerns to not interfere with the independence and individuality of the child. The more traditional Hispanic/Latin American approach to education is often criticized (Kagan, 1977) because it is viewed as promoting control and conformity. The literature generally suggests that while the U.S. emphasis on education is more narrowly focused on the acquisition of knowledge, for the Hispanic Americans education involves a broader process that includes moral, behavioral, and other dimensions of socialization.

### EDUCATION

SCHOOL, COLLEGE

PROGRESS, DEVELOPMENT

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 31

#### EDUCATION/EDUCACION

The Americans and Mexicans are in fundamental agreement on three dominant parameters of education: It involves attending schools of various types, a great deal of learning and studying, and being taught by teachers and professors. Even within this consensus, Americans place considerably more weight on the various schools, from primary or elementary schools to colleges and universities.

Knowledge and its acquisition emerge as particularly important from the American perspective. This goes along with their emphasis on intelligence and their strong recognition of education as good, necessary, important, and needed. Their attention to degrees and diplomas reflects a personal interest in tangible results.

Compared to the Americans, Mexicans as well as Colombians think of education in broader human perspectives. Their stronger references to parents (padres), children (ninos), and family (familia) suggest that education for them begins in the family with the parents and other family members as primary teachers. The connection of education with culture (cultura) and behavior (comportamiento) conveys that they think of education in a broader behavioral sense of upbringing and socialization as discussed by Romano (1968), Madsen (1972), and others. While Mexicans also consider education as good (bueno) and necessary (necesario), their references to progress (progreso), excelling (superacion), and development (desarrollo) suggest a concern which beyond personal consequences has some broader social consequences and implications.

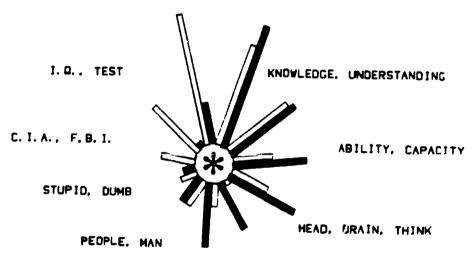

Most of the similarities and differences between American and Mexican students are supported by the Semantic Differential results on high-schoolers in Illinois and Mexico City. The closest subjective synonyms of "education" (among concepts referring to institutions) were "university," "law," and "United Nations" for Americans and "marriage", "patriot," "school" and "library" for Mexicans. The antonyms were the same for both groups: "divorce," "prison," and "war." This frequently referred to, unpublished study also probed the concepts of "teacher," "school" and "university." The concept of "teacher" and "university" was equally evaluated by Americans and Mexicans, but the Mexicans saw them as more powerful and more active. "School" was equally powerful but Mexicans evaluated it more and saw it as more active.

The only substantive difference observed between the Mexicans and Colombians was in the context of studying and learning. It is interesting to observe that the U.S. and Mexican students place more emphasis on books and reading as a resource, while the Colombians stress the process of studying (estudio). This probably reflects differences in actual practices. While in Mexico and in the United States individual reading and research are encouraged, according to Colombian educators, rote learning and memorizing are more prevalent requirements in the Colombian schools.

# INTELLIGENCE

SMART, BRIGHT STUDY, SCHOOL, WORK

DEVELOPMENT, PROGRESS

GOOD. DESIRABLE

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 32.

#### INTELLIGENCE/INTELIGENCIA

To be intelligent and smart is an attractive quality bearing on learning, education, and school performance. The acquisition of knowledge is relevant to the inverest of all three student groups compared. Smartness and brightness seem to be particularly highly valued by U.S. Americans. This goes hand in hand with the observation that knowledge has both high prestige and high practical value to U.S. Americans. Since the acquisition of knowledge as a base of intellectual performance was found to be closely related to schooling, it is not surprising that U.S. Americans also stress schools and the educational process in the context of intelligence.

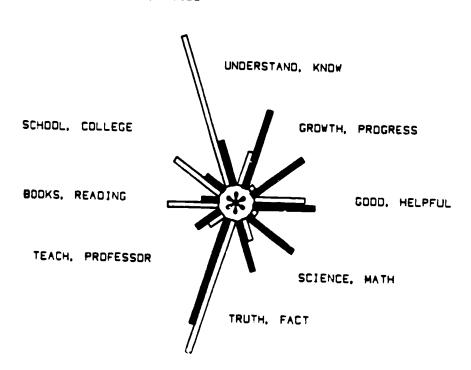

Parallel to a strong interest in knowledge, the Mexi ans and particularly the Colombians emphasize understanding (entender). your intellectual elements this understanding involves predominantly a personal attitude with strong affective overtones reminiscent of friendship and empathy (see Chapter 4). These human, social considerations are salient to the Hispanic/Latin American groups even in the context of intelligence. References to man (hombre, humano) convey the view that intelligence is a human quality recognized as good (bien) and desirable (deseable).

While Americans are used to the practice of intelligence testing (they think in terms of I.Q. and relate intelligence to the functioning of the brain), to Colombians it is primarily a capacity (capacidad) and mental faculty (facultad) considered as a valuable gift. An important application of this capacity in the Mexicans' and the Colombians' view is again in development (desarrollo), progress (progreso), and in the human and social objectives which were observed in a broad variety of contexts to play a dominant role in their way of thinking.

# KNOWLEDGE

INTELLIGENCE, WISDOM

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 33.

#### KNOWLEDGE/CONOCIMIENTO

The U.S. group sees knowledge in a particularly close relationship to people's intellectual abilities, i.e., their intelligence and wisdom. Intelligence is a relatively new concept, particularly in terms of its psychological assessment, that is, its measurement by specialized tests. Since the history and application of intelligence tests are predominantly American, a stronger U.S. emphasis on intelligence is not surprising. The predominance of related synonyms indicates, however, that this U.S. emphasis is broader and more general. Knowledge is very closely connected to education, probably because the U.S. American meaning of education is closely synonymous with the attendance of school.

The acquisition of knowledge through study (estudio), learning, and knowing (saber) appears to be more dominant to the Colombians; it receives somewhat less weight from the Mexicans. The Mexicans emphasize specific subjects such as science (ciencia), mathematics (matematica), nd history (historia); the Colombians emphasize the university universidad), science (ciencia), and philosophy (filosofia), while to Americans school and college are more salient. The explanation for these latter differences may come from the U.S. system of organizing and labeling schools of various types and levels. The Colombian concept of university encompasses institutions of higher learning labelled in the United States as universities as well as colleges (there is no such distinction among these institutions in Mexico or Colombia). The U.S. students speak more of books and reading, probably because more importance is given in the United States to individual reading and inquiry, and to an individualized learning process.

The Mexican tendency is not as strong as the general Colombian tendency to emphasize the human dimension. This becomes apparent in the present context by references to person (persona), man (hombre), friends (amigos), etc. Yet, this tendency is stronger than the U.S. Americans'. Mexicans also convey again a stronger disposition to relate knowledge to the broader national issues of progress (progreso) and development (desarrollo).

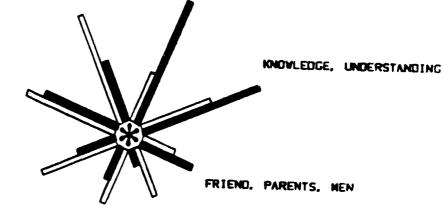

# TEACHER

SCHOOL, COLLEGE, CLASS

TEACHING. HELPING

LEARNING. EDUCATION

PROFESSORS, INSTRUCTOR

STUDENT, PRINCIPAL BOOKS, SUPPLIES

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I. page 34.

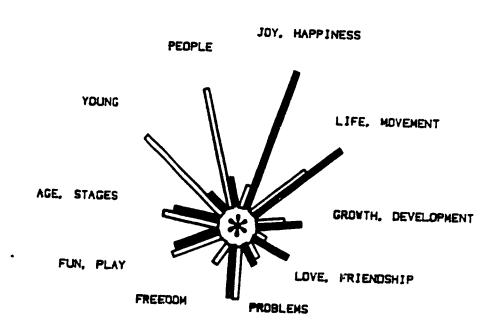

#### TEACHER/MAESTRO

The image of teacher contains similar elements for the three groups compared such as being the main representative of the school, and being instrumental in learning and education, in teaching and helping. The main difference is again that the U.S. group shows a narrower focus on the teacher's characteristics and termical functions, while the Mexican students see the teacher from a less technical, more human angle. U.S. Americans view the teacher as part of the school, as one who facilitates learning, as an instructor or professor whose most salient nexus is with the student, and whose most critical characteristic is to be knowledgeable. Their image includes elements of the school environment——books, class, board, chalk, etc.

The Mexican as well as the Colombian students' image of the teacher is more personal. In addition to the main task of teaching (ensenanza), a great deal of attention is given to helping (ayuda) and guiding (quia). While the "maestro" can be a prophet to the Colombians, both the Mexicans and Colombians identify teacher as a friend. The Mexican students emphasize that teachers are good (buenos), capable (cap.2), and fair (justo). Contrary to expectations based on the literature, there is little indication of social distance. For instance, references to respect (respeto) and authority (sutoridad) do not exceed those by the U.S. students. By speaking of standing (regara), punishment (castigo), and bad (malo), the Colombian sturbits actually convey a more critical attitude towards the teacher than go the U.S. Americans. In view of the frequent characterization to Hispanic cultures as being authorityoriented, the relative lack of distance is rather interesting. At the university level, Colombian students, especially graduate students, sometimes address their teachers by their first name.

### YOUTH

JOBS. EDUCATION

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 35

#### :OUTH/JUVENTUD

Along the broad cultural trends observed, U.S. Americans emphasize here children and kids, boys and girls, and play and fun. Mexicans and Colombians view youth along their general concerns with affective ties, i.e., love (amor) and friendship (amistad). There is a general emphasis on life as a source of joy and pleasure (alegria), fun (diversion), and parties (fiestas). In the context of youth only a few specifics emerge but they are rather characteristic.

There is also a strong Mexican and Colombian tendency to view youth as representative of life and health, comparable to the U.S. tendency to associate youth with strength and energy.

U.S. Americans look at youth with special emphasis on age and age differences. Youth includes from their perspective children, adolescents, and teenagers. In comparison to the U.S. view, the Hispanic/Latin American view appears less differentiated; <u>juventud</u> refers apparently more to adolescents than to very young children.

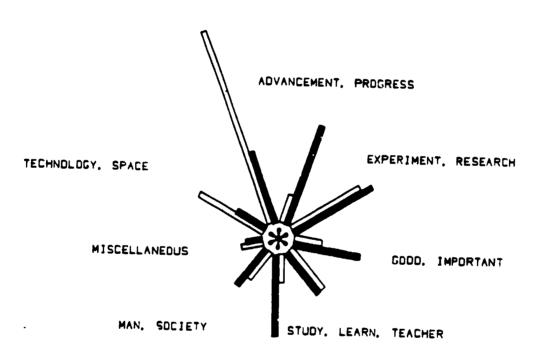

Furthermore, there seems to be a special U.S. emphasis on being young in contrast to old age and age in general. This may be a function of the frequently observed U.S. cultural disposition to place high priority on youth and being youthful (Toffler, 1970).

Since all our respondents are young themselves, our data do not lend themselves to the task of reconstructing the image of youth as seen by middle-aged and elderly members of the society.

# SCIENCE

BIOLOGY. CHEMISTRY

#### KNOWLEDGE

Perceptions and Evaluations

- by Americans - b Mexicans

For more information please turn to Appendix I, page 36

#### SCIENCE/CIENCIA

The U.S. image of science has essentially three main components. The main focus is on specific subjects such as chemistry, biology, and physics. The attention given to math, medicine, and astronomy is noticeable but substantially less. The Mexicans think most of physics (fisica) and medicine (medicina) while the Colombians think primarily of medicine (medicina) and art (arte), but compared to the Americans the weight of their attention is much less.

The second main U.S. focus is on research and experiments and on the methods of acquiring scientific knowledge in general. The Mexicans' interest in scientific investigation (investigar), discovery (descubrir), and experiments (experimento) matches that of the U.S. Americans. The third main U.S. focus is on technology and space exploration. The weight of this category, together with the attention given to science fiction, suggests that this domain strongly appeals to their imagination.

The Mexicans' and the Colombians' attention is more broadly distributed. Beyond the elements ju: mentioned it includes a general concern with knowledge (conocimiento) and wisdom (saber, sabiduria) and with the acquisition of scientific knowledge, i.e., studying (estudio) and learning (aprender). There is again a strong Mexican and Colombian interest shown in science from the angle of progress (progresar) and development (desarrollo). As an extension of this interest Colombians and Mexicans show a concern with the human dimension of science from the angle of its social implications for society (sociedad, social), culture (cultura), and man (hombru).

#### SUMMARY

Based on the few themes examined, some of the Mexican and U.S. American characteristics discussed in the literature do receive empirical support while others fall beyond the scope of our present assessment. The themes reviewed offer a better opportunity to examine U.S. American and Mexican views with regard to education as a matter of schooling rather than upbringing and socialization which is more along the Mexicans' orientation.

The results consistently indicate that compared to the U.S. Americans' focus on schooling and the acquisition of knowledge, education has a broader and more general meaning to the Mexicans. This is shown not only by their reactions to the theme education but also by those obtained in the context of the other educational themes (teacher, intelligence, youth, knowledge, and science). In these contexts the U.S. Americans consistently emphasized knowledge in a technical/intellectual sense. While the Mexicans and Colombians emphasized an understanding in the sense of empathy and human rapport. In a similar vein the U.S. group has shown a particularly strong preoccupation with the institutions of formal education (schools, colleges). The Mexican concern with schools is less dominant, and compared to the U.S., it involves education in a broader behavioral sense of acquiring the norms and standards of human behavior, such as politeness. Actually, the expression "educated child" (nino educado) or "educated person" (persona educada) in Mexico refers fundamentally to one who is well bred, courteous, well mannered, respectful, deferential, proper and even formal.

Consistent with this dichotomy is the observation that while the U.S. group places strong emphasis on intelligence and also on smartness and brightness, the Hispanic/Latin American groups view education more as a matter of human behavior and culture. This is indicated by frequent references to human beings, people, family members, and friends. There is an indication here as well as in previous studies (Szalay and Brent, 1967) that the Colombian students see the educated person not only as schooled and intelligent but also as someone who behaves properly and who commands social recognition and respect.

The U.S. group refers repeatedly to degrees, grades, and other performance related themes, while such performance oriented considerations carry less weight for the Mexicans and Colombians in the context of upbringing and education. These trends do bear on the problem area of school performance of Hispanic children. This subject has received considerable attention particularly with regard to the educational performance of children of Mexican, Puerto Rican, and Cuban background living in the United States. In view of the statistics which show a

high dropout rate and a significantly lower success rate of educational performance for Hispanic than for Anglo Americans, it has become a rather stereotypical explanation that these differences are rooted in different cultural values and motivations. The problem with this explanation is that usually it lacks the specificity and details needed to take steps to improve the situation. To become genuinely informative and useful in practical applications it is necessary to spell out the critical factors which are actually responsible for differences in achievement and which bear on measures which could enhance school performance.

The data on the Mexican and Colombian views of education suggest that there are indeed some deep-rooted differences between the U.S. and the Hispanic/Latin American views. The Latin Americans do place somewhat less emphasis on schools and school performance. This does not mean, however, that education is not an important issue to them. What the data do show is that their focus of interest is significantly different in several respects from that of Americans. Their views do have internal logical consistency and suggest that the Mexican view of education shows more emphasis on the human, social and behavioral dimensions of upbringing. It has to be observed, however, that the above comparison is based on a small sample of educational themes. While we did collect more information, due to the limited scope of this report we could not include in the analysis here other concepts like upbringing or politeness, which could help to broaden the base and increase the specificity of the above conclusions.

#### Observations from Related Studies of Upbringing, Culture and Personality

Thanks to the unique cross-cultural study of child development in the United States and Mexico (Holtzman, Diaz-Guerrero, and Swartz, 1975), we have rich empirical data on several important aspects of upbringing in the two cultures. Holtzman and his associates point out that until recently the study of culture and personality was described as the youngest and smallest branch of anthropology (Spiro, 1968). Since, anthropologists and psychologists have produced hundreds of serious cross-cultural investigations. The specific problems of the interaction of culture and personality in development are, however, relatively little discussed in the literature. It appears that a problem in dealing with culture and personality has been the elaboration of sufficiently precise, operationally defined concepts of the terms culture and personality in a way to stimulate theory and research. Although biological as well as social factors enter into the development of each personality, shared attitudes, beliefs and values within the culture provide a common basis for socialization of the child. These constitute sociocultural premises that are fundamental determinants of shared personality characteristics within a given culture (Diaz-Guerrero, 1967).

The following excerpt from the Holtzman, Diaz-Guerrero and Swartz study (1975, pp. 331-333) provides an example of a measurable important dimension reflecting a sociocultural premise:

is the primary dimension underlying the sixty bipolar items comprising the Views of Life Questionnaire (Diaz-Guerrero, 1973). Tentatively labelled Affiliative Obedience versus Active Self-Assertion, this general dimension sharply discriminates among four different groups of fourteen-year-old populations, as illustrated in Table 8-1. Several of the pairs of statements making up the subdimension of Authority under this general dimension within the View of Life Questionnaire are given in Table 8-2, where the results are broken down further to indicate social class as well as cross-cultural differences. individual filling out the questionnaire is asked to choose which of the alternatives in each item is closer to his own personal beliefs. The overall sociocultural-premise dimension of Affiliative Obedience versus Active Self-Assertion is obtained by combining a number of the items into a more abstract scale in accordance wit earlier factor analyses of item intercorrelations conducted as part of the Cross-National Study of Coping Styles and Achievement (Peck et al., forthcoming). While similar data are also available for Japan, Brazil, Italy, and Germany, only data for the two major cultures of the present study and their historical antecedents are summarized in Tables 8-1 and 8-2.

