ABSTRACT
        Assuming that pacifist and ROTC allegiances are
associated with differing basic orientations toward mankind and
differing preferences for resolution of international conflict, the
Worldmindedness Scale and the peace proposal preference procedures
(developed by cooperating participants in the international survey
"Images of the Year 2000") were administered to: 1) military
(R.O.T.C.), 2) avowedly pacifist, and 3) "neutral" sample groups of
the U.S. college students. Although polarity in beliefs was expected,
it failed to emerge, and, instead, there was merely a difference in
scale position. The pacifist students emerged as distinctly
worldminded and tended to favor a socio-psychological control of
aggression while the ROTC students were neutral toward
worldmindedness and emphasized organization solutions toward
aggression. However, a remarkably high level of agreement between
groups was found regarding ways to achieve peace, the differences
being matters of focus. The relationship of worldminded attitudes to
peace proposal preferences suggests that the preference for direct
control of aggression at the interpersonal and international levels
is the minority orientation in the world today, mainstream
peacethinking being primarily organizational in nature.

HUMANISTIC WORLDMINDEDNESS AND PEACE PROPOSAL PREFERENCES

IN PACIFIST, ROTC AND RANDOM STUDENT SAMPLES

Dale D. Simmons, Knud S. Larsen, Daniel Fajardo

Oregon State University

Abstract

Assuming that pacifist and ROTC allegiances are associated with differing basic orientations toward mankind and with differing preferences for resolution of international conflict, the Worldmindedness Scale and the peace proposal preference procedure developed by cooperating participants in the international survey "Images of the Year 2000" were administered to samples of military (R.O.T.C.), avowedly pacifist, and "neutral" groups of U.S.A. college students. The pacifist students emerged as distinctly worldminded, whereas the ROTC students scored near an absolute neutral point, suggesting that the structure of attitudes toward mankind associated with pacifist and ROTC allegiance is not bi-polar, but one of differences in scale position. A remarkably high level of agreement between groups was found regarding ways to achieve peace, the differences between groups appearing to be largely matters of emphasis or focus. Again a polarity in beliefs failed to emerge. The ROTC students tended to emphasize organizational solutions whereas the pacifists revealed a preoccupation with socio-psychological control of aggression. The relationship of worldminded attitudes to peace proposal preferences, suggests that the preference for direct control of aggression at the interpersonal and international levels, is the minority orientation in the world today, mainstream peacethinking being primarily organizational in nature.

(end of abstract)

In this world of conflict and potential conflict, there are several major approaches to international relations. Young people are often faced with decisions as to their allegiance to any of these styles. The two major campus groups which have active proselytizers pressing the young people for commitment are the ROTC and the pacifists. Although many young people do not seem influenced by the efforts of these two groups of proselytizers, many others appear to experience a great deal of "strain" in their effort to resolve the conflict between these two styles. The "strain" seems especially intense because the ROTC and the pacifist positions seem bipolar, requiring a commitment to one and a rejection of the other. Any attempt to understand the beliefs and attitudes of those who commit allegiance to one or the other of these positions is always complicated by the particular issues confronting the individual. For example, because of the controversy over the war in Viet Nam, it is often difficult to take a purely militarist or pacifist position. In the United States we find some ROTC students who are opposed to the Vietnam involvement appearing pacifist, and at the same time some pacifistically-inclined activists behave quite military "out of frustration".

Sampson and Smith (1957) in distinguishing between international-mindedness ("an interest in or knowledge about international affairs") and worldmindedness ("a frame of reference apart from knowledge about or interest in international relations. . .the individual who favors a world-view of humanity, whose primary reference group is mankind, rather than American, English, Chinese, etc.") seem to have proposed a distinction which could be one of the bases for favoring ROTC or adopting a pacifist position.

Allegiance to one of these positions could be a result of a more basic
orientation to humanity, the pacifist allegiance deriving from a broad
conception of the needs of mankind and the ROTC allegiance deriving from
a more narrow allegiance to one's own specific local identify group. Thus,
we would predict that avowed pacifists would have significantly higher
scores on Sampson and Smith's W-scale than would militarists.

In addition to expecting pacifists and ROTC students to have differ-
ing orientations toward mankind, we should also expect them to have quite
differing orientations toward the resolution of international conflict.
In order to study similarities and differences in conflict resolution
strategies among citizens of many nations on both sides of the Iron Cur-
tain (and later in Asia), participants in the international survey, "Ima-
ges of the Year 2000", sponsored by the European Coordination Centre for
Research and Documentation in Social Science and the International Peace
Research Institute, Oslo, developed an inventory of 25 peace proposals to
which the individual was asked to express his agreement or disagreement
(Larsen, 1970). Although designed for international comparisons, this
instrument seems especially promising as a means of exploring conflict
resolution styles of the ROTC students and the pacifist. In particular
we would expect a negative correlation between ROTC students' and paci-
fists' preferences for achieving peace.

