ABSTRACT

This KIDS COUNT data book for 2002 examines statewide and county level trends in the well-being of Michigan's children. The statistical portrait is based on the following: (1) demographics; (2) juvenile arrests; (3) teen births; (4) children of two working parents; (5) child care costs; (6) child care capacity; (7) children in subsidized child care; (8) children in families receiving FIP (Family Independence Program) cash assistance; (9) food stamps enrollment; (10) merit scholars; (11) child support; (12) health insurance; (13) lead poisoning/asthma; (14) birth defects; (15) special education; (16) children receiving SSI; (17) children in poverty; (18) children receiving free/reduced lunches; (19) less than adequate prenatal care; (20) low birthweight; (21) infant mortality; (22) child deaths; (23) families investigated for abuse; (24) victims of abuse/neglect; (25) children in out-of-home care; (26) teen deaths; (27) high school dropouts; and (28) academic performance in the sciences. Introductory comments note the data book's focus on adolescents. Section one describes what is new and different

in this year's data book. Sections two through five present current data in the areas of economic security, child health, child safety, and adolescence. Sections six and seven focus on state profiles. The remainder of the data book contains data on Michigan's 83 counties. The data book concludes with data notes and source information. (SD)

Acknowledgments

The *Kids Count in Michigan Data Book 2002* was developed by Jane Zehnder-Merrell of the Michigan League for Human Services (MLHS) with the assistance of League and project staff and the support of the Advisory Committee. A special thanks is accorded to the Center for Prevention Research and Development at the University of Illinois at Urbana-Champaign that provided special data runs from the Michigan Middle Start survey data as well as editorial comment on the adolescence discussion. Thanks also to Juliet Scarpa from Child Trends for compiling Michigan data from the National Survey of American Families.

The book represents the collaborative efforts of numerous individuals. Pranab Rajbhandari and Jim Lunday secured and compiled the data with the assistance of the following:

Many thanks to the reviewers, which included the following: Ann Marston, Jim Lunday, and Sharon Parks from the Michigan League for Human Services; Michele Corey and Pat Sorenson from Michigan's Children; William Long from the Michigan Federation of Private Child and Family Agencies; and Beverley McDonald from the Kids Count Advisory Committee.

The Michigan project staff also acknowledges the sustained support and ongoing technical assistance from the national KIDS COUNT project staff. Most photos for this year's book were supplied by the Michigan Middle Start project, but selected photos from a special exhibit *Boys will be Men: Photographs by Bill Bamberger* were made available by the photographer and the Flint Institute of Arts. Bill Bamberger spent a year with students at Flint Central High School through *Artists and Communities: America Creates for the Millennium*, a program of the Mid Atlantic Arts Foundation. Photographs that appear in the data book were acquired independently and have no relationship to the discussion or indicator with which they appear.

The project is funded by the Annie E. Casey Foundation, Skillman Foundation, and the Blue Cross and Blue Shield of Michigan Foundation, as well as United Ways. The special section on adolescence was supported by a grant from the W.K. Kellogg Foundation.

Foreword

This data book marks the tenth annual report on child well-being for Michigan and its counties. Although all of these data are publicly available and now, in many cases, on the internet, this report provides a one-stop data shop by compiling key data about children from multiple sources into profiles for the state and each of its counties.

County profiles include the economic circumstances in which children live, the number of deaths among children, the number of youth dropping out of high school, the number of teens having babies, and the number of children in the juvenile justice or child welfare systems. By showing trends and rankings, the profiles provide context for the core Kids Count indicators, such as teen injury deaths and infant mortality.

Kids Count responds to the need for easily accessible and timely data at the state and local level. This information is critical to the formation of decisions about policies, programs and expenditures to improve the circumstances of children in Michigan. This report

constitutes a comprehensive compilation of child well-being information used by decision-makers at the state and county levels, as well as advocates, grant writers, and program planners.

Its annual release also provides an opportunity to review the big picture, to assess an overview of child well-being in the state and counties, and to examine those areas where the numbers show a loss or gain in the efforts to build better lives for kids in the state and our communities.

This year's focus on adolescence also provides an opportunity to celebrate the tremendous improvement in Michigan on several measures such as teen births, juvenile arrests, and teen injury deaths, while examining in more detail some of the issues for young Michigan adolescents in the middle grades and ways they could be addressed. Michigan Middle Start survey data show that many youth struggle to succeed academically, yet, in many cases, the resources and supports they need to accomplish this goal are not available. As the necessity for successful comple-

tion of a K-12 education increases in order to be a competitive worker in the global economy, state and community resources must be directed to assisting more youth achieve as learners during this critical period.

Deborah Strong
Chair, Kids Count in Michigan
Advisory Committee

What's New this Year

This report represents the tenth annual *Kids Count in Michigan Data Book* focused on measuring child well-being for Michigan and its 83 counties. Over the years most key trend measures have remained consistent, but changes are made as new data become available and measures are modified to focus on a wider or narrower age group, as is the case this year with teen births and children tested for lead poisoning. The following discussion outlines the changes in the county profiles this year and some of the reasons for those changes.

County Profile: Background Page

With the focus on adolescence in this year's report, trends for two measures of youth well-being are highlighted on the county profile background pages: juvenile arrests for index crimes (violent and property) and teen births, ages 15-19. These are two critical measures for which almost all counties collect data.

- **Juvenile Arrests:** For the past few years, arrest data have not been included as a "trend" indicator because of a lack of consensus about whether increases in arrests were

good or bad. Nonetheless, trends in juvenile arrests provide an insight as to the number of youth contacts with the criminal justice system in a county and the kinds of offenses these contacts represent. Arrest policies often differ dramatically among communities; an offense may result in a warning or parental meeting in one community and an arrest in another. The arrest measures distinguish between those for index "violent" offenses that involved harm to other people as opposed to property offenses.

- **Teen Births:** Births to high-school-aged teens aged 15-17 have been the focus of Kids Count data at the national and state level, but this year data for 18 and 19 year-olds have also been included.

Other "new" or altered components on the background page include the following:

- **Children under the age of 6 with all parents working:** This number from the Census 2000 provides a rough estimate of the number of children who may need full-time child care. While two-parent households can sometimes balance their work and parenting

responsibilities to avoid the need for non-parental child care, single parents often do not have this option. This issue takes on added significance when it is considered that one of every four children in Michigan lived in a single-parent family according to the U.S. Census 2000. Low-income families often face additional constraints caused by shift work or changing schedules that limit their flexibility.

- **Child care costs as percent of average wage per job:** While the average cost of full-time child care represented 16 percent of the average wage per job, a third of Michigan low-income families (with income under 200% of poverty) who needed to purchase child care spent roughly double the share of income on child care as higher income families, according to the National Survey of American Families.

- **Regulated child care facilities:** In previous years the total number of regulated "slots" in the three kinds of child care facilities was provided. This year the number of various facilities providing care shows the range of options available to families in individual counties. It is also

important to note that regulated “capacity” can differ dramatically from actual “availability” of care; the average family home provider chooses to care for three or four children, not the six that are allowed at capacity.¹

¹ Based on analysis of the 1999 National Household Education Survey in *Estimating the Size and Components of the U.S. Child Care Workforce and Caregiving Population*. Washington, DC: Center for the Child Care Workforce and Human Services Policy Center, May, 2002. (p.42).

– **% full-day:** Centers supply 70 percent of licensed child care capacity in Michigan, but only half those centers offer full-day programs. As state policies require more women to spend 40 hours a week in work or work-related activities in order to qualify for cash assistance, the need for more regulated full-time child care options will increase. In order to be eligible for a child care cost subsidy, families must use regulated care facilities or one of two

specific kinds of unregulated care—a relative providing care in his or her own home or an aide in the child’s home.

- **Children with a Court Order for Child Support:** During some part of their growing up years almost half of the state’s children will live in a single parent household, thus many children depend on financial support from a non-custodial parent to sustain their economic well-being at some point. The percent of non-custodial parents with a support order who had not made any payments for half the year provides insight into the numbers of children who may be economically vulnerable.

- **Michigan Merit Scholars:** Beginning with the class of 2000, Michigan high school graduates who met or exceeded standards on the high school tests for math, science, reading and writing and met other eligibility requirements could receive \$2,500 toward their post-secondary education expenses at a state college or university.² Recipients attending an out-of-state institution receive a \$1,000 scholarship.

² Students who meet or exceed standards on only two of the four tests may still qualify for the scholarship by receiving scores in the 75th percentile or above on the SAT or ACT test or qualifying scores on the ACT WordKeys job skills assessment test

- **Children tested for lead poisoning:** Only children aged one and two are included since they are most vulnerable for lead poisoning because of their hand-to-mouth behaviors and their developing nervous systems. All children aged one or two insured by Medicaid should have been tested for lead in the previous year since a blood lead test is required for any Medicaid-eligible child at 12 and 24 months, according to Michigan’s Medical Services Administration.³ MICHild enrolled children should be tested if any risk factors exist, such as living within high risk zip codes with high incidence of lead poisoning among children (12% or more) or with large shares of pre-1950s housing, preschool children, and child poverty.⁴

³ Medicaid-insured children between 36 and 72 months should be tested if they have not been tested previously.

⁴ Two-thirds of Michigan zip code areas are designated as “High-Risk,” according to the Childhood Lead Poisoning Prevention Project Statewide Screening/Testing Plan (6/00)

County Profile: Trend Page

On the trend page, three changes were made.

- **Less than adequate prenatal care:** For the past several years “inadequate prenatal care,” which is one of two categories included in “less than adequate care” as defined by the Kessner Index, has been used as a measure of risk for newborns. The problem is that inadequate care includes cases where data are unknown or missing, and those cases increased substantially in several southeast Michigan counties between 1990 and 2000. Due to this data-reporting problem, the broader category of “less than adequate care” provides a more reliable measure, especially in the counties where the reporting problems exist.
- **Children in out-of-home care:** For the first time this year’s number and rate include those children placed in kinship or relative care.
- **Students not meeting the state standard for science:** This percentage has been included in order to maintain consistency for the trend chart, that is, to reflect the numbers and rates of children at risk. MEAP science scores are usually portrayed as the share of students who have performed at a proficient level.

Economic Security

Despite an improved economy over the 1990s and a 26 percent decline in the child poverty rate between 1989 and 1999, roughly one-third of the state's school children remained only marginally above poverty, qualifying for free or reduced prices in the School Lunch Program. (Students qualify with family incomes below 185 percent of poverty.) The share of K-12 students participating in the School Lunch Program at free and reduced prices rose slightly in the 2000-01 school year as the economic boom waned and the state unemployment rate climbed. Between June of 2000 and 2002, Michigan's unemployment rate almost doubled—from 3.5 to 6.2 percent.¹

While the economy improved in the mid-1990s, Michigan workers still did not regain ground lost over the 1980s. Although Michigan's hourly median wage rose by 2.8 percent (adjusted for inflation) over the 1990s, in 2000 it still remained 11 percent below its 1979 value.² The median pay for a job in

Michigan dropped from \$14.34 an hour in 1979 (inflation adjusted) to \$13.09 in 2000.

Michigan's average hourly wage in 2000 of \$17.44 reflects a relatively large difference from the state median; this disparity means the majority of Michigan workers earned well below the average wage. (Only average wage data were available for the state's counties.)

Child Poverty

Children living in families where family income did not exceed the poverty level—\$16,895 for a family of four in 1999. (The US Census 2000 reflects income in the previous year.) Poverty thresholds are adjusted each year for inflation to reflect the actual purchasing power and for family size.

Between 1989 and 1999 child poverty in Michigan declined by 26 percent—dropping from 18 percent to 13 percent of children, ages 0-17. Roughly 340,300 of the state's children lived in families where income did not exceed the poverty threshold in 1999, near the height of the longest economic expansion in recent history, compared to 440,100 in 1989.

While the economy improved in the mid-1990s, Michigan workers still did not regain ground lost over the 1980s. ... The median pay for a job in Michigan dropped from \$14.34 an hour in 1979 (inflation adjusted) to \$13.09 in 2000.

Among all 83 counties, Livingston and Ottawa had the lowest child poverty rates—4 and 5 percent, respectively, and Lake and Wayne counties the highest—28 and 23 percent.

All counties but two experienced improvements in child poverty over the decade although some saw only minimal change; for example, Macomb County's child poverty rate (7% in 2000) declined by only 3 percent. The northwestern counties of Benzie and Grand Traverse saw the biggest declines in child poverty rates—a drop of roughly half. Among the state's most populous counties, Wayne County led with a decline of 24 percent in its child poverty rate.

Erosion in family support and minimum wage leaves many Michigan families in poverty.

Poverty among Young Children
During this period poverty among the state's young children under 5 dropped slightly more than overall child poverty, declining by 29 percent—from 22 to 16 percent of young children.

County poverty rankings for this age group mirrored overall child poverty with Livingston (4%) and Ottawa (5%) counties having the smallest share of their young children in poverty, and Lake County the largest (32%). Young child poverty declined in every county but Menominee over the decade, with Macomb experiencing the least improvement (2%) among the most populous counties. Young child poverty rates were cut in half or more in the counties of Benzie, Lenawee, and Tuscola, while among the most populous counties, Ottawa and Genesee saw the biggest drops—about 30 percent.

² *The State of Working America 2001/2002*. (Draft) Lawrence Mishel, Jared Bernstein, and John Schmidt. Washington, D.C.: Economic Policy Institute. Table 16.

Free and Reduced Priced Lunch

Students qualify for free or reduced prices in the School Lunch Program if their family income is below 185 percent of the poverty level. Students in families with incomes below 130 percent (\$23,348 for a family of four in 2001) qualify for a totally subsidized lunch, and those in families with incomes below 185 percent (\$33,226 for a family of four) for a reduced priced lunch.

Participation in the School Lunch Program at free or reduced prices in Michigan increased by 39 percent over the 1990s, rising from slightly less than a quarter of K-12 public school students to almost a third. Over half a million (551,300) K-12 public school students in Michigan participated at free or reduced prices in the 2000-01 school year.

Program participation at free and reduced prices ranged from a low of 8 percent in Livingston (half the level of the counties with the second lowest rate—16 percent in Clinton and Oakland counties) to 87 percent in Lake County (well above the second highest level of 54 percent in Iosco County).

Over the decade only four Upper Peninsula counties saw a slight decline in program participation at free and reduced prices—Schoolcraft, Luce,

Mackinac and Houghton. Some of the most prosperous large counties, specifically Macomb and Ottawa, sustained the largest increases with their participation rates doubling over the decade. By the 2000-01 school year, roughly one in five Macomb students participated in the School Lunch Program at free or reduced prices.

