ABSTRACT

This project was undertaken to assist South Texas industries in improving export to nearby Mexican maquiladoras (factories). The maquiladora program is based on co-production by two plants under a single management, one on each side of the border. Activities addressed four objectives: (1) to determine the dollar value, quantity, and source of the different component parts, materials, supplies, technical design services, equipment and repair services, transportation service, brokerage, and other services purchased by plants operating in the Mexican border area; (2) to determine the potential that South Texas manufacturers, wholesalers, and service companies from Brownsville to Laredo have for supplying maquiladoras with parts, materials, and services and the problems to be overcome in becoming suppliers; (3) to develop a computerized database for matching South Texas manufacturers with maquiladoras; and (4) to determine the general feasibility of establishing one or more business incubators to assist development of a South Texas maquiladora supply industry. Based on results of the study, it was recommended that a task force of representatives from the South Texas manufacturing community and the maquiladora industry, community leaders, public officials, educational leaders, and state and federal agency officials be established to develop and support six specific initiatives for information gathering and dissemination, coordination, and direct technical assistance. AASCU/ERIC Model Programs Inventory Project

The AASCU/ERIC Model Programs Inventory is a two-year project seeking to establish and test a model system for collecting and disseminating information on model programs at AASCU-member institutions--375 of the public four-year colleges and universities in the United States.

The four objectives of the project are:

- o To increase the information on model programs available to all institutions through the ERIC system
- o To encourage the use of the ERIC system by AASCU institutions
- o To improve AASCU's ability to know about, and share information on, activities at member institutions, and
- o To test a model for collaboration with ERIC that other national organizations might adopt.

The AASCU/ERIC Model Programs Inventory Project is funded with a grant from the Fund for the Improvement of Postsecondary Education to the American Association of State Colleges and Universities, in collaboration with the ERIC Clearinghouse on Higher Education at The George Washington University.

EXECUTIVE SUMMARY

Maquiladora plants operating between Matamoros and Nuevo Laredo in the Mexican State of Tamaulipas along the South Texas border purchased \$1.3 billion in component parts and materials from suppliers in 1987. Less than two percent of the purchases were made with companies in South Texas.

The maquiladoras have expressed an interest in buying from South Texas based suppliers. Estimates indicate that if local manufacturers could capture 25 percent of the current component parts and materials market over 10,000 new jobs would be created in the manufacturing and service sectors. This is good news for a region that historically has suffered the nation's highest unemployment rates.

To realize this opportunity however will require that South Texas manufacturers overcome several impediments. Problem areas include inadequate facilities and equipment, a shortage of skilled workers, poor management practices, and the need for capital to finance new business start-ups and expansions.

Several joint private and public sector initiatives could be undertaken to overcome these problems, including efforts to:

1. Continuously update and disseminate information on maquiladora supply market opportunities, including expanding the data bank initiated by the Center for Entrepreneurship and Economic Development at Pan American University;
2. Establish one or more business incubators to assist South Texas manufacturers establish themselves as viable maquiladora suppliers;
3. Strengthen, coordinate and target the efforts of public and private job training programs, including Texas State Technical Institutes (TSTI), private industry councils vocational tech schools, community colleges, and universities to meet the specific trained manpower needs of the maquiladora suppliers;
4. Improve the general business management practices of South Texas manufacturers through the expansion of business development at Pan American University and similar programs in the region;

5. Establish a development fund to meet the special financial needs of South Texas manufacturers seeking to establish themselves as maquiladora suppliers; and
6. Establish a South Texas manufacturers association to bring together maquiladora managers and area manufacturers to share information on business opportunities.

SOUTH TEXAS MAQUILADORA

SUPPLIERS PROJECT

STATEMENT OF PROBLEM

The population of the South Texas border counties of Cameron, Hidalgo, Starr, Webb, Willacy and Zapata doubled between 1950 and 1980, and is expected to double again by the year 2000, when the region's population is forecast to exceed one million two hundred thousand. While farming, ranching and commercial fishing have historically been the economic mainstays of the region the decade of the 1970's saw considerable growth in other important income and job producing sectors, including manufacturing, construction, trade, and services.

Notwithstanding these gains the region has long suffered from conditions of poverty and unemployment. Over the past two decades 30 to 40% of South Texas border families have lived in poverty, compared to 11 to 15 percent for the state. (U.S. Census, 1980)

Unemployment rates for the South Texas border region have historically been two to three times higher than the state average with some counties (Starr) exceeding 40 percent. Today, approximately 60,000 South Texas border residents are without work and another 30,000 to 50,000 are underemployed. In March 1988, 62,550 workers or 19.4 percent of the region's labor force was unemployed according to the Texas Employment Commission

(TEC). This compares to an unemployment rate of 8.3 percent for Texas and 5.9 percent for the U.S. for the same month. (TEC, 1988).

The South Texas border area remains underdeveloped compared to the rest of the State. Poor health, low educational achievement and limited job opportunities characterize the region. In 1980, per capita income was \$4,416, 40 percent below the state average of \$7,205. (U.S. Census, 1980)

Today, the region's economy while experiencing some growth in manufacturing continues to be dominated by agriculture, tourism, trade and services. Jobs are low paying and require minimum skill levels. The public sector (local government and school districts) employs over 20 percent of the region's labor force. (TEC, 1988)

Historically, South Texas border communities have enjoyed close economic ties with their Mexican sister cities along the northern border of the State of Tamaulipas. Mexican workers remain an important source of inexpensive labor for Texas border agricultural and service industries. Mexican consumers are important patrons of border retail establishments, and Mexican investors have played a key role in real estate and construction activities of the region.

