ABSTRACT

Techniques of sociological research--defined as the assembly, organization and interpretation of facts that help explain human activity--are described in this guide to community research strategies. In Part I of the booklet some basic aspects of research are examined, illustrating procedures of stating and examining a research problem. The scope is narrowed in Part II to the problem of community research and suggestion is made of a variety of ways in which to gather information for research purposes. Appendices include an outline of questions involved in sociological research and examples of questionnaires and interview techniques. (SHM)

Community Research  
Technique Guide  
developed by

Carl Danzinger  
Sociologist

Consultant to M.D.I.P.E.

In this brief booklet we hope to open the door, and throw at least a ray of light on the subject of social research. You might consider this text an invitation to a means of better understanding the world around you. Sociological Research assembles, organizes and interprets facts that help to explain human activity.

The first part of our booklet attempts to examine some of the very basic aspects of research: To teach by example, to illustrate the procedures of stating and examining a research concern. Part two, although in general terms, narrows the scope to the problem of "community" research and suggests a variety of means by which we can attach a research problem.

Do not expect to have all your questions answered. Do not expect to be magically transformed into a professional research methodologist.

In fact our goal is more to provoke questions than to provide answers. Our hope is that you will use this introduction as a stepping stone into the vast and complicated yet meaningful unknown world of social research.

Part I - Everything you always wanted to know about research but didn't know how to ask.

A. How do you get started?

What is it that we want to research? Our first step in the research process is to choose and state the specific problem or issue which we are interested in studying. Although we ask ourselves questions all the time, we do not usually consider these to be social research. For example, John

wonders whether Mary likes him enough to go out with him on Saturday night (please excuse the sexist direction of this question). John decides to do research on this question; he calls her up and asks for a date. She answers that she expects to be going out and offers to fix him up with one of her girlfriends. John analyzes and interprets this information. Not only does she not want to go out this Saturday night, she also wants him to go out with a friend of hers. What conclusion should John draw from this information (data)?

Although this example may seem somewhat trivial it does make a basic point. A problem you decide to study might be almost anything with which you are concerned. The most important ingredient is your own interest or desire to explore the problem. The term problem, as used here in discussing research, means any topic of concern or any issue raised for study. Be careful not to restrict the meaning of "problem" to "something wrong" or to something in conflict with your own or society's values.

It is helpful to state the problem in the form of a question. For example:

1. Does involvement in community organizations increase political awareness?
2. What is it like to live in a Mobile Home Park?
3. Are the residents in different parts of a city equally satisfied with police service?
4. What effect do wives and girlfriends have on the recidivism (return to prison) of parolees?

5. Are there some workable alternatives to marriage other than the present, nuclear family arrangement?
6. How do individuals decide which political party to support?

In attempting to formulate your research question there are a number of important considerations that you should keep in mind. Your answers to the following questions will give you a good idea as to whether your problem is useful, reasonable and researchable. Ask yourself:

1. Why do you want to study this question?
2. Will the information you obtain have some practical significance in real-life situations?
3. Of what interest or importance is your problem theoretically? will your findings probably be useful in developing ideas or theories on the subject?
4. Have you narrowed your problem sufficiently so that it can reasonably be handled with the time and resources you have available?

B. What is the purpose or goal of the study?

Social research generally falls into one of two categories although any project may have both of the following goals.

1. The main purpose of an exploratory study is to examine a problem or field in order to uncover areas for more intensive study. We often think of this type of procedure as a descriptive analysis. Our goal is to accurately and systematically paint a picture of what is occurring, to report about, or to describe, some phenomenon which interests us. This

type of study will usually answer such questions as who, what, where, when, or how much. A few examples will be helpful.

- a. What are the causes of drug addiction?
- b. Who are the people living in a Mobile Home Park?  
Where do they come from (geographically)? How long do most mobile home dwellers live in one place?
- c. What happens in a process of small group interaction?  
Does one person usually wind up as a leader of the group?

The descriptive or exploratory study simply describes the situation.

It gives an account or a picture of the social reality.

