ABSTRACT

In the sixth annual Southern Regional Education Board analysis of state and local revenue potential, the authors suggest that 1972 tax collections, here reported, represent a kind of watershed in revenue availability. The economic boom over the last two years has substantially removed the need for many states to consider new revenue measures. In fact, several states have reduced taxes. However, the economic boom period is generally thought to be coming to an end in early 1974. The authors venture to predict a return to a period of revenue shortages that will last at least for the remainder of the 1970s. This report is intended for those who are responsible for maintaining an adequate flow of revenue at the state and local level. In their search for new revenue, states may simultaneously pursue objectives of developing more progressive tax systems in the interest of greater equity and adequacy in the financing of education and other public services. Statistical tables are presented. (Author/PG)

FOREWORD

The present publication is the sixth annual Southern Regional Education Board analysis of state and local revenue potential. Quindry and Engels suggest that 1972 tax collections, here reported, represent a kind of watershed in revenue availability. "The economic boom over the last two years has substantially removed the need for many states to consider new revenue measures. In fact, several states have reduced taxes." However, "the economic boom period is generally thought to be coming to an end in early 1974." They venture to predict "a return to a period of chronic revenue shortages that will last at least for the remainder of the 1970's."

It would be pleasant, in the coming years, to see history prove the authors wrong. Failing that happy ending, those who are responsible for maintaining an adequate flow of revenue at the state and local level may look to these reports for some of the facts needed in tapping unutilized potentials in the years to come. We would also hope that, in their search for new revenue, states may simultaneously pursue objectives of developing "more progressive tax systems in the interest of greater equity and adequacy in the financing of education and other public services"--in the words of the Carnegie Commission on Higher Education.

INTRODUCTION

Since 1967 the Southern Regional Education Board has produced annually a study measuring the revenue potentials of state and local tax structures. In this series of reports major emphasis is placed on measuring potential revenue by comparing potential with actual collections for states (and the District of Columbia) by major tax sources. Data are presented in amounts per capita and per \$1,000 of personal income as well as in total dollar amounts. It is hoped that these comparisons will serve as a guide to public officials if and when they find it necessary to search for additional funds to finance public services. They also should provide an informative resource for authorities in providing tax reforms directed at improving tax equity and responsiveness to economic growth.

The purpose of these reports is not to recommend either that state authorities should search out new ways of increasing tax revenues or that any particular state should reform its revenue structure. The presentations emphasize the data and to a lesser extent focus on analysis. No value judgments are meant to be implied. The worth of the reports lies in their value as references and guides to decisions if state authorities are inclined to seek out new sources or change the relative reliance on tax sources.

This report is primarily a series of statistical tables. The data in the tables are designed to be comparable, with a few minor exceptions, with those presented in earlier reports. Previous to presenting tabular data, and following a description on methods of

computing revenue potential, tax burden, and tax effort, a section lists major state tax changes enacted in 1972 and 1973. A particular state, in evaluating its position relative to the other 49 states, should consider changes which were not reflected in collections in fiscal 1972.

The extent to which it is necessary or desirable to raise additional revenue depends on several things. Most important are the adequacy of present service levels and the desires of the taxpayers and decision makers to improve public services. In some states, in which the responsiveness of the tax structure is low, it will be necessary to look for new revenue merely to maintain the present level of services. These and other factors determine the effort expended in raising revenue. Effort must be measured in relation to ability.¹ Taxpayers are contributing more to the public treasury relative to their ability in some states than in others. It is obviously less feasible to raise taxes in states in which above-average effort is made. High tax effort may result from a low tax base or a high service level or both.

The economic boom over the last two years has substantially removed the need for many states to consider new revenue measures.

¹ The ability of taxpayers to contribute to government support is determined by such factors as income, wealth, business activity and by alternative demands made upon the taxable resources. The ability of a taxpayer to increase his contribution depends on his resources out of which to pay taxes and the level of his present tax load. In many states a better distribution of the tax load would make the present tax load, or any increases in the tax load, less burdensome in the aggregate, and, hence, easier to justify and to implement.