Child Care and Early Childhood Education

The low unemployment rate in the late 1990s meant that many previously unemployed parents could find jobs. Between 1990 and 2000 the share of children under the age of six with all parents in the labor force rose 13 percent in Michigan, bumping up from 54 percent of young children to 61 percent. Among the largest counties, Genesee and Wayne experienced increases of roughly 21 percent while Lake County saw a 47 percent rise. All counties but three—Livingston, Washtenaw, and Ottawa—experienced at least a marginal increase. (These counties saw a slight decrease—less than 5 percent—over the decade.)

Families where all parents are working often require child care, and the cost can consume a large portion of the family budget. The *average* full-time cost for *one* preschool child represented roughly 16 percent of the *average* wage per job (\$36,278) in

Michigan in 2000.³ Many families with young children do not have income anywhere near the average; in fact, over a quarter of families with newborns in 2000 qualified for Medicaid payment for the birth costs, and that share rose to over half the newborns in the northern and Upper Peninsula counties of Schoolcraft, Alcona, Luce, Crawford, and Roscommon, and around 40 percent in the larger counties of Saginaw and Genesee. (Pregnant women are eligible for Medicaid if under 185 percent of the poverty level—\$25,642 for a family of three in 2000.) Many families with both parents working also have two young children so their child care costs would essentially double.

While child care costs place a heavy burden on young working families, particularly low-income parents, child care providers are among the most poorly paid workers in the labor force. Many studies have documented the effects of high turnover and minimal training on the quality of child care. While Michigan initiated a T.E.A.C.H. (Teacher Education and Compensation Helps) program in 2001 to increase child care provider education and the quality of care, the state is one of only two in the nation that require no

³ The majority of Michigan workers earned well below the average; the state's median wage per job was \$27,227 in 2000—less than \$13.60 an hour for a full-time worker. (Median wage per job data were not available for Michigan counties.)

...the state is one
of only two
in the nation that
require no training
or certification
for child care providers.

training or certification for child care providers. Further threatening the quality of care, recent cutbacks in the state budget have increased caseloads to 300 for inspectors monitoring basic health and safety requirements in child care settings, more than three times the nationally recommended caseload of 75.⁴

Family Support Programs

Several state and federal programs such as the child care subsidy, cash assistance, and Food Stamp programs provide supplementary goods or services for children in low-income families.

Child Care Subsidy

The Child Development and Care Program of the Michigan Family Independence Agency assists low-income families with child care costs for the number of hours actually provided as attested by the provider. A total of 65,000 families received assistance with child care costs in fiscal year 2001, with 37 percent of the families current or former Family Independence Program (FIP) recipients. Families in FIP or in transition are eligible for 100 percent of the maximum allowable hourly subsidy rate (based on age of child, type of provider, and shelter

⁴ Wendy Wendland-Bowyer. "Child care quality on decline in state" *Detroit Free Press* (August 5, 2002).

area).⁵ The average monthly payment per child was \$291; the average was \$570 per family.

The majority of families using the child care subsidy qualify for the support based on their income and family size with their subsidy tied to a sliding scale. For example, a family of four with an annual income under \$26,383 would qualify for 95 percent of the maximum hourly subsidy rate. (At an annual income of \$31,039 a family of four would no longer be eligible.)⁶

Subsidy rates do not represent the actual current cost of child care; the last adjustment in basic subsidy rates was based on the 1996 market rate survey. Maximum rates for preschoolers in centers range from \$1.90 to \$2.50 an hour; for family, group family and relative care from \$2 to \$2.50 an hour; and for day care aides from \$1.35 to \$1.65 an hour. To expand the supply of regulated child care for infants and young children, an incentive payment of 15-85 cents an hour was instituted for the care of infant and toddlers (under age two and a half) in centers and 20-50 cents an hour in family and group family homes.⁷

⁵ A transitional three months of a 100 percent subsidy is available to FIP recipients leaving the program with employment.

⁶ As annual household income rises by roughly \$680 (\$1.92 a week), the percentage of the designated subsidy rate per hour drops by 10 percent.

⁷ Aides and relatives who have completed 15 hours of basic child care classes approved by the Michigan 4C Association receive an extra 25 cents an hour for children under age two and a half.

(These incentives began in fiscal year 2001 and have continued to be funded through 2003.) No incentives or special rates, however, are available for providers to care for children with special needs such as those who have a physical, emotional or mental disability. (Recent Michigan legislation no longer automatically exempts FIP parents of special needs children from work requirements.)

Food Assistance Program

Children under 18 comprised roughly half of Michigan participants in the Food Stamp Program, which provides nutrition support for people in need. In December 2001, one of every eight children in the state (336,400) depended on the program, now known as the Food Assistance Program in Michigan.⁸ Although food stamps are a federal entitlement program, funded and regulated largely by the federal government, the program is administered by the states.

To qualify for the program, families must have gross monthly incomes of less than 130 percent of the poverty level (\$1,219 per month for a family of three in 2001).⁹ The average amount of food assistance provided in Michigan in 2001 was \$17 a person per week (80 cents a meal) or \$51 a week for a family of three.

⁸ The name change occurred in November 2001.

⁹ Michael Wiseman. "Food Stamps and Welfare Reform." *Welfare Reform and Beyond*. Policy Brief No. 19. April 2002. Washington D.C.: The Brookings Institution. p. 2.

Subsidy rates do not represent the actual current cost of child care; the last adjustment in basic subsidy rates was based on the 1996 market rate survey.

Over the 1990s participation in the Food Stamp Program dropped dramatically nationwide, and evidence suggested that many eligible working families did not receive benefits.

Within the past year Michigan streamlined its food stamp application process to increase access to the program by eliminating asset verification, granting six-month eligibility periods, and eliminating office interviews for eligibility extensions.

The low-poverty counties of Livingston and Ottawa had only 2 percent and 4 percent of their children respectively, participating while the highest participation counties of Genesee, Wayne, Roscommon, Saginaw and Lake had one of five children in the program.

Family Independence Program

Two-thirds of the people dependent on the cash assistance program are children under 18. Between 1992 and 2000 the Family Independence Program (FIP) caseload dropped by almost 70 percent, from 225,349 families to 68,200. Sweeping changes were made at the national and state level in the program, especially in the emphasis on work requirements for parents. An expansion of support services such as child care and transportation and a boom economy allowed many more parents to participate in the labor force during the 1990s.

In Michigan in 2001, roughly 148,200 or 5 percent of the state's child popula-

tion depended on FIP. Among Michigan counties, the share of children in FIP ranged from 0.4 percent in Livingston County to 12 percent in Saginaw County.

Participation in the (FIP) cash assistance program, however, is dependent upon an income eligibility ceiling of \$775 a month for a family of three; a ceiling that has not been adjusted for inflation in the last ten years so fewer poor families with children qualify. In 2001, families with incomes up to 33 percent below the poverty level had too much income to qualify for cash assistance. Furthermore, the value of the cash assistance grant, frozen at \$459 since 1993, has had its purchasing power reduced by 22 percent by 2002.¹⁰

The grant no longer covers the cost of a two-bedroom residence in most areas in the state. With the widening gap between the frozen FIP income eligibility ceilings and the inflation-adjusted poverty level that represents a better measure of financial vulnerability, a growing number of children are living in economically deprived families that do not qualify for the cash assistance program.

Michigan Merit Scholars

Unlike other family support programs, the Michigan Merit Award is not based

¹⁰ *Information Packet* (May 2002). Lansing, MI: Family Independence Agency, Policy Analysis and Program Evaluation Division of the Budget, Analysis and Financial Management Administration, p 21.

Youth in highest income districts are four times more likely to benefit from Michigan Merit Awards.

Source: Michigan Dept. of Education,
Michigan Dept. of Treasury

on financial need. The award, first instituted to benefit the high school graduates of 2000, draws on the tobacco settlement money to the state. Over \$112 million was appropriated for the scholarships in fiscal year 2002. To qualify for an award, Michigan high school graduates must have met the standards on the state's four high school tests for math, science, reading, and writing. Not only are Michigan Merit Scholars not required to demonstrate any financial need to qualify for the \$2,500 award for their post-secondary education at a state college or university, students of the class of 2001 in Michigan's highest income districts were four times more likely to benefit from a Merit Award than their counterparts in the lowest income

districts.¹¹ Among Michigan's 2002 graduating class, 43,650 students (39%) qualified for the award, almost all (97%) by their performance on the four MEAP tests rather than the alternative tests.¹²

Child Support

Since the 1970s every state has operated a program under Title IV-D of the Social Security Act to help locate absent parents and establish paternity, as well as establish, periodically modify, and enforce child support orders. More than a quarter (28%) of the children under 18 in Michigan are covered by court-ordered child support, which is processed by the state's Child Support System. Of the roughly

435,000 non-custodial parents who were obligated to provide financial support to minor children in 2002, only half (51%) had made at least one payment during the first six months of the year. Since the usual custodial parent is the mother, this non-compliance aggravates the poverty among female-headed families in Michigan, as elsewhere. These families suffer much higher rates of poverty: 32 percent in 2000 compared to 11 percent among all families.

¹¹ Recipients attending an out-of-state college or university receive \$1,000.

¹² Students who meet or exceed standards on only two of the four tests may still qualify for the scholarship by receiving scores in the 75th percentile or above on the SAT or ACT test or qualifying scores on the ACT WordKeys job skills assessment test

Child Health

By the end of the 1990s Michigan infants and children were less likely to die. Michigan mothers and infants were also less likely to receive adequate prenatal care and the relatively high share of low-birthweight babies born each year (8%) persisted. (Michigan's 1999 percentage of low-birthweight babies ranked the state 33rd in the nation.) All improvement in the infant mortality rate occurred in the early years of the decade; after 1994 the state's infant mortality rate stalled at 8 deaths per 1,000 infants each year. In 2001 the state's immunization rate for toddlers of 75 percent ranked Michigan 43rd in the nation, compared to the national average of 79 percent and the best state rate of 89 percent in Vermont.¹ Detroit, Michigan's largest city, had the lowest coverage among the nation's 28 large metropolitan areas with only 65 percent of toddlers ages 19 through 35 months immunized.

¹ As derived from the National Immunization Survey that provides estimates of vaccination coverage levels among children ages 19 to 35 months in the states and large metropolitan areas. The figures here reflect the percentage of children who have "4:3:1 Series Coverage"; that is, four or more doses of Diphtheria and Tetanus Toxoids and Pertussis vaccine, three or more doses of oral Poliovirus vaccine, and one or more doses of Measles-Mumps-Rubella vaccine.

Michigan's relatively low immunization rate for two-year olds, as well as other measures, raises concerns about access to basic preventive care. In 1999 roughly 9 percent of the state's children lacked health insurance, and many children insured through Medicaid were not receiving the preventive screening and treatment services mandated in federal law.² From a 1999 sample of Michigan Medicaid-insured children who had seen a provider in the previous year and were eligible for a health exam, fewer than half the federal standard of 80 percent had received the requisite screenings for dental, vision or hearing problems or tests for lead poisoning.³ (The proportions of those not receiving specific services would be even higher if the sample included Medicaid-insured children who had not visited a provider during the year.)

² Early Periodic Screening Diagnostic and Treatment (EPSDT) services are comprised of 17 components, including screening for vision, hearing and dental problems as well as necessary medical treatments to correct any diagnosed medical conditions.

³ Michele Strasz, Debbie J. Allen, and Amy K. Paterson Sandie. *EPSDT: Early Periodic Screening Diagnosis and Treatment—A Snapshot of Service Utilization by Health Plan for 1999*. Data from the External Quality Review 1999 prepared by the Michigan Peer Review Organization for the Michigan Department of Community Health.

It is particularly important that young children be screened for lead poisoning; scientists have documented the transformation of the brain during the first three years of life. If lead instead of calcium infuses neural tissues during this period, the brain is irreversibly damaged. Although 28 percent of Michigan newborns in 2000 were insured by Medicaid and should have received a lead test as part of their annual exam, only 17 percent of one- and two-year-olds were tested in 2001. Without screening for lead poisoning, affected children cannot be identified for intervention before the developing nervous system is compromised. By the time symptoms appear, the lead burden has already done its harm. Research has linked even small amounts of lead to mental retardation, an inability to learn, attention deficit disorders, violence, and substance abuse.

Older children insured by Medicaid were even less likely to receive screening services than younger children, according to a services analysis.⁴

⁴ *Ibid.*

Detroit, Michigan's largest city, had the lowest coverage among the nation's 28 large metropolitan areas with only 65 percent of toddlers ages 19 through 35 months immunized.

Compared to younger children, children aged seven and older had particularly low rates for the components of nutritional assessment, developmental assessment, and anticipatory guidance. Only 18 percent of children over age 12 had received a dental inspection as part of their annual exam. These low rates reflect large numbers of children whose health is compromised by dental pain, poor nutrition, or hearing and vision problems.

Clearly health insurance coverage and access to care are two separate issues. To improve access to health care, the state must hold the qualified health plans that receive Medicaid funding accountable for outcomes. The state could also promote those strategies used by more successful plans with

higher rates of children receiving preventive services. State and local health agencies and providers must join forces to address the barriers that prevent children from receiving adequate preventive care.

Less than Adequate Prenatal Care

Mothers who receive timely prenatal care are less likely to experience complications during pregnancy and delivery. Medical, nutritional and behavioral factors that can affect the developing fetus and the health of the mother can be addressed during prenatal visits. This measure reflects the level of access to the health care system for mothers as well as the share of infants who may also have little or no preventive care during their first years.

One in four Michigan mothers giving birth in 2000 started prenatal visits after the first trimester or not at all or did not have the minimal number of visits based on the length of the pregnancy. At the end of the 1990s, roughly 33,400 Michigan infants on average were born each year to a mother who had received care defined as "less than adequate" by the Kessner Index. (See Data Note.) Over the trend period the share of Michigan babies receiving too little prenatal care, however, dropped slightly (4%) from 26 percent in 1990-92 to 25 percent in 1998-2000.

The four counties with the best rates (under 10% of births receiving less than adequate prenatal care)—Clinton, Alcona, Otsego, and Ingham—also reflected the greatest improvements over the 1990s. In 2000 Clinton County, with only 7 percent of newborns not receiving adequate prenatal care, had cut its share of such births by almost two-thirds over the decade.

Jackson County, with the largest share of such births (45%) in the late 1990s, sustained one of the largest increases (23%). Among the most populous counties, Ottawa County experienced the most dramatic worsening with rates jumping by three-quarters from 17 percent to 30 percent of newborns not having received adequate prenatal care.

Low Birthweight Babies

Babies weighing less than five and a half pounds face higher risks of developmental delays, serious illness or even death.