--Drug addiction is related to social status, age, education and ethnicity

--Mobile home dwellers are more likely to be young married couples or retirees rather than families with children.

or

The average mobile home dweller moves his home very infrequently; perhaps, only once every five years.

--Almost all groups have a tendency to have the leadership role fall to one individual.

2. The main purpose of the hypothesis testing study is to determine the relationship existing between two or more variables. The hypothesis testing study places emphasis on the reasons for, or the causes of, an attitude or behavior. It attempts to explain the phenomenon rather than just describe it. This type of study answers the questions how? and why?

An hypothesis is a statement of a relationship between variables. For example:

- a. The lower the socio-economic status of an area the less efficient are the public services.
- b. The higher the social class background of the individual the lower the possibility that he will have a "record" as a juvenile delinquent.
- c. High income is positively related to voting Republican.
- d. Marital status is related to rates of suicide: Being single (as an adult) increases the likelihood of suicide.

Each hypothesis contains two variables that we have suggested are related.

- a. SES and public services
- b. Class and delinquency
- c. income and voting preference
- d. marital status and rates of suicide.

One variable is called the independent variable. This is the variable which either comes prior in time (to the other variable); or is thought to be a possible causal factor of the other variable. The second variable is called the dependent variable. This is the variable which either comes after the independent variable in time, or is the variable we are trying to explain. For example, we explain voting preference the dependent variable by the causal factor of income the independent variable.

To summarize, the purpose of social research is either to explore and describe social phenomenon or to test "hypothesis that examines the relationship between variables. In developing a hypothesis you should keep in mind that your variables should be clearly defined. You must be capable

of (operationalizing your concepts, measuring the variables in some accurate way). You must develop a means by which you can reasonably test your hypothesis.

It is not possible in this brief introduction to examine all the questions we must answer in designing and carrying out our research. Appendix A of this booklet suggests some questions we must ask ourselves in creating a research design. Appendix B provides a few example questionnaires and Appendix C shows an outline of a structured interview.

## A GUIDE TO COMMUNITY RESEARCH

The local community provides a setting for a conceivably infinite number of research projects. A researcher may ask questions about housing, education, politics, race relations, economic structure, police behavior, crime, delinquency, drugs, new life styles and find answers related to all these issues in a single community.

Not so long ago community studies focused on the entire community. Researchers spent long periods of time living in communities and studying several aspects of community life at one time. At that time, sociologists were interested in discovering the differences between rural and urban communities as much as they were interested in describing individual towns and cities. Today, due to the effects of the mass media and rapid transportation, rural-urban differences are not as great as they were at one time, and community studies have tended to become focused on problems "within" the community. This new perspective allows researchers to focus on one area of community life at a time and often on one particular question or issue.

In the next few pages, we will describe the three basic methods of data gathering from which you will choose when conducting your own research and then describe four areas of community life which you may be interested in studying.

The three principal methods of gathering information for research purposes are observation, questioning, and the use of available data. In this section, we present a brief discussion of each method examining the usefulness and practicality of each in terms of community research.

## OBSERVATION

Observation is a method of gathering information which has frequently been used in studying community activity. The procedure involves taking notes on what you see taking place and later looking for patterns of behavior that may emerge in your notes. A good example of a research project which used observation is a study conducted by William Foote Whyte in an Italian slum in Boston in the 1940s entitled Street Corner Society. Whyte wanted to study the principal organizations in the Italian community. He lived in the area for three years and collected a great deal of information on political activity, church involvement and family life. Eventually, his attention became focused on the "street-corner" gangs in the neighborhood. He observed two gangs and learned among other things the differences in the behavior of gang leaders and followers and what purposes the gangs served for the boys in the neighborhood. He found, for example, that the gang leader was more likely, than other gang members, to be expected to fulfill all of his personal obligations and that the leader always spent more money on his followers than they spent on him. Whyte noticed that when the leader was not present, the other members of the gang were divided into a number of small groups rather than interacting as a single gang.

Other observation studies have focused on church groups, community associations, bars and night clubs, and communes. In another well-known study using observation as the method of data-gathering, Elliot Liebow described the day-to-day lives of unemployed black men in Washington, D.C.