Among the three English-speaking groups, the majority of fourteen-year-old boys subscribe to Active Self-Assertion as a sociocultural premise, while their Mexican counterparts prefer Affiliative Obedience. The four populations are distributed on a continuum ranging from London, which is highly active, through Chicago and Austin, which are moderately active, to Mexico City, which is the least active. The differences among all four groups are statistically significant. As indicated in Table 8-2, the most striking differences among cultures appear for the lower working class rather than the upper middle class, a finding consistent with the social-class-by-culture interactions found repeatedly in the present study. The lower working class, especially in a more traditional society, that is still developing toward modern industrialism, tends to be the primary carrier of traditional sociocultural premises inherited from the past.

NOTE: Table gives percentages of fourteen-year-old boys from each city and social class who selected each statement in the forced-choice bipolar statement pairs constituting the Authority Factor in the Views of Life Questionnaire. N=100 for each percentage.

#### Item Statement Pairs from Authority Factor

- 22a. When a person thinks his (or her) father's orders are unreasonable, he should feel free to question them.
- 22b. A father's orders should always be obeyed.
- 40a. A teacher's orders should always be obeyed.
- 40b. When a person thinks his (or her) teacher's orders are unreasonable, he should feel free to question them.
- 57a. A person should not question his (or her) mother's word.
- 57b. Any mother can make mistakes, and one should feel free to question her word when it seems wrong.

It is interesting to examine the four variations in culture represented by the four cities. The underlying sociocultural premise represented by the Affiliative Obedience versus Active Self-Assertion dimension is intimately linked to the historical antecedents of contemporary culture in each of the four cities. Let's examine several of the critical historical incidents in the overthrow of absolute, religious, or state authority in each of these cities. London, as the seat of power for British kings over the centuries, laid the groundwork for the development of individual freedoms and the overthrow of absolute authority with the Magna Carta in the thirteenth century, the English Reformation in the sixteenth century, and the execution of Charles I by Parliament in 1649. The first major reformation in Mexico occurred in 1860, a reformation that was not completed until the Mexican Revolution of 1910, only sixty-five years ago. Although Austin and Chicago are both cities within the same nation, unlike Chicago, Austin shares its cultural heritage with Mexico. In addition to their common Anglo-Saxon heritage, the American Revolution of 1776 predated the establishment of both Chicago and Austin as cities. Both Mexico City and London, on the other hand, have existed as metropolitan areas for many centuries. Clearly, the cultural antecedents of all four cities with respect to the handling of authority and related sociocultural premises are different.

This extensive quotation strengthens the primary thesis of this report that culture is fundamental in the understanding of Mexicans and Americans and reminds the reader that the differences found reflect distinct historical developments. Obedience to significant individual authorities, the parents, the teachers, is also reflected in a greater disposition to comply with ordinances, institutions and shared attitudes, beliefs and values for the Mexican. While this is true for most Mexicans, higher and university education has been proven (Diaz-Guerrero, 1982) to reduce this disposition to obey and comply with authority and other cultural beliefs. In its extreme forms this rebellion can account for the well known student upheavals in Latin America.

In his efforts to demonstrate the importance of shared sociocultural premises to cognitive and personality development Diaz-Guerrero (1976) shows significant correlations between the previously cited authority factor across samples of 400 14-year-old children in Mexico, U.S. (Austin), Yugoslavia and Japan and tests of mathematics and reading and in teacher's grades. In this and later studies with Mexican school children the correlations between obedience and most measures of cognitive development or knowledge are consistently negative. This alone can explain that in the Holtzman et al. painstaking study (1975) American school children scored higher than Mexicans in all or most of the many replications in WISC's vocabulary, Block design, Arithmetic and

Picture Completion. That in 18 replications Mexican school children are shown as field sensitive or dependent and American children as field insensitive or independent in Witkin's Embedded Figures Test also shows the preponderance in the Mexican culture of the social, the other, the sociocultural premises and in the U.S. of the individual, the self, and an apparent limitless freedom. However, Diaz-Guerrero observes that this freedom may be strongly limited by unrecognized American sociocultural premises that command" "Americans should be individualistic"; "competition is better than cooperation to achieve results"; or "one should fight for the rights of the individual" as opposed to one should fight for the rights of the family. In actual studies three-fourths of American students sided for competition and the rights of the individual contrasted to three-fourths of the Mexicans siding with cooperation and the rights of the family (Diaz-Guerrero, 1982).

#### CHAPTER 9

#### ECONOMY, MONEY

According to leading experts on world development, such as Sigmund (1967) and Lewis (1966), the most consequential division of the people of the world is between the rich and the poor, between the industrially highly developed and the inderdeveloped nations. Since economic considerations bear on human subsistence, they are probably dominant in people's minds everywhere. The findings presented in the chapter on national images show that the Mexicans perceive themselves as members of a poor nation which is plagued by problems stemming from underdevelopment. At the same time, their image of the United States is characterized by wealth and economic power. The sharpness of this contrast makes a comparison of American and Mexican views of such pressing economic problems as poverty, inflation, and unemployment particularly rele ant and interesting. They may affect the perceptions and meanings even of such basic subjects as money and economy.

These questions gain additional importance in light of previous comparative studies involving Middle Eastern (Szalay and Scrohl, 1980) and Far Eastern (Szalay, Kelly, and Moon, 1972) culture groups. As the results show these groups consider economic development an objective of utmost priority; it emerged as a central issue with strong ties to broad social and national problems. As Kautsky (1962) has observed, some of the developing countries are relying on mass mobilization in support of economic development. His observations were supported by our findings on Koreans (Szalay, Moon, and Bryson, 1973) is well as Jordanians (Szalay and Strohl, 1981). In light of these findings and in view of the strong Mexican concern wit the underdeveloped, poverty stricken status of their country, this and similar tendencies aiming at the mobilization of their resources deserve attention.

On the other hand, such impressive concern with these topics raises the crucial problem of what is most important in human life, the material or the so called spiritual, that is, the psychological development and well-being of people and also the little explored questions of what is the value of money and what are the monetary goals of idividuals of different cultures and different social classes. Diaz-Guerra o (in press) and Ramirez III (in press) find that as far as the quality of life is concerned, Mexicans, even after the recent economic crisis, consider far more important psychological, sociological and health factors than the economical.

## MONEY

#### (ASH, DOLLARS

FOOD, HOUSE, CLOTHES

BAO. EVIL ECONOMY INFLATION EARNINGS. INCOME

# Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix I, page 37.

#### MONEY/DINERO

As a clear reflection of the advanced mone ary sphere of American life, the U.S. sample show considerable familiarity with a broad variety of monetary concepts (e.g. cash, checks, currency) as compared to the Mexicans who use less differentiated labels and think mainly of cash--particularly coins (moneda), paper (papel), and change (cambio). In a similar vein the U.S. Americans speak of financial transactions and banking procedures from exchange to saving. Americans view money as the foundation of wealth, while Mexicans recognize it more as a source of power (poder).

From the U.S. perspective money is recognized for its potential to satisfy all types of needs and wants. From the Mexican angle money appears in closer relationship to basic commodities such as clothes (ropa), food (comida), houses (casa), etc. The advantages and benefits associated with money are also somewhat different. The dominant U.S. values are security, success and freedom, while the Mexicans stress more happiness (felicidad), satisfaction (satisfaccion), and comfort (comodidad). The U.S. American group emphasis on jobs and work apparently leads to more references to paychecks and earning money. Americans more explicitly object to greed and see money in emphatic contrast to poverty.

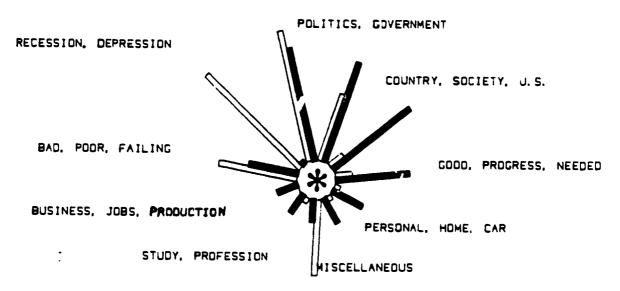

As a main difference both the Mexicans and the Colombians relate money more intensively to basic necessities and similarly both emphasize more its instrumental utility, its relevance to satisfaction and wellbeing. This indicates an instrumentality and utility dimension which is apparently more salient to the dispanic/Latin American groups. Similarly, both groups relate money more to such broader collective issues as development (desarrollo), progress (progreso), and economics (economia); they also relate it more to capitalism.

In the Semantic Differential studies previously mentioned there was no difference in the subjective worth or activity of the concept money, but its power was perceived as greater by the Illinois than the Mexico City adolescents. Also the concept was significantly more meaningful and there was more agreement about its meaning in the U.S. sample. Interestingly, while the strongest subjective synonym among 19 commercial and economic concepts was insurance in both samples, next subjective synonyms for money in the U.S. were saving, success and banker, and in Mexico salary, saving and shop. Antonyms for money in the U.S. sample were poor people, debt and failure, and for the Mexicans failure, borrowing, and debt. While there are similarities in this alternative way of measuring the meaning of money, the differences speak once more about the importance of culture where economics is concerned.

## ECONOMY

MONEY. SAVING

SUPPLY. DEMAND. EXCHANGE

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 38.

#### ECONOMY/ECONOMIA

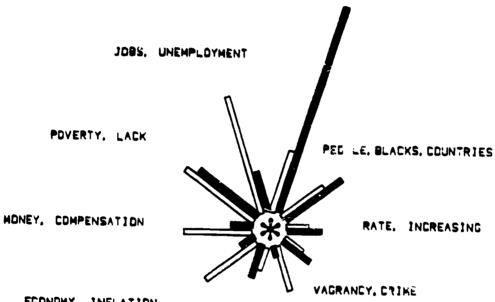

To both U.S. Americans and Mexicans economy is closely related to money and wealth. Economy primarily refers to material life conditions, activities and organizations which serve to sustain and promote welfare and prosperity. The main U.S. interest is not what economy actually is or how it functions but what it may have in store. The image is rather gloomy, replete with anxieties and fearful anticipations. Americans are concerned with the bad shape of the economy, its weakness and possible failing. Their most dominant concerns are inflation, recession, and depression. The main interest is less a tracing and understanding of this obviously complex subject but rather in anticipating what the future may bring and how it will affect the individual.

Mexicans are also concerned with the economy and see it in close connection with the financial matters---money (dinero), saving (aherro)---but their main preoccupations are somewhat different. From their perspective the ups and downs of the economy attract less attention. Paralle! to economic development (degarrollo) and progress (progreso), they think of well-being (bienestar) and necessity (necesidad). They do not think in terms of supply and demand but rather of the capability to produce (produccion) the necessary goods, food, and other industrial products. Furthermore, both Mexicans and Colombians see economy as a broader problem involving the entire country (pais), politics (politica), administration (administracion), society (sociedad), and nation (nacion). To these groups economy is a broad national and social issue, which in turn has the potential to influence the life and well-being of the individual. This view ties in with their general tendency to place problems and events in social perspectives.

149

## UNEMPLOYMENT BAD. PROBLEMS. HUNGER

ECONDMY. INFLATION

UNHAPPY, WORRIED GOVERNMENT, POLITICS

Perceptions and Evaluations - by Americans by Mexicons

For more information please turn to Appendix I, page 39.

#### UNEMPLOYMENT/DESEMPLEO

To U.S. Americans unemployment means the lack of a job. The image which the Mexicans associate—th unemployment is more extreme; it involves hurger (hambre) and other severe problems (problemas). Poverty appears as the most common, important consequence of unemployment to both groups, although its meaning is apparently different. The American group thinks intensively of money, both the lack of money and the money from unemployment compensation, checks, and insurance. There is little mention of this type of support by the Mexicans. The practice of unemployment compensation is less known. In Mexico labor laws demand that upon firing, the worker will receive three months of pay plus 20 days of salary for each year of service. In Colombia according to the law, once an employee leaves his/her place of work or is fired or laid off, he/she is paid by the employer the equivalent of one month's salary for each year of service. This payment is called the "casantia." Employers must set aside a special fund for this purpose.

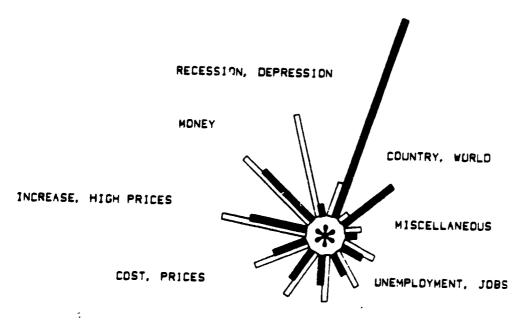

While Americans associate unemployment more with laziness and boredom, the Mexican image includes more preoccupation with vagrancy (vagancia), theft (robo), violence (violencia), and an extreme state of poverty, misery and desperation. The Mexicans' and Colombians' extreme image of deprivation probably comes from the broader scope of hard-core unemployment combined with the high level of poverty and a stagnant economy in general. From the U.S. angle unemployment is a function of economic fluctuations and is thus viewed as a consequence of recession, depression, or inflation. Along this line the American group expresses concern with the trend of a high and growing rate of unemployment, one of the most important economic indicators used in the United States.

Another source of observed differences may be the frames of reference of our studen, samples. A sizable subgroup of our U.S. respondents referred to themselves as unemployed, probably because they are interested in part-time jobs. The sizable U.S. references to government reflect apparently two main conditions; first, the government is considered the source of welfare legislations and payment, and secondly, they consider the government and the president responsible for the state of the economy. In the case of both the Hispanic/Latin American c ups there are more references to such social consequences as injustice (injusticia), exploitation (explotacion), and inequality (designaldad).

## INFLATION

PROBLEMS: HUNGER, POVERTY

PRODUCTS, CARS, CLOTHES

GOVERNMENT, POLITICS ECONOMY

Perceptions and Evaluations

- by Americans - by Mexicans

For mare information please turn to Appendix I, page 40.

#### INFLATION/INFLACION

The U.S. and Mexican views and meanings correspond in both the primary and secondary denotations of inflation. To both groups inflation denotes the economic processes and phenomena whereby money is losing its buying power and the prices are growing. The second denot tion refers to the physical process of rising, swelling, and growth.

Along the U.S. American cultural view inflation is conceived as part of a broader syndrome of depression and recession reflecting the downward side of the economy. Interestingly, this most domin at U.S. perspective is almost entirely missing from the Mexican perception. To Mexicans inflation is a major contributor to a bad economic situation, characterized by such severe problems as poverty (pobreza) and hunger (hambre).

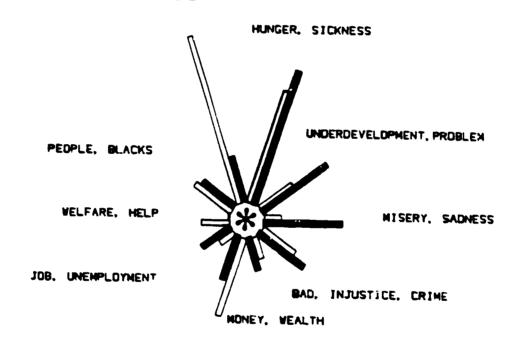

U.S. Americans and Mexicans agree that inflation is a serious economic and monetary problem and that it involves the cost of products. Yet, their views and interpretations of inflation reflect their different frames of reference. These are probably the result of different economic conditions in their respective countries and of different views of economy. To Americans inflation appears to be one of those more or less uncontrollable problems endemic to a highly developed complex economy; they show an inclination to blame the government and contemporary leadership.

To Mexicans as well as Colombians, inflation appears to be the consequence of a very bad economic situation with special emphasis on unemployment, poverty, hunger, which are endemic to their respective countries. They view the situation as a national crisis which affects their nation, and yet they also see it in broader international contexts.

## POVERTY

COUNTRIES, PLACES

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 41.

#### POVERTY/POBREZA

With some simplification one may suggest that the differences emerging in the context of poverty convey some characteristic contrasts resulting from an external and internal view of poverty. There is agreement between the U.S. and Mexican perceptions that poverty entails such unpleasant conditions as hunger (hambre), malnutrition (desnutricion), sickness (enfermedad), suffering (sufrimiento), death (muerte), etc. These concomitants of poverty are salient to both groups, but as other important components of their images reveal, they approach poverty from contrasting positions.

All the countries mentioned by U.S. Americans are distant overseas places; they do not include the United States, except perhaps in their references to slums and ghettos in the cities. Similarly, their references to people include Blacks, minorities, children, and only a negligible mention of the mainstream represented by our U.S. student sample.

While from the U.S. angle poverty is somewhere out there, the Mexicans and Colombians make many references to their own country and Latin America. They obviously view poverty as their own problem. The Mexicans' and the Colombians' concern with extreme poverty and misery (miseria) accompanied by feelings of sadness (triste) and humiliation (humilacion) conveys the idea that to be poor is not only unpleasant but it also hurts one's pride. Furthermore, they see poverty as a concomitant of their underdeveloped economic status characterized by needs and scarcity. They do not view poverty simply as accidental but at least as a partial consequence of injustice (injusticia), inequality (desigualdad) and exploitation (explotacion), as various manifestations of human greed. These reactions reflect a frame of reference which places more weight on social and national dimensions with the apparent implications that the remedies and solutions needed may require broader intervention measures as well.