U.S. border residents and tourists are frequent shoppers in Mexican border cities. South Texas farmers continue to invest in vegetable production and packing operations along the Mexican border. U.S. investment, direct and indirect, in Mexico's

border manufacturing activities has grown significantly over the past decade.

After a year of intensive work the Texas Border Economic Development Task Force concluded that:

"The State of Texas can no longer afford the luxury of letting the border stagnate and decline. The cost in human misery, in lost opportunities, and in dollars and cents is simply too great.

Sharing an international boundary has intensified the problems. At the same time, Mexico gives the border not only its unique, binational culture, but also its unique economic development potential. Lured by low wages and abundant energy, increasing numbers of manufacturers, U.S. and foreign, are showing interest in the Texas-Mexico border as they seek to meet global competition. The factories (maquiladoras) they establish produce jobs for Texans and Mexicans alike, and generate income ripples throughout the state and nation." (TBED Task Force, 1986)

THE MAQUILADORA PROGRAM

During World War II, Mexican citizens were admitted into the United States under the (agricultural worker) Bracero program to meet seasonal agriculture labor needs at a time of wartime shortages. One result of the program was the attraction of workers and their families to Mexico's northern border. When the program was terminated in 1964, approximately, 185,000 Mexicans were employed on farms and ranches in the United States. Unemployment levels, already high in Mexico's border cities, became much higher with the end of the program and the return of the Mexican workers.

Faced with rising unemployment and a shortage of housing and municipal services in its border cities, Mexico initiated the Border Industrialization Program (BIP) in 1965 to alleviate the

problems. Noting the success that Asian countries had in the 1960s in creating jobs for their growing population by securing the assembly and process work of U.S. firms serving American markets, Mexican officials sought to capture similar benefits by designing the BIP to take advantage of provisions of the U.S. Tariff Code.

The BIP provides for the duty free import of machinery, equipment and components for processing and/or assembly within designated areas along the U.S.- Mexico border and interior sites, provided that all the imported products are re-exported. The U.S. Tariff Code (Items 806.3 and 807) permits the re-importation of the processed and/or assembled products into the U.S. and taxes only the value added portion of the goods, which usually consists only of the labor used to produce the product.

The basic concept of the BIP, also known as the maquiladora or "twin-plant" program, is one of co-production. U.S. firms establish two plants under a single management, one on each side of the border. The U.S. plant provides the capital intensive processes of component making and the factory on the Mexico side, the labor-intensive processes of assembly. The U.S. plant supplies its Mexican plant with the component parts and materials and the Mexican plant returns assembled products to the U.S. for possible further processing and shipment to the various markets.

The maquiladora program is an important force in the development of the border region. In addition to the thousands of jobs the program has created for Mexican workers, the program

has become Mexico's second largest foreign exchange earner, behind oil and gas revenues and ahead of tourism. The program is also an employment generator on the Texas side of the border, where hundreds of jobs have been created in such industries as transportation, communications, construction, custom brokerage, and warehousing. In addition, according to many U.S. firms operating maquila plants in Mexico, the program has saved thousands of U.S. jobs that would have otherwise been lost to foreign competition. The maquila program permits U.S. firms to reduce their costs and remain competitive by moving certain portions of their production activities off-shore. (USITC, 1988)

The maquiladora industry has grown from 12 plants employing 3,000 workers in 1966 to 1,350 plants employing 385,000 in 1988. By the year 2000 the industry is projected to have close to 2,000 plants employing three quarters of a million (750,000) workers. Over the past five years (1983-88) the maquiladora industry growth rate has been phenomenal, the number of firms has increased by 115% and employees by 123%. (SCOFI, 1988)

Maquiladoras process and/or assemble a broad range of products ranging from automotive equipment to electric motors, integrated circuit boards, T.V. components, radio receivers, tape decks, hospital supplies, garments and food items. Electrical, textile, and transportation related products account for over 75% of the items handled by the maquiladoras. The majority (over 80%) of the maquiladora plants are located along the 2,300 mile U.S.-Mexico border from Brownsville, Texas to San Diego,

California. The balance (20%) can be found at different sites in the interior of Mexico. (SCOFI, 1988)

In 1987, 54% of the maquiladora plants were either 100% or majority owned by foreign companies, while 46% were either 100% or majority owned by Mexican companies. (SCOFI, 1988) The U.S. is the principal foreign country operating maquiladora plants in Mexico. In recent years interest has been shown by Japanese, European, Korean and Taiwanese companies in establishing co-production operating along the U.S. border.

PREVIOUS STUDIES

While little studied, it is believed that maquiladora operations have made a significant contribution to development of the border by linking together the economies of U.S. and Mexican border communities.

Although there is substantial anecdotal evidence to suggest maquiladoras contribute to economic interdependency along the border, very few empirical studies are available to validate the nature and extent of the relationships. (Martinez, 1978) Case studies providing for the general estimation of the employment, income and expenditure impact of the maquiladora activity on Texas-Mexico border communities indicate mutual benefits are realized by both sides (Mitchell, 1986, Patrick, 1987).

Other researchers have used various methods to estimate the effects of the maquiladoras on border communities. An econometric model using linear regression was employed to

estimate the maquiladora industry employment linkages between the cities of Ciudad Juarez and El Paso (Sprinkle, 1986). An economic base study was utilized to estimate maquiladora related employment, income and expenditure multipliers for Agua Prieta, Sonora, Mexico. (Ladman, 1972) An input-output model was used to determine the population, employment and expenditure impacts of the maquiladora program on Nogales, Sonora (Ayer, 1974). An econometric evaluation of employment and retail sales effects on four Texas border SMSAs has been conducted. (Holden, 1984)

Stoddard (1987) found that Mexican and U.S. border communities benefited from the maquiladora program. The program provides employment for Mexican border residents, generates local revenues from assessed fees to fund public services, encourages local investment in industrial parks and infrastructure, and spurs growth in such support industries as transportation and business services. U.S. border merchants also benefit from the maquiladora program since a large portion of maquiladora worker wages are spent in the U.S. for clothing, food and recreation. The program also stimulates the development of local component parts supply operations.