Although these studies seem particularly broad and time-consuming, you should not reject observation as a useful and practical means of collecting data. Sociologists usually rely on observation when neither questioning nor the use of available data (discussed below) seem appropriate. Sometimes people are unable to describe their behavior to an outside researcher. They become so involved in their activities that they are not aware of certain recurring patterns in group activity. This is certainly true of "Doc", one of Whyte's gang leaders. Doc didn't realize that as the leader of his gang he typically initiated all action for the group without consulting other members while followers discussed alternatives with each other in the leader's absence. Thus, Doc was unable to answer some questions about the gang's behavior.

Observation need not be limited to extremely long periods of time such as a year or more. An observer might spend an afternoon watching children playing on a playground or in a kindergarten class noting how children from different backgrounds behave, whether there are friendship groups, which children are in each group and how members of different groups interact. (This suggestion provides another illustration of the special usefulness of observation. The children would have a difficult time answering a researcher's sophisticated questions about their behavior.) A researcher might attend City Council meetings over a period of weeks or months to learn how the representatives of different districts in the city differ from one another in their discussion of the issues and voting activity, whether there are political factions among the Council members, or simply how a formal Council meeting proceeds. An even simpler use of observation

is to note the kinds of people who use public transportation into and out of a particular area at different times of day. Busses traveling to some suburban communities in the early morning, for example, are crowded with domestic workers from a nearby central city while transportation going in the other direction is used primarily by commuting businessmen. Even this simple observation can give the researcher an insight into the kind of community he is studying.

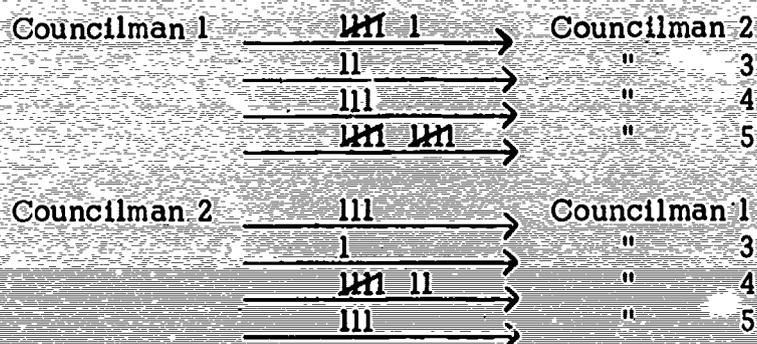

Whatever subject is chosen for study, there are some general limitations to the method of observation which the researcher should recognize. One limitation has been labelled a "biased viewpoint." This limitation refers to the fact that people (even sociological researchers) often see what they want to see or what they expect to find, thus biasing the results of a study. A means of avoiding this problem is to have two or more researchers observe the same activity. The notes of the independent observers are likely to be somewhat different, requiring a discussion among the researchers in order to arrive at some consensus regarding what "really" happened.

There is no single set of instructions for note-taking when using observation. Some researchers have a very clearly formulated question in mind when they begin to observe and can use a short checklist of activities as their notes.

Other investigators feel that they do not know enough about the area they are planning to study and thus proceed by taking very full notes on everything that occurs. Returning to our City Council example for a moment, one researcher may already know that the Council is divided into two factions

and which members make up the two sides from having read newspaper accounts of past meetings. He or she may be interested in finding out whether the members of each faction speak primarily to each other or primarily to members of the opposing group. He starts with a diagram which will help him note very quickly who speaks to whom during a meeting.

The page might look like this:

He places a mark on the appropriate line each time one of the councilmen speaks to another. When the meeting is over he can tally his marks in order to answer his question.

A less knowledgeable researcher, on the other hand, may not know what aspect of the City Council meetings he is interested in. In this instance, it is more appropriate to take notes which are as complete as possible. When they are complete, the researcher is better able to determine any predominant patterns of action. It is generally useful to distinguish between actual observations and your interpretations of what you have observed. Notes should include "facts" only. You can interpret the facts after the observation is completed.