Another angle in the contrasting view of poverty between Americans and Mexicans is given by the subjective concept of <u>poor people</u>. The subjective meaning of poor people for U.S. adolescents in Illinois is an unworthy, extremely powerless and passive group. For the Mexican adolescents in Mexico City they are neither good nor bad, only slightly weak and neither passive nor ctive. Diaz-Guerrero and Peck (1963) found a similar attitude in college students from Mexico City and Austin, Texas. At the time that data led Diaz-Guerrero to suggest that in the U.S. there is a feeling that it is the fault of the poor people to be poor while, consistent with the social personalism vs. individualism dichotomy, poor people in Mexico are perceived as the victims of an unjust social order. It is apparent that only the cultural, social and economic ecosystem can fully explain the difference.

#### SUMMARY

To the U.S. group money and economy are dominant concepts involving a great deal of personal interest which has both subjective and complex intellectual roots. Money relies on a rich, differentiated terminology; economy is an omnipresent and omnipotent theme replete with uncertainties and challenge.

From the perspectives of the Mexican group economic problems involve basic needs and subsistence. Their main preoccupation is with hunger and poverty, stemming from their underdeveloped economy resulting in problems of production and scarcity. The problems are viewed in broad perspectives as affecting the entire society, culture, and nation, suggesting that an individual's economic problems are seen as inseparable from those of the entire society, culture, nation.

Sherif and Sherif (1964) asked Mexican-Americans and Anglo Americans to complete the following question: "If a person earns at a week, he is really well off." Upper class Anglo Americans responded \$230, middle class Anglo Americans \$145, middle class Mexican Americans \$95, and lower class bilinguals \$85. Money aspirations appear to strongly vary with culture and social class. That it is not money but culture that is predominant in human affairs is also shown by Szalay and Diaz-Guerrero (in press). In response to 120 stimulus words the psycho-cultural distance in meanings was consistently small between high and low income groups of Anglo, Mexican American and Puerto Rican extraction, while the same psycho-cultural distance was consistently higher between the cultures. Despite the trends (Diaz-Guerrero, in press; Ramirez III, in press) which indicate that Mexicans consider psychological, sociological and health factors more important than economical ones in considering the quality of life, Diaz-Guerrero believes that below a certain minimum economy---the minimum, like "really well off", will be different for different cultures and social classes---personality, health, family, and society will disintegrate. All of these findings are very pertinent to the long standing controversy between economic and cultural determinism of personality development and social evolution.

The U.S. American view of economy emerges from a different if not contrasting perspective. The main angle of observation is that of the individual who is worried about the downward trend of a highly advanced and complex economy which may affect his own future. The dominant syndrome involves recession, depression, and inflation as constantly recurring themes throughout this chapter. In view of the opportunities in the United States, the individual sees his personal future apparently in less absolute dependence on the economy. Yet he is obviously concerned that the various symptoms of the downward trend can affect him adversely as well.

The different U.S. and Mexican perceptions of and approaches to employment and unemployment seem to follow from different economic conditions and different views of economy. To U.S. Americans employment means finding new and better 'ob opportunities which offer security and satisfaction, money and a career in a mobile occupational environment. To our Mexican students it is working preferably in an office, in a commercial or other enterprise, in their own occupation or profession which provides a salary necessary for subsistence and well-being.

Unemployment is an unpleasant status to both groups but for somewhat different reasons and with different implications. To Mexicans and Colombians unemployment entails extreme deprivation such as hunger, extreme poverty, misery, and desperation which can lead to various forms of antisocial behavior (vagrancy, theft, or robbery). While in the eyes of our U.S. student group it can be a psychological trauma and financial hardship to be unemployed, their image of unemployment is much less extreme. It is viewed as a potentially unhappy and painful status; boredom and laziness are assumed to play an important role. Recognized as particularly serious among some minorities, unemployment does appear to be a potential threat to the respondents as well. Considerable attention is given to the financial consequences, although compensation and welfare benefits receive at least as much attention as do financial loss and shortage.

The subjects of inflation and poverty reflect perceptual and motivational trends consistent with those just registered. The U.S. group ties inflation and poverty to what we may call the down syndrome of economy: recession, depression, unemployment, etc. The Mexican and the Colombian groups in turn see poverty and inflation as part of an economic deprivation syndrome encompassing hunger, sickness, and other symptoms associated with a lack of resources. While the U.S. group conveys worries about the future of the economy, there is little indication that they search for an explanation that goes beyond a circular reasoning that inflation produces depression and vice versa.

The Mexican views do convey a different reasoning and set of explanations. Fundamentally, the economy related themes suggest the same logic. The poverty, hunger, and other dominant characteristics come from the status of the economy. In turn, references to the main symptoms—-backwardness, underdevelopment, poverty, and unemployment—are accompanied by references to exploitation and injustice. The social and political undertones of these reactions is quite apparent. It is more ambiguous, however, in what particular ways they are used as explanation of their economic situation.

A comparison of U.S. and Mexican views is somewhat disadvantaged by the wide gap in their economic frames of reference. To understand the Mexican frame of reference a comparison with other developing countries offers some useful reference points. Previous studies involving Koreans, Egyptians and Jordanians are very informative in this respect.

Although Koreans (Szalcy et al., 1973) and Jordanians (Szalay et al., 1981a) also identify themselves as members of underdeveloped and developing countries, an important difference in comparison to the Mexicans is that they not only place special emphasis on development. but they also appear to be more specific and more action oriented about Together with economic development, Koreans and Jordanians stress progress and advancement, particularly in the context of industry and technology. For both Koreans and Jordanians economic development is not just a matter of vaque generalized desire but starts with such practical steps as planning and specific details of development and modernization. both of these groups complain about backwardness and poverty with regard to their own economy just as the Mexicans and the Colombians do: what differentiates these groups from the Mexicans is their active, actionoriented approach which has been characterized by experts of economic modernization (Kautsky, 1962; Sigmund, 1967) as movements of national mobilization. By comparison the Mexican and Colombian views appear more reflective and passive.

There has been much written about the Spanish tradition that manual labor is of low status and degrading, while thinking and reflecting is paramount. This view is consistent with the Latin American contrasting concepts of culture and civilization. "Culture" implies exclusively high and abstract spiritual values. "Civilization" refers to the many comforts provided in the material life.

Urbanski (1965), a keen observer of the Americas, says: "Angloamericans appear overly practical and Hispanicamericans overly theoretical" (p. 67). Jose Enrique Rodo, a highly appreciated literary figure in Latin America, wrote Ariel. Many a Latin American student as well as intellectuals consider Ariel a cultural bible. Rodo addresses Latin American youth alerting it against "Caliban"'s ways of the materialistic utilitarian Anglo American philosophy and impels them to follow in the footsteps of Ariel, that is, to avoid the impoverishment of the human personality that threatens whomever is fascinated by technical progress and material goods. On the positive side Rodo pleads for youth to follow in the path of the world of beauty, of ideals and of grace. A modern and more thoughtful Ariel would perhaps speak of pluralism in ultimate values such as truth, justice, goodness, health, perfectior, richness, and, if you want, even profit.

There is little doubt in our minds that the existing economic differences between Americans and Mexicans do relate to the value differences observed in the chapter on these values. Just as extreme competitiveness can produce disruption and dehumanization, the type of competitiveness and social mobilization shown by Koreans (Szalay et al., 1971, 1973) and Jordanians (Szalay et al., 1981) appears desirable to achieve economic development and modernization.

#### CHAPTER 10

#### WORK, ACHIEVEMENT

The role and relative importance of work in the U.S. American and Hispanic cultures is a widely discussed issue in the social science literature. The obvious differences in economic conditions and in living standards creates a strong inclination to search for simple explanations such as differences in people's attitudes toward work. These explanations find fertile ground in ethnic stereotypes which tend to explain poverty by laziness, and wealth by diligence or work motivation. Such stereotypes reinforce echnocentrism despite the strenuous efforts of the social sciences to combat these simplistic ethnocentric biases by substituting them with deeper insights.

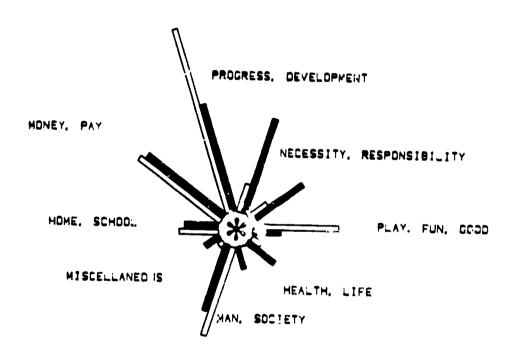

According to Kluckhohn and Strodtbeck (1961), the American work orientation has its roots in the Protestant work ethic, which glorifies the "man of action" and contrasts doing, laboring, and striving with a more passive, leisurely approach to life. Investigations of McClelland (1961), Atkinson (1966), and their associates centered on "achievement motivation" have provided considerable empirical evidence on the intensity of this need in American society.

On Hispanic work orientation there is less agreement. Some say explicitly that Hispanics have a low work motivation (Ladsen, while others argue that Hispanics are just as strongly work oriented as Anglo Americans (Grebler et al., 1970; Cohen, 1975). Related studies conducted mainly with Hispanic American samples encompassed questions such as the Hispanic view of manual labor, the importance of having a good rapport with supervisors and coworkers, preference for self employment, and the importance of the social dimensions of work in general. The pursuit of these questions was helpful in developing a broader psychological understanding of wor, motivation. The findings of several scholars converge on the importance of the distinctic setween Anglo Americans and Hispanics who approach work with two rather This distinction is of special different frames of reference. importance from the angle of the following analysis. It suggests that work motivation is not a single, homogeneous force or propensity which varies in intensity; rather it appears as a complex disposition which can vary widely in its main thrust and its main components.

#### WORK

' JOB. EMPLOYMENT

EFFORT, HARD WORK

Perceptions and Evaluations

- by Americans - by Mexicans

#### **HORK/TRABAJO**

Work means different things to different people even within our own cultural environment. The comparison of U.S. and Mexican responses to work (trabajo) suggests here some interesting group differences. The single most pervasive idea for Americans is job which implies primarily a task to be performed. The Americans place relatively less emphasis on employment or occupation which are more salient to the Mexicans.

In approaching work as a job critask, U.S. Americans mention "hard" as the single most salient characteristic. Although this could mean a complaint, it most likely refers to hard work as a source of pride, a challenge. While to U.S. Americans hard work is a value, to Mexicans work is more an effort, a source of fatigue, hardship, exploitation, and evil. Mexicans speak strongly of work as a necessity (necesidad, necesario) with the indication that one has to work for one reason or another. In this context, the Mexican responses indicate that they place a greater emphasis on work as a source of security (seguridad) and stability (estabilidad). At the same time, U.S. Americans relate work to play and characterize it as a source of fun and enjoyment.

The Mexican perspective of stressing necessity and obligation ties in apparently with the Mexican disposition to pay more attention to the rarious social dimensions of work, to see work more in the context of man (hombre), friends (amigos), and society (sociedad.) While Americans and Mexicans give similar attention to financial remuneration, money (dinuro), wages (salario), and gains (ganancias), the Mexicans place a special emphasis on such broad social and national objectives as development (desarrollo) and progress (progreso). The U.S. Americans think more of personal success and categorize work along specific tasks (e.g., house work, school work' and show more awareness of the time dimension These dispositions, the emphasis on hard work and the view of work as fun and enjoyable, indicate that U.S. Americans have an intrinsically positive work orientation whereby work has a value and importance on its own. At the same time Mexicans as well as Colombians emphasize more the instrumentality, utility, and social dimension of work. From the perspectives of these Latin American groups, work appears to be less important for its own sake, but rather for its utility to reach or serve important objectives, economic, human and social.

#### EMPLOYMENT/EMPLEC

Job and work in the context of employment are closely synonymous. As discussed in the context of work, job implies essentially a task requiring various amounts of work. The U.S. American group thinks primarily of jobs while the Mexicans as well as the Colombians think more of work, with stronger emphasis on the effort it requires. This conveys the importance for Americans of having a work task. The Mexicans appear to be more preoccupied with the practical utility of employment. Money (dinero) has similarly high importance for all groups; the Mexicans and Colombians also think more in terms of salary (salario, sueldo).

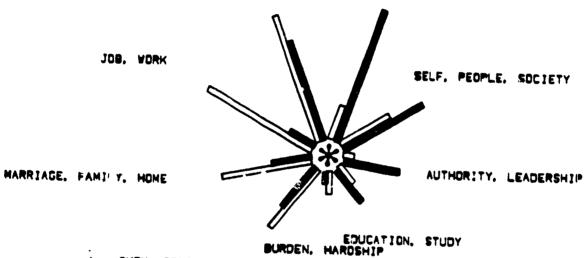

U.S. Americans look at employment more as a process built around a task and its performance. The process starts with the hiring and includes such details as learning of employment opportunities and going to job interviews. Along this line they give more attention to time considerations and view employment from the angle of a career. The attention given to unemployment indicates that employment is regarded more as situation-bound and less permanent.

Accordingly, Americans and Mexicans show some characteristic differences in the salient attributes ascribed to employment. The U.S. group places security and job satisfaction at the top of the list, while the Mexican group looks at employment more from an existential angle by considering its relevance to well-being (bienestar), security (seguridad', and stability (estabilidad). This view is supported by the heavy Mex.can references to necessity (necesidad). This existential importance of employment for the Mexicans is also conveyed by their emphasis on life (vida), health (salud), and basic commodities such as food (comida) and house (casa). Colombians show stronger inclination to think of employment in negative terms such as difficult (dificil), poor (pobre), bad (malo), exploitation (explotacion), and slave (esclavo). While U.S. Americans consider employment more in term of their personal career, Mexicans lock at it more from the angle of family and include in their considerations some social perspectives as well: development (desarrollo), and progress (progreso).

## RESPONSIBILITY

TRUST, RESPECT. MATURE PROGRESS, GOOD, MECESSARY

DUTY. DBLIGATION

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 44.

#### RESPONSIBILITY/RESPONSABILIDAD\*

To the U.S. Americans the most overriding responsibilities are in the context of job and work. This is consistent with our other findings on the U.S. attitudes toward work and employment. In the realm of interpersonal relations there is also a strong U.S. American emphasis on family in general; the Mexicans show relatively little preoccupation with family.

The difference between the Mexican and U.S. views is increasingly pronounced in the broader realm of interpersonal relations. Mexicans express a sense of responsibility not only toward friends (amigos), but also toward people (gente) in general: men (hombres), society (sociedad), everybody (todos). The Mexican responses progress (progreso), development (desarrollo), and justice (justicia) indicate that to the Mexicans responsibility involves much broader societal concerns. This is the same broadly conceived human/social responsibility that became apparent from our findings on the social domain.

To the U.S. Americans responsibility is an attribute of the mature individual, like loyalty, trust, and caring. The Mexicans view responsibility as a concern with others, a readiness to help others, being conscientious. To Americans it is a personal attribute shown by accepting duties and obligations in the context of work, family and personal relations in a mature, adult way. Mexicans, on the other hand, view it less as an individual choice but rather as a basic dimension of social relations.

In this respect there is an interesting difference between the Mexicans and the Colombians. The Colombians view responsibility very much as a matter of duty, an obligation to particular people and to human beings in general. Mexicans think of responsibility as intrinsic to human conscience. Also, among U.S. Americans responsibility is viewed somewhat as a burden, which gives it a negative connotation, whereas Mexicans view it as a positive thing.

It is unfortunate that in the actual social fabric of Latin America these days the positive prosocial directives evident in the Mexican and Colombian subjects have little opportunity to be implemented. They naturally flower in the more individualistic and competitive but freer American social fabric. This may be a powerful magnet for immigration.

<sup>\*</sup> Mexican student sample responded to the stimulus theme "responsabilidad social."

## SECURITY

FINANCIAL. MONEY, BANKS

POLICE. LOCKS. PROTECTION

FAMILY. HOME

TRANQUILITY. HAPPINESS

PERSONAL. SDCIETY

JDB. WORK. EDUCATION

NATIONAL. MILITARY

SAFE. CONFIDENT

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I. page 45

#### SECURITY/SEGURIDAD

The distribution of the groups' interest in this context reflects again some different concerns and preoccupations. There is basic agreement that security is good and desirable, that the police play an important role in maintaining it, etc. However, some of the motivational differences provide interesting insights.

On the American side money and financial considerations are sources of security. This is partially due to terminology, namely that "securities" is a broadly used financial term. At the same time the U.S. responses make it clear that financial resources are considered instrumental in enhancing a feeling of security. Savings, insurance and money are viewed as protection in an age and society characterized by Riesman (1950) and others as anxiety ridden and full of dangers and threats. According to these authors the unstable and uncertain nature of interpersonal relationships is the main source of insecurity in our highly mobile social environment. It is also interesting to observe that indeed meaningful and emotionally satisfying interpersonal relations (love, friendship, trust) are considered particularly important by U.S. Americans. Probably along this same psychological need, family and home also receive considerable attention. In a study of degree of need satisfaction 180 8th graders of two sexes and two social classes in Mexico City (Diaz-Guerrero, unpublished), it was found that among 22 important needs, those most satisfied for all the groups were love and friendship and the least satisfied need was justice. Different cultural groups appear to vary in kind and degree of satisfaction of their personal needs.

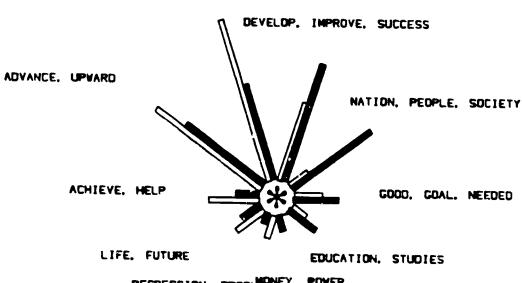

On security the Mexica's and Colombians show more differences, at least in comparison to the generally close agreement found on most other issues or subjects. Mexicans show more preoccupation with economic security and well-being. They also stress more the importance of trust. Furthermore, they show particularly strong preoccupation with social security.