One of twelve Michigan babies weighed less than five and a half pounds at birth in 2000—roughly the same share of newborns as in 1990 (7.9 compared to 7.6 percent). Studies estimate that about half the total 10,600 babies born at low birthweight in 2000 will experience some long-term effects of this condition.

Among all Michigan counties, Oscoda County had the smallest share of low birthweight babies (3%) and Wayne County the largest (11%). Upper Peninsula counties experienced the most dramatic changes: Baraga (48% improvement) and Schoolcraft (162% worsening). Among the populous counties, Ottawa sustained the most dramatic worsening (45%), and Wayne (5%) the most improvement.

Only 18 percent of children over age 12 had received a dental inspection as part of their annual exam.

The share of Michigan women receiving adequate prenatal care remained almost the same between 1985 and 2000.

Source: Vital Records and Health Data Development Section, Michigan Department of Community Health.

Infant Mortality

The number of babies that die from any cause before their first birthday.

Eight of every 1,000 babies born in Michigan in 2000 died before their first birthday—a total of roughly 1,100 infants. Over the 1990s, the infant mortality rate dropped by 22 percent—from 10.4 to 8.1 per 1,000 live births. Unfortunately, all the improvement occurred at the beginning of the decade; no significant improvement has taken place since 1994.

Among the state's counties, Monroe County had the lowest infant mortality rate (4), and the northeastern counties of Presque Isle (17), Alpena and Roscommon (13) the highest. Among the ten most populous counties, Genesee had the highest infant mortality rate (12) and Oakland the lowest (6).

Several counties, including St. Joseph, Bay and Ionia, saw their rates drop by half or more over the decade while Wexford and Roscommon experienced the most dramatic increases in infant mortality. Among the populous counties, Ottawa County sustained the largest increase (8%), while Saginaw County's rate improved by a third.

18

Child Deaths

The number of children, ages 1-14, who died from any cause, including disease or injury.

The total number of child deaths in Michigan dipped from an average of 601 a year in the early 1990s to 471 at the end of the decade. The state's child death rate dropped from 31 deaths per 100,000 children aged 1-14 to 23—a decline of 26 percent. Unlike the infant mortality rate, the child death rate decreased steadily throughout the 1990s.

Among all Michigan counties, Monroe had the lowest rate (12 deaths per 100,000 children); Macomb had the lowest (13) among the most populous counties. Statewide, the highest child death rates occurred in Ogemaw (49) and Huron (48); among the most populous counties, Wayne County had the highest rate (29).

Ionia and Monroe counties reflected the biggest improvements with rates cut in half over the decade, as did Macomb among the most populous counties. Rates climbed the most in Sanilac and Hillsdale; among the large counties, only Ottawa experienced an increase in its child death rate (5%).

Child Safety

19

When family systems break down, and children are harmed or threatened with harm from abuse or neglect by a parent or legal guardian, the state intervenes. State workers in Children's Protective Services (CPS) at the Family Independence Agency usually learn of such questionable situations through reports from concerned friends, relatives, neighbors or from persons mandated to report such as nurses or teachers. If the report has merit, a field investigation must be started within 24 hours and completed within 30 days.

In fiscal year 2001, a quarter of all investigations confirmed that abuse or neglect had occurred, and about a third of confirmed child victims were removed from parental care. This occurred in a climate in which an erosion of resources in the system has heightened worker turnover and compromised the recruitment and retention of foster parents. State funding for the care of children in foster homes as well as the placement and monitoring activities of nonprofit child welfare agencies has risen at approximately half the inflation rate.¹

¹ Bill Long. Comments and data attached to foster children's letters for the Child Welfare Learning Collaborative. (August 23, 2002), p. 2.

Affected children were much more likely to be placed with a relative in 2001 than ten years earlier. The number of foster children in Michigan placed with a relative jumped by 87 percent between 1990 and 2001, while those placed with non-relatives rose by only 3 percent. Roughly 6,200 children, or one in three children in foster care for

Financial stress in kinship placements is compounded by other factors such as the age of the caregiver and the physical health problems of both the caregiver and the child.

abuse or neglect, were living with relatives in 2001, compared to 3,300 in 1990, roughly one in five foster children that year (23%). Encouraging this shift over the last decade, both federal and state policies have emphasized kinship placement as a way of keeping children connected to their families, but this emphasis has also eased the financial burden to the state as the increased numbers of children in

out-of-home care have been placed with kin.

Although placement with a relative can maintain important emotional linkages for the child, national data show that these children are living in highly stressed families. One third of children living with relatives as a result of a placement by the state child welfare agency were living in poverty, and another 44 percent in a low-income family (between 100 and 200% poverty), according to findings from the National Survey of American Families.² Two of five of these households reported difficulties paying rent or living in crowded conditions, and three of five reported problems affording food.

The number of children in kinship foster care in Michigan almost doubled between 1990 and 2001.

Source: Michigan Family Independence Agency, (Reports CY-091)

Financial stress in kinship placements is compounded by other factors such as the age of the caregiver and the physical health problems of both the caregiver and the child. Roughly half of these caregivers were grandparents (with another quarter, uncles or aunts),³ and half reported fair or poor health or a limiting condition for the caregiver. A third of the children in kinship care also had health problems.

These stresses may discourage the initial acceptance of a child into kinship care or disrupt the placement over time, thus causing more loss for the child. Among the 2,112 children in Michigan's foster care system reentering non-relative foster care or residential placement from the care of a

² Jennifer Ehrle and Rob Green. *Children Cared for by Relatives: What Services do They Need?*

³ Unpublished data from the National Survey of American Families. The Urban Institute.

parent, relative or guardian in fiscal year 2000, 75 percent were returning from relative care.⁴ A major concern has been that relative caregivers in the state are not routinely informed of resources available to them so they can access supplemental support before the placement is jeopardized.⁵

The exodus of experienced state child welfare caseworkers resulting from the 2002 early retirement initiative will also affect kinship caregivers. Kinship placements are managed by the state agency and not through private contract agencies due to funding constraints. Policies that allow only one replacement for every four state retirees will compromise the agency's capacity to meet the needs of the growing numbers of children in kinship care in the system.

All relative caregivers regardless of family income or court involvement are eligible for "personal needs assistance" or a "child-only grant" to help pay for the care of the child. This payment in Michigan amounts to \$137 a month or about one-third of the payment to a licensed foster care provider of \$420.⁶

⁴ Supervising Agency Report Card (CY-370). State FIA/Private Child Placing Agency Total. (Reporting Period 10/01/1999 through 9/30/2000)

⁵ *Office of Children's Ombudsman Annual Report 1999-2000*. Lansing: Office of the Ombudsman. May 2001. p. 21

⁶ Foster parents receive \$14 per day to parent a child under age 13, and \$17.30 for a child 13 and older; the child-only grants provide \$4.60 per day in kinship care.

Relative caregivers may not be aware of the option of becoming licensed in order to access the more reasonable level of state support for the child in their care. Some may have difficulty meeting the criteria that involve a home visit, several training sessions, and a background check, or simply choose not to pursue this option. (Roughly 8 percent of Michigan's relative caregivers for foster children were licensed in 2002.)⁷ Although data are not available for Michigan, nationally one-third of relative foster caregivers involved through the state system receive neither a foster care payment nor a child-only grant.⁸

Unlike other foster children, children placed with relatives do not receive spring and fall clothing allowances of \$107-\$122, as well as an initial clothing allowance when appropriate, or stipends for special needs. In order to address some of the issues affecting the well-being of children in kinship care, Michigan's Office of the Children's Ombudsman has recommended that child-placing agencies be required to provide relatives with written information about resources

⁷ Foster care living arrangement data. e-mail from FIA (June 28, 2002)

Coding issues in Michigan data about relative foster parents suggest relatives who become licensed foster care providers may not be classified as relatives.

available to them before asking them to accept a relative foster child.⁹ Other advocates point to the need for providing trainings and supports specifically for kinship care providers, as well as inservice for caseworkers about working with kin.

Children in Families Investigated for Abuse or Neglect

In Michigan roughly 173,000 children lived in a family where an investigation of child abuse or neglect occurred in fiscal year 2001—67 of every 1,000 children in Michigan. This rate represented a 43 percent increase from the 1990 rate of 47. This dramatic increase may be partially explained by policy changes that require more reports to be investigated. During an investigation of abuse or neglect all children living in the family are interviewed although in some cases only one child is the alleged victim.

Michigan's northwestern counties reflected the lowest and highest rates: only 18 of every 1,000 children lived in a family where an investigation of abuse or neglect occurred in Leelanau County compared to 168 in Kalkaska and 158 in Antrim. (These rates mean that almost one of every six children in Kalkaska and Antrim lived in an investigated family in fiscal year 2001.)

⁹ Office of Children's Ombudsman Annual Report 1999-2000. p. 21.

Among the most populous counties, Ottawa had the lowest rate (31), and Kalamazoo the highest (95). The northern counties of Leelanau and Cheboygan experienced the largest declines in the rates of children involved in an investigation, with rates cut in half over the decade, while the Upper Peninsula county of Alger saw its rates almost quadruple over the same period. The most populous counties all experienced higher rates, but Washtenaw sustained the smallest increase (8%). Rates in Kent and Ingham counties more than doubled.

Substantiated Victims of Abuse or Neglect

Despite the 43 percent increase in investigations in the 1990s, remarkably the rate of children who were confirmed victims of abuse and neglect grew by only 6 percent—11 of every 1,000 children compared to 10 of every 1,000 in 1990. In fiscal year 2001, more than 28,600 children in the state were confirmed as victims of abuse or neglect. Among all Michigan counties, Livingston had the lowest rate of confirmed victims of abuse or neglect (3 of every 1,000 children) and Antrim (28) the highest. Among the populous counties, Ottawa had the lowest rate, 4 of every 1,000 children, while Genesee had the highest, 22.

Out-of-home Care

In Michigan a total of roughly 20,900 children resided in out-of-home care in fiscal year 2001—8 of every 1,000 children, ages 0-17. Roughly 84 percent (17,500) of these children had been removed from their homes because of abuse or neglect, and the other 16 percent (3,400) for delinquency. The rate of children placed outside of their homes rose by 14 percent over the 1990s, driven mostly by the 17 percent increase in out-of-home placement due to abuse or neglect. The placement rate for delinquency rose by only 5 percent.

Among all Michigan counties

Livingston County had the lowest rate (1 per 1,000) of children living in out-of-home care due to abuse or neglect, and Luce and Lake counties the highest: 15 of every 1,000 children. Among the most populous counties, Ottawa had a rate of 2 children of every 1,000 in out-of-home care compared to 13 of every 1,000 in Wayne.

The majority of Michigan counties sustained increased rates of children placed in out-of-home care because of abuse and neglect over the 1990s, with the steepest climb occurring in Macomb County where rates quadrupled over the decade, rising from 1 of every 1,000 children in out-of-home care to 4. Gladwin County experienced the most dramatic decline with a drop of over 70 percent in its rate.

Among all Michigan counties, Midland (0.3 of every 1,000 children) and Macomb (0.5) had some of the lowest rates of children placed in out-of-home care for delinquency while the Upper Peninsula counties of Gogebic (7) and Iron (6) had some of the highest. Out-of-home rates for delinquency rose in just over half the Michigan counties where change could be calculated (50 of the 83 counties). The rates of

children in out-of-home care for delinquency doubled in the lightly populated Upper Peninsula counties of Iron, Gogebic, and Menominee as well as in populous Washtenaw County. Over the trend period St. Joseph County experienced the largest decrease in the rate of children placed in out-of-home care for delinquency, a two-thirds drop.

Adolescence

One of every seven Michigan residents is an adolescent, according to the 2000 Census. Of these roughly million and a half Michigan youth, half are in a period characterized as "early adolescence," ages 10-14, and the other half in late adolescence, ages 15-19. These years mark the transition to adult life, and decisions and actions during this second decade of life often shape lifelong opportunities.

Similar to the first decade of life, the second decade starts with significant changes in brain activity. Young adolescents aged 10-14 go through a period of brain development second only to the first three years of life in terms of the magnitude of change. Connections in the brain strengthened during this period become "hard-wired," thereby influencing lifelong capacities. The frontal lobe of the brain, which is the locus of problem solving, planning, memory, critical thinking, and mood modulation, develops during this stage.¹ This area of

¹ Brenda A. Dyck. "Hovering Teaching the Adolescent Brain How to Think." *Middle Ground*. April 2002, p. 19. Lucinda M. Wilson and Hadley Wilson Horch "Implications of Brain Research for Teaching Young Adolescents." *Middle School Journal*, Vol 34, No. 1 September 2002, p. 58.

the brain is not mature until about the age of 18.²

This information has profound implications for the necessity of enriching the environment of young adolescents to help them develop and strengthen skills for their long-term best interest. It also implies the importance of positive adult interaction to assure safety, guidance and emotional connection during this transitional period when judgment skills are being honed.

Assessing the well-being of Michigan's young adolescents is difficult because most available measures, such as teen births and teen injury deaths, track outcomes in late adolescence. Clearly, however, these outcomes are often rooted in the events, behaviors, and decisions occurring in the young adolescent years. The available measures show that many aspects of life have been improving for Michigan teens.

Connections in the brain strengthened during this period become "hard-wired," thereby influencing lifelong capacities.

Trends in Adolescent Well-Being Measures

Remarkable improvement has occurred over the 1990s with rates dropping steeply for teen injury death, pregnancy and births, as well as juvenile arrests and property crimes. While mirroring national trends, Michigan experienced sharper declines than the nation on several of these measures. For example, the state's birth rate to teens aged 15-17 registered declines roughly double the national average.³ In fact, over the 1990s Michigan had the second largest improvement in births to teens in this age group among the 50 states.

Another positive trend over the decade was the sharp drop in index crime arrest rates for Michigan youth aged 10 through 17. Juvenile arrests for violent crimes declined by 43 percent and for property offenses by 38 percent.⁴ Two arrests for a violent index crime were made for every 1,000 youth ages 10-17 in the year 2000, compared to four in 1991. Similarly, arrests for property index offenses dropped to 11 among every 1,000 youth, down from 18 in 1991.

³ *Kids Count Data Book 2002: State Profiles in Child Well-Being*. Baltimore, Maryland: Annie E. Casey Foundation.

⁴ Seventeen year-olds are included as juveniles to fit the national definition even though in Michigan they are not considered juveniles.

Despite improvements in these measures of adolescent well-being, the share of students graduating from high school on time has declined. Between the 1990-91 and the 1999-00 school years, the dropout rate for Michigan high school students worsened by 15 percent. In the 1999-00 school year, almost 7 percent of high school students left high school without a diploma—a total of 30,600 youth across the state. This annual dropout rate multiplied by the four years of high school means that roughly one of every four Michigan high school students who start the ninth grade leaves school without a diploma.