Another limitation to observation is a possible "control effect." The interaction or behavior being observed may change because of the observer's presence. People sometimes behave differently when they know they are

being observed. This limitation may be overcome by not revealing your presence (or the purpose of your presence). This in itself presents another question--whether it is ethical to observe people without their knowledge. Each researcher must answer that question for himself. The observer may choose to participate in the activity or to observe from some unobtrusive vantage point. (non-participant observation)

We should also point out that observation taps behavior only. By simply observing groups, we cannot know the attitudes and feelings of the individuals. To learn about these aspects of community life, we turn to the second method of data-gathering--questioning.

## QUESTIONING

We are all familiar with national surveys and polls. The mass media report the findings of surveys regularly. Polls usually tell us how the country feels about a certain issue or predict which candidate is most likely to win an upcoming election.

Surveys are often conducted at the local level as well as at the national level, although their results are not as widely reported. A researcher or a research team may poll an entire community or smaller areas within the community such as political wards, neighborhoods, school districts, and so on.

The basic tool in carrying out a survey is the questionnaire. Questionnaires may be self-administered, that is, filled out by the respondents themselves, or completed by an interviewer who personally asks the questions to the respondents. In addition to questions concerning the focus of the research (such as attitudes concerning the need for a day-care center in the area or feelings about police-community relations or landlord-tenant relations), a good questionnaire should also include questions on the background characteristics of the respondents. The complete list of background information depends in part on the object of the study, but we can give a partial list of information that is commonly obtained. Usually included are questions on age, sex, marital status, occupation, income, education, religious preference and possibly ethnic backgrounds. If the focus of a study is on felt need for a day-care center in a neighborhood, the researcher will want to ask for the number and age of children in each family. Other special

studies should include any other seemingly relevant background characteristics.

When a study group wants to survey an entire community or a large section of a community, there are special procedures for choosing a sample of respondents rather than questioning all residents of the area. These procedures are too involved for us to consider here, but we can suggest that researchers interested in conducting a large-scale survey consult an expert and/or refer to the books by Riley and Blalock listed in the bibliography.

Questioning, of course, is not limited to the use of detailed and specific questionnaires. As with the different types of observation, when the student has limited knowledge about the area of inquiry, perhaps the best approach is to conduct intensive interviews with well-informed respondents. A researcher may want to find out how an important community decision has been made. He or she decides to question some of the people whom the local newspaper reports as participants. Because intensive interviews will require more time than questionnaire interviews, it is necessary to make an appointment with the respondent or respondents beforehand. When the appointment is made, the interviewer should tell the respondent what subject area the interview will be concerned with and how long it will take. During the actual interview, it is a good idea to have a list of questions or subjects that you want to cover in the interview. Take

Questionnaires should be pre-tested with a small number of respondents before the final form and nature of the questions are decided.

notes as completely as you can and fill in any details as soon after the interview as possible.

Occasionally, intensive interviews are conducted before constructing a questionnaire. They tell the researcher what questions would be suited for a future questionnaire and suggest appropriate wording for those questions.

### AVAILABLE DATA

Data which has already been collected provides perhaps the best single source of information for obtaining an overall description of a community and its resources. For most communities, there exists a vast reservoir of information in libraries, in city and county offices, social service agencies and newspaper clipping files. The use of available data for social research is less expensive and less time-consuming than collecting new data by means of observation or questioning, and available data covers a broader range of subject areas than any single first hand data collection can provide.

The questions to ask of available data are: Is the information accurate? and Does the information which is available help to answer my question? In some cases, available information will be too dated for your purposes; in others, it may not conform directly to your needs.

Here we list some of the major sources of available information:

- 1) Census Data - Census data can be found in local libraries or may be obtained directly from the Superintendent of Documents at the U.S. Government Printing Office in Washington. Local or county planning boards may also have census reports for public use.

What kinds of information does the census give us? The census provides housing and population statistics for the United States as a whole, for each state, counties, metropolitan areas, cities and even small areas such as census tracts (specially defined by the Census Bureau) and city

blocks. Population characteristics reported for each of these areas are color or race, sex, age, years of school completed, employment status, occupation, industry and class of worker, income, place of work and other characteristics of the population living in the area. The data on housing includes such items as condition of the housing units, average number of rooms in residences, whether households have such facilities as telephone, complete kitchen equipment or basement, whether housing units are owned or rented by their occupant, the median value of housing units in the area and the median monthly rent paid for rented units.