To the Colombians peace and tranquility (tranquilidad) have a particularly strong relationship to security. There is also more emphasis on national (nacion) and military (ejercito) security by Colombians than shown by the U.S. American group. Finally, there is intensive Colombian concern with personal security and protection against crime. This is most likely a reflection of the low level of public safety in Colombia and especially in Bogota. The particularly high crime rate and the famous "wave of violencia" have startled not only Colombians but the outside world as we'l. A difference in history may also be noted: Mexico's "violencia" took place between 1910 and 1940, while Colombia's began in 1948 and extends to the present.

## **PROGRESS**

SCIENCE. TECHNOLOGY

RECRESSION, PROBLEMSTY, POVER

Perceptions and Evaluations □ - by Americans = - by Mexicans

For more information please turn to Appendix I, page 46

#### PROGRESS/PROGRESO

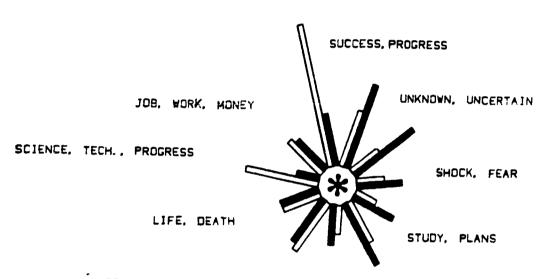

Advancing, moving ahead, is the core idea of progress for both culture groups, although it is somewhat more salient to U.S. Americans. While growth, improvement and success are important ideas to U.S. Americans, the Mexicans emphasize development (desarrollo). Progres is seen by U.S. Americans largely as a matter of individual achievement, while Colombians think primarily of help and work. This is in essential agreement with the Mexican tendency to regard progress as a national (nacion) and social (social) objective, a goal for the country (pais). The Mexican emphasis on improvement (mejorar), well-being (bienestar), and economy (economia) conveys similarly a tendency to view progress in terms of broader national objectives.

In agreement with the Mexican view of economy and their strong concern with the underdeveloped status of their country, in the present context we find that the Mexican view of progress is clearly a matter related to their national economy. They see a close connection to education, which also emerges frequently in the context of broader social and national objectives. From the U.S. American perspective the most critical factors are science and technology, factors which receive substantially less attention from the Mexicans or Colombians. The national, developmental considerations are dominant in the views of both the Mexican and Colombian groups.

## FUTURE

TIME: PRESENT, PAST

MARRIAGE, FAMILY, PEOPLE BRIGHT POSITIVE HOPE, ASBITION, GOALS

## Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix I, page 47.

#### FUTURE/FUTURO

There is a particularly strong American emphasis on the time perspective: future is seen as a linear extension of the past and present. This may be a reflection of a more intensive time awareness as attributed frequently to modern industrial societies (Toffler, 1970). Just as in the case of progress, the U.S. group assigns in the context of future an important role to science and technology. Love, marriage, family, and children also receive intensive attention from the Americans. Americans refer to Toffler's notion of "future shock," They express indeed a great deal of interest and fascination with the future which they approach with optimism, curiosity, and positive expectations.

Mexicans express more uncertainty, fear, and anxiety which may account for their responses to plan (planear) and think (pensar). On the positive side they have high hopes (esperanza) for the future, characterizing it as good (bueno) and filled with promise (promesa) of progress (progreso), development (desarrollo), prosperity (prosperidad), and happiness (felicidad). They also think of work (trabajo), study (estudio), and school (escuela). With their focus on personal goals and aspirations, U.S. Americans look toward the future with optimistic expectations. There is a similar emphasis on future as a source of happiness, success, and money. Mexicans and Colombians are similar in emphasizing development and progress, yet they are also rather similar in giving relatively lesser attention to technology and science. As previously observed, their idea of development is less technologically oriented.

#### SUMMARY

The social science literature is rich in controversies on certain domains of Hispanic values. One of the most debated issues is work (Rivera, 1970) and motivation (Hernandez et al., 1976; Romano, 1968). Several Hispanic social scientists argue that the social science literature is guilty of promoting a biased, stereotypical image of the Hispanic culture. Generalizations such as laziness, resigned attitudes, and lack of initiative and positive work motivation are particularly common.

As our findings suggest, there are several characteristic differences between the U.S. and Mexican view of work. Some of these differences may explain why even Hispanic authors show considerable disagreement on the Hispanic work attitude. Postulations about who works more or less are naturally much too simplistic. Some of the differences emerge in support of Kluckhohn and Strodtbeck's (1961) original observation about the action oriented nature of Americans. As they observe, compared to most cultures where work is more or less a necessary, indispensable inconvenience, Americans value work not merely as a means to earn a living but as an end in itself.

The data presented in this chapter make this difference rather explicit. The U.S. reactions to work and also to employment show that work is viewed indeed as fun and enjoyable. There is little complaint about tiredness or difficulty, and hard work is viewed as a positive experience. Mexicans do complain about difficulties and fatigue; they emphasize money as a motivating force; they stress its important instrumentality and necessity. They also view it more as a matter of responsibility.

Not only the personal utility and importance is considered but Mexicans consider work in a broader context of society and man, a disposition clearly revealed by the attention they give so such broad objectives as development and progress. While Americans, with their individualistic focus, see work more in the context of personal success and accomplishment, the Mexicans' focus on progress and development conveys the idea that work is seen as a necessity serving social and national objectives as well.

A closer look at the meaning of responsibility and security supports similar conclusions. Responsibility conveys a heavier concern with people, with friends and other persons, as well as with man in general. Responsibility is seen less as an individual choice, but more as a necessity and social duty. Compared to Americans to whom security is, beyond personal safety, predominantly a matter of financial status and affective personal ties, Mexicans are more concerned with social conditions, and problems of national and military security.

The marked difference between the individualistic personal perspective of the Americans and the more social, collective orientation of the Mexicans

is explicitly expressed in the context of progress. In the American mind the central ideas of progress are technology and science, accompanied by strong expectations and hopes related to personal success, achievement, and happiness. To the Mexicans progress involves primarily social and national issues. Progress is viewed in the context of national development, improvement and general well-being.

Across the thames analyzed we find a strong American tendency to emphasize jobs, the everyday context of work, and work associated with a particular task. Success, happiness, and career appear again and again, reflecting a strong personal interest as the driving force of individual work motivation. It would be futile to speculate whether success is viewed more as a matter of future goal or as a reward emerging from past What matters here is that to Americans success is typically achievements. personal and intimately related to individual achievement. On the part of necessity is the pervasive consideration, accompanied by duty and reconsibility, both of which convey predominantly social In the context of work motivation, these differences are considerations. likely to have practical implications. They underscore the fact that whether and how much U.S. Americans and Mexicans work depends on incentives which take dominant cultural dispositions into consideration.

In general, the results indicate a close similarity between the Mexican and the Colombian views of work, particularly if the main reference point is emparison with the U.S. Americans. Actually most of our conclusions awn in the context of the U.S.-Colombian comparison (Szalay et al., 1982) do hold, with minor modifications, for the U.S.-Mexican comparison.

Probably the single most central conclusion bears on the widely held view which assumes that work motivation is the same universal propensity and the main difference be meen cultures is that some have more of it, others less. The present results show that U.S. Americans and Mexicans approach mork differently. For U.S. Americans work has a more intrinsic value and serves as a major source of satisfaction and self-reliance mediated through achievement and success. For Mexicans, work has much more an instrumental value, it is the main source of existence, personal as well as social. The consistency and the broad ramifications of these distinctions become inclusingly apparent from the parallel comparison of both the Mexicans and the Colombians with the U.S. Americans.

Another source of useful insights is offered by Szalay's comparative studies of various Hispanic American samples——Mexican Americans, Puerto Ricans, Cubans and other Latin American immigrants living in the U.S. with the U.S. mainstream. Two recent studies (Szalay et al., 1982; Szalay et al., 1984) show a highly consistent pattern of gradual transition from the instrumental view of work as characteristic of the transitional Hispanic group to an achievement based intrinsic valuation characteristic of these Hispanic American samples which have shown a high degree of acculturation to the U.S. environment, not only in their view of work, but of other domains as well.

Holtzman, Diaz-Guerrero and Swartz (1975) found American school children significantly, but far from spectacularly, ahead of Mexicans in most but not all cognitive abilities and knowledge. But American classrooms had much fewer children and the salaries of the American teachers were at least four times greater than those of the Mexican at the time. Without higher teachers yield it is hard to improve school children's cognitive abilities and knowledge.

As the results obtained in high school children of Illinois and Mexico City with the Semantic Differential indicate, Mexican highschoolers rate the concept of failure as worse and more active than did American students, Americans value progress less than Mexicans and see success even if it means to them individual the success as less powerful than Mexicans. Particularly surprising is the differential subjective meaning of work: Americans value it less and see it as more passive than Mexicans. Furthermore, affective synonyms (among relevant concepts) for work are rich people, banker. and insurance for Americans and worker, shop, and storekeeper for Mexicans. Expectedly, antonyms for work are poor people, debt and failure for Americans but for Mexicans they are failure, borrowing and debt.

This meaningful panorama supports the view of many observers and sociologists that Hispanic and other immigrants in the United States are willing to work harder and for less in order to avoid failure and achieve their kind of success.

It is the actual and real differences, as illustrated in this book, that are fundamental regarding what to expect in the thinking, behavior, and various forms of yield for the individuals and the groups. Thus, it has become clear that presently Americant will work hard for anything relevant to or which adds to their individual self esteem. Hispanics will have to be given a good external reason to work: family, money, a mission, a fantastic opportunity to break with an uninspiring past, a mystique: national progress, a better society, national development, etc.

#### CHAPTER 11

#### GOVERNMENT, POLITICS

Kautsky (1962), Pye (1958), Apter (1965), and other leading scholars specialized in the field of national development observe some common characteristics of the political elites and the general population of developing countries with regard to their political views and frames of reserence. The elites are frequently characterized as being motivated by strong nationalistic sentiments; they show a tendency to subordinate the interests of the individual to the interests of the national collective. Amidst conditions of poverty and hunger in the general population, the people feel helpless as individuals and expect their government to make large-scale, collective improvements in education, economic development, and industrialization. This in turn calls for strong leadership, centralized power and authority.

Szalay's comparative in-depth studies of Konean (Szalay et al., 1972), Slovenian (Szalay and Pecjak, 1979b), Egyptian and Jordanian (Szalay et al., 1978b), Iranian (Szalay et al., 1978a) and other cultural samples with matching U.S. American samples have indeed shown interesting similarities as well as differences in their political frames of reference. The similarities among the people of developing nations become especially apparent when they are compared with U.S. Americans.

The parochial and erroneous claim that politics is the same all over the world overlooks fundamental perspectives, which frequently separate industrially highly developed countries from less developed countries. Such simplifications are harmful when they reduce our own capabilitic to address the problems of billions of people overseas whose for a ference and experiences are vastly different from ours.

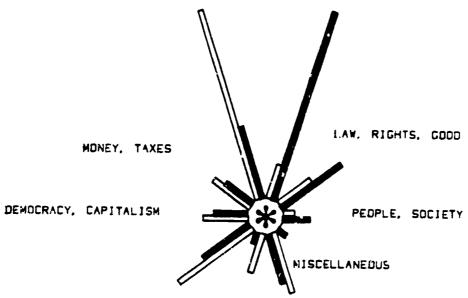

The following comparative analysis of the Mexican and U.S. American views of a few selected themes will be used to examine important similarities and differences.

#### GOVERNMENT

POLITICS, PRESIDENT

BUREAUCRACY, DRGANIZATION

BIG. RULE, POWER

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 48.

## GOVERNMENT/GOBIERNO

Americans perceive government as a large organization, a bureaucracy, which is in the business of politics. The president and the Congress attract about the same interest, the Senate somewhat less. Nonetheless, heavy emphasis is placed on the legislative and the executive branches of government. They emphasize the election process by which people express their preferences and choice. They make a clear distinction between federal, state, and local governments.

From the Mexican perspective only the office of president (presidente) receives any sizable attention. The Mexican image of government is less differentiated, focused on the government of the country and Federal District. This is most probably due to the actually centralized approach to government, in spite of the fact that it is a federal system like that of the United States. The Departmental Assemblies and the Municipal Councils, although they are elected, have no legislative functions; they are admiristrative bodies. The only governmental body which has truly legislative functions is the Congress, whose members are elected, as is the president, by direct popular vote. "The government" for Mexicans means the central national government, particularly the executive branch. Congress, although legally elected by the people, appears simply to accept and legalize the decisions and proposals of the president.

While the Americans' image of government centers on the legislature and the administrative-bureaucratic organization, in the Mexican view of the government, power (poder) and authority (autoridad) are more dominant. This difference may partially explain the very strong criticism directed against the government---corruption (corrupto), bad/evil (malo), injustice (injusticia), fraud (engano), and concern with the misuse of power as in oppression (opresion) and repression (represion). Yet at the same time Mexicans show stronger affective identification with the government as good, fair, necessary. Democracy receives attention from both groups although, as we have seen and will see, it has a somewhat different meaning to Mexicans than to Americans. Americans interconnect government more with the law and with such practical matters as taxes and employment and contrast capitalism with socialism.

On the Semantic Differential the Illinois highschoolers gave more power and meaning to the concept of "government" than the Mexicans, for whom it was worse, nearly meaningless, and polarized in evaluations.

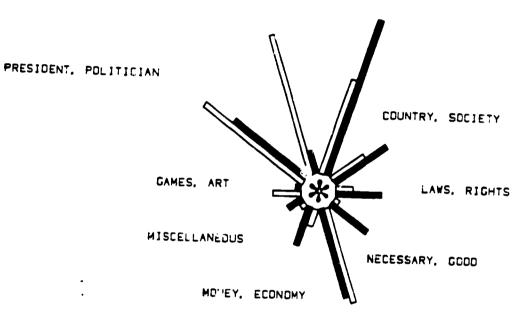

Those familiar with the Mexican sentiments suggest that the "docena tragica" (a reference to the two six year mandates of Luis Ecceverria and Jose Lopez Portillo) is what makes them exclaim corruption and fraud about the government.

## POLITICS

CORRUPTION. BAD

ELECTION. CAMPAIGNS

GOVERNMENT. DEMOCRACY

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, pagr 49.

## POLITICS/POLITICA

Mexicans and Americans both see politics in close relationship to government, and they both relate politics to the role of the president and to power in general. Beyond these similarities the two groups differ in several respects. Americans construe politics as an activity or process closely connected with the Congress, the Senate, that is, political institutions established by the constitution and manned by the elected representatives of the population. In addition to these elected bodies Americans give a great deal of attention to the voting and election process by which people express their preferences and by which the representation is implemented and decisions are made. This process, including campaigning, debates, political conventions, competition between the Democratic and Republican parties, has a special salience for Americans, while it receives comparatively little attention from the Mexicans. The people most representative of politics in the American mind are the presidents, past and present (Kennedy, orter, Nixon, Reagan). Interestingly, the Mexicans do not mention specific presidents or politicians, but think of the president in general.

The particularly intensive negative reactions contrasted with sizable positive evaluations indicate that politics is for Mexicans a highly emotional issue characterized by a high degree of ambivalence. Both groups speak of the corruption in politics. Americans mention crookedness, cheating, and dishonesty, with Watergate and Abscam vividly in mind. The Mexicans characterize politics as bad/evil, dirty, a source of injustice and demagogy; yet they also characterize politics as good and necessary and as a source of justice and help. The Americans have very little positive to say about politics. The Mexican expectations are more positive and the disappointment greater.

Americans relate politics to nation, while in the eyes of the Mexicans politics involves more intensively the problems of society, social issues. Mexicans also see a stronger connection between politics and the economy or economic situation. World politics and international relations receive little attention from both groups.

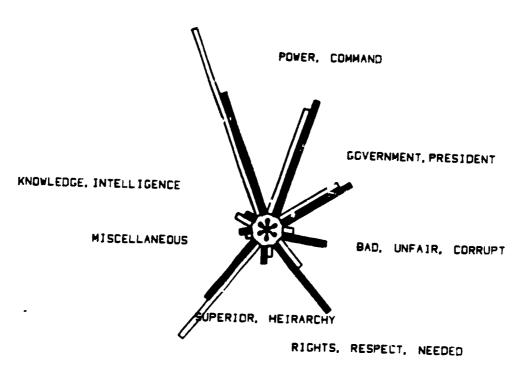

In other studies the Colombian meaning of politics was more similar to the Mexican than to the American. Colombians think little of elections and the political process but do pay relatively more attention to political parties, liberal and conservative. On the Semantic Differential Illinois highschoolers ascribed more meaning and more power to "politics" than did Mexicans, for whom it was clearly worse and nearly meaningless.

In general, the American meaning of politics, unlike the Mexican, is focused on the election process, on political institutions, and competition between the political parties. The Mexicans relate politics more to society, economy, and law; they express positive expectations and intense dissatisfaction.

## AUTHORITY

PARENTS, TEACHER, BOSS

LAW. PULICE

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 50.

#### AUTHORITY/AUTORIDAD

The differences in the U.S. and Mexican meanings of authority stem mainly from the focus of attention. To the U.S. group power is one of the most dominant sources of authority and vice versa. It is also connected closely with the idea of control. The Mexicans see authority as the foundation for mandates (mandato), commands (mando), and order (orden).

In thinking of where authority should be placed, both groups mention the police (policia) and the law (ley) as important sources. And while the police are more salient to Americans, the government is the most dominant source of authority to the Mexicans. The president receives less attention in this context from both groups. To U.S. Americans parents are authority figures more as a team, whereas the Mexicans have more specifically the father in mind. Both mention teachers and school.