The benefits of the maquiladora program for Mexico have not gone unquestioned however (Grunwald, 1985). Negative effects on Mexico's economy and society have been attributed to the assembly operations. Three areas of concern have centered on: the absence of significant linkages of the assembly activities to the Mexican economy, the effects on the labor force in areas where

maquiladoras are concentrated, and the vulnerability of maquiladoras to swings in the U.S. and world economies.

Arguments have been made that by their very nature assembly operations constitute an enclave in the Mexican economy. First, it has been noted that only a small percentage of materials used in the assembly operations is of Mexican origin. Second, although many of the maquiladora plants use sophisticated equipment and technologies, there is little transfer of technology to the rest of the Mexican economy. Third, the employment generated by the maquiladoras tends not to absorb the traditionally unemployed and underemployed males but rather young women who have not previously been in the labor force. Fourth, it is said that maquiladora wages are destined to remain low, not only because of the low skill requirements of assembly operations but also because of the effort to keep such activities attractive to foreign manufacturers. Finally, only a part of the wages paid to maquiladora workers are spent on Mexican goods and services because of the workers and their families shop across the border. Thus, it is argued, that income generated by the maquiladora operations of foreign corporations provide only limited stimulus to the Mexican economy.

Counter arguments note that the institutional framework for maquiladora operations reinforce their economic isolation from the Mexican economy. Overall, while the assertion of low wages is accurate, it must be recognized that minimum wage scales are set and regulated by the Mexican government not the maquiladora

operators. In general, maquiladoras are not permitted to sell in the Mexican marketplace but must export their entire production. Both U.S. and Mexican maquiladora managers report that attempts to increase their use of Mexican components and materials in their assembly operations are fraught with problems. Mexican suppliers cannot meet the maquiladora's vigorous quality control specifications and delivery schedules, their production capacity is insufficient and their prices are too high. Finally, the low participation of Mexican capital and entrepreneurship in maquiladora activities limits the transfer of technology from maquiladora operations to the Mexican economy. Nevertheless, local public officials on both sides of the border acknowledge that the maquiladora plants are an important stimulus to their economies.

Maquiladora plant operators and public officials however express concern and frustration over the inadequacy of local infrastructure -- streets, international bridges, industrial parks, and utilities that limit the growth of the maquiladora industry. In addition, there is growing concern among Mexican officials over the lack of adequate housing, health care and transportation services to accommodate the needs of the rapidly growing maquiladora labor force.

MAQUILADORAS ON THE SOUTH TEXAS BORDER

The general consensus along the South Texas-Mexico border is that the maquiladora industry is mutually beneficial to U.S. and Mexican border communities. There is agreement that efforts should be made to promote its future growth. Of particular interest to Mexican and U.S. officials is finding ways to bring greater integration between border maquiladora activities and the Mexican and U. S. economies. The recent focus of many U.S. border communities has been on the development of their local manufacturing base so as to capture a share of the maquiladora supply market for component parts and materials.

Maquiladora activity has grown in importance along the South Texas-Mexico border over the past decade. The number of maquiladora plants between Brownsville, Tx./Matamoros, Mex. and Laredo, Tx/Nuevo Laredo, Mex., increased by over 56 percent from 73 in 1978 to 114 in 1987. Employment in the maquiladora plants increased by over 100 percent during the same period from 24,000 to 60,000. Preliminary research results based upon interviews with industry representatives and analysis of secondary data indicate that the maquiladora plants are responsible for over 10,000 U.S. border economy jobs from Brownsville to Laredo. (Patrick, 1987)

The payroll for the 60,000 Mexican maquiladora workers in 1987 was estimated to be \$130 million, while the payroll for U.S. border residents working in maquiladora-tied jobs was estimated to be \$90 million. Mexican maquiladora workers spent an

estimated \$40 million in U.S. border communities in 1987, while the combined expenditures of Mexican and U.S. maquiladora-tied workers generated an estimated \$10 in sales tax for the State of Texas and \$1 million in local sales tax for South Texas border communities. (Patrick, 1987)

In recent years, faced with increasing international competition, the maquiladoras have turned their attention to cutting costs and improving productivity. The focus has been on reducing inventory and transportation costs by emphasizing the replacement of long distance suppliers with local suppliers. Recent estimates (Patrick, 1987) indicate that the 114 maquiladora plants operating between Matamoros, Mex. and Nuevo Laredo, Mex. purchase \$1-\$3 billion in component parts and materials annually from suppliers located in the midwest and eastern states of the U.S. The Vehicle Safety Division of TRW, in McAllen, Texas, for example, purchases and maintains an inventory of 40,000 individual items on a monthly basis, at a cost of \$5 million. Over 95 percent of the items are purchased from suppliers outside the South Texas region. TRW has set for itself, the goal of eventually purchasing 90 percent or more of its component parts and materials from local suppliers. (Rankin, 1987) The company is actively pursuing this goal by seeking out and working with the local manufacturers to develop their capabilities to meet strict TRW quality control standards. Many other maquiladora plants in the region have expressed a strong interest in buying from local suppliers but indicate they do not

have the personnel nor the time to actively seek out and develop local manufacturer/suppliers, as TRW is now doing on a limited scale. It has been estimated that if South Texas manufacturers could capture 25 percent of this multi-billion dollar market, 7 to 8 thousand new jobs could be created along the South Texas-Mexico border. (Patrick, 1987)

Establishing a South Texas maquiladora supply industry has indirect as well as direct job creation and economic development benefits. Maquiladora suppliers are manufacturers with material and service needs of their own. Consequently, the opportunity exists to develop a second tier of local firms to supply locally based maquiladora suppliers.