In fact, several states have reduced taxes. Even states with relatively unresponsive tax systems have been able to finance services adequately because of the unusual burst of construction and consumer activity. In other words, property and consumer taxes have demonstrated a responsiveness beyond that expected in periods of less growth.

The economic boom period is generally thought to be coming to an end in early 1974. This belief is strengthened by two recent developments. First is the emerging energy shortage, which can create a situation in which the real output of goods and services may essentially level off during the next few years. Second is the possibility of continued widespread inflation over the next few years. Together they presage a return to a period of chronic revenue shortages that will last at least for the remainder of the 1970's.

The extent to which new directions in tax policy may be sought depends upon each particular state's present tax structure and social and economic conditions as well as its philosophy in regard to the state's role in promoting or controlling economic and social change. Taxpayers in states with relatively unresponsive and regressive tax structures may wish to continue this direction in order to minimize the government's role. Taxpayers in other states may wish the state to increase its influence.

Since 1967, total state and local taxes have grown from \$61,429 million to \$110,392 million, a growth of 79.7 percent. In this same period, the unutilized revenue potential has grown from \$11,645 million

to \$19,735 million, a growth of 69.5 percent and total personal income increased by 50.4 percent. Table A presents unutilized potential by major source for the years 1967 to 1972. There is little evidence that growth of unutilized potential is centered in either business or individual taxes. The individual income taxes indicate the greatest growth in unutilized potential. However, other taxes growing near or above the average rate are levied on both business and families and individuals. The amount of unutilized potential in the corporation income taxes decreased during the last few years because of the decline in corporate profits. It can be expected to increase in 1973.

Even though unutilized revenue potential has grown impressively over this time span, revenue as a percentage of personal income has grown from 9.9 percent in 1967 to 11.8 percent in 1972.

SOURCE OF DATA

Data for the statistical tables of this report were supplied by the U. S. Bureau of the Census. State tax collection data were published in State Tax Collections in 1972 and State Government Finances in 1971-72. Other and local tax collection data were supplied by the Bureau and will be published by them in total in Governmental Finances in 1971-72. Local taxes by category of tax were estimated by the authors from totals supplied by the Bureau. Data on income and population are reported in Survey of Current Business. Information on tax rate and other changes came from reports published by the Commerce Clearing House, the states themselves, or the Federation of Tax Administrators.

The Census of Governments publishes data on state and local tax collections every five years. Data for 1972 will be published, beginning in 1974. They may differ insignificantly from estimates arrived at in this publication.

METHODOLOGY

As suggested above state tax collection data by source are adequately reported in State Tax Collections for 1972. Local tax collections were reported in total (all states) by tax source in State Government Finances in 1972. Estimates by state for local collections were made and added to state collections; then to these totals, utility net profits and net liquor store profits were added to state and local utility taxes and liquor sales tax, respectively.

Interstate comparisons of tax collections and unutilized potential were then made.

In the interstate comparisons, the basic statistical attack rested on the assumptions that the average effort to collect revenue from any particular tax was reasonable, and that any state should be able to put forth such effort if it chooses to do so. That is, each state collecting above-average amounts from a particular tax source should be able to maintain its rate of collections and still be able to tap, at an average level, other taxes previously underutilized.

However, the unavailability of an adequate effective tax base, and the distribution of the base may, in some cases, render these assumptions unrealistic. Some types of tax bases are not uniformly available in all states. A few states with extensive extractive industries can use severance taxes profitably. A few states can tax the tourist industry effectively; the securities exchange industry is concentrated largely in New York.

The average level and the distribution of income may influence the degree to which a state can utilize a personal income tax. Moreover, taxpayers paying high taxes of a particular type (e.g., consumption) would have their capacity to pay other types of taxes (e.g., income or property) seriously impaired. The overall level of taxation must be considered.