- 2) **Historical Information** - If any community histories exist, they will most likely be found at the local library or Historical Society.
- 3) **Newspaper Clipping Files** - Local newspaper offices not only have collections of back newspapers, they very often maintain clipping files indexed by subject areas and prominent community names for the use of their reporters. Outsiders are usually allowed to study these files which are particularly useful for following the course of a community issue.
- 4) **Chamber of Commerce** - The local Chamber of Commerce can provide information on local business and industry. Chamber of Commerce reports usually paint a rosy picture of the community's future, but they do include useful and up-to-date information.

- 5) **League of Women Voters** - The LWV usually puts out a factbook on community government describing the structure and functions of local government with the names and addresses of government officials.
- 6) **Information on Corporations** - The reference section of the local library should have Moody's Industrial Manual, Poor's Register of Corporations, Directors and Executives, and Who's Who in America.
- 7) **Social Service Agencies** - These offices usually have quite a bit of information on the aspect of the community which concerns them. Examples are welfare agencies, health services, clinics, counseling services, drug rehabilitation centers, unemployment and job training offices, etc.
- 8) **General Reference Material** - The public or university library in the community will probably have a special section on the city. In addition, the reference department has many useful sources of information and a reference librarian to help you find what you want.

Observation, questioning, and the use of available data are the three methods of collecting information for research in the community. Each approach has advantages and limitations, and you should carefully consider the most useful approach for answering your question about community life. Remember that the three data-collection procedures may be used in any combination. Combining the methods may lead to a clearer understanding of the phenomenon you choose to study.

In the next section we discuss four areas of community life which may be of interest to students--economic structure government, housing and education. There are suggestions for questions and directions to sources of information. You should remember that there are many more areas of community life to consider and any number of questions to ask. The following discussions should be viewed as examples of possible research procedures.

## SOME AREAS TO INVESTIGATE

### Economic Structure

Perhaps the first question you will want to answer about the economic structure of your community is: What are the principal businesses and industries? Every state publishes an Industrial Directory (available at the public library and university libraries) which lists every business employing over 100 people. There is a separate list for each county. Remember that certain service institutions such as the educational system, government, hospitals, prisons, and so on, may employ large numbers of people in certain communities. Census data can give you a rough idea of the number of people employed in this sector.

For financial information about particular businesses, consult Moody's Industrial Manual and/or the companies' annual reports which are on file with the state's Secretary of State, and for information about corporation executives, see Poor's Register of Corporations, Directors and Executives or Who's Who in Commerce and Industry.

You may also be interested in the labor movement in your community. You can find out what percentage of workers in your community are members of unions and the names of the largest unions in the area by asking at the local or regional AFL-CIO office. If you are curious about the history of the labor movement or labor-management relations in the community, a good place to start looking for information is in newspaper clipping files. You might also interview local radio, television or newspaper reporters who cover labor relations or try to locate books on the subject. To obtain

information on working conditions in local employment situations, the best approach is to gather current data by either observation or questioning. You may also want to find out about migrant labor in the area, wages and working conditions.

Another aspect of a community's economic structure is its residents' income. You may want to know what percentages of local families fall into various income groups or how many families fall below the poverty level or in the very high income categories and where each income group lives. All of this information is available in printed reports from the Bureau of the Census. Your library should have them.

Other questions to consider under the general heading of economic structure are: What is the local unemployment rate? Is the rate different for whites and blacks, males and females? Are there any job-training programs in the area? How many families or individuals are on welfare? You should think of more.

#### Government, Politics, Law Enforcement

To understand the structure of the local government, begin by making a list and if possible an organizational chart of the city, county and state elected and appointed offices with the duties of each office. As mentioned above, the League of Women Voters will probably be able to supply you with this information. If the League cannot, consult the city charter or the city or state government directory. Also note the extent to which governmental units overlap in authority.