In addition, if we assume the ROTC and pacifist positions to be bi-
polar allegiances, we would expect that the peace proposal preferences of
a sample of world-citizenry would fall somewhere between these extreme
positions. It would thus be predicted that there would be, in addition to

a negative correlation between the ROTC students and the pacifists, a zero
order correlation between a world-citizen sample and each of the two forms
of allegiance.

To assess the above predictions the following study was undertaken.

Method

Subjects: Three groups of students attending Oregon State University,
U.S.A., served as subjects. The ROTC position was represented by 103
junior and senior male students who volunteered for the Reserve Officer
Training Corps (ROTC); the pacifist position was represented by a group of
27 male and 12 female students who avowed to be pacifists to a student
majoring in social psychology (the psychology student obtained this sam-
ple primarily by circulating among those students who were suspected of
pacifist leanings), and a "neutral" student position was represented by
a group of 26 males and 25 females attending a sophomore level General
Psychology course during the summer session (it was assumed that there was
no basis for expecting students taking such a course to be either mili-
taristically or pacifistically inclined).

Questionnaires: The subjects all completed the 32-item Worldminded-
ness W-scale (Sampson and Smith, 1957). The items in the Worldmindedness
Scale were selected from 60 items on the basis of item analysis, and the
requirement that there be 16 pro-worldminded and 16 anti-worldminded
items. The items which were retained in the final scale discriminated
between upper and bottom 10% by at least 2 scale points. Corrected
split-half and test-retest reliability is .93. The worldmindedness scale
correlated negatively (-.71) with the E Scale and (-.53) with the

California Political-Economic Conservatism Scale. The scale also discrim-
inated between Quakers (known for worldmindedness) and samples of students.
The subjects also rank ordered the 25 peace proposals as developed by the
"Images of the Year 2000" participants (Larsen, 1970).

Results

Differences in Worldmindedness: The means and standard deviations on
the W-scale were as follows: pacifist students $--\bar{X} = 158.83$, s.d. $= 14.76$;
General Psychology students $-- \bar{X} = 130.35$, s.d. $= 27.61$; ROTC students $--$
$\bar{X} = 101.82$, s.d. $= 22.92$. By $\underline{t}$-test all three groups were significantly
different from one another at the .001 level. It should be noted that the
General Psychology students represent a point exactly equidistant between
the two other groups; i.e., they scored 28 points below the pacifist stu-
dents and 28 points above the ROTC group. As the W-scale runs from 0 to
192 points, with a theoretical midpoint at 96, it would be best to describe
the pacifist group as decidedly worldminded, the General Psychology group
as somewhat worldminded, and the ROTC group as neutral with regards to
worldmindedness. The mean score for the pacifists (158) is quite com-
parable to the mean score of the Quaker International Voluntary Service
students (155), a group identified by Sampson and Smith (1957) as a known
worldminded group. The General Psychology mean (130) seems comparable to
the "various student population means . . . ranging between 123 and 128"
as cited by Sampson and Smith. Thus, the militarists seem at an opposite
pole from the pacifists only when viewed from relative group scores. On
an absolute score level basis, the militarists differ from the pacifists
only in degree of worldmindedness, the militarists (as a group) being

neutral and the pacifists distinctly worldminded. From this it would seem that the bi-polarity of basic attitudes may be more apparent than real and it would be best to describe the groups as differing only in scale position, not in polar position.

Peace proposal preferences: The peace proposal preferences of citizens from eleven nations (Czechoslovakia, Finland, Great Britain, India, Japan, Netherlands, New Zealand, Norway, Poland, Spain and Yogoslavia), based on data provided by "Images of the Year 2000", studies (Larsen, 1970) are found in Table 1, as are the preference rankings of the military, ROTC and General Psychology students, and the correlations between peace proposal preferences and the worldmindedness scale. Table 2 presents the Coefficient of Concordance (W) within each of the three student groups. As all three coefficients are significant beyond the .001 level by Chi-square test, we may proceed with confidence that the agreement within each group is beyond the chance level. However, on examination of the average rank order correlation (r_s ave), the pacifists and the General Psychology students would appear to have a greater degree of unity of belief than do the ROTC (.48 and .40 compared to .20).