In the statistical comparisons, totals combining state and local taxes (and in two instances, in lieu payments were combined with state

and local taxes) were used. Interstate comparisons are more meaningful when based on combined amounts because of the diversity in the division of labor between states and their subdivisions.

An effective way to dramatize the relative utilization of tax sources is to show the amount of revenue possible at average rates in each state and to compare this amount with actual collections. Thus, tax practices were examined by computing the average yield for states using each of several particular taxes. In most cases, the actual effective tax base for a particular tax was not available; therefore taxes were computed as a levy per \$1,000 of personal income.² For severance taxes, the common denominator most suited for computing an average rate was the value of taxable resources extracted from the air, land, and waters of the state. For motor vehicle-related taxes, the number of registered vehicles seemed the most adequate measure of tax capacity.

Following the computation of an average tax rate for all states using a particular tax, the rate was multiplied by the common denominator (personal income, value of severed products, registered motor vehicles) for each state in order to provide an estimate of potential revenue. The next step was to compare the potential amount with actual collections. If the potential were less than actual

² This amounted to totalling collections from a particular source for all states effectively using the tax and dividing the collections by the total personal income for the same states and stating the quotient as dollars per \$1,000 of collections.

collections, a state was assumed to have no unutilized capacity for that particular source. If the actual were less than the potential collections, the unutilized potential was measured as the difference between the two.

THE STATISTICAL TABLES

Tables 1 through 10 present, by state, the actual collections, and potential and unutilized potential collections for 14 tax sources. Table 11 presents other minor tax collections and total collections by state. As reported in Table A, total unutilized potential collections grew by 69.5 percent from 1967 to 1972. Gross unutilized potential is summed up by state and by tax source in Table 12.

In Tables 13 through 17 actual collections, unutilized potential, and possible collections (using the total of unutilized potential) are listed by state in amounts per capita and per \$1,000 of personal income for the five principle state-local tax sources.

A number of measuring devices have been employed for interstate comparisons of capacity and effort. The most commonly used simple measures are income and population. While it is more popular to compare taxes in per capita terms, the most reliable measure is personal income. One argument for its use for comparative purposes is that taxes are ultimately paid from personal income. Another is that, while personal income is a less than complete measure of taxable resources, it seems to correlate well with total resources. Thus, while state-to-state comparison in relation to income is considered

the better measure of relative capacity and effort, both are presented in these and other tables.

As mentioned above, there is some diversity in the use of the popular tax sources. Local units in all states and some state governments employ property taxes. A few states employ one, but not both, a general sales tax or personal and corporate income taxes. The relative use of these tax sources is reported in Table 18.

The average level and the distribution of personal income affect the tax capacity and the degree of burden or effort that can reasonably be applied. Table 19 reflects, in addition to tax collections as a percentage of income as a measure of tax effort, this effort measure weighted by the average level of income. In other words, a tax equal to 10 percent of personal income is a greater burden if average income is low than if it is high. The measure in column 4 reflects this. Table 35 lists the distribution of federal adjusted gross income by class for the states, but no weighting can be made.

Tax effort or burden is also influenced by the extent of use of nontax revenue sources. Some states by choice garner relatively larger amounts of revenue from state or local nontax sources or are able to exact federal funds in relatively large amounts. Taxes as a percentage of general revenues from own sources, and federal aids as a percentage of general revenues are also reported in Table 19.

Tables 20 through 34 list the net unutilized potential of the SREB states individually and in total. By net unutilized potential,

it is meant that amounts collected above the average tax yield from some sources were subtracted from amounts collected below the average tax yield from other sources. Table 36 adds actual collections to net unutilized capacity and thus computes collections on the average of all states. This is termed for present purposes as tax capacity. The percent of capacity unutilized and the capacity and utilization per capita and per \$1,000 of personal income is listed by state. States overutilizing this capacity measure are found in the New England and the Pacific areas. The greatest percentages of underutilization are found in the SREB states.