Dropping out of school is not an event but the culmination of a process that often accelerates at the middle grades level as students who haven't mastered the basic skills fall further and further behind. In the transition from elementary school some students struggle to negotiate a larger building with more students in a competitive atmosphere with increased grading rigor. Results from the Michigan Education Assessment Program (MEAP) reflect a significant decline in the share of students performing at satisfactory or proficient levels for several subjects in the middle grades (6th through 8th) compared to students at the elementary level.

Teen Births

In Michigan births to teens aged 15-17 plummeted by 32 percent over the 1990s—from 35 of every 1,000 school aged teens giving birth at the beginning of the decade to 24 by the end. Roughly 4,600 Michigan teens gave birth in 2000 compared to almost 7,000 in 1990.

Among all counties, Livingston County had the lowest rate (7 births per 1,000 teens aged 15-17), and the west Michigan counties of Lake (49) and Muskegon (42) the highest. Among the most populous counties, Wayne had the highest rate (34) and Macomb (10) the lowest. Wayne County, however, also experienced one of the most profound declines (40%) in the birth rate among this age group over the trend period. Throughout the state most counties experienced improvement on this key measure: only ten counties saw their teen birth rates increase over the decade.

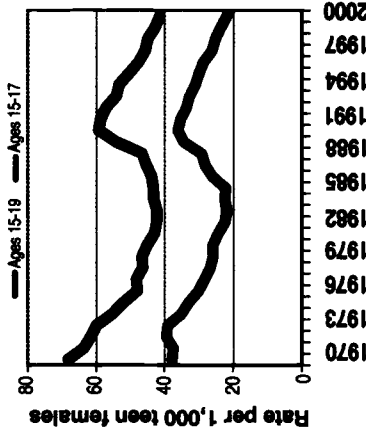

Birth rates for Michigan's younger teens aged 15-17 in 2000 dropped close to the record low of 1983 when teen birth rates started to climb after a steady decline over the 1970s. While Michigan's rate of births to teens aged 15-17 ranked the state 16th in the nation, according to the 2002 national KIDS COUNT report, the national teen birth rate continued to be

Michigan teen birth rates dropped to near-record lows in 2000.

Source: *Vital Records and Health Data Development Section, Michigan Department of Community Health*

the highest in the developed world—about four times the average of the European Union and double the second highest rate.¹

Most teens neither wish nor intend to become pregnant: 86 percent of births to Michigan teens (under age 20) were unintended compared to 41 percent for women in their 20s.² A multi-faceted approach to teen pregnancy prevention that includes encouraging teens to postpone intercourse while providing information and the means to protect sexually active teens from pregnancy and sexually transmitted infection seems to be the best strategy to maintain the steady decline in teen birth rates, according to the Alan Guttmacher Institute.³

Young Adolescents at Home

Some recent studies, such as the National Survey of American Families and Michigan Middle Start—an initiative to improve teaching and learning in the state's middle grades—provide valuable insight into the lives of Michigan's young adolescents. The Middle Start data are based on 56,000 Michigan middle grades students in 127 Middle Start schools in the 2000-01 school year. (Unless otherwise cited, all data cited in this discussion are from the Michigan Middle Start student survey data compiled by the Center for Prevention Research and Development at the University of Illinois.) Data from these studies clearly demonstrate the disadvantages suffered by youth in low-income families.

One-third of Michigan young adolescents lived in a low-income family.

One of every three Michigan youth, ages 10-15, lived in a low-income family, according to the National Survey of American Families.⁵ (Low-income is defined as less than double the federal poverty level or \$33,790 for a family of four in 2000.)⁶ Roughly

⁵ National Survey of American Families. (1997-99) Tabulations by Child Trends, Inc.

⁶ While low-income is defined as under 200% of poverty by the National Survey of American Families, low-income references to data from the Michigan Middle Start survey in this discussion will reflect family income at 185% of the federal poverty level (eligibility for free and reduced lunch participation).

three of every five African American youth lived in a low-income family compared to just over one of every four white youth (59% compared to 28%). They thus are more widely affected by the significant inequities linked to income, particularly in the areas of enrichment activities during non-school hours, health care, and education. The concentration of racial minorities, particularly African American youth, into relatively few urban areas with high unemployment and poverty compounds this economic disadvantage. Three quarters of Michigan's African American children lived in eight Michigan cities, according to 2000 Census.

Youth in low-income families are at much higher risk of food insecurity or hunger. Roughly half of Michigan's low-income children lived in families where parents worried about or experienced difficulty affording food in the previous year, compared to 14 percent of children in higher income families.⁷ Hungry children are more likely to experience fatigue or irritability. Recent research studies have documented the direct link between food insecurity and hunger in children and poor mental health and higher rates of behavioral disorders, including

⁷ Shirley Rafferty Zedlewski. "Family Economic Well-Being: Findings from the National Survey of American Families." *Snapshots of America's Families II*. Washington D.C.: Urban Institute. (October 2000). Table 1, p. 6.

Teen Injury Deaths

The injury death rate from accidents, homicides and suicides among teens aged 15-19 also dropped by a third in Michigan over the 1990s. In Michigan the death rates from all causes dropped, but homicide, with a decrease of almost two-thirds, showed the biggest decline.

At the end of the decade 48 of every 100,000 teens in this age group died from an injury compared to 71 in the early 1990s. A total of 342 Michigan youth suffered a fatal injury in 2000 compared to 508 in 1990. Several of the largest counties led the decline with rates in Ingham, Saginaw, and Wayne dropping by half. The 2000 rate ranged from a low of 25 per 100,000 youth in Ingham and Macomb counties to 160 in Menominee County. Among the most populous counties, Genesee (58) and Wayne (57) had the highest rates.

Older teens in Michigan died at twice the rate of children in other age groups when disease deaths are included. Injury deaths represented roughly three-quarters of all Michigan teen deaths in the year 2000 compared to only half of total deaths for children ages 1-14. Two of three Michigan teen injury deaths resulted from an accident; most (80%) involved a motor vehicle.

hyperactivity, depression, and withdrawal.⁸ Hungry children were also more likely to suffer from difficulties in getting along with their peers, and, significantly, teens experiencing food insufficiency also sustained double the rates of school suspension.⁹

Source: Based on data from Vital Records and Health Data Development, Michigan Department of Community Health

The health status of Michigan's young adolescents differed dramatically by income level.

Source: National Survey of American Families 1997-99. Tabulations by Child Trends.

One of seven low-income youth did not have health insurance, and many lacked access to mental health services.

Health status and health insurance are also significantly linked to family income levels. Michigan's youth in low-income families were more than twice as likely to have a health condition that limited their activity—20 percent compared to 9 percent of youth in higher income families.¹⁰ However, Michigan youth in low-income families were five times more likely to be uninsured compared to those in higher income families—15 percent compared

¹⁰ National Survey of American Families. (1997-99) Tabulations by Child Trends, Inc.

to 3 percent.¹¹ Uninsured children have much less access to care. National studies show that only two of five (42%) uninsured children, ages 6-17, were likely to receive timely care for illness or injury compared to 56 percent of publicly insured children and 65 percent of those with private insurance.¹²

Family income also made a significant difference in the mental health of young people. Almost half (48%) of Michigan young adolescents from low-income families were described by a parent as having been sad or depressed within the past month, compared to 37 percent of higher income youth.¹³ They were also significantly more likely to have their

20

Income significantly affects mental health and relationships for Michigan's young adolescents.

Source: National Survey of American Families, 1997-99. Tabulations by Child Trends.

While the majority of low-income youth succeed in school, the more they are burdened with chronic economic, social, and psychological "stressors" or risks, the greater the likelihood that success in this critical area will elude them encumber them.

The level of parental involvement for Michigan middle graders did not vary with income level.

Parents of Michigan middle grades students on average, were most likely to have provided homework assistance and oversight (sometimes), and least likely (between hardly ever and sometimes) to have participated in educational activities. There was essentially no difference in the average level of parental involvement in education for

¹¹ Ibid.

low-income and higher income middle grades students.

Overall roughly half (54%) of Michigan middle grades students reported that their parents often made sure homework assignments were completed, and over a third (35%) reported often receiving parental help with homework.¹⁴ Two of every five middle graders reported often receiving parental rewards for doing well in school. In contrast, over a quarter (27%) of Michigan parents never attended school events or meetings. While almost two-thirds of middle graders reported their parents talked to

Middle grades students home alone after school for long hours were more likely to suffer problems.

These scores are standardized t-scores. The average, based on a national sample of middle-grade students participating in the Self-Study over the past seven years, is set at 50. Ideally student reports of depression and behavior problems would be lower than average.

Source: Center for Prevention Research and Development, University of Illinois.

them sometimes or often about the importance of school subjects in the “real” world and potential careers, roughly half said their parents never or hardly ever talked to them about getting along with teachers or getting along with other students. Other studies of Michigan youth have shown positive family communication where youth report seeking advice and accepting counsel from a parent dropped from 45 percent to 30 percent between sixth and eighth grades.¹⁵

Young adolescents left on their own for long periods averaged higher levels of behavior problems and depression.

Strong relationships with caring adults exert a steady influence during this formative stage, but as an increasing number of parents work outside the home, youngsters in these middle years are likely to be left on their own. Young adolescents left home alone for three hours or more were much more likely to suffer ill effects.¹⁶ For example, these youth averaged much higher depression scores than their peers who did not stay home alone or stayed home alone less than three hours at a stretch. Similarly these youth had significantly higher averages for behavior problems,

¹⁵ Joanne G. Keith, Melissa Q. Huber, Amy Griffin, and Francisco Villarruel. *Building Best Lives: Profiles of 24,000 Michigan Youth from 2 Asset Approaches*. (February 2002), p. 35.

and lower scores for self-esteem and academic efficacy.¹⁷ Overall, 23 percent of Michigan middle graders reported being left on their own without adult supervision after school for three or more hours, but 29 percent of students in low-income families were in this situation compared to 20 percent of students from higher income families.

Youth in low-income families participated in extracurricular activities at lower rates.

Participation in extracurricular activities provide youth with structured opportunities to interact with adults and

Higher income Michigan middle graders were much more likely to participate in school-based activities and community sports programs.

¹⁷ Academic efficacy is defined as: “Students are willing to work hard to be academically successful.” A sample item from the survey is “I can do even the hardest work in my classes if I try.” Center for Prevention Research and Development, University of Illinois.

Significant declines in leisure reading occurred over middle grade years for Michigan students.

Source: Center for Prevention Research and Development, University of Illinois.

27

develop social and team skills outside the academic arena. Such activities are related to positive adjustment, better academic performance, and successful completion of high school. Participation can be hampered for youth whose parents are at work during after-school hours or on weekends because transportation may be a problem, especially for middle grades students. Low-income workers tend to have much less flexibility in their hours and schedules than higher income workers. Michigan's low-income middle grades students were much less likely to report participation in community sports programs like Little League baseball or soccer than their higher income peers.¹⁸ Just over a third (36%) of youth from low-income families reported participation in such community sports programs compared to over half (52%) of

students in higher-income families. Although middle graders from both income groups participated at higher levels in school sports programs, participation for low-income youth still lagged behind youth in higher income families (55% vs. 63%). A similar pattern persisted with participation in school clubs and organizations (44% vs. 56% higher income students).

Time spent watching television or playing computer games remained steady over the middle grades years, but leisure reading dropped steeply.

Most Michigan middle grades students reported spending substantial amounts of times watching television or playing computer/video games on weekdays.¹⁹

¹⁹ Television watching cannot be separated from playing computer or video games. The question was: On an average school day, how many hours a day do you watch TV, or play computer or video games before or after school?

¹⁸ Center for Prevention Research and Development, University of Illinois.

Photo by Bill Bamberger, from the exhibit Boys Will Be Men: Photographs by Bill Bamberger. Courtesy of Flint Institute of Arts.

Two of five middle grades students reported engaging in such activities before or after school for more than three hours a day.²⁰ Another two of five spent one to three hours a day. Only one of five reported such activities for an hour or less each day. This pattern persisted across grade levels.

A striking difference, however, did occur between low-income and higher income students in that almost one in three students in low-income families spent more than *four* hours a day watching television or playing computer/video games compared to one in

five students in higher income families.²¹ Lower participation in extra curricular activities and more time home alone may explain some of this difference. Students in low-income families would also be more likely to watch television than play computer/video games since access to computer technology is significantly affected by income level. Only two of three low-income middle graders reported having access to a computer at home, compared to nine of ten higher income middle graders.²²

²⁰⁻²² Center for Prevention Research and Development, University of Illinois.

Unlike the consistent pattern over the middle grades in time spent watching television or playing computer games, leisure reading dropped significantly between the sixth and eighth grades, according to findings from the Michigan Middle Start survey. Given the importance of literacy in the information age, such findings are troubling. Just over a tenth (12%) of eighth graders reported having read seven or more books (not including assigned books for schoolwork) within the past three months compared to almost a quarter (22%) of sixth graders, and almost a third (30%) eighth grade of middle graders had not read any books compared to only 15 percent of sixth graders.²³ The pattern varied little by family income—only a percentage point in most categories.

Substance abuse among Michigan middle grade students declined significantly between 1995 and 2001.

Many youth begin to experiment with drugs and alcohol during the middle grades, and many studies have documented initiation at ages 13 or 14. Prevention efforts seem to be paying off, however, as substance abuse among Michigan middle grade students dropped steeply between 1995 and 2001, according to the latest survey findings from Michigan Middle Start.²⁴ In 1995, more than two of five Michigan eighth graders (42%) reported having had an alcoholic drink in the

Substance abuse* among Michigan eighth graders dropped steeply in late 1990s.

* at least once in previous month

Source: Center for Prevention Research and Development, University of Illinois.

previous month compared to 36 percent in 2001. The use of tobacco and illegal drugs declined even more steeply with only a fifth (20%) of eighth graders reporting having smoked at least one cigarette in the past month, compared to almost a third (32%) in 1995, and 16 percent had tried an illegal substance, compared to 24 percent in 1995.²⁵

Risk factors for substance abuse include problems with academic performance, antisocial behaviors, student perceptions of risk, and availability of the substances. Current research suggests that multiple strong positive relationships within the family, school, and community, are one of the most effective ways of preventing youth from getting involved in long-

Photo by Bill Bamberger from the exhibit Boys Will Be Men: Photographs by Bill Bamberger. Courtesy of Flint Institute of Arts.

term substance abuse. Less than half of Michigan youth in middle grades, however, reported receiving support from three or more non-parental adults, and youth experiences of "caring neighbors" dropped from 53 percent to 41 percent between the sixth and eighth grade.²⁶

Juvenile Arrests for Violent and Property Offenses

The number of juvenile arrests in a community provides a measure of the frequency at which youth come into contact with the criminal justice system and the kinds of offenses involved. In the year 2000, youth ages 10-17, accounted for 14,900 of Michigan arrests for the eight index crimes—11 percent of all arrests for violent index offenses and 34 percent of property offenses.¹

Most juvenile index crime arrests (86%) were for property offenses, especially larceny, which includes such activities as purse snatching, shoplifting, theft from motor vehicles, and bicycle theft. The 8,800 arrests for larceny represented three-quarters of the juvenile arrests for index property offenses, with the other three offenses—burglary, motor vehicle theft and arson—accounting for the other quarter.