Some of these differences follow from the circumstance that for the groups compared authority has somewhat a different foundation. To Americans beyond power and the capability to control, knowledge appears to be of considerable importance, which may explain why they make more mention of teachers, professors, and experts. To Mexicans, justice, law, and order ace of greater importance than to the Americans which explains their preoccupation with the government. As on all previous political issues Mexicans express again considerable ambivalence. They characterize authority as bad/evil, a source of oppression, repression, injustice, etc. While in most other respects they are similar to the Colombians, on this negative evaluation Mexicans sho a ronsiderable difference.

For U.S. and Mexican highschoolers no affective meaning difference was found for "authority" with the "mantic Differential. It was neutral for evaluation and activity and slightly powerful in both samples.

## POWER

MONEY, YEALTH

ENERGY, NUCLEAR

STRENGTH, MIGHT

GREED. EXPLOITATION, BAD

GOVERNMENT, POLITICS

CONTROL, AUTHORITY, COMMAND

RUSSIA. COUNTRIES PRESIDENT, LEADER

STRUGGLE. FIGHT

Perceptions and Evaluations

- by Americans - by Mexicans

## POWER/PODER

The Americans' references to gas, electricity, nuclear power, and other forms of physical energy are not shared by the Mexicans. The Spanish word "pocer" does not connote physical force or energy. The idea of power is used by Mexicans mainly in a human or social context.

Nonetheless, for both groups the primary meaning of power is social and political, involving political leadership, particularly the president, and government. This may explain some of the strong negative connotations that power has for both groups, although with a different accent. Americans think more of power in the context of world powers—U.S., U.S.S.R.——that is, the field of international relations. In the domestic field of politics there is some preoccupation with corruption, greed, and misuse of power by Americans.

Mexicans show a fore domestic, social focus and a much stronger preoccupation with the abuse of power: exploitation, wickedness, bad/evil, oppression, injustice. These critical reactions are directed against the representatives of power. The main culprits are the government, the rich, riches, money. References to capitalism and the United States are moderate. The heavy references to money and riches suggest that the Mexicans are particularly sensitive to and critical of the social abuse of economic and political power. Yet again, while the Mexicans express many misgivings about power and its misuse, they show considerable fascination with it as well.

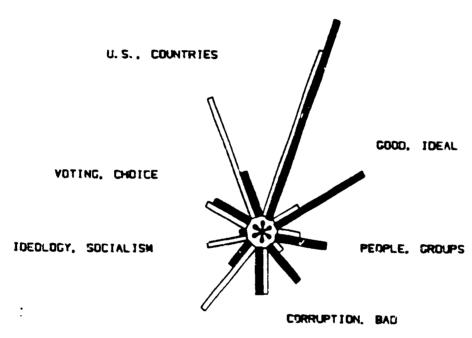

Americans see power as an important motivating factor; they to ink of the hunger for power, power struggle, control, and manipulation. The Mexicans emphasize authority (autoridad) and mandate (mandato) as important sources of power and convey stronger preoccupation with the social and psychological dimension of influence.

Clearly in agreement with the AGA results, "power" in the Semantic Differential study was found to be better, more powerful, active and meaningful for American highschoolers than Mexican. Additionally, there was significantly more agreement on its subjective meaning for the rican sample.

## DEMOCRACY

FREEDON, EQUALITY

POLITICS, PARTIES GOVERNMENT, SYSTEM

# Perceptions and Evaluations - by Americans - by Mexicans

For more information please turn to Appendix I, page 52.

## DEMOCRACY/DEMOCRACIA

Both Mexicans and Americans express a strong personal identification with the political system of democracy. While Americans see the United States as the country most representative of democracy, the Mexicans make remarkably few references to Mexico; that is, they are apparently hesitant to recognize their own country as democratic yet they appear aware of what democracy involves and requires. Their many references to elections (elecciones) and voting (votar) indicate a recognition of the procedural requirements of democracy, a dimension which usually receives little recognition from other less developed countries, as shown by the results of our previous comparisons. There is considerable agreement between Americans and Mexicans in emphasizing important social values such as freedom, liberty, equality, human rights. Americans consider freedom to be the most salient attribute of democracy. (igualdad) and justice (justicia) receive stronger recognition from the Mexicans. While the Americans emphasize fairness, the Mexicans give more attention to laws (leyes) and justice (justicia). Interestingly, Mexicans give special weight also to the ideas of union and unity.

The Mexicans stress the human and social dimension of democracy. They think more of society (sociedad) and particularly of the general population (pueblo). As another important difference, Mexicans express rather skeptical and cynical views: nonexistent (inexistent), lie (mentira), demagogy (demagogia). This suggests a certain disappointment resulting more likely from discrepancies between their high ideals of liberty and equality and the actual political realities observed.

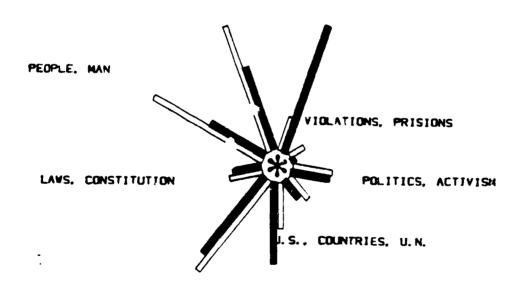

In general both the Americans and the Mexicans, and the Colombians as well, attach high positive values to democracy. They also recognize the procedural requirements of democracy. Mexicans, however, do not identify Mexico as a democratic country, while both Americans and Colombians think of their own respective countries as the most salient representative of democracy. Mexico has been a one-party state since 1917.

## HUMAN RIGHTS

EQUALITY, FREEDOM

NECESSARY, IMPORTANT

JUSTICE, RIGHTS, FAIR LIFE, PURSUIT OF HAPPINESS

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix 1, page 53.

## HUMAN RIGHTS/DERECHOS HUMANOS

for both Americans and Mexicans human rights are based on two dominant values, equality and freedom. Their main concerns are with the pplication of these values in the widest and most general terms. Along their dominant tendency of practicality, U.S. Americans mention specific people and groups whose rights are violated, whose freedom is restricted, and who do not receive equal treatment. Their interest in human rights is centered on domestic groups——Blacks, women, children—who have failed to receive equal treatment in one or another area of their human rights. U.S. Americans are particularly concerned about the rights of free speech, religious choice, and the pursuit of happiness.

Mexicans are par cularly emphatic in stating that human rights are necessary and good and that they are matters of obligation and responsibility, that they involve such essentials as security (seguridad), protection (proteccion), and guarantees (garantias). Yet despite this strong endorsement Mexicans remain rather general in their references to persons, humanity, society, everybody, etc. without indicating whose human rights are at the core of their concern, which appears to imply everybody. All Mexicans may feel abused by the authorities. They speak of law, fairness, justice, and respect but fail to convey in ways similar to Americans who are the specific targets of their human rights concerns. The closest practical issues they mention are education, work, development, which appear to be broad national concerns rather than human rights problems.

The Colombians are more specific. They express concerns with extreme instances of violation of justice. Most of these instances suggest the misuse of force, i.e., the treatment of prisoners, torture, and other unspecified violations. The Colombian references to the marines, the military, and guerrillas are of a different nature than those by the U.S. Americans in the context of the rights of women and ERA.

#### SUMMARY

How Mexicans and Americans differ in their subjective understanding of issues related to government and politics may be looked at from two different angles. One is through a comparison of Mexicans with U.S. Americans, and the other is through a comparison of Mexicans with Colombians as well as representatives of other developing countries. The following brief summary will encompass both these perspectives.

The Mexican and American views differ consistently along several main parameters across most of the issues examined. Whether it is government, politics, or democracy, Americans think of governmental institutions—Congress, Senate, the president—that is, of actors and organizations which are constitutionally created and regulated. The political actors and organizations mentioned by the Mexicans are more vague, less clearly articulated. The Americans think intensively of elections and voting, the political process by which the political representatives are chosen and the decisions are made. Americans think also more intensively of the political parties, Democrats, Republicans, which compete with each other and offer the public different options and alternative solutions.

The Mexican ideas are in all these contexts relatively few and nonspecific. The Mexican views involve more abstract ideals, reflect positive expectations and identification. Simultaneously they are accompanied by strong criticism and complaints involving exploitation, abuse, oppression, suppression, and other misuses of power. In all these respects Mexicans lay more stress on law and justice, respect, responsibility and other high ideals, and they invariably express more dissatisfaction and frustration conveying a high degree of ambivalence. The expectations conveyed by the Mexican reactions are reminiscent of the observations made by Kautsky, Apter, and other experts with regard to the political frame of reference of people in the Third World. As these experts have observed, people of the developing countries feel intensively helpless and they look to the government and national politics as potential sources of help and solutions. The intensity of expectations may be in the case of the Mexicans a major source of the dissatisfaction expressed in most political contexts examined.

Politics, government, and power are close's interrelated in the minds of both Americans and Mexicans, yet the nature and foundation of this close relationship differs. In the American mind they are based on the framework of institutions (Congress, Senate) and on constitutionally regulated processes (elections which assure political decision making in agreement with the views of the majority). They are based, furthermore, on political parties (Democrats, Republicans) which compete and assure that views appealing to the people receive popular representation.

In the Mexican mind politics, government, democracy, and all the associated ideas are similarly interrelated, but mostly on a different foundation. They all entail high expectations about law, justice, social

equality, unity, that is, all the desiderata necessary to achieve economic and social development. They all elicit similar sentiments of dissatisfaction and frustration as expressed in their references to exploitation, abuse, oppression, suppression, etc.

Similarly, power and authority seem to be closely but differently related for Americans and Mexicans. To U.S. Americans power is primary, implying a potential for control and influence. In the pragmatic view of U.S. Americans this potential seems to be the very essence of authority. Mexicans seem to interpret this relationship the other way around; authority appears to be primary, based on human roles which become the source of influence and power. As indicated, the Mexicans view authority and political power as mandated, which suggests a rationale that certain critical choices are at the discretion of those with authority and power. These views appear to be in agreement with the domestic practices which are quite different from American experiences. The American democratic process does not mandate freedom of action for the office holder but provides elaborate mechanisms to keep him in line with public sentiments, i.e., with the views of his constituents. On this question there is considerable similarity between Mexicans and Colombians and people from other developing countries.

The American-Mexican comparison involving politics, government, and other issues related to politics reveals differential trends in people's subjective views, their frames of reference, which appear with considerable consistency across most of the ideas and issues compared.

In the context of the Mexican-Colombian comparison we observe rather different trends. Compared to the Mexican American differences, the Mexican-Colombian differences are usually small. Due to the close similarities of the Colombian views with the Mexican, most of the above Mexican-American differences observed previously apply to the Colombian-American comparison as well. Compared to the Americans, the Colombians also approach politics, government, democracy, etc. with high expectations and attach high ideals to them, but they are relatively vague on specifics involving institutions, the role of the parties, and the working of the process. Colombians also express strong negative feelings with regard to government and political issues; like the Mexicans they complain about exploitation, oppression, suppression, abuse, etc.

Most of these trends observed support the literature on national development which indicate a rather high degree of politicization of the elites in the countries of the Third World. They also support observations related to the frequently abstract and affect-laden nature of political orientation, the feelings of relative helplessness, the identification of large-scale social and national objectives, the emphasis on unity, etc.

On other matters the Mexican and Colombian views and aspirations deviate rather noticeably not only come the generalizations provided by the experts, but also from our own data obtained on other countries of the Third

World. Mexicans and Colombians show relatively little preoccupation with industrialization, modernization and economic development compared for instance, with Koreans (Szalay, Moon and Bryson, 1973) or with Jordanians (Szalay et al., 1978).

Compared to the characterizations of the "ideology of accelerated national development" as described by Shils (1960), Moore (1963), and others, Mexicans and Colombians do reveal sensitivities and pride, but do not show the same emphasis on national identity and national objectives as do many other developing nations from the Far East or Middle East. Kautsky (1962) characterized nationalism as the strongest and most dynamic force in developing nations. Although the Mexicans and the Colombians both show some distinct signs of national identification, their political frames of reference show little indication of strong national feelings or of a process through which nationalism can transform into a practical, action oriented force serving the goals of national development.

#### CHAPTER 12

#### NATIONAL/ETHNIC IMAGES

Mental images are selective, affect-laden representations of reality. Whether the mental representations are of concrete objects or of complex events or problems, they are all shaped by the experiences and frame of reference of the observer. Selectivity and subjectivity are natural and intrinsic attributes of human perception. They are the main sources of variations in human behavior. This is the reason that the study of mental images, mental representations, can be so important and valuable. Careful examination of mental representations will reveal not how people actually are but how people tend to see themselves and others. For example, although Americans may not perceive themselves as capitalists or exploiters, people from other countries may see Americans in this light. Culturally widely shared perceptions are potent forces shaping history, frequently more potent than tangible realities. The following results show the culturally shared subjective representations and frames of reference characteristic of Mexicans and Americans.

The images of the United States and the Soviet Union are interesting in view of their potential to answer such questions as how these two leading world powers are viewed and evaluated by Americans looking at themselves and at their major antagonist and by Mexicans who are geographically close to the United States and distant from the Soviet Union. It is of interest to see to what extent and in what ways the Mexicans' image of the United States is similar and in what particular ways it differs from that of Americans.

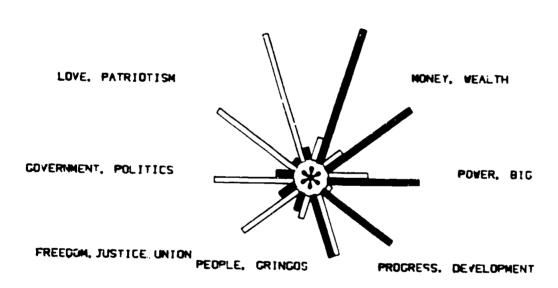

The American and Mexican groups' images of Mexican Americans, Puerto Ricans and Cubans provides a contrast of the perspectives of the culturally related Mexicans who are physically distant with the perspectives of Anglo Americans who may be culturally more different but who live in the same society with these various Hispanic American culture groups.

Compared to the more structured assessment strategies, the present unstructured, open-ended approach offers new insights into characteristics and perspectives that spontaneously emerge as dominant in the minds of the Mexican and American groups compared. But there is a crucial limitation to what we are to report next. On nonpolitical subjects Mexican and American students may be quite representative of their entire cultural group. On highly politicized terms such as the United States, Soviet Union, and North Americans, the subjective views of students may at times be representative of the entire culture and at others limited to their group. What follows represents urban university student views. It will be interesting to compare them in the future to the views of workers, rural people, etc.

## UNITED STATES

AMERICA, STATES EXPLOITATION, WAR

COUNTR", CULTURE

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 54.

#### UNITED STATES/ESTADOS UNIDOS

U.S. Americans think of the United States as a country formed of many states, a nation with its own history and other intrinsic characteristics. From a political angle the democratic principles, governmental organization, and the presidency represent salient considerations. The most dominant single attribute of the United States is its freedom.

The Mexicans' image of the United States shows a very different distribution of priorities and interests. The most agreement between U.S. Americans and Mexicans is shown in their recognition of the U.S. as a country (pais). The Mexicans stress power (poderio) and the large size as particularly dominant attributes. In addition to physical power, money and various ispects of the economic situation—capitalism (capitalismo), wealth (riqueza)—attract their attention. On the positive side, power becomes an asset in the context of development (desarrollo), progress (progreso), technology (tecnologia). On the negative side, however, this recognition of U.S. power leads to critical views built around the abuse of power: war (guerra), exploitation (explotador), imperialism (imperialismo), oppression (oppresion).

There is a great deal of similarity between the Mexicans and the Colombians, both in terms of what they admire and what they disapprove or resent about the United States. The Mexicans place more emphasis on richness, money, and capitalism, and they are particularly critical of the misuse of power. The Colombians think more in terms of political might (empire, dominion) and in terms of people (gringos, Yankees). The human, social dimension has low relative salience here for the Mexicans.

## ANGLD AMERICANS

WHITE, BLONDE TALL

U.S., ENGLISH

#### ANGLO AMERICANS/ANGLOAMERICANOS\*

With regard to the physical image, the reference to "white", which comes predominantly from Americans, is probably more a matter of ethnic identification than a physical distinction. If that is true we may conclude that physical appearance plays a negligible role in the national self image. The Mexicans, on the other hand, provide some distinct imagery, viewing Americans as blond, tall and large, and even handsome. That Americans are white receives little attention from the Mexicans, probably because they also consider themselves white as well.

With regard to national identification or identification by origin, the Americans think predominantly of Europe, England and Ireland. The Mexicans refer to Canada and Mexico in addition to the United States. For Americans the idea of America and English dominate naturally.

As a part of cultural identification Americans think of WASP, Protestant and Baptist and of culture and church in general. Mexicans use the expression gringos and mention culture and society in more general terms.

As the relatively few responses and the low dominance score indicate, the collective self image of the Americans is not particularly rich, compared to the Mexicans' image of the Americans. The most outstanding characteristics of Americans in the eyes of the Mexicans involves the economic conditions: capitalism, money, doliars, wealth, etc. Mexicans also see Americans as powerful, with military power, arms and with aggressive tendencies involving war and invasion. They are positively impressed by American technology, science, progress and development. In terms of positive human qualities intelligence is the most salient followed by ambition, creativity and goodness.

On the negative side, which is more dominant, Mexicans view. Americans as exploiters, racists, and imperialists, as bad/evil, false, and selfish. Compared to the Colombians, the Mexicans' image of Americans is distinctly more negative, more focused on the "syndrome" of capitalism, exploitation and imperialism. The Colombian image is focused on the people, culture and development; it is also less affect laden and ambivalent. The Mexicans' images of Americans and of the United States show essentially similar trands of perceptions and evaluations.