The economic benefits (i.e., new jobs and expenditures) of developing a second tier of local firms to meet the raw product, materials and service needs of a locally based maquiladora supply industry could be considerable.

In 1987, for example, a newly established South Texas manufacturer (supplier) of plastic components for several large maquiladoras spent over \$5.0 million on raw materials, equipment, services and supplies. Less than 10% (\$50,000) of the material, equipment and other services were purchased from local firms. The firm estimates that more than 75% of its future purchases could be made with local South Texas companies. The materials, equipment, and services purchased range from cutting tools, grinding wheels and blades, sand paper, solvents, emery cloth and belts to metal plating, heat treating and industrial painting.

The firm has plans to increase its sales five fold, to \$20 million over the next five years, and will likely spend \$15 to \$16 million on raw materials and production services. Based upon job to sales ratios for industries producing similar materials and services across the state, the \$15 to \$16 million in purchases would generate 100 to 150 direct jobs. On a larger scale, it is estimated that if South Texas based maquiladora suppliers could capture 25 percent of the \$1-3 billion component parts and materials market a second tier of firms employing 3,500 - 3,750 would be required to supply the locally based maquiladora supply industry.

The total number of new jobs, direct and indirect, created as a result of establishing a South Texas maquiladora supply industry that captures 25% of the existing market would be in the range of 10,500 to 11,750. This is significant in view of the fact that the South Texas border region historically has led the nation in unemployment and poverty.

PROJECT GOAL AND OBJECTIVES

GOAL: To determine the potential for developing a South Texas based maquiladora supply industry. The establishment of the industry would provide for economic diversification and new jobs in the region.

The project goal is consistent with the goals of the U.S. Department of Commerce, EDA's Austin regional office and area economic development efforts by:

- A. Creating private sector jobs in severely distressed rural economic area with high unemployment and low per capita income;
- B. Promoting private and non-federal public capital formation and investment, economic diversification and enhancement of local economic development capacity;
- C. Increasing the competitiveness of U.S. companies in the world economy;
- D. Providing an opportunity for agri-business equipment (component and parts) manufacturers to convert over to the production of non-agriculture but related components and parts.

OBJECTIVES: Project activities sought to achieve four objectives:

1. Determine the dollar value, quantity and source of the different component parts, materials, supplies, technical design services, equipment and equipment repair services, transportation services, brokerage and other services purchased by maquiladora plants operating in the Mexican border area and cities of Matamoros, Rio Bravo, Reynosa, Camargo, and Nuevo Laredo.
2. Determine the potential that South Texas manufacturers, wholesalers, and service companies from Brownsville to Laredo have for supplying maquiladoras with component parts, materials and services. Identify the problems (i.e., technical, managerial and financial) that South Texas manufacturers need to overcome in order to become maquiladora suppliers.
3. Develop a computerized data base for matching South Texas manufacturers with maquiladoras to supply component parts, materials and services.
4. Determine the general feasibility of establishing one or more business incubators to assist the development of a South Texas maquiladora supply industry.

PROJECT METHODOLOGY AND RESULTS

Objective 1: Determine the dollar value, quantity and source of the different component parts, materials, supplies, technical design services, equipment and equipment repair services, transportation services, brokerage and other services purchased by maquiladora plants operating in the Mexican border area and cities of Matamoros, Rio Bravo, Reynosa, Camargo and Nuevo Laredo.

The first step in meeting objective 1 required compiling a current list of maquiladoras operating along the South Texas-Mexico border. This was done through consultation with chambers of commerce, industrial development foundations and economic development entities in South Texas as well as the maquiladora associations in Matamoros, Reynosa, Nuevo Laredo, and Mexico's Department of Commercial and Industrial Development (Secretaria de Comercio y Fomento Industrial).

The names and addresses of 114 maquiladoras (for 1987) were obtained in this fashion. In addition, information on the types of products handled was obtained. Based upon available product information the maquiladora plants were classified by two and four digit SIC codes. The complete listing of the maquiladoras can be found in Appendix A.

A breakout of the 114 maquiladora plants by location and SIC code classification follows.

Table 1

Maquiladoras Between Matamoros and
Nuevo Laredo By Location, 1987

City	Number	Percent
1. Matamoros -	55	48%
2. Reynosa -	26	23%
3. Nuevo Laredo -	24	21%
4. Cd. Camargo -	5	4%
5. Cd. Rio Bravo -	<u>4</u>	<u>4%</u>
Total	114	100%

Table 2
Maquiladoras Between Matamoros and
Nuevo Laredo By SIC Classification, 1987

SIC Classification (Code)	Number	Percent
1. Electronic & Other Electrical Equipment & Components (3600)	41	26.0%
2. Fabricated Metal Products, Except Machinery & Transportation (3400)	14	9.0%
3. Industrial & Commercial Machinery and Computer Equipment (3500)	13	8.0%
4. Transportation Equipment (3700)	12	7.0%
5. Measuring, Analyzing & Controlling Instruments (3800)	11	6.5%
6. Misc. Manufacturing Industries (3900)	10	6.0%
7. Rubber & Misc. Plastic Products (3000)	9	6.0%
8. Leather & Leather Products (3100)	9	6.0%
9. Primary Metal Products (3300)	7	4.0%
10. Stone, Clay, Glass & Concrete Products (3200)	6	4.0%
11. Chemical & Allied Products (2800)	5	3.0%
12. Apparel & Other Finished Products Made from Fabric (2300)	5	3.0%
13. Food & Kindred Products (2000)	5	3.0%
14. Misc. Repair Services (2600)	3	2.0%
15. Furniture & Fixtures (2500)	2	1.0%
16. Textile Mill Products (2200)	2	1.0%
17. Mining & Quarrying of Non Metals Min., Except Fuel (1400)	1	0.5%
18. Lumber & Wood Products, Except Furniture (2500)	1	0.5%
19. Paper & Allied Products (2600)	1	0.5%
20. Printing, Publishing & Allied Industries (2700)	1	0.5%
21. Business Services (7300)	1	0.5%
TOTAL	159	100%