Arrests for violent index offenses (involving another person) represented roughly 14 percent of all juvenile arrests for index crime. Of these 1,900 arrests, two-thirds were for aggravated assault, which usually involves a weapon or the

¹ Index crimes are considered more serious or more frequent. An arrest is classified under the most serious offense committed during the incident. Index offenses are used to compare the incidence of crime across communities as they have standard definitions.

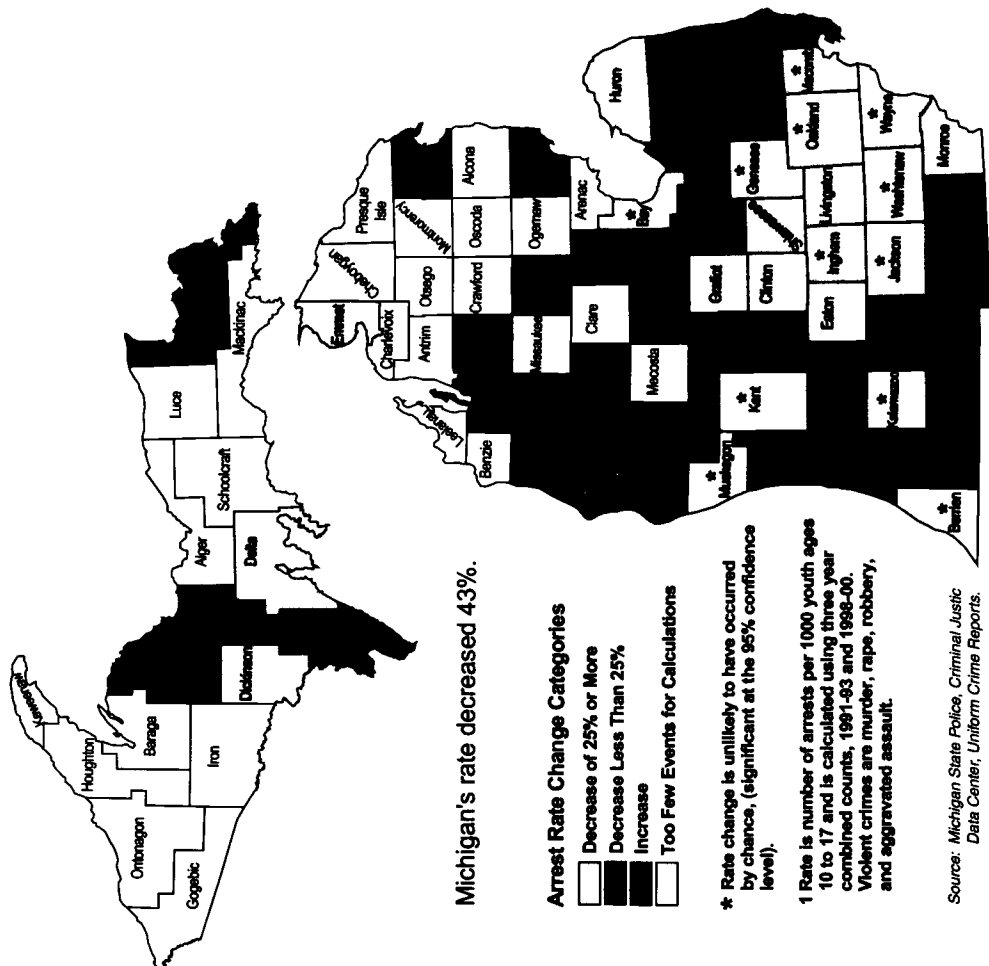

potential of serious injury. Arrests for homicide, rape and robbery made up the balance.

Among the 63 Michigan counties where rates could be calculated for juvenile arrests for violent crime, Eaton County had the lowest rate (0.3 among 1,000 youth), and Ingham and Wexford the highest—4 arrests per 1,000 youth ages 10-17. Of the 57 counties where the percentage change could be calculated, 12 experienced a significant decline in these arrests over the 1990s—with declines of over 25 percent; only Ottawa County sustained a significant increase.

Eaton County had the lowest juvenile arrest rate for property offenses, 0.3 arrests per 1,000 youth, with Grand Traverse sustaining the highest arrest rate—37. Trends in juvenile arrests were even more positive for property offenses with a substantial majority of counties experiencing declining rates. Of the 81 counties where trends could be calculated, 57 reflected significant declines, almost all of them down by at least a quarter over the decade. These trends mirror downward trends in crime in the nation and among the adult population over the same period.

Young adolescents, ages 10-14, represented about a third of all juvenile index crime arrests, and a slightly lower percentage (29%) for the violent index crime offenses. Young adolescents represented a third or more of juvenile

Juvenile Arrests: Violent Crimes Percentage Change from 1992 to 1999¹

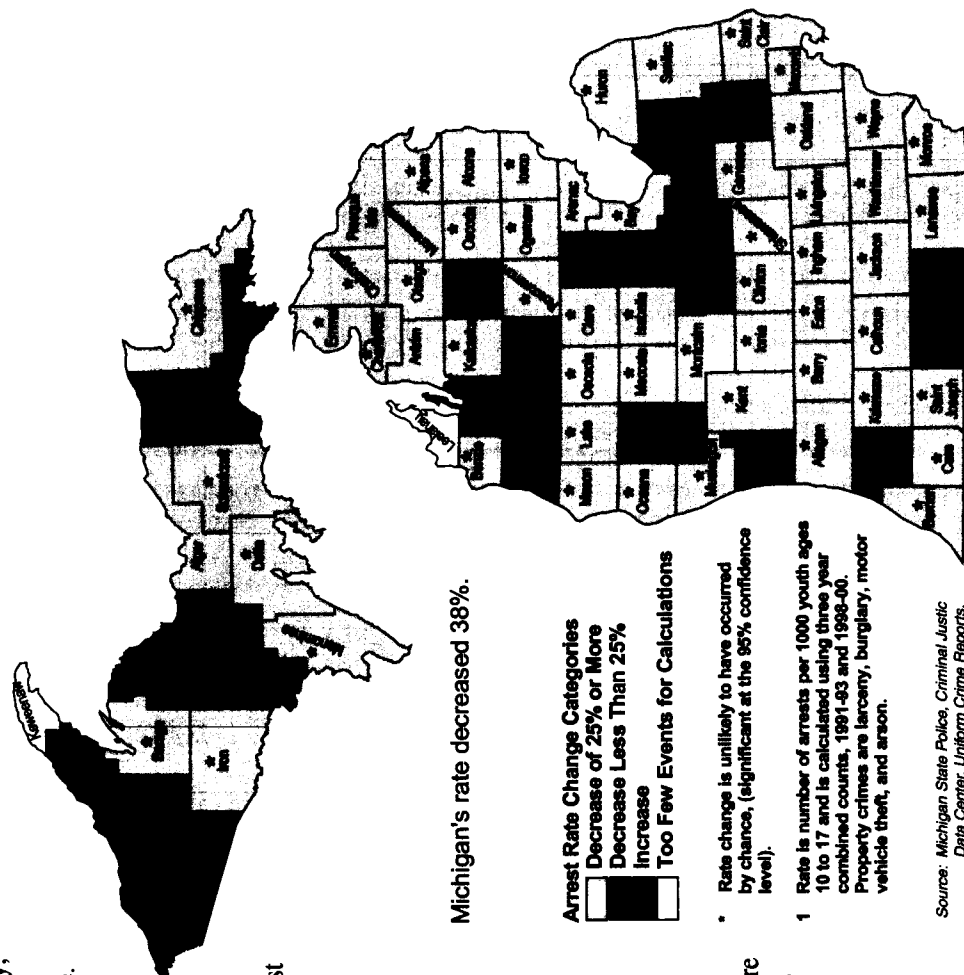

arrests for five of the eight index crimes: aggravated assault, burglary, rape, larceny and arson. The largest share for any individual offense by young adolescents was the 61 percent of the 159 arrests for arson. Not surprising,

young adolescents also constituted roughly half the arrests for the status violations, which affect only minors; vandalism; and sex offenses (other than rape and prostitution).

Juvenile Arrests: Property Crimes

* Rate change is unlikely to have occurred by chance, (significant at the 95% confidence level).

¹ Rate is number of arrests per 1000 youth ages 10 to 17 and is calculated using three year combined counts, 1991-93 and 1998-00. Property crimes are larceny, burglary, motor vehicle theft, and arson.

Source: Michigan State Police, Criminal Justice Data Center, Uniform Crime Reports.

Female offenders were also more likely to be arrested for a status offense, especially run-away; they represented 61 percent of the 84 juvenile arrests for this offense. Females represented half the juvenile arrests for the non-index crime of embezzlement, and close to 40 percent for curfew/loitering and fraud. Of the eight index crimes, larceny was the most gender-neutral offense with females representing 38 percent arrests. For five of the eight index crimes, males comprised close to 90 percent or more of all arrests.

White youth represented 70 percent of all juvenile arrests for index crimes in Michigan, compared to their 72 percent share in the child population. Their shares of arrests for burglary (81%) and arson (88%) were disproportionately high, while overall their share of arrests for violent index crimes was low (55%). They represented almost all (93%) of the almost 6,000 arrests for the non-index liquor law violations, the second largest group of arrests for any single offense.

African American youth represented 27 percent of all juvenile arrests for index crimes in Michigan, compared to their 17 percent share in the child population. They had particularly large

shares of arrests for the violent index offenses of homicide and robbery. Among the index offenses, their share was smallest (10%) for the property index offense of arson. For non-index offenses African American youth had

disproportionately low shares of arrests for runaway (1%), liquor laws (4%), driving under the influence (5%), vandalism (10%), and sex offenses (14%).

Young Adolescents at School

School is the place where young adolescents gain a sense of themselves in the larger world. Pressures mount during the middle grades, as students must exercise basic skills in reading and math to master ever more complex content. The numbers of children receiving special education services peak during these years, as do disciplinary actions such as suspension and expulsion. Many educators have recognized the importance of implementing more effective strategies to improve teaching and learning during this stage by addressing the developmental needs of young adolescents and helping more students become successful learners. The middle school setting is critical in a myriad of interrelated ways in the lives of young adolescents. Their social relationships, especially with their peers, and academic lives are centered within its formal and informal structures. Survey results suggest that too many students in the middle grades face mounting pressures to perform academically without the resources to succeed.

Academic rather than social stressors mounted during middle grades years.

Young adolescence is often viewed as a period when youth are most concerned about their social life and relationships, but much larger shares of middle

graders reported academic stressors. These stressors affected growing shares of students across the middle grades, according to Michigan Middle Start student survey data.²⁷

In contrast, relatively small shares of middle grades students reported social stressors, and the shares remained stable over the middle grade years.²⁸ Most middle graders reported they did not experience social stress such as peer pressure to smoke, drink alcohol or use illegal drugs or feeling friendless. At least 85 percent of Michigan middle grade students reported not

Academic stressors grew over middle grades for Michigan students.

encountering negative peer pressure, no shortage of friends, and no prejudice from other students or from teachers. In fact, among all social stressors middle graders were least likely to report the experience of negative peer pressure; only one in twenty of all Michigan middle graders reported *big* hassles from such pressure. Negative peer pressure, however, was the only social stressor that showed substantial change over the grades. The share affected almost doubled between the sixth and eighth grades, rising from 7 percent of sixth graders to 13 percent of eighth

graders. Social skills were a problem for one in ten of Michigan middle graders, who reported *big* hassles with getting along with other students, fighting or having problems with friends, or not being part of the “popular” group.

In contrast to the relatively small shares of middle graders reporting having experienced social stress, roughly half of Michigan middle grades students reported stress on four of the six academic measures within the previous

^{27,28} Center for Prevention Research and Development, University of Illinois.

Education: Science MEAP

The majority of fifth and eighth graders did not meet the state proficiency standard for science skills in the 2000-01 school year. *Three* of five fifth graders and *four* of five eighth graders taking the science test of the Michigan Educational Assessment Program (MEAP) did not demonstrate proficiency in science. While most high school students passed the science MEAP, a sizeable share failed to meet the proficient standard—*two* of five test takers. The improvement in performance may be partially explained by the attrition in the number of students taking the test: Only three-quarters of the class of 2002 who had taken the science MEAP in the eighth grade took the test in high school.

Fifth graders and high school students both showed improvement on the science test over the trend periods: the share of elementary students unable to meet the standard dropped by 21 percent and by 18 percent for high school students. In contrast, the share of eighth graders not meeting the standard rose by 2 percent. Almost all of the improvement in the fifth grade MEAP results, however, occurred in the second year (1997) of the test, when those scoring at the proficient level rose from 27 to 37 percent of test takers. Since 1998 the share of proficient students has not shown any consistent improvement.

At the eighth grade level, outcomes are much worse than among fifth graders with less than a quarter of students demonstrating proficiency over the last six years, and the share of students in the lowest performance category, “not yet novice,” growing enough over the years to exceed the share of achievers in 2001. These standards may have made unrealistic demands on students not taught the appropriate skills or material. Despite these shockingly low achievement rates no systemic professional development was implemented to improve skills and content knowledge for the science teachers at the middle grades level. (A new science test was administered with adjusted standards in the 2001-02 school year for fifth and eighth graders; on the new test 73 percent of fifth graders and 66 percent of eighth graders met the proficiency standard.)¹

County Trends

Outcomes varied dramatically among the counties for students taking the science test in 2000-01. Less than a third of fifth graders did not meet the science proficiency standard in the science MEAP in the northwestern counties of Leelanau and Missaukee while three-quarters or more of students could not meet the standard in the Luce, Lake and Gladwin counties. Midland County’s one-third of eighth

¹ County MEAP data for 2001-02 were not available in time for publication.

Achievement for Michigan eighth graders on the science MEAP showed little gain between 1996 and 2001.

Source: Michigan Department of Treasury

graders meeting the proficiency standard on the science test represented the best county performance at this level while Lake County had the worst with only 3 percent demonstrating proficiency. On the high school science test, only 18 percent of eleventh graders in Leelanau County were unable to meet the science proficiency standard compared to over half (56%) in Wayne.