SOVIET UNION

COMMUNISM, SOCIALISM

DEVELOPMENT, TECHNOLOGY

U. S., CHINA

BAO, ENEMY, PROBLEMS

OPPRESSION, CONTROL

MISCELLANEOUS

WARS, ARMS, BOMBS

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix 1, page 56.

## SOVIET UNION/UNICH SOVIETICA

In the identification of the Soviet Union the Mexicans do not use the political label of U.S.S.R., but think of Russia and Russians. The U.S. Americans speak mainly of Russia and to a lesser extent of U.S.S.R. The American students mention more geographic and historic details such as Moscow, Siberia, and the Kremlin.

In terms of its political, systemic identity, Americans view the Soviet Union as the country of communism, with only a slight reference to socialism. The more it is interesting to observe that the Mexicans' references to socialism and socialist outweigh their references to communism. While these systemic identifications with socialism and communism occupy a larger share of the Mexicans' image of the Soviet Union, the Mexicans do not refer to the role of leaders, which is an important part of the Americans' image of the Soviet Union.

Yet, interestingly, the Mexicans show an intensive awareness of Soviet might, power, potency, and military preparedness: arms, armament, war, invasion, intervention, fight. This may explain why the Mexicans make more references to repression and control, at least compared to the U.S. Americans who are slightly stronger in their overall negative characterization. The Mexicans are more positive in their characterizations; they see the Soviet Union as representative of the ideas of equality, justice, development, technology, work, etc.

The Americans think of Afghanistan and oppression, and of the Soviet technological achievements only the Sputnik comes to mind.

In general, the U.S. Americans' image of the Soviet Union is consistent with their understanding of communism, but essentially rather different from their understanding of socialism. While socialism carries generally more positive connotations, communism and the Soviet Union convey more intensively the idea of oppression, control, lack of freedom.

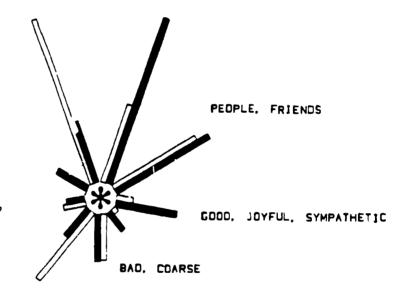

To the Mexican students the images of the Soviet Union, communism, and socialism have intrinsic similarities; they use socialism and communism to denote the Soviet Union rather interchangeably. While their evaluations do show some negative elements, the Mexicans are predominantly positive, with special emphasis on the egalitarian ideals of communism and socialism and on the role given to workers. In the case of the Soviet Union these positive elements are little affected by a simultaneous recognition of the country's power and military might.

## PUERTO RICANS

SPANISH, HISPANIC, AMERICAN

PUERTO RICO, ISLAND, U.S.

POOR, EXPLOITED. DEPENDEN

GOVERNMENT, EDUCATION, HELP

CULTURE, FOOD, MUSIC APPEARANCE: DARK, BROWN

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 57.

## PUERTO RICANS/PUERTORIQUENOS

A recent study comparing Hispanic American and Anglo American groups from various regions of the United States (Szalay, Diaz, Brena, and Vilov, 1983) revealed that Hispanic Americans who were geographically close described each other more in terms of personality characteristics (goodness, friendliness, generosity), while groups separated by greater distances made more stereotypical references to customs, popular food items and products (e.g., rice, rum).

The single most dominant perceptual component in the image of Puerto Ricans for Mexicans (as well as for Colombians) ties them to their homeland, the island of Puerto Rico, and to their geographic location in relation to the United States and Central and South America. The Americans think of New Yor. .most as much as of Fuerto Rico as the home base of Puerto Ricans.

From the American perspective the most outstanding characteristic of Puerto Ricans is their Spanish language and Hispanic cultural background. The Mexicans characterize them more as Latinos as well as Americans and gringos. With regard to appearance, both Americans and Mexicans pay about the same attention to the brown skin color and dark hair of Puerto Ricans Mexicans make more mention of small body siz. Americans think more vividly of customs, culture, music, dancing, although music and dancing get considerable attention from the Mexicans as well.

The Mexicans place more emphasis on friendship, interpersonal relations and personality attributes in their image of the Puerto Ricans chan do Americans. This may be partially a consequence of closer ethnic identification. It is also possible, however, that this is merely a reflection of the Mexican disposition to emphasize the human dimension in contrast to the material, technical dimensions of life. This is naturally not merely a Mexican trait but appears to be a common characteristic of Colombians, Puerto Ricans, and Cubans, that is, of all culture groups of Hispanic-Lutin American cultural background.

In this vein Mexicans (and particularly the Colombians) show consistently stronger dispositions to think of Puerto Ricans as human beings, people, man, person, friend. Compared to these Hispanic groups, Americans think of Puerto Ricans more as immigrants and a minority, although they refer to friendship rather extensively as well. Furthermore, Americans characterize Puerto Ricans as poor, living on welfare and in slums. Although Mexicans think of poverty as well, they speak more of exploitation, dependency and domination.

## CUBANS

GODD, LIBERTY, JOYFUL

POOR, PROBLEMS, OPPRESSION

CULTURE: CIGARS. MUSIC EDUCATION. PROGRESS
PEOPLE, MEN. FOREIGNERS

Perceptions and Evaluations

- by Americans - by Mexicans

For more information please turn to Appendix I, page 58.

#### CUBANS/CUBANOS

A dominant component in the image of Cubans involves their origin, their homeland. The island of Cuba, including its geographic location in the Caribbean, is by far the most dominant to the Mexicans, while for the Americans this is superseded by Cuban settlements in the United States (Florida, Miami). These trends indicate that Americans are thinking predominantly of Cuban immigrants, while the Mexicans have the Cubans in Cuba mainly in mind.

This differentiation applies to political identification as well. While Castro has high salience to all groups (particularly to the Colombians), Americans think of Cuba in the context of communism and Russia, while to the Mexicans the idea of socialism is the most pervasive.

In the Americans' image of Cubans the Spanish language or Spanish background is again the single most salient identification. Somehow this attracts little explicit attention from the Mexicans. Also, the econo ic and cultural products associated with Cuba---cigars, sugar, music, etc.--are much more representative of Cubans in the eyes of the Americans than Mexicans.

Again, the Mexicans think of Cubans in more general terms of people, persons, humans, and they express friendship with considerable weight. Americans think of Cubans more as foreigners, further stressing their foreign background by characterizing them as refugees and immigrants and by referring to the boats used in their escape from Cuba. With regard to the physical imagery it is interesting to observe that the Mexicans tend to perceive Cubans as people with black, brown or dark skin color. This color identification is remarkably intensive.

Goodness, liberty, equality, freedom, and particularly joyfulness again receive stronger recognition from the Mexicans. This trend is shared by the Colombians as well. Similarly, both Mexicans and Colombians express here negative evaluations as well, referring to oppression, discrimination, manipulation and other negative activities which they attribute probably more to the Cuban political system or government than to individual Cubans.

In general, the Colombians' image of Cubans is in considerable agreement with the Mexicans' but the Colombians think more in terms of communism than socialism and pay more attention to the role of the Soviet Union, Castro, and guerrilla warfare. This could be explained by possible socioeconomic differences between the Mexican and Colombian student samples or by more favorable treatment of Cuba by Mexican press and diplomacy.

## MEXICAN AMERICANS/MEXICOAMERICANOS

The image of Mexican Americans reflects the different perspectives from which Americans and Mexicans look at this culture group. These perspectives are consistent with those observed in their images of Puerto Ricans and Cubans as well.

From the American angle the visible and tangible cultural items like food (tacos, tortillas), music, and appearance (dark skin, sombreros) are most salient. The Mexicans think in more generic terms of culture and nationality.

As a somewhat related identification the Americans think of the Spanish language and culture. Most interestingly, the Mexicans do not think of this at all. They may take the language for granted since they also speak Spanish. Furthermore, in their eyes the proper national/ethnic identification is Chicano or Latino. They also speak of gringos and mixture (mezcla) and make references to race (raza).

The Mexicans characterize Mexican Americans in general terms as people, human beings, persons and also as friends and brothers. Americans use the general label of people as well, but they also use more specific terms such as immigrants, migrants, minorities, illegals, foreigners. The idea of the border is rather salient to both groups.

Similarly, both Americans and Mexicans think of Mexican Americans as poor and suffering from discrimination. The Mexicans note more problems and exploitation. The Mexicans also give more attention to the work done by Mexican Americans as well as to the money or dollars earned.

Americans associate Mexican Americans more intensively with Mexico, while the Mexicans refer to their Mexican American brothers in the United States. With regard to geographic location California and Texas are the two most important states identified by Americans.

Mexicans characterize Mexican Americans as good persons and as fighters, but they also describe them in such negative terms as bad/evil, negative, foolish, as betrayers and traitors, and also as resigned, dependent, and indifferent.

In general, the image of Mexican Americans is similar to the image of Puerto Ricans. Interestingly, the image of Puerto Ricans appears to be more positive and more sympathetic as seen by Mexicans.

#### SUMMARY

The images examined here offer a vivid illustration of how people's views depend on their point of observation and of how one's perception of reality is a function of perspective.

We found generally consistent trends in the images of the United States and Americans. U.S. Americans express identification more indirectly than explicitly. They refer to the U.S. as home and to themselves (me, we) as Americans. Other relevant reactions include flag, patriotism, love, and pride. In reference to the political system and social value orientation, by far the most valued single attribute is freedom, coupled with democracy. The U.S. Americans place only a moderate emphasis on richness and wealth in their images of the U.S. and Americans in general.

In comparison, the Mexicans' images of the United States and Americans are more ambivalent, polarized and affect laden. They contain particularly strong emphasis on U.S. might and power, which from their perspective appear both impressive and excessive. On the positive side Mexicans see development, progress, and advanced technology. On the negative side there is a concern with exploitation, injustice, and oppression. Compared to democracy, capitalism is used heavily, with a negative connctation as elaborated by Ralph K. White (1966). Their references to gringos and Yankees may or may not have negative connotations.

Another context useful in placing the image of the United States in proper perspective involves a comparison with the image of the U.S.S.R. Since the findings show that the great power status, strength and aggressive tendencies are dominant in the Mexicans' image of the United States, it is interesting to see to what extent the same perceptual and attitudinal trends are similar in their image of the U.S.S.R. The Mexicans do show a similarly strong emphasis on the strength and military might of the U.S.S.R., which they view as intensively armed, bent toward aggression, suppression and intervention. These negative features are contrasted with intensely positive evaluations stressing equality, justice, development, technology, work opportunities, etc. Communism is the single most dominant characteristic.

With no references to democracy, the Mexicans' image of the United States and their image of Americans contain strong identification with capitalism as associated with exploitation and imperialism. The intensity and the tone of these reactions make it clear that the idea of capitalism affects not only how Mexicans view the United States as a country but also Americans as a people. The salience of this concept to the Mexicans made it desirable to explore just how Mexicans understand capitalism.

In the eyes of the Mexicans the United States and Americans appear to be the epitomy of progress and development and are to some extent identified as potential sources of help. However, there were several indications that the Mexicans consider the U.S. responsible for their economic situation and

underdevelopment. Heavy references to exploitation in the context of the United States and the contrasting characterization of the might and richess and aggressiveness of the United States compared to the poverty and underdevelopment of other countries seem to suggest such trends.

The famous Chilean poetess Gabriela Mistral several decades ago quipped: "Pity poor Mexico---so far from God and so close to the United States." Part of the implication was that while all Latin American countries might be client states of the U.S., those that are in closest geographical proximity to the "Colossus of the North" have the least freedom of action and least control over their own destiny. U.S. financial interests are perceived (and not entirely without justification) as controlling the Mexican economy. High Mexican officials are often presumed to be on a U.S. payroll surreptitiously.

The image of Hispanics and the image of Latin America support the above interpretations and help to place them in a broader context. As a general trend it appears that, contrary to expectations, Americans see Latin America more emphatically in a Hispanic cultural context than do Colombians (Szalay, Vasco, and Brena, 1983). The trends observed in the Colombians' image of Colombia and of Latin America suggest that the main problems of the country and the continent are viewed as very similar: poverty, hunger, underdevelopment. Also exploitation, oppression, injustice, the social and political evils plaquing Colombia and Latin America appear to be similar.

In agreement with the findings of a recent study (Szalay, Diaz, Brena, and Vilov, 1983), the Mexicans' and Americans' images of Mexican Americans, Puerto Ricans and Cubans support the observation that there is a broad spectrum of orientations reflecting various degrees of psychological distance. People in close contact with each other are usually particularly preoccupied with human attributes and personality characteristics which dominate interpersonal relations. The stronger are the ties, the more predominant is this human dimension. At the opposite end of the spectrum, there are certain external manifestations of a culture: customs (fiesta), artifacts (pyramids), food items (tortillas) which may not tell much about the people but can reflect familiarity and interest at the level of the tourist. Beyond and above these different perspectives there is a generally stronger Anglo American disposition toward the more tangible dimensions of the material culture, while the Mexicans, together with other Hispanic people, show generally more concern with human and social attributes. These contrastive trends are evident in the images of Mexican Americans, Puerto Ricans, and Cubans.

Similarly, while U.S. Americans show more detachment, less affective involvement, Mexicans exhibit consistently more emotional involvement. This affect-laden approach involves more intensive evaluations in both positive and negative directions, reflecting opposing sentiments, more tension, more ambivalence.

In the broader socio-political dimension both groups do recognize poverty and other miseries and related inequities. From the American perspectives these appear to be conditions and disadvantages of historical origin with foundations in such social attitudes as racism and prejudice. From the Mexican angle they are seen much more as the result of injustice, oppression, and exploitation due to selfish, evil intent and design.

#### APPENDIX I

#### THE U.S., MEXICAN, AND COLOMBIAN GROUP RESPONSE LISTS

Included here are the U.S. American, Mexican, and Colombian original response lists with all the actual reactions produced by the groups. These reactions are the empirical foundation for the results presented in this volume. While we have used non-technical language in the main body of this work, several of our terms have technical definitions as well which have assured consistent treatment of the data over many years of intercultural investigation. In the text, the "salience" of a particular idea or subject is frequently mentioned. In a more technical context this term refers to the magnitude of a particular response score. Similarly, "relative salience" refers to a comparison of score values obtained for the U.S. American, Mexican, and Colombian groups. A "meaning component" is the cluster of semantically related responses characterized by a score value which is the sum of the individual response scores included in the cluster. We speak in the text of the "cultural dominance" of a particular theme. This is defined as the total score accumulated by all the responses from a group which are elicited by a particular theme.

The following tables show the responses elicited by each theme. The responses in each list are arranged in semantically related clusters identified through content analysis. The score for each response is based on the frequency with which that response is made. The scores are summed within each cluster to reflect the salience of each meaning component in the group's cultural images. Each of the response lists is presented with a percentage table which summarizes the relative contributions of each of the semantic clusters. At the bottom of each percentage table, the "total score" of all responses is presented. This score is analogous to Clyde Noble's (1952) measure of "meaningfulness," and shows the subjective importance of a particular subject to the culture groups studied based on solid empirical foundation.

A word of caution must be interjected here: although total scores may readily be compared from one stimulus subject to another to understand the relative strengths of subjects within a culture group, comparisons across culture groups should not be made unless cultural differences in response rates are taken into account. The expression "total adjusted scores" refers to a 15% increase of the original Mexican dominance scores and a 10% increase of the original Colombian dominance scores to compensate for the fewer responses which resulted in lower score values when calculated across all stimulus themes used in this study.

In the development of this information hundreds of thousands of word responses were processed and compared. Because of certain characteristics of our computer programs we limited our analysis to responses not exceeding ten letters and relied on a single translation. The main focus of our work is on the observation of response trends which emerge across several response distributions rather than on single isolated words as in a thorough linguistic analysis.

As elaborated in more detail in Appendix II, the content analysis performed on the lengthy response lists does entail some subjective

i

decisions. This occurs in grouping the clusters of related responses in such a way that the reader can receive a simple summary presentation of a rich and complex composite of perceptual and evaluative elements. Naturally, each attempt at simplification entails dangers of misrepresentation and distortion. For this reason the reader with deeper and more specialized interest is encouraged to review the actual responses rather than to rely merely on the clusters identified through the content analysis.

### APPENDIX II

## THE ASSOCIATION GROUP ANALYSIS (AGA) METHOD

DATA COLLECTION, ANALYSIS: AND MAIN CATEGORIES OF INFERENCES

Associative Group Analysi ( AGP) is a research method for assessing the perceptions, psychological meanings, and attitudes of specific social or cultural groups. The central assumption behind the AGA approach is that a group's psychological meaning of a parcicular theme may be reconstructed rom their word associations to the theme. Ever since Noble (1952) introduced his verbal-association-based measure of meaningfulness, investigators have been exploring rays of using verbal associations to assess various dimensions of psychol pical meaning. Especially important in this field are the investigations of James Deese (1962, 1965). The AGA method was developed for the systematic assessment of subjective culture. It is used to draw inferences about such important variables as cultural mearings (Szalay and Brent, 1967), attitudes (Szalay, Windle, and Lyune, 1970), and value orientations (Szalay, Brent, and Lysne, 1968). The AGA method has proved capable of measuring psychological meanings with an efficiency comparable to that of other widely used methods---similarity ratings, substitution tasks, and the word-adapted semantic differential (Szalay and Bryson, 1972).