The next step was to develop a questionnaire to be sent to the maquiladoras asking for information on the nature of their current supplier relations. That is, what component parts and

materials were they purchasing, in what quantities and dollar value, and from whom. The maquiladoras were asked about their interest in using local suppliers and under what conditions. They were also asked to provide information regarding their use of local services such as transportation, warehousing, equipment repair, business services and, in general, the types of items and materials they buy from South Texas sources. The questionnaire can be found in Appendix B.

The questionnaires were mailed, with the assistance of the maquiladora associations, to either the plant manager or purchasing agent of the 114 maquiladoras. The response to the questionnaire was poor. Although, forty seven (47) surveys were returned, the majority contained incomplete information. Follow-up phone calls produced some information from an additional 25 firms. Overall, it was felt that the information provided was not adequate to get an accurate measure of the size of the maquiladora market. One reason that many maquiladoras turned out to be an incomplete source of information is that they are subsidiaries of large Fortune 500 companies (i.e., Ford, GM, TRW, G.E., Zenith and Sony) and their purchasing decisions are made at corporate headquarters located elsewhere in the U.S. and not at the local plant. Another reason given by several plant managers was that such information was confidential.

Over 50% (40) of the maquiladoras, however, did indicate interest in using local suppliers. While some of the larger maquiladoras indicated they would like to purchase between 25%-

35% of their component parts and materials locally, the smaller maquiladoras indicated a desire to buy up to 85% (in some cases 100%) locally. The maquiladoras responding to the survey indicated a particular interest in finding reliable local suppliers for: plastics, metal stampings, castings, electronic components, screw machine products, plating, heat treating, and general machining capability.

After failing to acquire the desired market opportunity information directly from the maquiladoras several indirect options were considered. Both the U.S. and Mexican Customs Services maintain records on all merchandise crossing the border, including maquiladora bound shipments. Preliminary contact with each source revealed that the Mexican Customs Service in Mexico City would be the best choice in terms of time and cost.

Volume and dollar value data was obtained from the Mexican Customs Service on all component parts and material shipments for the months of January, May and September of 1987 bound for maquiladora plants operating between Matamoros, Mex. and Nuevo Laredo, Mex., including Rio Bravo, Reynosa, and Camargo. The data was adjusted for seasonality and projected for the entire year.

Study results indicate that in 1987 maquiladora plants between Matamoros, Mex. and Nuevo Laredo, Mex. purchased \$1.3 billion in components parts and materials for processing and/or assembly. Literally thousands of different types of items were purchased by maquiladoras. (See Appendix C) Grouping the items

by two-digit SIC Codes permits categorizing the items into 20 groups. Five SIC groups account for 85 percent of the total purchases, while ten groups account for 92 percent. The rank order by dollar value for the SIC groups follows. (Table 3)

TABLE 3

**Rank Order of Component Parts and Materials Purchased
By Maquiladoras Between Matamoros and Nuevo Laredo
By SIC Classification, 1987**

RANK	CATEGORY (NAME, SIC)	ANNUAL VALUE (MILLIONS DOLLARS)
1.	Electronic and Other Electrical Equipment and Components, Except Computer Equipment (SIC - 3600)	\$ 816
2.	Industrial and Commercial Machinery and Computer Equipment (SIC - 3500)	132
3.	Fabricated Metal Products, Except Machinery and Transportation Equipment (SIC - 3400)	72
4.	Rubber and Miscellaneous Plastics Products (SIC - 3000)	48
5.	Transportation Equipment (SIC - 3700)	48
6.	Chemical and Allied Products (SIC - 2800)	47
7.	Measuring, Analyzing, and Controlling Instruments; Photographic, Medical and Optical Goods; Watches and Clocks (SIC - 3800)	42
8.	Primary Metal Industries (SIC - 3300)	36
9.	Food and Kindred Products (SIC - 2000)	24
10.	Misc. Manufacturing Industries (SIC - 3900)	17
11-20.	(All Other SIC Groups)	<u>18</u>
	TOTAL	\$1,300

Items (components parts, materials, etc.) purchased by the maquiladoras in 1987 are listed by 4 digit SIC Codes in Appendix C.

The maquiladoras spent nearly \$1 billion in 1987 on electronic and other electrical equipment and components, except computer equipment (\$816,000,000) and industrial and commercial machinery and computer equipment (\$132,000,000). These purchases represent close to 75% of the total purchases made by the maquiladoras in 1987.

The expenditure figure of \$1.3 billion for component parts and materials purchased is consistent with previously reported numbers. Mexico's Department of Commercial and Industrial Development (Secretaria de Comercio y Fomento Industrial, SCOFI) reported purchases of \$1.2 billion by the maquiladoras in the same region in 1986 (SCOFI, 1988)

For comparative purposes, SCOFI reported total maquiladora purchases of component parts and materials of \$4.2 billion for 1986 from Matamoros, Mex. to Tijuana, Mex. Maquiladoras operating along the Texas-Mexico border made purchases of \$2.7 billion, or 64% of the total. Maquiladoras in Cd. Juarez accounted for approximately 50% of the purchases, the balance by the maquiladoras operating along the South Texas border. (SCOFI, 1988)

Summary: In 1987, the maquiladora plants operating on the Texas-Mexico border between Matamoros and Nuevo Laredo spent \$1.3 billion on component parts and materials. Plants involved in the assembly and/or processing of electronic equipment and components spent in excess of \$800,000,000 on component parts and materials. Plants assembling industrial and commercial machinery spent \$132,000,000, while plants assembling fabricated metal products spent \$72,000,000.