MAJOR TAX MEASURES IN 1972

Fewer states enacted major revenue raising programs in 1972 than in 1971. Some states, taking advantage of surpluses, have provided new exemptions or deductions or tax decreases designed to increase tax equity. About one third of the states actually raised major tax rates. These are reported in Table B. Tax raises are concentrated most generally in motor fuel taxes, followed by income taxes, tobacco taxes, and alcoholic beverage taxes.

There are two significant changes in tax policy that are having an increasing effect on the relative reliance on tax sources. The first one was brought about because state legislatures have been presented with a crisis in educational financing. The basic argument that the quality of public education may not be a

function of wealth other than the wealth of the entire state as elicited in the Serrano and other court cases has spread to more than 30 states. It will ultimately result in the raising of a relatively larger amount of education funds from state nonproperty taxes.

The second change gives an illusion of increased tax burden when in reality it is more in the nature of a shift in emphasis on sources. It reflects in the collection statistics as a tax raise, however. Presently all 50 states and the District of Columbia have some measures of property or sales tax relief; about 3/4 supported by the state from nonproperty tax sources. In these latter cases, taxes collected at the local level are relieved directly by refunds to the taxpayer from state collected taxes.

General Sales and Use Taxes

Two states and the District of Columbia raised sales and use tax rates in 1972. California raised its state rate from 3.75 percent to 4.75 percent, but delayed its effective date to March, 1974. All counties in the state raised local rates from 1.0 percent to 1.25 percent. Connecticut first raised its rate from 6.5 percent to 7.0 percent, then reduced it. The District of Columbia raised general rates from 4.0 to 5.0 percent, and on hotels and motels and restaurant meals to 6.0 percent. Rates on food for home consumption, prescription medicines, and laundry and dry cleaning remained at 2.0 percent. Tennessee continued its 3.5 percent rate for another year. Mississippi reduced rates on

certain transactions from 5.0 to 3.0 percent, and New Jersey extended its base to include sale of alcoholic beverages.

Sales tax bases were narrowed in Kentucky by the exemption of food for home consumption. Expenditures on pollution control facilities were exempted in Georgia, Nebraska, and Virginia. Broader exemptions of foods, medicines and medical equipment, and water and household fuels were adopted in several states.

Individual Income Taxes

No new individual income taxes were enacted in 1972. Three states raised rates or imposed surtaxes effective in 1972.³ New York acted to increase its revenue by repealing individual tax credits and raising the rate on capital gains. Michigan and Vermont extended temporary rate increases.

Several other states raised personal exemptions or deductions or authorized new or increased tax credits, including exemption of income of the armed forces, of senior and disabled taxpayers, of former prisoners of war, and such, thereby reducing tax revenues. Also popular were new or expanded credits, rebates, or deductions for nonpublic school tuition and residential and sales tax payments. Idaho reduced tax rates but disallowed the federal income tax paid as a deduction.⁴

³ These states were Nebraska, New York, and Virginia.

⁴ For more details see Federation of Tax Administrators, Tax Administrators News, published monthly by Federation of Tax Administrators, 1313 East Sixtieth Street, Chicago, 60637.

Corporate Income Taxes

Seven states⁵ raised tax rates or continued temporary rate increases. Kentucky reduced its rate from 5.0 to 4.0 percent on the first \$25,000 of taxable income and from 7.0 to 5.89 percent on income in excess of \$25,000. A franchise tax on banks in Florida and an income tax on savings and loan associations in Virginia were new minor taxes. Alaska increased its tax rate on financial institutions from 2.0 to 7.0 percent, and the District of Columbia raised gross receipts rates on gas, electricity, lighting, and telephone companies from 4.0 percent to 5.0 percent.

Gradual or complete elimination of the federal income tax as a deduction for state tax purposes occurred in Connecticut, Kansas, and Kentucky.

Special Sales Taxes--Motor Fuels

Ten states⁶ raised tax rates on motor fuels in 1972. The privilege tax on aircraft fuel was increased from 2.5 cents to 3.5 cents per gallon. Florida authorized a county tax of one cent per gallon for transportation purposes. Motor fuel tax rates for all states as of August 1, 1973, are reported in Table C.