In contrast to traditional word-association approaches in which the subjects are asked to give a single response for each stimulus word in the AGA method the subjects give as many responses as they can think of in one minute. The technique is referred to as "continued free verbal association." This "continued association" technique produces response material with sufficiently broad foundation without having to use extremely large samples---a requirement that frequently makes socially relevant studies unfeasible and impractical. Generally, samples of 50 to 100 subjects are used to represent each particular group. The samples include preferably equal numbers if males and lemales. The requirements for representative sampling are fundamentally the same as in any other data collection aiming at generalizable results.

Through careful, systematic selection of stimulus themes, investigations can be focused on any desired problem areas or domains. Several related themes are selected in the representation of each domain in order to observe consistent trends on a broader data base and thus produce more generalizable findings. A strategy has been developed for selecting themes that are representative of the domains for each culture group (52 alay and Maday, 1974).

1

## DATA COLLECTION, TEST ADMINISTRATION

The standard AGA testing conditions of group testing, written form of administration, and working with little time pressure help promote more spontaneous, meaning-mediated responses. Individual subjects remain anonymous (demographic data being obtained by a brief questionnaire that carres the same code number as the subject's test slips); assurance of this helps to reduce the likelihood of bias in the form of acquiescence, considerations of social desirability, etc.; it also opens up a variety of emotion-laden issues to objective inquiry.

It'e subjects are asked to write free verbal associations to each of the st mulus words presented on randomly sequenced cards. They receive the following instructions, as well as the test material, in their native language:

native language. This experiment is part of a study, in verbal behavior, and this particular task involves word associations. These are group experiments, and your responses will not be evaluated individually but collectively for your group. Your responses are completely anonymous, and you are free to give you. associations concerning any subject. There are no bad or wrong answers, so do not select your responses but put them down spontaneously in the order that they occur to you.

The task is easy and simple. You will find a word printed on each slip of paper. Reading this stimulus word will make you think of other associated words (objects, ideas, issues, etc.). You are asked to write as many separate responses as you can think of in the time allotted. Try to think of one-word responses and avoid long phrases or sentences.

It is important that in giving your responses you always take the given stimulus word into consideration. For example, if the stimulus word was sable and your answer was writing, in giving the subsequent responses you must refer back to sable and avoid "chain" responses (writing, pen, ink. blue, ocean, acil....).

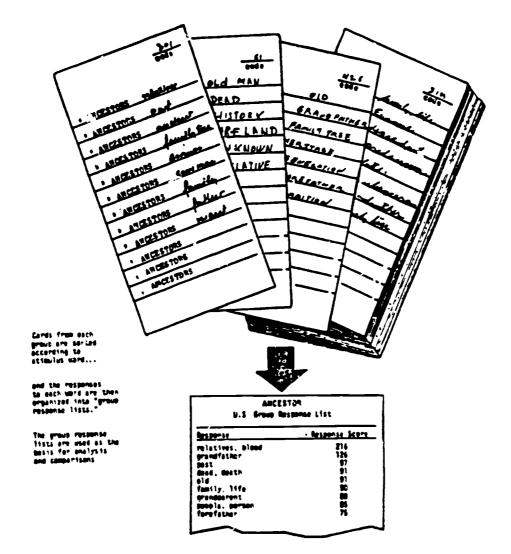

Please work without hur: \_ ig, but do your best to give us as many answers as possible. One minute will be given for each word. At the end of each minute I will ask you to go on to the next word. Do not work longer than one minute on any word and do not read shead or return to others later.

DATA ORCANIZATION: SCORING RESPONSES, COMPILING GROUP RESPONSE LISTS

A logical assumption is that earlier responses are more meaningful than later ones, that the first response has more salience to the subject than the last. This assumption is supported by empirical evidence. The stability of responses obtained at different rank places was studied by comparing the responses obtained from the same group in two separate sessions one month apart (Szalay and Brent, 1967). The responses obtained at higher rank places in the first test showed higher stability in the second test than did the responses first obtained at lower rank places. The coefficients of stability obtained in the comparative study provide the weights for the various rank places. The weights, beginning with the first response, are 6,5,4,3,3,3,3,2,2,1,1,1.

The cards are organized by stimulus words, and the individual responses from all the subjects are tallied into group response lists. Certain responses (e.g., school to educated) will occur to many members of the group; other responses may be given by only one or two members. In order to focus on the shared meaning for a particular group, the responses given by only one person are excluded from analysis. Dropping the idiosyncratic responses helps us to concentrate on the more stable, shared responses and simplifies the data processing and analysis. Dropping the idiosyncratic responses helps us to concentrate on the more stable, shared responses and simplifies the data processing and analysis.

If we look at associations produced by members of our own culture group, they appear to be just plain common sense. We tend to feel that everybody would produce similar responses and that the responses do not tell us anything new. This impression is probably the major reason that the potential information value of associative response distribution has not been clearly recognized in the past. The systematic exploitation of associations as an important information source is the central objective of the AGA method. The feeling that everybody would produce similar responses is a culture-bound impression. This becomes apparent if we compare associations obtained from groups with different cultural backgrounds. A comparison of U.S. and Korean responses to the stimulus ancestors, for instance, shows that the most frequent U.S. response relative occurs only down around the middle of the Korean response list. Of the five most frequent Korean responses, only two, grandfather and forefather, occur to the Americans. Both lists contain numerous responses which have high scores or salience for one culture group and low or no salience at all for the other group. A quick glance at the most frequent responses readily reveals that they are not accidental, but deeply rooted in the cultural background, religious-moral philosophy, life conditions, and contemporary experiences of the respective groups.

Each group response list represents a rich information curce reflecting the group's characteristic understanding of the stimulus word, including perceptual and affective details which are frequently unverbalizable and below their level of awareness. Actually, a systematic examination of such response lists has shown that every response contains a piece of valid information about the group's characteristic understanding and evaluation of the stimulus word. Responses with a sizable score value (10 to 15) are rarely accidental. Using conservative estimates, score differences of 18 can be considered significant at the .05 level, score differences of 24 at the .01 level. The wealth of information provided by the group response list is impressive, since even small score differences can have significant implications for communication and behavior (Szalay et al., 1972).

The treatment of the responses is consistent with the conceptualization of subjective meaning as a composite of several main perceptual and evaluative components. It reflects enterprise to reconstruct this composite meaning through a reproduction of its main components by their context, and in their actual saliences. In the framework of our analysis, the subjective saliences of specific perceptual and evaluative elements is inferred from the response scores. The more people give a particular response, like evacuation, the greater is the salience of this mosiac element, for instance, in subjective meaning of ANCESTORS. In our effort to achieve a faithful proportionate reconstruction of the group's subjective meaning we rely on all of the shared responses given by the members of a group to a particular issue or theme. The salience of each mosiac element revealed by a particular shared response is revealed by the response score which is a function of how many people gave this response and with what subjective weight. Along this rationale of proportionate representation the relative salience of a specific response or of a particular response cluster is not only a function of the absolute score value but depends also on the relationship of the responses to the total score accumulated by all shared responses given to that particular stimulus theme. The same score value shows less salience in the context of a group which produces many responses. than in the context of another group which produces fewer responses.

In the following treatment of the data the requirements following from this principle of proportionate representation are consistently maintained. It is particularly important to keep this distinction in mind to understand certain basic differences between the AGA and the survey results. In the case of the surveys the number of those who took a favorable stand and those who chose a negative position on a particular question represent absolute numbers reflecting positive vs negative choices. In comparision the response scores used by AGA convey relative saliences. To maintain consistency with this rationale of relative saliences in the processing of the AGA data, as necessary, various types of score adjustments are made to maintain comparability. The following two examples may be indicative.

In the comparative study of Koreans and U.S. cultural meanings, we found that in responding to 200 themes, the Koreans gave 10% fewer responses than the Americans. It became obvious by various controls that this difference was largely an influence of the Korean alphabet, which requires more time to erite. To account for this discrepency, unrelated to the subjective meanings, an adjustment score was added to the Korean score to make the U.S. and Korean scores comparable. To maintain comparability samples of 100 respondents are generally used. In a few instances where we have to compare smaller groups, like 75 adults with 100 students, we adjust the scores of the smaller group (in this case by 33%) to maintain direct comparability.

## MAIN CATEGORIES OF INFERENCES, THEIR RELIABILITY AND VALIDITY

For the identification of various psychocultural characteristics, several analytical procedures have been developed, relying on the group response lists as the main data base.

GROUP PERCEPTIONS, IMAGES, AND MEANINGS

The group response lists contain a rich variety of responses, each reflecting a different mosaic element of the total psychological meaning. Grouping responses with similar content together helps to identify the main components of meaning and their characteristic saliences. This content analysis is performed by two or more independent judges whose background and frame of reference is by and large similar to that of the group tested. Korean and American groups are to be tested, the coders would be a Korean and an American. Each judge receives a list of all responses to a particular stimulus word (the Korean responses translated into English). They choose eight to sixteen categories which they feel subsume all the responses in meaningful groupings relevant to the stimulus word, and then assign the responses to these categories. The categories may be of low or high generality, concrete or abstract; but they should be simple, not very abstract, and at the same level of generality. It is important to chose clearly different, well=delimited categories that ' not overlap. It is necessary to choose between alternative possible categories: some will fit into the total system of categories better than others; some will communicate better than others. Responses that do not seem to fit into any of the categories are put into a miscellaneous category. Responses that may be assigned with equal justification to two or more categories are recorded for further discussion. The coders then meet with a senior researcher to discuss their agreements and disagreements. Where there are discrepant categories, three solutions are possible: new alternative categories, category combinations at a higher level of abstraction, or complementary The final categories are selected to highlight the most characteristic aspects of the groups' responses to the stimulus word. method maintains comparability of results in the analysis of the responses from the different cultural population samples. Once the categorization is finalized, a final check is required to make sure that all the responses are included and that they have their proper response scores.

Each category is described by a score and by a label to indicate its content. The category score is the sum of the scores or each subsumed response and expresses the importance of the category for a particular group. If a category yields a high score for a group, it may be said that the category constitutes an important meaning component of that theme for that group. The categories and category scores present a logical selected from which the central meaning of the stimulus word may be deduced. either directly or through advisors or background literature on the culture.

Using this procedure to analyze the stimulus theme <u>ancestor</u>, for example, we find a sizable group of responses dealing with "rites, veneration, and worship." The overwhelming majority of these responses come from the Koreans while only a few of the American responses fall in this category. A modest familiarity with the cultural background of the Koreans

makes it obvious that this component reflects the traditional ancestor worship and shows how salient this cultural element is in the minds of contemporary Korean citizens. Another group of responses identified by the judges concerns the past and other time references, indicating that ancestors belong very much to pat, ancient times in the minds of our American respondents. This is less the case with the Koreans, probably because active veneration and worship is still part of the contemporary religious practices. Another cluster of related responses involve references to foreign, predominantly European countries. These responses come practically exclusively from Americans and show their awareness of their foreign ancestry. Naturally this component of cultural meaning is essentially missing from the Korean image of ancestors. Through this process of content analysis, the Lages assign all responses to main response categories of U.S. and Korean cultural meanings.

In the case of the responses to ancestors the judges used ten categories to identify the most salient components of the groups' contemporary meanings of ancestors. The scores the various components accumulated in this process reflect the subjective salience of each component for the cultural groups compared. The main content categories obtained by this analysis describe the total subjective meaning of the theme in terms of the main components characteristic of each group's understanding. Because there is usually a difference between the two groups in their level of responding, the category scores are converted to percentages of the respective total scores in order to make them directly comparable.

This process of using relevant categories for the identification of main response clusters which are separate from each other and internally homogenous aims to simplify the rich and diverse picture of hundreds or so separate mosaic pieces to a simpler picture based on a fewer number of main components. This simplification involves human judgements and a certain degree of inescapable subjectivity. A critical consideration here is that while the related responses are aggregated in considering their relationship, the analysts have to consider the context of the stimulus theme. Whether "Neanderthal" or "Java" fits better into a category of geographic location or a category of prehistoric man depends on a great deal whether the stimulus theme was "ancestor" or "tourism." To allow the interested reader to look for additional details and to develop his or her own judgements the response lists are presented in full in Appendix I.

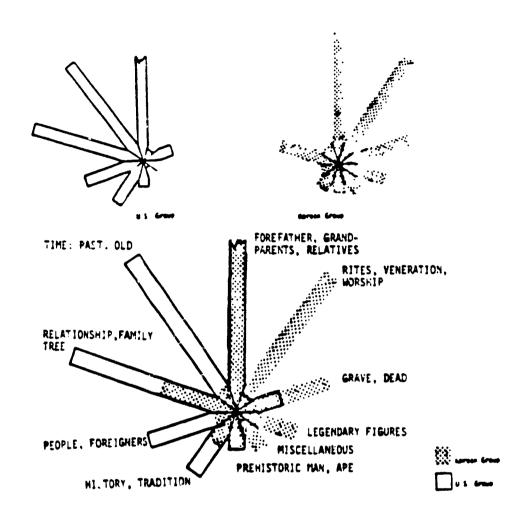

|   | U.S. (     | Korean | Group |    |
|---|------------|--------|-------|----|

| Total Scores (Dominance)                | 1,802      |        | 2,100 |    |

The reliability of the content analytic method was tested by comparing the performance of five judges working independently from each other. The interjudge reliability measured by product-moment correlation across 76 categories was .7. The validity of such inferences on particular single meaning components cannot be directly assessed because simple criterion measures are not available. There are, however, findings which show, for instance, that the salience of these meaning components provides valid predictions on the meaningfulness of messages in intercultural communications. Communication material that capitalized on salient components of cultural meanings was judged by members of this culture as relatively more meaningful than comparable communication material produced by cultural experts (Szalay, Lysne, and Bryson, 1972).

Another way to present the results of content analysis is the semantograph. It shows the main categories of group meaning by using radially arranged bargraphs. The dotted bars represent the main components of Korean interpretation and the striped bars the main components of U.S. interpretation. Where the bars are similar in length, substantial agreement exists between U.S. and Korean responses. The bars are arbitrarily arranged so that those on the left of the semantograph show meaning components especially strong (salient) for the U.S. group and those on the right show meaning components aspecially strong for the Korean group. This presentation is designed to help the reader to recognize components on which his own group and the other culture group are in agreement or disagreement.

## **ANCESTOR**

Main Meaning Components for U.S. and Korean Groups

## U.S. and Korean Groups' Main Meaning Components in Combined Presentation

Effective communication requires that we address members of other cultures on components that are salient to them. Thus, in communicating with Spanish-speaking groups on education, components that are predominantly Hispanic (e.g., politeness, family background, etc.) can be expected to elicit interest and understanding. For those familiar with the cultural backgrounds of the groups producing the associations, it is apparent that the high-scoring responses reflect their salient characteristics. The response polite from an Hispanic group, for example, reflects their emphasis on formal, polite behavior. With a deeper knowledge of the cultural background, all the responses can be traced to the religious-moral philosophy, history, life conditions, and contemporary experiences of the respective culture groups. These trends of cultural interpretation, of course, are not limited to single concepts; rather, they reflect general cultural experiences, life conditions, and philosophies characteristic of the groups compared.

## SUBJECTIVE PRIORITIES OR IMPORTANCE

### THE DOMINANCE SCORE

Every group has its own set of priorities: Americans are said to be preoscupied with material comfort, technical details, and scientific progress, while Hispanics are said to focus on family traditions, personal friendships, and spiritual values. The psychological priorities characteristic of a particular group can be inferred from dominance scores. How important a certain subject, theme, idea, or issue is to a particular group can be inferred from the number of responses they give to it as a stimulus word. The dominance score, simply the sum of the scores of all responses elicited by a particular theme or domain, is used to measure subjective importance. It is a modified version of Noble's (1952) "meaningfulness" measure.\* The priorities of different social or cultural groups can be compared by looking at their dominance scores on the same concepts. Dominance scores reveal group-specific priorities not only on single issues but also for larger domains, as shown in the example below.

### DOMINANCE SCORES OF BLACK AND WHITE GROUPS

| Domair<br>and Themes | White       | Black | Domain and Themes | White | Black       |
|----------------------|-------------|-------|-------------------|-------|-------------|
| ISMS                 |             |       | SOCIAL PROB.      | 1     |             |
| democracy            | 636         | 449   | society (U.S.)    | 316   | 342         |
| socialism            | <b>3</b> 96 | 280   | social class      | 402   | 475         |

| mean                 | 532         | 382   | mean              | 338   | <b>3</b> 82 |
| NATION               |             |       | NEEDS             |       |             |
| nation               | 661         | 591   | goal              | 514   | 581         |
| United States        | 877         | 765   | expectation       | 236   | 298         |
| patriotism           | <b>5</b> 08 | 222   | desire            | 621   | <b>7</b> 01 |
| Americans            | 605         | 648   | valuable          | 832   | <b>8</b> 76 |
| mean                 | 663         | 556   | mean              | 551   | 614         |

These results come from a study of Black and White blue-collar workers who were compared on the relative importance they assigned to 60 selected themes in 15 domains. The table indicates that the Black group was more concerned with social problems and needs, while the white group placed more emphasis on political isms and nationalism.

\*Noble (1952) first demonstrated that the number of associations given by a person in a continued association task of one minute provides a measure of "meaningfulness" that is highly correlated with the person's familiarity with the word and its meaning.

The group-based dominance scores have been found to be highly culture-specific (Szalay, Moon, Lysne, and Bryson, 1971) and have a reliability of

More information on the dominance scores can be found in <u>Communication</u> <u>Lexicon on Three South Korean Audiences</u> (Szalay, Moon, and Bryson, 1971).