The level of expenditures on component parts and materials is expected to increase significantly over the next 3-5 years as the number of maquiladora plants increase. The maquiladoras have expressed an interest in buying from local suppliers.

Objective 2: Determine the potential for South Texas manufacturers, wholesalers and service companies, from Brownsville to Laredo, to supply maquiladoras with component parts, materials and services. Identify the problems (i.e., technical, managerial and financial) that South Texas manufacturers need to overcome in order to become maquiladora suppliers.

Although the focus of the study was on South Texas manufacturers, an effort was made to determine the level of interest that wholesalers and service companies in the region have for doing business with the maquiladoras. Utilizing information from various sources including chambers of commerce, industrial and economic development foundations, manufacturing directories and the State Comptroller of Public Accounts business franchise list, 303 manufacturers, 211 wholesalers and 228 service companies were identified in the South Texas counties of Cameron, Hidalgo, Starr, Willacy and Webb.

Each business was mailed a questionnaire seeking to identify selected characteristics of their business and determine their interest in doing business with the maquiladora plants in Mexico.

The survey questionnaire forms are contained in Appendix D. The overall response rate to the questionnaires was 29%. The wholesale group had the highest response rate - 37%, followed by manufacturers - 30%, and service companies - 21%. (See Table 4)

Table 4

**Distribution of South Texas Businesses
By Economic Sector and Number
of Surveys Returned**

Economic Sector	Number of Surveys Mailed Out	Number of Surveys Returned	Percent Returned
Manufacturers	303	91	30%
Wholesalers	211	78	37%
Service Companies	<u>223</u>	<u>48</u>	<u>21%</u>
TOTAL	742	217	29%

The individual responses for 217 South Texas businesses surveyed are contained in Appendix G.

The distribution of businesses responding to the survey by economic sector, principal product and service are provided in Tables 5,6, and 7.

Table 5

Distribution of Manufacturers By Product

Product	Number	Percent

* Because several wholesalers carried more than one product the number of businesses, when added up, exceed the actual number (78) responding to the survey.

Table 7

Distribution Of Service Companies
By Activity

Activity	Number	Percent
Repair and Rebuilding Services	4	8%
Freight Forwarding	16	33%
Custom Brokering	17	35%
Engineering	2	4%
Accounting & Financial	2	4%
Legal	2	4%
Technical Consultant	3	6%
Other	2	4%
TOTAL	<u>48</u>	<u>100%</u>

The principal product and service categories reported by the companies surveyed include: for manufacturing- machinery, except electrical, 27%; for wholesale- industrial and mill supplies, 44%; and, for service- customer brokering, 35% and freight forwarding, 33%.

Although the survey results indicate that several wholesale and service companies are already doing some business with maquiladoras and others would like to, the focus of the study was limited to South Texas manufacturers. Time and available funds did not permit a more detailed look at the wholesaler and service companies. Nevertheless, a separate study of these firms would be appropriate, since they too can be an important source of jobs to the region.

Survey results indicate that 62% of the manufacturers responding to the survey were small, employing under 25 employees. Fourteen percent reported employing over 100 employees. (Table 8)

Table 8
Distribution of Manufacturers By
Number Of Employees

Number of Employees	Number	Percent
Under 25	56	62%
25 - 50	13	14%
50 - 100	9	10%
Greater than 100	<u>13</u>	<u>14%</u>
TOTAL	91	100%

The manufacturers reported performing a broad range of industrial processes. (Table 9) Product quality control is critical to securing maquiladora contracts. Most South Texas manufacturers surveyed appear to have a long way to go in this regard. Fewer than half (45%) reported using written quality control procedures. Even fewer reported having segregated inspection areas or utilizing statistical process control procedures. (Table 10)

Segregated Inspection Area	14	15%

Based upon survey information, the manufacturers were classified into three categories: those doing business with maquiladoras; those with an interest in doing business with the maquiladoras; and, those with no interest in doing business with the maquiladoras. Table 11 provides a breakout of the manufacturers based upon this classification. A listing of the manufacturers arranged by 2 and 4 digit SIC Codes is contained in Appendix E.

Table 11

**Distribution of Manufacturers Based
Upon Present Relationship with the
Maquiladoras**

Classification	Number	Present
Doing Business	27	30%
Interested in Doing Business	31	34%
Not interested in Doing Business	<u>33</u>	<u>36%</u>
TOTAL	91	100%

Of the 58 manufacturers that indicated they were either doing business with one or more maquiladoras or were interested in doing business, 43 agreed to a plant visit by a manufacturing engineer.

The purpose of the plant visits was to evaluate the firms capability for expanding or initiating a supplier relationship with the maquiladoras . The plant evaluations focused in three areas: adequacy of the firms' existing facilities and equipment; adequacy of the technical knowledge, skill levels and experience possessed by the firms' staff; and adequacy of the firms' general management capability. An attempt was also made to acquire information in a fourth area, the firms' ability to acquire funds for the expansion of facilities, the purchase of equipment, and operating capital.

Table 12 presents information on the current level of business activity that the 27 South Texas manufacturers identified in the survey are doing with the maquiladoras. Total

sales for the 27 firms with the maquiladoras approached \$17 million in 1987 and are projected to increase by 30% in 1988, to slightly less than \$22 million.