The extent to which a local government can perform the functions

which its citizens want is limited by the amount of money it can raise from taxes and obtain from other governmental sources. You may want to find out what the community's sources of income are. Some possibilities are property taxes, sales taxes, sale of property, fines, fees and licenses, and grants-in-aid. What proportion of local income comes from the state and how much comes from the federal government? You will also want to know how the city spends its money. A copy of the city's operating budget is probably available at city hall. A useful way of presenting this information is to draw a circle divided into parts which show how much of each dollar spent goes to certain services.

Under the heading of politics, consider the strength of the major political parties. You can get a good idea of the formal structure of local political parties from the election laws obtainable at city hall or from the Secretary of State. If you are interested in voting statistics for particular areas in the community, go to the city clerk's office for local election statistics and the county clerk's office for state and congressional elections. Also make sure to get a ward or precinct map from the city or county clerk.

If you are interested in the workings of the city council or assembly, attend a few meetings--they are open to the public. If you have a question about community or neighborhood attitudes concerning a particular political issue, conduct a small survey. If you are interested in the informal workings of the political parties, participate in a local campaign or interview some "insiders."

Law enforcement has become topic of general interest to everyone in the last several years. Some people complain about police brutality and

unfair treatment while others lament the lack of law and order and the rise of crime in the streets. To find out about police and community attitudes, you might interview residents from several areas of the community and some policemen as well.

Local police departments may have on file an annual report which gives the structure of the department and type of personnel (patrolmen, detectives, etc.) and reported statistics on crime, arrests and convictions.

### Housing

As we mentioned in the discussion of available data, printed reports from the Census Bureau provide a great deal of information on the condition of housing in the community as a whole and for smaller areas such as census tracts and city blocks. You can learn where most homeowners and renters live, where the most and least expensive dwelling units are located and what kind of facilities the dwelling units in each block house, how many units are for sale and the median price asked for the units on the market. These data can tell you how segregated housing is in your community and whether blacks pay higher rents than whites for housing of similar quality.

Other questions to consider are: What types of control such as zoning ordinances, building code, sanitary codes are exercised over new housing construction? How well are controls enforced? How many people live in low-income or public housing projects? What are the living conditions in the projects? Are there any tenant organizations in the area? If so, what are their major complaints and activities? You should think of additional questions.

## Education

As under the other headings, the data collection concerning the educational system should begin with available data. The local Board of Education is the most logical place to go for the basic facts about the public school system. There you can learn the names and boundaries of schools, budget appropriations and expenditures, number of students in the schools and so on. The state Department of Education can provide information on state laws and regulations affecting local school systems, such as source of funds and policy on racial balance.

Some questions to consider might be: Who are the members of the Board of Education. How long do they serve? Are they elected or appointed? How much money does the city, state and federal government contribute toward the local school budgets? Have local bond issues for education typically been approved or turned down? How much money is spent per pupil for the entire system and for each school? Are the schools overcrowded? How old are the school buildings? Are there plans for new facilities?

Are the teachers unionized? What positions on various issues do teacher organizations take? Is the "track" system used in junior and senior high schools? Can you obtain average reading and mathematics test scores for the entire school system or for individual schools? What is the drop-out rate in junior and senior high schools for particular schools and among blacks, whites, boys and girls?

If you are interested in segregation in the schools, find out the racial composition of each school and the means by which the school board is

attempting to de-segregate the school system. You may also want to know how many children who are eligible to go to public schools attend private ones. How many of these attend private schools within the community? What are the opportunities for adult education in the community?

Economic structure, government, education and housing are only four of many areas of community life which you as a social researcher may want to investigate. We urge you to think of other areas of interest for community research and to formulate interesting and imaginative questions to ask.

Obviously, it is to your best advantage to carefully evaluate and employ any data which is available for public use before going out into the field to collect new data through questioning and observation. The use of available data will cut down on time and expense in the data-collection process. If there are no data available for answering a question you might have, then you should conduct small scale studies of your own, remembering the particular advantages and disadvantages of observation and questioning.