All counties showed improvement in reducing the share of *fifth* graders who could not demonstrate proficiency in the science test. The northwestern county of Missaukee led the way with a reduction of more than half in the share of fifth graders not passing the science MEAP between 1996 and 2001. Similarly all but eight counties experienced smaller shares of students failing the *high school* science test. Among the eight counties with increasing shares of students unable to demonstrate proficiency, most showed

only a marginal worsening with Alcona County having a large increase—57 percent more students unable to meet the standard. Manistee County showed the largest improvement with the share of eleventh graders not meeting the proficiency standard dropping by half over the trend period.

In contrast to the widespread improvement across all or most counties for the fifth and eleventh graders, the share of their *eighth* graders failing to meet the science standard grew in most Michigan counties (52). Most counties, however, registered only marginal gains or losses. The largest improvements occurred in the Upper Peninsula counties of Dickinson, Iron, and Ontonagon, where the share of eighth graders failing the science MEAP test dropped by 15-16 percent. In Benzie and Livingston counties the share grew by 19 and 16 percent, respectively.

Larger shares of low-income middle grades students reported academic/school stress on almost all measures.

Source: Center for Prevention Research and Development, University of Illinois.

month, according to Michigan Middle Start data.²⁹ Over half (58%) of Michigan middle graders reported somewhat or a big “hassle” from having too much homework, and roughly half felt stressed by trying to get good grades, and not understanding the class work. One in four middle grades students in Michigan reported that trying to get good grades and having too much homework were “big hassles.”³⁰ Almost a third of students in all grades spent more than an hour each night on homework, and a tenth reported spending more than two hours each night.³¹ (These patterns remained

stable over the three grades.)

Academic stressors also affected ever-larger shares of Michigan students over the middle grades; for example, between sixth and eighth grades the share of students reporting academic pressures rose nine percentage points in the following areas: not understanding class work, teachers expecting too much, and not getting along with teachers.³² By the eighth grade one of two students reported having the experience of teachers expecting too much and not understanding class work; almost two of five reported trouble getting along with a teacher.

Getting good grades posed a “big hassle” for almost a third of low-income middle grades students.

The biggest difference between low-income and higher income middle graders was the nine-percentage-point difference in the effort to get good grades: almost three of every five low-income students reported struggling for good grades compared to roughly two of five higher income students. Furthermore, almost a third (30%) of low-income students reported stress from the effort to get good grades as a “big hassle” compared to a fifth (20%) of higher income middle graders.

The second largest gap in the academic stressors between low-income and higher income middle graders was the

seven-point difference in the share of students reporting some or big hassle in not getting along with their teachers—38 percent vs. 31 percent among higher income students. Some of this difference may be explained by the fact that schools with high concentrations of low-income children tend to have more new and uncertified teachers who may be less practiced in defusing conflict with students. Also, students may focus their frustration over standards-based education on teachers.

Only two and three percentage points separated the two income groups, however, in the share of Michigan middle graders reporting too much homework or having hard teachers.

Relatively few middle grades students in Michigan reported feeling they had ready access to teachers and other school staff members, according to findings from the Middle Start survey.³³

Achievement Gap

Overall these outcomes are particularly troubling in an era when competency in science and mathematics will be ever more critical in an increasingly technological society and economy. Occupations in science and engineering, especially computer specialists, are projected to grow over the decade. At the same time, the upcoming generation will be more diverse, as African Americans, Latinos, and American Indians will constitute almost 60 percent of the national population increase over the decade. In order to meet the need for a sufficient supply of scientists and engineers, it will be necessary to improve the math and science achievement of underrepresented minority students.

Research has demonstrated that while race and ethnicity seem linked to school achievement, when such socio-economic differences as family income and parental education are taken into account, black and Latino teens are actually more likely to graduate from high school and attend college than their white peers.² Nevertheless, minority children continue to suffer from poverty rates two to four times those of white children in Michigan, according to the 2000 U.S. Census; individual achievement on the MEAP is not available by socio-economic status at this time.

² Zalkia Redd, Jennifer Brooks, and Ayeleish McGarvey. *Educating America's Youth: What Makes a Difference*. Washington D.C.: Child Trends. August 2002. p. 2.

In Michigan's 19 most diverse counties, the achievement gaps between minority racial/ethnic groups and white non-Latino children (hereafter referred to as white students) on the fifth grade science MEAP test is striking. (The achievement gap narrows dramatically in the eighth grade mainly because the share of students demonstrating proficiency in science dropped to only 20 percent in 2001.) The fifth-grade gap was widest between African Americans and whites with an average 35-percent-point difference; Latinos had a 27-point difference; and American Indian students a 22-point difference. Overall, on a weighted average basis (based on enrollment) white students were about twice as likely to pass the MEAP as African American students according to an analysis of a five-year period by Standard & Poor's.³

Among the counties, minority fifth graders in Kalamazoo and Kent counties suffered from the largest achievement gaps for all three groups—African Americans, American Indian, and Latinos. For example while 57 percent of white fifth graders in Kent County passed the science MEAP, only 13 percent of Latino youngsters did—a difference of 44 percentage points.

Note: The percentage represents the difference between the share of minority and white students meeting or exceeding science proficiency standards in the specific county.

* Minority/ethnicity data are not reported for counties where either the total test takers or number proficient in science were less than 6.

Caution: The share of cases missing race/ethnicity are not considered in the calculations. The majority of the counties considered here had less than 2 percent missing but Saginaw and Kent counties had 3 and 4 percent, and Muskegon and Oakland had 8 and 9 percent.

Low-income middle graders reported feeling less access to teachers and staff about academic or school problems than higher income students.

Source: Center for Prevention Research and Development, University of Illinois.

Less than a third of Michigan middle graders felt they could talk to a teacher or other staff member about academic problems or career and college information always or most of the time, and only 15 percent felt they had substantial access to talk about personal or family problems.³⁴ Half or more students reported feeling they could never or hardly ever do so. The biggest difference in access to school services between low-income and higher income middle

³⁴ Center for Prevention Research and Development, University of Illinois.

Michigan middle graders in schools with higher concentrations of low-income students have much less computer access.

Source: Center for Prevention Research and Development, University of Illinois.

graders in Michigan was that 39 percent of low-income middle graders felt they could *never* talk to a teacher or staff member about academic problems or issues, compared to 31 percent of higher income students. This is particularly troubling in light of the findings about low-income students experiencing much higher academic stress.

Middle grade students in schools with the largest shares of low-income students had the least access to technology in school.

Literacy in computer technology is an essential skill in today's work world. Eight of the ten fastest growing jobs are computer-related, according to the latest projections from the Bureau of Labor Statistics.³⁵ Having a computer in the home is a strong predictor of academic success in math and science, and higher test scores on reading, even after

controlling for other factors, such as income.³⁶ The difference in home access to computers is closely allied to family income and has been popularly labeled "the digital divide." Almost all higher income Michigan middle graders (90%) had computers at home compared to only two-thirds of lower-income students.³⁷

On the surface, school access to computers in Michigan schools narrows the digital divide, but students in schools with the largest concentrations of low-income students reported far less access than student from schools with largest shares of higher income students, 80 percent compared to 94 percent for

Proficiency on MEAP science test (2000-01) for minority fifth graders differed dramatically among Michigan counties.

Source: Michigan Department of Treasury

Proficiency rates for white fifth graders ranged from 38 to 57 percent in the 19 counties with passing rates highest in Kent, Oakland, and Ottawa. Therefore, these counties have the potential for the largest gaps. Although Berrien, Calhoun, and Wayne counties had the smallest gaps (28 percentage points) for African American fifth graders, their share of white children passing the science MEAP was also down about 12-19 points from the best-performing counties. The smallest gap (18 percentage points) between Latino and white fifth graders occurred in Genesee County, and between African American and white fifth graders (27 percentage points) in Calhoun County.

The largest shares of African American fifth graders demonstrating proficiency occurred in Oakland (21%), and Latino fifth graders had their best passing rates in Ingham (31%). For American Indian fifth graders the gap was less than 5

percentage points in Lenawee, Saginaw, and Schoolcraft counties while the difference in Kent County was 32 percentage points, and Kalamazoo, 38. Saginaw County had the largest share of American Indian children passing the MEAP (43%), and Kalamazoo the smallest (14%).

The disparities in these outcomes raise troubling issues. Minority students who have two to four times the risk of poverty also tend to be concentrated in high-poverty communities and school districts. (African American children suffer from the highest poverty rates and the deepest concentrations of economic distress.) Despite school funding changes in Proposal A to bring about more equitable funding among the state's schools, Michigan still has one of the largest per-student funding gaps in the nation between high-poverty and low-poverty districts, according to a recent report based on

Photo by Bill Bamberger from the exhibit Boys Will Be Men. Photographs by Bill Bamberger. Courtesy of Flint Institute of Arts.

development, smaller classes, and additional instructional time. Instead, these high poverty schools are more likely to lose state and federal dollars with expansions of charter schools and the latest federal legislation facilitating the movement of students from "failing" schools as measured by achievement on standardized tests.

1999-2000 school year data.⁴ The state ranked 41st of 47 states in targeting resources to high-poverty schools. The state's funding gap of \$1,103 per student between high- and low-poverty schools translates into a revenue difference of almost half a million dollars (\$441,200) between a typical elementary school of 400 students in a high- versus low-poverty school in Michigan.⁵ These resources could support research-based strategies and tools to improve teaching and learning, such as high quality professional

School was a safe place for most Michigan middle graders, but fear affected two of five students.

Source: Center for Prevention Research and Development, University of Illinois.

most affluent schools.³⁸ The frequency and type of computer access was also much greater for middle graders in schools with a larger share of higher income students; for example, 42 percent of students in most affluent schools reported *daily* access to computers, compared to 28 percent of those in schools where more than three-fifths of the students were from low income families. Furthermore, much larger shares of middle grades students in schools with a preponderance of higher income youth reported having computer access in the classroom, a technology center, or the school library.

Focused professional development for teachers in high-poverty schools in the effective use of classroom technology would be an important step in addressing the digital divide. Higher income parents often have technology access and skills in their jobs so they not only provide their children with computers at home but also with the technical assistance in using them as tools for learning. Teachers have a key role to play in helping low-income students make computers a tool for learning and enrichment.

Most Michigan middle grades students felt safe at school.

School represented a safe place for most Michigan middle graders most of the time. Close to 90 percent of Michigan middle graders have never been hurt at school although almost half (44%) reported having been afraid at least once or twice; 12 percent reported being beaten up or really hurt at school, and 7 percent brought "something" to school as protection. On most measures of safety the share of low-income students reporting at least one incident was slightly larger (2-4 percentage points) than that of their higher income peers.³⁹ The biggest difference was the five-percentage point difference in the share of students who reported bringing "something" to school for self-protection (10% vs. 5% higher income). The smallest differences (two-percentage points) were in the share of students offered drugs at school (18% vs. 16% higher income) or those reporting being afraid of being hurt at school (43% vs. 45% higher income).

The majority of middle grades students (55%) reported feeling about as safe in school as they did the previous year, with 22 percent feeling a little more or much more safe while 23 percent felt a little or much less safe.⁴⁰ Over a quarter (26%) of low income middle graders in Michigan felt a little or much more safe than the year before compared to a fifth (20%) of higher income students.

Low-income and minority youth suffered from higher rates of discipline.

Young adolescents often test the boundaries of permissible behavior. Roughly two of five Michigan middle grades students reported having been sent to a school administrator's office at least once within the past year as a result of "getting in trouble."⁴¹ One of five students reported three or more such visits. More serious behavior problems often result in suspensions, which can be served within the school or out-of-school. Fifteen percent of middle grades students reported receiving at least one in-school suspension within the last year, and 12

Michigan middle graders in schools with higher concentrations of low-income* students were more likely to be suspended.

* under 185% poverty

High School Dropout

Over 30,600 Michigan high school students left high school during the 1999-2000 school year without having obtained their diploma. The share of high school students dropping out of high school rose 15 percent over the decade from 6 percent in the 1990-91 school year to almost 7 percent in 1999-00. For a graduating class, this rate would mean that roughly a quarter of students who began the ninth grade would not graduate. Some of these students may complete a General Equivalency Diploma or return to Adult Basic Education to complete their diploma requirements at some later date, but many will not.

Some of the lowest dropout rates (2% or less) were in the Upper Peninsula counties of Dickinson, Houghton and Ontonagon while the large urban counties of Wayne (19%) and Ingham (14%) sustained some of the highest rates. The northern counties of Clare and Mecosta experienced the biggest improvements with their dropout rates dropping by more than half while Ingham County saw its dropout rates triple.

percent at least one out-of-school suspension. Roughly 5 percent of students reported three or more in-school suspensions, and 5 percent reported three or more out-of-school suspensions. For many students these incidents represented a continuum of disciplinary action; for example, of the students sent to "the office" at least once during the year, over a third (35%) also received at least one in-school suspension, and more than a quarter (28%) at least one out-of-school suspension.

In general, older students, males, and students in schools with larger populations of low-income students received more out-of-school suspensions, according to an analysis of the Michigan Middle Start survey data. Other studies have documented the disturbing racial and ethnic disparities in expulsion and

suspension actions in Michigan schools. For example, African-American students in Michigan were expelled at a rate two and half times their proportion in the general student population.⁴² When compared with the general population of students in the state, expelled students were twelve times more likely to be sad or often depressed, or not getting along with others; nearly five times more likely to have difficulties with concentration; four times more likely to have skipped school; three times more likely to be living below the federal poverty level, and twice as likely to have no extracurricular activities, according to findings from the National Survey of American Families.⁴³

⁴² Hahn, Walker, Villarruel, Dunbar, & Borden (2002) based on data from the 1999-2000 academic year.
⁴³ *Zero Tolerance* report, p.11.

One of eight young adolescents received special education services.

Since 1975 public schools in the U.S. have been required to provide students with a broad range of disabilities an appropriate education in the least restrictive environment. These education services tailored to individual student's needs are now popularly known as "special education." In Michigan the number enrolled in special education by age peaked at age 11 in the 2001-02 school year. A total of 93,300 Michigan young adolescents aged 10-14 received special education services, representing 40 percent of the total special education students in 2001. The majority (55%) of young adolescents receiving services were identified as having learning disabilities with the other two largest single diagnosis groups—Speech and Language Impaired (11%) and Emotionally Impaired (11%) comprising roughly another quarter. Students with "severe" disabilities represented 3 percent of all young adolescents in the program.

Half of Michigan's young adolescents in special education were classified as learning disabled.