The Spearman rank-order correlation coefficients (rho) among the groups are found in Table 3 and reveal a remarkably high level of agreement among the groups as to priorities desirable for attaining peace. The lowest correlation among the world citizenry and the three student groups is the .620 between the ROTC and pacifist student groups. Even though these two groups emerge as the most different we again fail to find the polarity of positions which was predicted. The correlation is not negative, but positive, and the level of the correlation is such that a case could be

made for the two groups being sub-samples of a single population. A close
examination, however, of the specific peace proposal preferences of these
two groups reveals some very interesting differences between them. Table 4
illustrates in simple form that the greatest differences between the ROTC
and the pacifists are not in terms of polar position, but rather in empha-
sis of preference to certain peace proposals. Each of these groups empha-
size two proposals and de-emphasize two proposals toward which the other group
is neutral. Hence, in attempting to "debate" the issues the proposals put
forward by one group might be met with indifference by the other group and
vice-versa. This may result in one of those parodies of communication pro-
duced by theaters of the absurd, in which two persons appear to be communi-
cating but neither is listening to the other. Each is concerned with what
is of positive and negative importance to him and is indifferent to the
other position (especially that which the other finds of positive and nega-
tive importance). Consideration of Table 4 suggests that the ROTC student
emphasizes organizational relationships; e.g., the U.N. and aid by developed
countries to developing countries, while they de-emphasize proposals to re-
duce military nationalism. The pacifist on the other hand seems especially
to focus upon aggression per se, at both the individual and the socio-poli-
tical level, and tends to de-emphasize economic and military proposals for
the achievement of peace. Hence, the preferential emphasis of the ROTC
student seems to be on organizational structures, while the pacifist is
focused upon aggressive behavior and is inclined to reject economic solu-
tions. Although some of these differences might have been anticipated,
the finding that there is a remarkably high level of agreement between
pacifists and ROTC students in overall priorities for peace achievement

seems especially significant. Certainly there are differences in belief, but these differences are matters of degree, emphasis, and/or focus, not of polar positions. The ROTC group and the pacifists have more in common than they have differences, so that the apparent separation of the two groups is not as great as might have been believed. Conflict between these two groups over ways to resolve disputes is, therefore, not a matter of basic differences in belief structure, but conflict over the use of a particular procedure at a particular time.

The extremely high correlations between the American military and General Psychology students and the eleven-nation citizenry is remarkable. It would seem that the thinking of these ROTC students does, in fact, represent the kind of thinking, the belief structure, of citizens of many parts of the world. As such, their beliefs would best be described as "mainstream" whereas the pacifists would be described as "less" mainstream (even though the pacifists show a rather high level of agreement with the world citizenry). From another vantage point it would appear that "mainstream" peacethinking is more organizationally oriented than psychologically oriented; i.e., the preoccupation with national organizations, whereas the pacifist emphasizes the direct control of aggression at the inter-personal (Item #2) and world-wide levels (Item #15). Further elaboration of this conclusion follows in the next section.

Peacethinking in Relation to Worldmindedness: When all three groups of students were combined into a single sample and their scores on the Worldmindedness Scale were correlated (product-moment) with each of the peace proposals, it was possible to obtain a "Worldmindedness peacethinking" ranking of the proposals. This ranking is found in Table 1 and suggests

that the Worldmindedness ranking is even more anti-military than the pacifist; i.e., three of the four top and bottom ranks refer to military alliances and to disarmament. That the Worldmindedness dimension would result in the promotion of a world state (proposal number 25) is not surprising, but the de-emphasis of the U.N. should require some analysis. Proposal number 22 which recommends improvement of the U.N., receives only a rank order position of 21 which is quite low. To the worldminded individual the U.N., even though it has accomplished humanitarian tasks, may still be viewed as an extension of the nationalistic mentality. This is exemplified by the use of armed forces by the U.N. to resolve conflicts (a technique rejected emphatically by the worldminded) and consequently a low valuing of the U.N. as a means of achieving peace.

The rank order correlations between the Worldmindedness peacethinking rankings and the other rankings are as follows: with the military student rankings .014; with the eleven-nation citizenry .316; with the General Psychology students .367; and with the pacifist students .679. These correlations suggest that the main reason the pacifists differ from the other students (and the eleven-nation citizenry) is in their preferences for direct control of aggression versus the organizational solutions of the majority. These correlations would also appear to support the earlier contention that mainstream peacethinking is more pre-occupied with relationships between organizations than persons.

Peace proposal rankings by an eleven-nation citizenry; by students with militaristic and pacifistic and "neutral" allegiance; and on Pearson product-moment correlations with the World-mindedness scale.

Item Number	Correlations with Worldmindedness Scale	Eleven Nation Citizenry	Ranks Militarist Students	Pacifist Students	"Neutral" Students	World-Minded	
5	.13	1	2	3	1	9	Hunger and poverty should be abolished all over the world.
19	.14	2	6	5	6	8	We should have increased trade, exchange and cooperation between countries that are not on friendly terms.
12	.28	3	9	9	5	3	The gap between the rich and the poor countries should disappear.
22	-.22	4	1	11	4	21	We should improve the United Nations so as to make it more efficient than it is today.
10	-.07	5	4	12	9	15	Developed countries should give more technical assistance and aid to developing countries than they do today.