TABLE 12

**Distribution of Manufacturers By
Industrial Category and Sales
1987 and 1988**

Industrial Category	Number Of FIRMS	1987 Sales (000)	1988 Sales (EST) (000)	Percent Change 1987-88

TOTAL	27	\$16,876	\$21,935	30%

As a group, the 27 firms were found to possess a wide range of specialized manufacturing expertise that the maquiladoras are looking for, including:

Plastic Products: injection molding, vacuum forming, hot stamping, sonic welding.

Machinery and Precision Machining: milling, boring and drilling, grinding, heat treating, stamping, pantograph and plasma-arc cutting magnafluxing, plating and anodizing, heliarc welding and centerless grinding.

Fabricated Metal Products: rolling bending, shearing, heliarc, tig and mig welding, stamping and swaging, screw machining, jog boring and can manufacturing.

Electronic Assembly: wave soldering, and plantronic simulating.

Several of the firms possess specialized equipment including CNC (Computer Numerically Controlled) DRO (Digital Readout) equipment, EDM (Electrical Discharge Machine) and CAD/CAM (Computer Aided Design and Manufacturing) capabilities. Average production capacity utilization for the 27 firms was 43%, ranging from a low of 21% to a high of 90%.

Although it was determined that many of the firms have the necessary facilities, equipment, skilled workers, and experience to supply the maquiladoras, the majority face hurdles in converting their excess capacity into more maquiladora business. Securing large volume contracts will require major improvements in areas of quality control and assurance, delivery time, and price. To achieve these improvements will require in most cases modifications in existing facilities and equipment, the adoption of quality control programs and improvements in key management areas of cost accounting, financial analyses, procurement and marketing.

Bidding on maquiladora contracts is very competitive. Frequently only a few pennies on a per unit job quote separate competing bidders. Firms that do not have a good understanding of their costs find themselves losing contracts or often being awarded contracts that end up costing them more to meet than they can earn.

Table 13 presents a summary of the results of plant visits/evaluations to 16 South Texas manufacturers that expressed an interest in doing business with the maquiladoras. The manufacturers fall into five product categories: Chemicals and Allied Products; Rubber & Miscellaneous Plastic Products; Fabricated Metal Products; Machinery, Except Electrical; and Electrical & Electronic Equipment.

Overall, only 31% of the firms were found to have adequate facilities and equipment for producing component parts and materials for the maquiladoras, 56% had adequate technical knowledge and experience, and 38% had adequate management skills and systems. (Table 14)

Table 14

Distribution of Manufacturers By
Performance Measures

	Facilities & Equipment	Technical Knowledge & Skills	General Management
Number of Firms Adequate	5	9	6
Number of Firms Inadequate	11	7	8
Percent of Firms Adequate	31%	56%	38%

In determining whether or not a firm had adequate facilities and equipment consideration was given to the presence of such factors as reinforced concrete foundations, industrial power supply wiring, dock high loading facilities, machine and tool maintenance shops, climatically controlled work environments, state of the art equipment and machinery, and quality control and equipment procedures .

In the area of technical skills, attention was given to the availability of qualified personnel in the areas of engineering, design, machining, tooling, finishing, heat treating, maintenance and quality control.

The firms were also evaluated on their general management practices and capability in key areas of planning, accounting, financial analysis, procurement and marketing.

As evidenced by the evaluations (Table 13), most of the manufacturers need to make improvements in all areas: facilities

and equipment; technical knowledge and skills; and, general management practices.

Financing the expansion of facilities and the purchase of equipment will also be a problem for many firms. Not because their businesses do not have potential, but because they do not have a proper business plan, including appropriate market information and financial statements (e.g. cash flow, balance sheet, income statement) to present to prospective funding sources.

In most cases, where new equipment and machinery is to be purchased and expansion is needed, there will also be a need to improve the knowledge and skills of the workforce. A general impediment identified by the study to the future development of a South Texas maquiladora supply industry is the absence of an adequately skilled workforce. Skill shortages exist in the areas of engineering (mechanical, electrical and chemical), skilled tool and die makers, and people with experience in plastic injection molding, metal stamping, plating, castings, screw machining, and general machining.

Summary: In 1987, 27 South Texas manufacturers had sales of \$16 million with maquiladoras. Although the interest is strong among South Texas firms to supply maquiladoras, the majority face impediments including inadequate facilities and equipment, an inadequately trained workforce, undercapitalization and poor business management practices. Overcoming these problems will open the door for many South Texas firms to the growing maquiladora market.

Objective 3: Develop a computerized data base for matching South Texas manufacturers and maquiladoras to supply for component parts, materials and services.

In establishing a computerized data base the first step taken was to classify the maquiladoras (114) and South Texas manufacturers (91) by two and four digit SIC (product) Codes. Using SIC Codes as the common denominator a computer program was developed to match the maquiladoras and manufacturers.

A listing of the maquiladoras and South Texas manufacturers classified by SIC Codes that form the data base can be found in Appendix F.

Matching maquiladoras and South Texas manufacturers by SIC Codes is just the starting point. Whether the matches lead to actual contracts can only be determined after additional study and negotiations takes place between the two parties. Such an endeavor is beyond the scope of this study.

Although only 58 of the 91 South Texas manufacturers surveyed indicated an interest in expanding or initiating business activity with the maquiladoras, all 91 firms are included in the data base.

Summary: A data base that matches South Texas manufacturers and maquiladoras by SIC Codes was established. Several potential matchups have been identified.

Objective 4: Determine the general feasibility of establishing one or more business incubators to assist in the development of a South Texas maquiladora supply industry.

Business incubators are facilities that provide small start-up firms with affordable and flexible space, shared support services and business development services, such as financing, marketing and management. There are over 275 incubators in the U.S. today helping young businesses survive and grow during the start-up period when they are most financially vulnerable. Manufacturers, research and development firms, and retail and service companies benefit from the sheltered and nurturing environment of incubators.