(N=93,298 students ages 10-14)

Source: Michigan Department of Education for school year 2000-01

Moderate disability includes four categories: Visually Impaired, Hearing Impaired, Trainable Mentally Impaired and Educable Mentally Impaired.

Severe disability includes three categories: Autistic Impaired, Severely Mentally Impaired and Severely Multiply Impaired.

Summary and Conclusions

While Michigan made dramatic improvement on several dimensions of adolescent well-being over the 1990s, particularly in measures such as teen births and teen injury deaths, the state lost ground on high school dropout rates. An effective strategy to address the growing dropout problem will be to ensure that more young adolescents have a positive experience during the middle grades years. Young adolescence is “a period of enormous opportunities and enormous risks,” a time of rapid physical, cognitive and social change.⁴⁴ Findings from recent survey data highlight the following key issues and recommendations for helping more youth make a successful transition through these critical years.

• Strengthen family supports.

A third of Michigan young adolescents live in economically vulnerable families where basic needs such as food, health care, and housing are jeopardized. Youth growing up in such circumstances are at higher risk of mental and physical health problems. Strengthening family support through outreach to enroll eligible families in available health and social welfare programs would mitigate some of the devastating effects of financial insecurity experienced by this large number of youth. An additional strategy

⁴⁴ Anthony W. Jackson and Gayle A. Davis with Maud Abeel and Anne Bordonaro. *Turning Points 2000: Educating Adolescents in the 21st Century*. New York: Teachers College Press, Columbia University, pp. 6 and 8.

would be to target tax relief to Michigan low-income families to offset the state’s increasingly regressive tax structure.

• Improve access to after school programs.

As more parents work outside the home, almost one of four young adolescents in Michigan is home alone for extended periods, thereby increasing their risk of depression and behavior problems. Youth in low-income families are at even higher risk, with less access to extracurricular activities. Expanding after school community programs for this age group, particularly in low-income areas, would be particularly helpful, especially if structured to promote positive interaction with adults with whom they could build trusting relationships. More flexibility in scheduling to allow working parents to shorten the time their young adolescents are left home alone would also ease the problem. These strategies to strengthen family and community ties for young adolescents would also lessen the likelihood of substance abuse and early pregnancies.

• Target resources to low-income schools.

While low-income students face the same pressures to perform on standards-based tests, survey findings document they have less access to resources at school than their higher income counterparts. Middle grades students from low-income families reported problems in accessing teaching

staff, as well as a lack of available computer technology. Furthermore, students in schools with high concentrations of low-income students were more than twice as likely to get suspended as students from schools with more affluent students. Targeting technology resources and focused professional development to schools with high concentrations of low-income and minority students has promise as an important strategy for providing more equity in educational opportunity. The under funding of special education services in the state’s schools by the federal and state government also clearly has a disproportionate impact on young adolescents as middle graders have the highest enrollment in this program.

• Invest in improving middle grades education.

Relatively large shares of middle grade students reported experiencing academic stressors, and these increased over the middle grades years. Low-income students were also more affected, particularly in their efforts to get good grades. While implementing rigorous academic standards, the state and schools must also provide support to students and enhance curriculum and extra-curriculum programs to engage early adolescents in varied learning approaches. School reform models such as Michigan Middle Start that group students into small learning communities and promote ongoing improvement in teaching and

learning so that every child has access to effective instruction and an appropriate level of support have demonstrated their potential to make a difference, particularly for disadvantaged students.⁴⁵ Such schools provide comprehensive services for physical and emotional development; involve parents as partners; and use the community as a classroom to promote active citizenship.

Recent scientific information and survey data provide compelling evidence about the importance of supporting young adolescents and providing an environment in which they can develop the skills to be caring and productive adults. Findings about the inequities in Michigan middle grades schools pose a challenge to the state and its communities. Too many students fail to find within their schools and communities the supports they need to succeed. Strategic interventions during this stage could improve the life chances for many more young people and reduce the numbers of Michigan youth dropping out of high school. At the beginning of the second millennium, a high school education has become essential in assuring a successful transition to adulthood.

⁴⁵ Middle Start, a comprehensive reform program for schools with middle grades, was introduced in Michigan schools in 1994. Evaluation results have demonstrated much larger gains on state standardized tests for schools implementing the program compared to similar schools without the program.

If Michigan Were a Village of 100 Children

Their living arrangements

- 66** would live in a married couple family
- 20** would live in a single mother family
- 5** would live in a single father family
- 7** would live in a household headed by a relative
- 2** would live in a household headed by a non-relative

Their safety and security

- 7** would live in a family investigated for child abuse or neglect
- 1** would be a confirmed victim of abuse or neglect

Their racial and ethnic background

- 73** would be non-Latino White
- 17** would be African American
- 5** would be Latino
- 3** would be of more than one race
- 2** would be Asian Pacific
- 1** would be American Indian

Their geographic distribution

- 42** would live in the Detroit metro area, ten southeast counties encompassing Flint and Ann Arbor
- 41** would live in other metro areas, such as Lansing and Grand Rapids
- 17** would live in the Upper Peninsula and rural northern lower peninsula

Their economic well-being

- 26** would live in families where no parent has full-time, year-round employment
- 28** would be owed court-ordered child support
- 11** would live in a low-income working family
- 13** would be in poverty
- 12** would receive food stamps
- 5** would receive cash assistance (FIP)¹

Their health and health insurance status

- 76** would be immunized before the age of three
- 24** would be insured by Medicaid
- 1** would be insured by MICHild
- 9** would not have health insurance
- 1** would be disabled and receiving SSP²

■ Eleventh graders	136	45.2%	93	30.7%	18 of 82	

Percentage change is calculated with unrounded rates. Missing bars indicate no change or a rate could not be calculated.

¹A ranking of 1 means a county has the "best" rate compared to other counties in the state. *Sometimes a rate could not be calculated because of low incidence of events or unavailable data. (Rates are not provided when events numbered fewer than 6 over three years.)

Data Notes and Sources

All data are reported by county of residence unless otherwise indicated.

Background Indicators

(in order of appearance on state/county profiles)

Population (2000):

Total, Child, and Adolescents
Total population represents all residents of that place on April 1st, including the homeless and those in group quarters and institutions such as prisons. The child population includes children, ages 0-19. The adolescent population includes younger teens, ages 10-14 and older teens, ages 15-19. Population figures are drawn from the 100 percent count (complete enumeration) 2000 census tables.

Source: U.S. Census Bureau, *Census 2000*. (<http://www.census.gov/>)

Births (2000):

Total, No Paternity, Medicaid
The total births represents all births to women ages 15-44 for 2000. The percent of births with no paternity acknowledged are based on the total births, as are the percent of births insured by Medicaid.

Source: Michigan Department of Community Health, *Vital Records and Health Data Development Section*.

Average Wage Per Job

The average wage per job data for the year 2000 is the latest data available. (Median wage per job data were not available for the state counties.) Since the Bureau of Economic Analysis bases its estimates on a job (not a person) count, people holding more than one job are counted in the employment estimates for each job they hold. The latest available state median wage (\$27,227) in 2000 also

“juveniles,” but they are included here to maintain comparability with national data.

These data should be used with caution because of several sources of error. First, the arrest count reflects numbers of arrests not numbers of youth; each arrest of an individual who was arrested multiple times is included in the count, as well as multiple youth involved in a single incident. Second, many county numbers are based on partial reporting by police jurisdictions in those counties.

Variations across counties may be more influenced by local law enforcement and community norms than actual incidents.

The numbers are the annual averages of three year periods 1991-93 and 1998-00, as are the rates per 1,000 children ages 10-17 for the beginning and end of the trend period. (U.S. Census 2000 and estimated populations for other years are used to calculate the rate).

Source: Michigan State Police, *Criminal Justice Data Center, Uniform Crime Reports*. As these data are periodically updated, current electronic information may differ from the data in this report.

Teen Births

(1990-92, 1994-96 and 1998-00)
The total number of births to teens under age 18 and between ages 18-19 is compared over three three-year periods of 1990-92, 1994-96 and 1998-00.

The rate of teen births is based on the number of live births per 1,000 females, ages 15-19. To mitigate year-to-year random variation, average annual rates were calculated using three-year periods. (U.S. Census 2000 and estimated populations for other years are used). Birth rates to teens, ages 15-17, computed in a similar manner, are based on females, ages 15-17.

Source: Michigan Department of Community Health, *Vital Records and Health Data Development Section* (Calendar years 1990-2000). Population estimates from the Michigan Information Center. Census figures from the U.S. Census Bureau.

Children Under 6, all parents working (2000)

The number of children under 6 years of age with all parents in the labor force in 2000, includes children under 6 who either have single parents who work or have both parents who work. The percent is based on all children under age 6.

Source: U.S. Census 2000, *Summary File 3*.

Child Care Costs (2002)

The monthly average costs in 2002 of all regulated child care facilities includes family care, group family care, and center care. Infant and toddler care and center-provided care tend to cost more than the average. Monthly child care costs are calculated as a percentage of average wage per job for the year 2000.

Source: Provider data from a March 2002 survey of regional Community Coordinated Child Care agencies by the Michigan Community Coordinated Child Care Association. Wage data from the U.S. Department of Commerce, Bureau of Economic Analysis, *Regional Accounts Data, Table CA34*. (<http://www.bea.gov/regional/rets/>).

Regulated Slots (2002)

Slots available for child care are divided into categories of family home, group family home and centers. The numbers are state-regulated child care slot numbers for 2002. Family home care providers are allowed to care for six or fewer children, family group homes for seven to twelve children; and centers serve over 12 children. The average center in Michigan provides care for 51 children.

Source: Department of Consumer and Industry Services, Division of Child Day Care Licensing, *Child Day Care Licensing Reports CT-200, CT-430, CT-070* dated March 2002.

Children in Subsidized Child Care (2001)

This number reflects the number of children in child care whose parents were receiving a subsidy payment from the state in December

Rates are calculated when an average of more than five incidents occur in a county. Rates based on small numbers of events and small populations can often vary dramatically and cannot be considered statistically reliable for projecting trends or considering impact. Rates for non-census years are based on population estimates available from the Office of the State Demographer or the Census Bureau. In most cases, the population year is the same as the indicator year.

Percentage Change is calculated by dividing the difference between the recent and base year rates by the base year rate: $(\text{Recent rate} - \text{base rate}) / \text{base rate}$. Rising rates indicate worsening conditions for children for most indicators. Changes on some indicators such as victims of abuse or neglect may reflect state or local policies or staffing levels.

The calculation is based on unrounded rates so calculations based on published rounded numbers may not reflect the same change. Caution should be used in reviewing trends based on small numbers as they have limited use in comparison or prediction.

2001. Eligibility for child care subsidies is based on family participation in the Family Independence Program or earnings below qualifying income levels (roughly 185% of poverty level). Payments are only extended to regulated child care providers or legally exempt care providers, such as relatives and in-home care aides registered with the state. Subsidies range from 100 to 5 percent of the hourly rate specified by age of child, type of provider and shelter areas as determined by the agency.

The rate is the percent of children ages 0-12 in 2000 (U.S. Census).

Source: Michigan Family Independence Agency, *Child Development and Care Program, Monthly Assistance Payments Statistics, December 2001*.

Children Receiving FIP Assistance (2001)

In 1997 the Family Independence Program (FIP) replaced Aid to Families with Dependent Children (AFDC) as the cash assistance program to needy families. Families qualify for assistance at incomes less than 67 percent of the poverty level and lose eligibility when gross monthly income reaches \$775 (for a family of three). The percentage is based on the number of children ages 0-18 in 2000

assessment test. The percentage is based on the number of students in the eleventh grade in 2001.

Source: Michigan Department of Treasury, *Merit Award Program, 2001* (http://www.meritaward.state.mi.us/mma2001/2001merit_a-c.htm)

Court Ordered Child Support (2002)

Children under 19 who have a parent mandated to pay court-ordered child support are included. The percent with a court order is based on children 0-18 in 2000 (U.S. Census). Non payment in the last six months by non-custodial parents is based on the period January - June, 2002. The percent is based on the number of unique non-custodial parents with a court order. Source: Michigan Family Independence Agency, *Federal Case Registry Tables, State of Michigan Child Support Enforcement System, As of 2002. (Run Date - July 1, 2002)*

Children Insured by Medicaid (2001)

All children covered by Medicaid are included in this total; children qualify through several different programs. Most recipients are in Family Independence Program (FIP) families, who automatically receive Medicaid, or in families with incomes below 150 percent of poverty—\$21,225 for a family of three in 2000. Pregnant women and infants are income-eligible at incomes below 185 percent of poverty level. These numbers do not include children in the MICHild (“my child”) program (see next note).

The count is the sum of children receiving Supplementary Security Income + children receiving FIP assistance + other children receiving medical assistance as reported by the Family Independence Agency. The percentage is based on the number of children ages 0-18 in 2000 (U.S. Census).

Source: Michigan Family Independence Agency, *Policy Analysis Division, Report EY-180 for December 2001*.

Children Insured by MICHild (2001)

MICHild (pronounced “my child”) is a federal and state funded program that provides health insurance to children, ages 0-18, whose families earn too much to be eligible for Medicaid or do not receive health insurance for dependents through an employer. Families with income between 150-200 percent of the federal poverty line, roughly \$21,000 to \$28,000 for a family of three in 2000, would meet income eligibility. The percentage is based on the number of children ages 0-18 in 2000 (U.S. Census).

Source: *MAXIMUS of East Lansing, MICHild, December 2001 Executive Summary, Table 2*.

Tested for Lead Poisoning, ages 1-2 (2001)

The number and percent of Michigan children ages 1-2 represents those tested for lead poisoning, not the prevalence of lead poisoning. The percent is based on the number of children ages 1-2 in 2000 (U.S. Census).

The percent of lead-poisoned is based on the number of children ages 1-2 who were tested. “Lead poisoned” children have 10 or more micrograms of lead per deciliter of blood (mcg/dL), according to the current guidelines from the Centers for Disease Control and Prevention (CDC). That standard represents just 10 millionths of a gram of lead in one-tenth of a liter of fluid. Research has shown that even more miniscule lead concentrations disrupt the workings of the brain and nervous system in children enough to impair their ability to think, concentrate, and to learn. The numbers reflect blood test results reported by laboratories to the Michigan Department of Community Health during the calendar year 2001. Additional tests on Michigan children may have been conducted but not reported.

Source: Michigan Department of Community Health, *Childhood Lead Poisoning Prevention Program, 2001*.

Hospitalized for Asthma, ages 1-14 (1998-00)

This number represents the discharges of children ages 1-14 from Michigan hospitals with asthma recorded as the primary diagnosis. It under-represents the prevalence of asthma among children and the incidence of asthma attacks because many children who have asthma may never be hospitalized for the disease.