### OVERALL SIMILARITY IN PERCEPTIONS

THE SIMILARITY COEFFICIENT AND INTRAGROUP HOMOGENFITY MEASURE

Without considering the actual <u>nature</u> of differences one may ask generally to what extent do two groups differ in their understanding of a particular theme. Free verbal associations offer an empirical answer to this question based on the principle that the closer the agreement between the associations of two groups on a particular theme, the more similar their meanings are. To measure the extent to which two groups agree in their perception and understanding of a particular theme, idea, or issue, the coefficient of similarity is used.

Similarity in subjective meaning is inferred from the similarity of response distributions measured by Pearson's product-moment correlation. Close similarity (high coefficient) means that the high frequency responses produced by one group are also high frequency responses for the other group; similarly, the low frequency responses produced by one group will generally be the same as those produced by the other group. The scores for the same (translation equivalent) responses from two groups respresent the pairs of observations (x,y) used in this calculation. No represents the number of pairs of observations, that is, the number of word responses used in the calculation of a particular coefficient. The coefficients provide a global measure of the level of similarities and differences without elaborating on the semantic components on which they are based.

In the example below the problem areas or domains are presented in descending order of agreement. The reactions of the Black and White groups were most similar in the areas of education and family. The problem areas showing least agreement, social problems and needs, are the same areas in which the dominance scores reflected more concern from the Black group.

INTERGROUP SIMILARITY BETWEEN BLACK AND WHITE GROUPS

|                          | NEEDS   |   |
|--------------------------|---|---|
| .90<br>.88<br>.92<br>.79 | goal expectation desire valuable  | .38<br>47<br>.76  |
| .88                      | mean  | .53   |
| .80<br>.92<br>.84<br>.79 | SOCIAL PROBLEMS society (U.S.) social class social justice social progress mean | .38<br>.50<br>.15<br>04   |
|                          | .92<br>.79<br>.88<br>.80<br>.92<br>.84<br>.79                                   | desire valuable  .88 mean  SOCIAL PROBLEMS society (U.S.) social class social justice social progress |

The reliability of the coefficient of similarity measure was tested by comparing two groups obtained by splitting a larger group randomly into two halves; the coefficients produced on a sample of themes were then averaged. In a comparison of two split-half groups on 26 themes, a correlation of .73 was obtained. An earlier comparison resulted in an r of .82, calculated over 40 themes. The coefficient depends a great deal on the particular theme under consideration. Themes that are specific and concrete produce steep response distributions characterized by a few widely shared responses, or meaning elements. The theme family, for example, is specific and concrete, and for everybody if means to a certain extent father and mother. The themes concern and anxiety are less definite, and instead of everybody agreeing on a few particularly salient responses, people produce a broad diversity of responses. In this situation, low correlation does not necessarily indicate low reliability of the measure but may be a consequence of the indeterminate nature of the theme. In such a situation the stability of the measure may better estimated by considering how stable a coefficient is within particular themes rather than across all themes. To assess this stability, the coefficients obtained on the same themes for the two splithalf groups were correlated over the 26 themes and produced an r of .89.

Certain Limitations of This Measure. Calculation of the similarity coefficient requires literal agreement; it does not take into account semantically closely related responses such as home and homely or synonyms such as house and home. Consequently, this measure is bound to underestimate the actual level of similarity. These biases are likely to increase the more the groups differ in their vocabularies. One could argue naturally that differences in vocabularies are not accidental and they

themselves are likely to reflect on psychocultural distance. Nonetheless, as some of these differences in the words used do not correspond to similar differences in perceptions, they are likely to give a somewhat inflated estimate of the actual perceptual differences. These biases are usually not significant and they are in general randomly distributed; in other words, the bias is likely to be the same regardless of the words used. This should not interfere with the utility of the coefficient to provide a valid estimate of the relative level of serantic differences.

In other words, the coefficient of similarity cannot overestimate similarity but it may overestimate the degree of differences in the perceptions of two groups. This problem can be offset through the use of one of the other analytic techniques developed with the AGA method. Once the similarity coefficient has been used to identify themes where the greatest differences are, it is desirable to take a closer look by categorizing the semantically related responses into clusters. content analysis the total score of the response cluster (synonyms, partial synonyms), rather than the individual response scores, represents the main source of information by revealing the salience of the main components of perception and evaluation. Thus, for instance, the nature and intensity of emotional ties projected into people's relationships by a particular group emerges from the total score accumulated by such responses as love, affection, and friendship. In this analysis the scores of single responses (e.g., synonyms) are inconsequential. The differences between groups may then be identified by a comparison of the scores showing the salience of the main attitudinal and perceptual components.

While the similarity coefficient is useful in measuring overall similarity or distance, the content analysis may be used to identify more specific cultural dispositions such as the Puerto Ricans' tendency to see personal relations within the framework of family in contrast the disposition of Americans to see people as individuals independent of family.

## Intragroup Homogeneity

A comparison of split-half groups shows how much agreement exists within a particular group on a particular stimulus theme. This intragroup agreement is affected by several factors.

One factor influencing the value of the coefficient is the size of the group. Based on 32 themes in the domains of family and health, mean coefficients were calculated using sample sizes of 13, 26, 52, 78, 104, and 156. They showed a distinct increase with the size of the groups compared. The rate of the increase is fast if we increase the size of small samples. For instance, an increase in sample size from 13 to 26 produced an increase of 27 points in the coefficient, while an increase from 52 to 104 produced an increase of only 9 points. Thus, there is a distinct decline in the growth rate in the case of large samples, and the coefficients come close to their plateau with a sample size of 200. Correlations do not generally increase just because the base of their calculation is extended. An explanation is likely to be found in the nature of mechanics of the calculation; the relatively large number of 0 scores obtained with a small sample decreases the correlation value.

13

Other important factors influencing the homogeneity coefficient relate to the nature and characteristics of individual themes under consideration. The variations are apparently explicable by the fact that some themes and domains are more concrete, definite, tangible (e.g., car, money), while others are more indeterminate, unobservable, abstract (equality, expectation).

These variations may be illustrated by calculating coefficients of homogeneity on 16 themes in the family domain (family, mother, father, home, etc.) using three different sample sizes: 13, 52, and 156. In contrast to the wide range of variation (-.12 to .70) observed at the level of the smallest sample, in the case of the largest sample the range was narrower (.72 to .96). Furthermore, the mean coefficient based on a sample size of 156 was .90, in strong contrast to the mean of .35 obtained with a sample size of 13. As a tentative explanation the phenomenon of "cultural sharing" (D'Andrade, 1959) seems appropriate. It follows from the rationale of this sharing phenomenon that larger groups, which provide a broader basis for observations, can be more completely described than smaller ones. These data underscore the importance of working with a sample size of at least 50.

### ATTITUDES AND EVALUATIONS

THE EVALUATIVE DOMINANCE INDEX (EDI) AND THE CONNOTATION SCORE

How people evaluate ideas and events——ERA, arms embargo, human rights, legalization of marijuana——can be assessed without asking them directly. Attitudinal inferences are derived from the distribution of associative responses with positive, negative, and neutral connotation. Based on empirical evidence that the evaluative content of associative responses is a valid indicator of the evaluative content of the stimulus word (Staats and Staats, 1959), a simple attitude index was developed to express the relative dominance of responses with positive or negative connotations (Szalay et al., 1970). First, the proportions of positive and negative categories are assessed by two independent judges who place the associative responses into positive, negative, and neutral groups. (In previous experiments this grouping task was performed with an interjudge agreement of .93 measured by product—moment correlation across categories.) Next, using the total response score for each of the three groupings, an index of evaluative dominance is calculated by the following formula:

EDI= scores of positive responses - scores of negative responses X 100 scores of all responses

Based on this formula, group indices are obtained on each stimulus for each group. The distance between groups in their evaluations is measured by comparing EDI scores using Pearson's  $\underline{r}$  coefficient.

A higher index implies more intense group evaluation, in either a positive or negative direction. The example below shows that Koreans are more negative in their evaluation of political systems, particularly communism. Their less negative evaluation of poverty and beggars may indicate more familiarity with or tolerance of these problems.

### EVALUATIVE DOMINANCE INDICES FOR U.S. AND KOREAM GROUPS

| Theme      | U.S. Group | Korean Group |
|------------|------------|--------------|
| family     | 25         | 22           |
| proud      | 12         | 28           |
| educated   | 51         | 51           |
| knowledge  | 50         | 44           |
| offense    | -27        | -53          |
| capitalism | 10         | -4           |
| communism  | -14        | -32          |
| equality   | 19         | 20           |
| poor       | -58        | -28          |
| beggar     | -63        | -42          |

The EDI measure is described in A Study of American and Forean Attitudes and Values Through Associative Group Analysis (Szalay, Lysne, and Brent, 1970; Szalay, Windle, and Lysne, 1970).

A direct method of assessing attitudes can also be used. It involves asking the respondents to give a general evaluation of each stimulus word after performing the verbal association task. To express whether the words mean something positive, negative, or neutral, they use the following the same association task.

A mean group attitude score is obtained for each stimulus word. Distance in eluations is then measured by Pearson's  $\underline{r}$  coefficient comparing two groups across stimulus words.

### RELATEDNESS OF THEMES, CONCEPTS

### THE AFFINITY INDEX

Measures of meaning similarity have considerable potential to assess how particular groups organize and interrelate elements of their environment. The associative affinity index measure indicates which words are related by a group to which other words and to what extent. The degree of relationship among these elements of a group's subjective world view is an important dimension of their cognitive organization. It is defined as the shared associative meaning of stimulus words as measured by the number of associations produced in common to these words (Szalay, 1965). Similar

15

<sup>3 -</sup> strongly positive, favorable connotation

<sup>-1 -</sup> slightly negative connotation

<sup>2 -</sup> quite positive, favorable connutation
1 - slightly positive, favorable connutation

<sup>-2 -</sup> quite negative connotation -3 - strongly negative connotation

<sup>0 -</sup> neutral or ambivalent feeling tones

concepts based on various meoretical positions are: overlap coefficient (Deese, 1962); verbal relatedness (Garskof and Houston, 1963); mutual frequency (Cofer, 1957); co-occurence measure (Flavell, 1959); and measure of stimulus equivalence (Bousfield, Whitmarsh, and Danick, 1958). These concepts, however, use single-word associative responses rather than continued associations. The associative affinity index, a modified relatedness measure similar to those reviewed by Marshall and Cofer (1963), was developed for use with continued associations.

The index of interword affinity (IIA) measure the relationship of one theme (A) to another (B) for a particular group based on the responses in common to the two themes. The formula for the affinity of them A to B is as follows:

| soure for responses | score for sirect elicitation |                               |
|---------------------|------------------------------|-------------------------------|
| · h combon          | <b>(4</b> )                  | index of interword            |
|                     | <del></del>                  | # 1000 = assectative affinity |
| tota                | I acore A                    | (AB)                          |

The formula for the afrinity of theme B to theme A is:

| seere for responses * sc | ore for direct elicitation |                               |
|--------------------------|----------------------------|-------------------------------|
| in common                | <b>O</b> A)                | trains of interverd           |
|                          | <del></del>                | 2 1000 - assectative affinity |
| total a                  | pere B                     | (BN)                          |

In the two lists in the table below beggar and poverty were responses to the two stimulus words under consideration. The lower score of the response in common (e.g., 38 for beggar) is used in the calculation because that is the portion that is common to both. (Although hunger and hungry are very similar as well as poor and poverty, they are treated as separate responses here.) Also, in the calculation is the score of the response to one stimulus word that is identical to the other stimulus word (e.g., the stimulus hungry eliciting the response poor). They are said to elicit each other directly; hence, what is here measured is called direct elicitation.

INDEX OF INTERWORD ASSICIATIVE AFFINITY

| Stimulu:      | A: HUNGRY                  | Stimulus B:   | POOR                       |
|---------------|----------------------------|---------------|----------------------------|
| Response      | Score<br>(Colombian Group) | Response      | Score<br>(Colombian Group) |
| meal          | 107                        | tungry        | 77                         |
| food          | 73                         | money         | 71                         |
| hunger        | 65                         | poyorty       | 44                         |
| p00 ^         | 59                         | beggar        | <b>3</b> 8                 |
| beggar        | 43                         | necessity     | 30                         |
| poverty       | 38                         | house         | 28                         |
| Total Score A | 385                        | Total Score B | 288                        |

The score of the responses in common to HUNGRY (76) plus the score of the directly elicited response (59) indicates the total degree of shared meaning. The score representing the shared portion of the total meaning reaction cannot be taken by itself or it would be merely a function of the length of the response lists. Therefore, it is divided by the total score of all responses (e.g., to HUNGRY, 385). The score representing the shared portion of the total meaning reaction is thus expressed as a fraction of the

total score representing the total meaning reaction. This fraction is multiplied by 1000 in order to make it an integral number. The resulting number is called the interword affinity index, here calculated for HUNGRY to POOR:

 $\frac{76 + 59}{385}$  x 1000 = 351 = index of interword associative affinity, HUNGRY to POOR

If the relationship of POOR to HUNGRY is being considered, the index would be different: the score representing shared meaning plus the score for the direct elicition of <a href="https://hungry.com/hungry">hungry</a> (77) would be divided by the total score for POOR (288), giving an index of 531.

The following matrix shows the relationship of eight themes from the motivational and economic domains. The generally higher indexes for the Black group suggest a stronger relationship between motivational themes and economic matters. On the relationship of single themes, the table shows that the Black group sees a relationship between expectation and unemployment, which does not emerge from the White group's responses.

# AFFINITY RELATIONSHIP OF MOTIVATIONAL AND ECONOMIC THEMES FOR BLACK (B) AND WHITE (W) SAMPLES

| STIMULUS<br>WORD A | Group   |            | STIMULUS WORD & AND DIRECTION OF RELATIONSHIP |            |            |            |            |            |                 |                    |            |            |            |                   |     |          |     |

| Expectation        | W       | 94<br>97   | 237<br>224                                    |            |            |            |            |            |                 |                    |            |            |            |                   |     |          |     |

Indexes on single word pairs provide empirical data on single relationships; index averages calculated on the affinity of one word with a set of words representing a particular domain have more generality. Indexes calculated between domains may be expected to gauge cognitive organization at an even higher level of generality by revealing how closely interrelated are such areas for a particular group.

The reliability of this index in split-half comparisons was in the range of .90 (Szalay and Windle, 1968). The validity of this measure was estimated in a comparative study based on correlations of this measure with other independent measures: similarity judgment .73; judgment of relationship .77; grouping task .84. (The calculations were based on 66 index pairs.) (Szalay and Bryson, 1972).

More information on the affinity measure can be obtained in Communication Lexicon on Three South Korean Audiences (Szalay, Moon, and Bryson, 1971) and in "Psychological Meaning: Comparative Analyses and Theoretical Implications", Journal of Personality and Social Psychology (Szalay and Bryson, 1974).

### RELIABILITY AND VALIDITY OF ASSOCIATIVE RESPONSES

The continued verbal association task used in the Associative Group Analysis method produces extensive response distributions characterized by contrasts of high and low response frequencies. Even though conclusions are never based on a single response, the specific responses are the fundamental mosaic elements of information obtained in the association tasks and thus it is necessary to determine how their reliability. The answer to this question depends naturally on the number of people who gave the particular response and on the score the response accumulated based on its rank places of emission. The use of continued associations required the development of a weighting procedure to account for the differences in information value between first responses and the responses produced later at lower rankings. An empirically founded weighting system was derived based on the differential stability of responses observed in test-retest results. The following reliability scores were obtained as a function of the rank place.

STABILITY OF RESPONSES DEPENDING ON THEIR RAIK PLACE

| Stability and                                | Rank of Response |     |     |      |     |      |     |     |     |      |  |  |

This suggests that the average stability of a single response in continued association tasks is .32. This mean value represents the stability of an average response for an average person. The mean stability substantially increases when calculated on group basis. The increase becomes explicable by the observation that while a particular person may fail in retest to give the same response ne gave in the first test. It frequently happens that other subjects will use the word as a response in the retest although they may not have given it in the first test. Thus, particularly the common responses substantially increase this stability on group basis.

As the Associative Group Analysis method draws inferences on groups rather than on individuals, the stability of responses on group basis requires particular attention. The group response lists representing response frequencies weighted by their individual rank places serve as the data base for such inferences. With focus on the shareo responses of the group, responses given by only one person are disregarded as idiosyncratic. To assess the stability of group responses, split-half comparisons were made of a group of 100 subjects split randomly. Comparing the group response lists of the two groups of 50 subjects, an average stability of .61 was obtained. Interestingly, this stability increased gradually when split-half groups of larger sizes were compared (N=100, N=200). This phenomenon bears apparently on the cultural sharing phenomenon which has been described by several authors (Roberts, 1951; D'Andrade, 1959), but its implications go beyond our present concern with stability.

In connection with the problem of stability of response lists and the average stability of particular responses, it should be pointed out that this stability is also affected by the stimulus words considered. Certain stimulus words are specific and produce steep response distributions focusing on a definite set of responses. Others are less definite and produce responses with great intragroup variations. This definiteness depends partially on the characteristics of the stimulus theme such as its concreteness and specificity; it also depends on the homogeneity of the group's experiences in respect to the stimulus.

These different variables cause considerable variations in the stability of responses. Thus, the average response stability value reported above is a rough estimate. When more precise data are needed, as in the case of the evaluation of changes, learning and training effects, it is desirable to obtain stability data on the relevant themes in separate splithalf stability tests. The stability of specific responses as a function of the size of responses is discussed in the relation to the problem of statistical significance.

Although the Associative Group Analysis method insection used to derive information on diverse categories of variables, the infer ices are usually based on entire response distributions or clusters of responses rather than on single individual responses. Thus, although the measures are based on responses, the problem of validity can be examined more meaningfully in the context of the particular measures rather than single responses.