According to National Business Incubators Association, 80 percent of companies nurtured in incubators survive, as opposed to an 80 percent failure rate after five years for small businesses in general. The Association estimates that by 1991 there will be over 1,000 incubator facilities across the country.

Incubators established to assist manufacturers provide tenants with functional and flexible space including proper power hook-ups and loading docks and staging areas. Tenants are provided with a wide range of shared services that normally include: administrative and secretarial services; receptionists/answering services; conference rooms; computer resources; word processing; photocopying; A/V equipment; telecommunications equipment and services; and, warehousing, shipping and receiving.

Tenants benefit from on-site technical assistance with engineering, production, and quality control problems as well as professional services in the areas of business management, accounting, marketing finance and legal resources. Some incubators provide tenants with customized job training programs.

Incubators have had a significant impact on local economies across the nation through the spawning of viable business that create jobs, promote investment, diversify the economy and broaden the tax base. Incubators have also played a key role in technology innovation, development and transfer.

Under present circumstances, the establishment of one or more business incubators to assist struggling South Texas manufacturers establish themselves as maquiladora suppliers has considerable merit. Of the 16 South Texas firms surveyed in this study that are seeking to establish themselves as maquiladora suppliers, less than a third were judged to have adequate facilities and equipment to accomplish their objective. Slightly over half had the required knowledge and skills, while less than 40 percent operated with adequate business management procedures and practices. An incubator could provide substantial assistance to these firms and new start-ups.

While conducting a detailed feasibility study to determine the precise design that an incubator for maquiladora suppliers should take is beyond the scope of this study, some general points can be.

It would be appropriate to start on a small scale focusing in those areas where success is likely to occur based upon current market demand conditions and the capability possessed the South Texas manufacturing community to respond. In terms of demand, areas of plastic injection molding, metal stamping, plating and screw machine operations are the strongest. Presently, in the South Texas manufacturing community there exists considerable experience in metal stamping and screw machining. Although experience in plastic injection molding and plating exists to a much lesser degree, qualified individuals from other parts of the country are finding their way to South Texas seeking to establish themselves in these fields.

In general, the South Texas manufacturing community possess the basic experience needed in these fields to get started. What is lacking are the resources necessary to develop and establish such an industry. Constraints include the large investments in facilities and equipment necessary to get started. Even small operations will require \$3-\$5 million dollar investments during the first few years. An adequately trained workforce presents another problem. Although there are some highly skilled individuals available, eventually hundreds will need to be trained if the businesses are to operate on a viable scale. Finally, being technically competent is not a guarantee to success in business. Becoming a maquiladora supplier is very

competitive. Only those manufacturers that are on top of all aspects of their business will prosper. Cost accounting, inventory control and pricing are critical areas. Personnel management is important. And perhaps most important of all is knowing the condition and needs of the business and being able to communicate this to local banks or out of town venture capitalists. Without adequate financing the business is sure to fail no matter what the quality of their product.

Summary: Establishing one or more incubators to nurture South Texas manufacturers has considerable merit. The idea is particularly attractive in light of the successes incubators have had around the country.

Conclusions

The purpose of the study has been to determine the potential for establishing a South Texas industry to supply maquiladora along the Texas-Mexico border with component parts and materials. Study results confirm that many South Texas firms are currently supplying maquiladoras and that the opportunity exists to expand the level of business activity significantly.

In 1987, maquiladoras operating in Mexican communities from Matamoros to Nuevo Laredo spent an estimated \$1.3 billion on component parts, materials and other items that were supplied almost exclusively by sources outside of South Texas. Studies estimate that if South Texas manufacturers could capture 25 percent of this market, over 10,000 new jobs, many of a higher skill and high wage nature, would be created in the South Texas economy. Clearly that would be good news to a region that

historically has suffered the nation's highest unemployment rates.

Presently only a fraction (less than 2 percent) of the maquiladora component parts and materials market is being supplied by South Texas firms. While the study confirmed that there is considerable interest on the part of the South Texas business community to take advantage of the market opportunity that the maquiladoras offer, it is clear that several impediments will have to be overcome before this can happen. Problems include inadequate facilities and equipment, a shortage of skilled workers, poor business management practices, and the need for capital to finance new business start-ups and expansions. These problems are manageable given proper attention.

Recommendations

Many South Texas entrepreneurs, public officials and community leaders are keenly aware of the opportunity that the maquiladoras hold for the economic growth of the region. They also recognize that significant impediments must be overcome if this opportunity is to be turned into reality.

As such, and based upon the results of the study, it is recommended that a task force comprised of representatives from the South Texas manufacturing community, the maquiladora industry, community leaders, public officials, educational leaders, state and federal agency officials be established to develop and support several initiatives including efforts to:

1. Continuously update and disseminate information on maquiladora supply market opportunities, including expanding the data bank initiated by the Center for Entrepreneurship and Economic Development at Pan American University;
2. Establish one or more business incubators to assist South Texas manufacturers establish themselves as viable maquiladora suppliers;
3. Strengthen, coordinate and target the efforts of public and private job training programs, including Texas State Technical Institutes (TSTI), private industry councils, vocational tech. schools, community colleges, and universities to meet the specific trained manpower needs of the maquiladora suppliers;
4. Improve the general business management practices of South Texas manufacturers through the expansion of business development at Pan American University and similar programs in the region;
5. Establish a development fund to meet the special financial needs of South Texas manufacturers seeking to establish themselves as a maquiladora supplier; and,
6. Establish a South Texas manufacturers association to bring together maquiladora managers and area manufacturers to share information on business opportunities.