Data are reported by the county of residence of the patient. The number reflects the average annual numbers of hospital discharges of children during the three-year period 1998-00. The rate is incidents per 10,000 children ages 1-14. Rates are reported as calculated by the Bureau of Epidemiology, Michigan Department of Community Health using population estimates for the years 1998-00. Rates are only provided for counties with a three-year total of 20 or more.

Source: Michigan Department of Community Health, Division of Epidemiology Services. (Michigan In-Patient Data Base, 1998-2000)

Birth Defects (1997-99)

The number reflects the annual average number of infants reported with a birth defect who were born in Michigan and whose mother was a resident at the time of the birth. Conditions are reportable only if identified within the first year of a child's life. This methodology represents a departure from previous years when children with birth defects identified by their second birthday were included. The Department of Community Health has also initiated some quality assurance strategies to improve data reliability. The latest available numbers, as of summer 2001, were for 1999. Caution must be taken in interpreting these numbers, because birth defects are likely to be underreported, especially in border counties,

where some Michigan mothers give birth in nearby states that do not collect birth defect data. Infants in those counties may also be diagnosed or treated for a birth defect in a facility outside the state. Evidence also suggests many facilities may not be submitting all cases nor correcting reports when the original diagnosis changes.

The percentage is based on live births by county.

Source: Michigan Department of Community Health, Michigan Birth Defects Registry.

Students in Special Education (2001)

This figure represents the percentage of the enrolled public school students in school year 2000-01 who are diagnosed with a mental or physical condition resulting in their eligibility for special education services. Local school districts report this information to the Michigan Department of Education. The county numbers represent the children served by local and intermediate school districts within the county. Children in programs operated by the Michigan Departments of Corrections, Community Health, or the Family Independence Agency are not included.

The special education count includes all individuals receiving special education services, ages 3 through 26. The rate is the percent of school enrollment for K-12 in October 2001.

Source: Department of Education, Office of Special Education & Early Intervention Services, Special Education Count By County and By Type Of Disability For December 1, 2001.

Children Receiving SSI, per 1,000 (2001)

Supplemental Security Income (SSI) is a federal program of the Social Security Administration that provides direct cash payments to low-income aged, blind and

Fiscal Years begin on the previous October 1st and end on September 30th. For example, Fiscal Year 2001 began on October 1, 2000, and ended on Sept 30, 2001. Data from the Family Independence Agency such as child abuse and neglect and out-of-home care are reported in fiscal years.

Three-year averages are used to calculate trends for most health indicators because they are less likely to be distorted than a single year. Rates are calculated for the average number and average population base. Many Michigan counties have small numbers of events for several indicators and small population bases.

disabled persons who have few financial assets. Children under age 18 are eligible if they meet one of the following criteria:

- have special health care needs as determined by assessment under SSI criteria;
- require institutional care but can be cared for at home for less cost;
- are "Department wards," that is, receiving foster care or for whom there is an adoption assistance agreement (Title IV-E).

The criteria for disability include medical proof of a physical or mental condition or conditions that result in marked and severe functional limitations lasting or expected to last at least 12 months or to result in death. As of January 2001, the maximum monthly amount for a child with a disability living at home was \$531 plus a \$14 state supplement. Persons who are eligible for SSI are automatically eligible for Medicaid, and, if they live in a household with only SSI or Family Independence Program (FIP) recipients, food stamps.

The rate is per 1,000 children ages 0-17 in 2000 (U.S. Census). Data for Missaukee and Wexford counties are combined and reported under Wexford.

Source: Michigan Family Independence Agency, Policy Analysis Division, Report EY-180 for December 2001.

Trend Indicators

(in order of appearance on state/county profiles)

Child Poverty, Ages 0-17 and Ages 0-4, 5-17 (1990 and 2000)

Poverty rates include only "related" children—defined as "related" to the head of the family by birth, marriage or adoption. Poverty thresholds are applied on a national basis and are not adjusted for regional, state or local variations in the cost of living.

The percentages are based on the number of children, ages 0-17, 0-4 and ages 5-17, in 1990 and 2000. Rates are based on the population of children (U.S. Census) in the respective age groups.

Source: Tabulations from the U.S. Census 1990 and U.S. Census 2000, Summary File 3, provided by Center for Urban Studies, Wayne State University.

Children Receiving Free/Reduced Priced School Lunches (1989/90 vs. 2001/02)

Students from families with incomes below 185 percent of the poverty level are eligible for free or reduced prices in the federal School Lunch Program. Students from families reporting income between 130 and 185 percent of the federal poverty line are eligible for reduced priced meals, while children from families with incomes below 130 percent of poverty are eligible for a fully subsidized or "free" meal. National estimates indicate that about 17 percent of children eligible for free or reduced priced school meals do not apply.

The percentage is based on total enrollment of K-12 public school students for school years 1989-90 and 2001-02.

Source: Michigan Department of Education, Food and Nutrition Services, Office of Nutrition (1989-90 and 2001-02).

Less Than Adequate Prenatal Care (1990-92 vs. 1998-00)

The Kessler Index is a classification of prenatal care based on the month of pregnancy prenatal care began, the number of prenatal visits, and the length of the pregnancy, that is, for shorter pregnancies, fewer visits are considered adequate. Less than adequate prenatal care occurs when prenatal visits do not start within the first three months of pregnancy or reach a minimal standard number of visits, based on the length of the pregnancy. Less than adequate prenatal care includes two categories: inadequate and intermediate prenatal care.¹

This indicator does not reveal the quality of care, and less than adequate prenatal care *per se* does not cause poor birth outcomes. The percent is based on total resident live births. To mitigate random year-to-year variation, average annual rates were calculated using three-year periods, 1990-92 and 1998-00. Births by county are based on the mother's county of residence.

Included in the measure are some cases where data are unknown or missing. Data-reporting problems in some hospitals have compromised the accuracy of this indicator, especially for the large southeast counties of Oakland, Washtenaw, and Wayne.

Source: Michigan Department of Community Health, *Vital Records and Health Data Development Section (Calendar years 1990-2000)*.

¹ Intermediate prenatal care is defined as having begun during the second trimester with corresponding fewer visits or during the first trimester but with fewer visits than considered appropriate for the length of the pregnancy. Inadequate prenatal care is none at all or care beginning in third trimester or the number of visits was less than the minimal standard, based on the length of the pregnancy, no matter when the visits began.

Low-Birthweight Babies (1990-92 vs. 1998-00)

Babies who weigh less than 2,500 grams (approximately 5 lb. 8 oz.) at birth are considered low-birthweight. The percentage is based on live births. To mitigate year-to-year random variation, average annual rates were calculated using three-year periods, 1990-92 and 1998-00. Births by county are based on the mother's county of residence.

Source: Michigan Department of Community Health, *Vital Records and Health Data Development Section (Calendar years 1990-2000)*.

Infant Mortality, per 1,000 (1990-92 vs. 1998-00)

Infant mortality numbers include deaths of infants up to one year of age. County totals do not always add up to the Michigan total because the county of residence is missing in some infant death cases.

The rate is the number of infant deaths per 1,000 resident live births. Since an infant death may occur in the calendar year following the birth year, some amount of error is introduced into the rate. To mitigate year-to-year random variation, average annual rates were calculated using three-year periods, 1990-92 and 1998-00.

Source: Michigan Department of Community Health, *Vital Records and Health Data Development Section (Calendar years 1990-2000)*.

Child Deaths, Ages 1 to 14 (1990-92 vs. 1998-00)

The number of child deaths includes deaths from all causes; disease as well as injury. The rate is the number of child deaths per 100,000 children, ages 1-14. To mitigate year-to-year random variation, average annual rates were calculated using three-year periods, 1990-92 and 1998-00 (U.S. Census 2000 and estimated populations for other years are used).

Source: Michigan Department of Community Health, *Vital Records and Health Data Development Section (Calendar years 1990-2000)*. Population estimates from the Michigan Information Center.

Children in Investigated Families (1990 vs. 2001)

These children are in families where an investigation of abuse or neglect was conducted, usually initiated by a complaint or report received by the Child Protective Services Division of the Family Independence Agency. Families may be investigated more than once in a given year, so these numbers represent a duplicated count. Rates are calculated per 1,000 children ages 0-17 in 1990 and 2000 (U.S. Census).

Source: Michigan Family Independence Agency, *Health and Welfare Data Center, Children's Protective Service Management Information, Report PS-31D, Victims by Category of Abuse/Neglect (Fiscal Years 1990 and 2001)*.

Confirmed Victims of Abuse or Neglect (1990 vs. 2001)

These numbers reflect an unduplicated count of children in a given fiscal year where alleged abuse or neglect is confirmed after an investigation. (These numbers reflect all categories where alleged abuse or neglect has been confirmed.) The operational definitions for child abuse and neglect are found in the Services Manual of the Family Independence Agency.

The rate is the number of child abuse and neglect victims per 1,000 children ages 0-17 in 1990 and 2000 (U.S. Census).

Source: Michigan Family Independence Agency, *Health and Welfare Data Center, Children's Protective Service Management Information, Report PS-31D, Victims by Category of Abuse/Neglect (Fiscal Years 1990 and 2001)*.

"Child abuse" means harm or threatened harm to a child's health or welfare by a parent, legal guardian, or any other person responsible for the child's health or welfare or by a teacher or teacher's aide that occurs through nonaccidental physical or mental injury; sexual abuse; sexual exploitation; or maltreatment.

"Child neglect" means harm or threatened harm to a child's health or welfare by a parent, legal guardian, or any other person responsible for the child's health or welfare that occurs through either of the following:

- (i) Negligent treatment, including the failure to provide adequate food, clothing, shelter, or medical care.
- (ii) Placing a child at an unreasonable risk to the child's health or welfare by failure of the parent, legal guardian, or any other person responsible for the child's health or welfare to intervene to eliminate that risk when that person is able to do so and has, or should have, knowledge of the risk.

Children in Out-of-Home Care (1990 vs. 2001)

The total number includes children in facilities or placements (other than their own home) supervised by the Family Independence Agency (FIA) or the courts, including children placed with a relative or guardian. The number of children in out-of-home care for reasons of abuse or neglect and the number for delinquency are both presented. The number of Wayne County children placed out of home for delinquency in 2001 was provided by the county's Department of Community Justice, which has jurisdiction over delinquency services for county youth.

Since children in mental health facilities or out-of-home placements supervised by the Department of Mental Health or Department of Corrections are not included, these numbers are viewed as an under-count of children in out-of-home care.

The rate is calculated per 1,000 children, ages 0-17 in 1990 and 2000 (U.S. Census). For 2001, data from a single month, December 2001, are reported because an annual average was not available.

Source: Michigan Family Independence Agency; Children's Services Management Information System, Report CY-091, Part G, Legal Status by Living Arrangement and Sex (Report Period September 1990 and 2001) and Wayne County Department of Community Justice, Juvenile Justice Services Division Information System, JAIS (Juvenile Agency Information System) for September 2001.

Births to Teens, Ages 15-17 (1990-92 vs. 1998-00)

See page 204.

Deaths by Accident, Homicide, Suicide, for Teens, Ages 15-19 (1990-92 vs. 1998-00)

Only teen deaths caused by accidental injury, homicide, or suicide are included, not those that result from disease.

The rate is the number of deaths per 100,000 youth, ages 15-19. To mitigate year-to-year random variation, average annual rates were calculated using three-year periods at the beginning and end of the trend period (U.S. Census 2000 and estimated populations for other years are used).

Source: Michigan Department of Community Health, Division for Vital Records and Health Statistics (1990-2000). Population estimates from the Michigan Information Center.

High School Dropouts (1990-91 vs. 1999-00)

The count of dropouts in a given year in Michigan is the sum of students enrolled in grades 9 through 12 on fall count day of one school year and who are not accounted for on fall count day of the following school year. Students who were enrolled on the beginning count day are considered accounted for on the

ending count day if they are enrolled, have transferred to another district, were retained in grade, or graduated. The calculation does not reflect those who return to an adult education program to complete their diploma requirements or those who drop out prior to the ninth grade. If districts with negative dropout rates represented more than 15 percent of the total county adjusted enrollment, county totals are not presented. For the 1990-91 school year, two counties were so affected.

The percentage, based on the expected enrollment on the ending count day, is reported as calculated by the Department of Education.

Source: Michigan Department of Education, Retention Drop-out Information (1990-91 and 1999-00 school year). (Obtained October 2001). As these data are periodically updated, electronic information, particularly for more recent years, may differ from the data presented here. (<http://www.state.mi.us/mde/cfdata/k12db/availdata.cfm?psource=MDEWeb>)

Students Not Meeting Science Standards (Grades 5 & 8, 1995-96 vs. 2000-01; High School Test, 1997-98 vs. 2000-01)

The Michigan Educational Assessment Program (MEAP) is the statewide testing program designed to assess school and student performance and identify educational needs. The MEAP science tests are administered to grades five, eight, and eleven.

At the high school level, the MEAP science test is administered to juniors. Certain students are eligible to take the test in their sophomore year and some students do not take it until the senior year. Students may repeat the test three times to improve scores. Some students opt out of taking the test, but recent policy changes make this less common than in past years. The 1997-98 school year was used for the high school base year because a new version of the high school science test was introduced in that year.

The base year for the fifth and eighth grade science test is 1995-96, the year science testing began in these grades.

Science test scores for fifth and eighth grades are reported in three performance categories: proficient, novice, and not yet novice. Proficient performance is considered "passing." Science scores at the eleventh grade are reported in four categories, and proficiency, or passing level, is defined as scoring at levels 1 or 2. The number of students reported includes only students who did not perform at the proficient level.

Only district percentages, not numbers, were available for the 2001 fifth and eighth grade science MEAP tests, so the numbers were calculated; thus, in some cases, the numbers reported here may not equal the original totals because of rounding errors. The percentage is based on the number of students in that grade who took the test.

Source: MEAP Science scores, 1995-96, 1997-98 and 2000-01. Michigan Educational Assessment Program, Michigan Department of Education K-12 data base; MEAP and High School Test Science scores, 2000-01, Merit Award Program, Michigan Department of the Treasury. Students in charter schools, also known as public school academies, have not been included in the following indicators: participation in free or reduced priced lunch, achievement (as measured by the Michigan Educational Assessment Program) or high school dropout. Many of these schools have not been required to comply with reporting requirements. Although their enrollment has increased, they still encompass a relatively small share (3%) of all K-12 public education students.

MISSION STATEMENT

To improve the status of children, youth, and families, Kids Count in Michigan collects and disseminates data as a basis for public policy development and community action.