⁵ The states are California, Connecticut, Idaho, Michigan, Nebraska, New Jersey, and Virginia.

⁶ The states are Idaho, Kentucky, Maryland, Michigan, Mississippi, Missouri, New Jersey, New York, South Carolina, and Virginia.

TABLE C
MOTOR FUEL TAX RATES
August 1, 1973

Special Sales Taxes--Tobacco Taxes

Cigarette tax rates were raised in five states.⁷ In addition, New Jersey, New York, Tennessee, and Louisiana reduced the discount to dealers. Idaho, Kansas, and Tennessee imposed new or higher taxes on tobacco products other than cigarettes. Florida repealed the authority of municipalities to impose a local cigarette tax with full state credit for local tax paid. Current cigarette tax rates are listed in Table D.

Special Sales Taxes--Alcoholic Beverage Taxes

Distilled spirits tax rates were raised in six states and beer gallonage or barrel tax rates in three states.⁸ Delaware and New Jersey increased rates on wine. Idaho imposed a 7.5 percent surcharge on alcoholic beverages sold in state liquor stores. Michigan imposed an additional tax on retail sales of distilled spirits. South Carolina placed a new levy on miniature bottles, and Virginia imposed a tax on mixed drinks sold by mixed beverage carriers.

Property Taxes

Changes were numerous and varied in 1972 with respect to property taxes, the most noteworthy being credits or exemptions for homesteads of selected groups, such as the low income, senior or disabled citizens, widows, veterans, and for pollution control

⁷ Idaho, Mississippi, New Jersey, New York, and Oregon.

⁸ States raising distilled spirits tax rates were Florida, Nebraska, New Jersey, New York, South Carolina, and South Dakota. Beer taxes were raised in Maryland, Nebraska, and South Dakota.

facilities. In nearly all cases the credits or exemptions were at the expense of the state. Thus, effective reliance was shifted from property taxes to state nonproperty taxes.

Several states made or proposed substantial changes in assessment practices or assessment ratios without actually affecting collections.

Other Taxes

Motor vehicle license taxes were increased or revised in at least six states during 1972.⁹ Alaska enacted a new severance tax on oil, Kentucky and Tennessee on coal. Severance tax rates were raised in Louisiana and Mississippi and reduced in Idaho.

MAJOR TAX ACTIONS IN 1973

General Sales Taxes

Only one state, Indiana, increased its general sales tax rate in 1973; and, in return for a doubling of the rate from 2.0 to 4.0 percent, food items for home consumption were exempted. Tennessee continued its temporary increased rate of 3.5 percent to July 1, 1974, when it is scheduled to return to the permanent rate of 3.0 percent. Exemptions for food were broadened in North Dakota. Louisiana exempted prescription drugs, food, and boiler fuel.

⁹ Rate raises were effected in Idaho and Kentucky and revisions in the District of Columbia, Massachusetts, New Jersey, and New Mexico.

New exemptions for medical supplies, pollution control equipment, and sales by nonprofit organizations continued to proliferate. The activities in revision of exemption provisions generally reflected the unexpected increase in revenue in 1973 which permitted some tax relief within the special areas.

Wyoming authorized a county sales tax, and Missouri authorized a $\frac{1}{2}$ of 1 percent sales tax by cities and counties for transportation purposes. Sales tax rates, as of December 4, 1973, are listed in Table E.

Individual Income Taxes

Tax rates were raised in Delaware, and the tax base was increased to include all capital gains and interest from U. S. government securities. Utah added a new tax bracket to help relieve the low income brackets, and North Dakota raised the rate of its highest bracket.

Nebraska reduced its income tax rate, and New York removed the 2.5 percent surtax for 1973. The dividends tax was removed in Connecticut. Arkansas, Colorado, Mississippi, and Wisconsin provided new or increased credits for low income taxpayers and senior citizens. Indiana authorized counties to impose a levy on individual adjusted income and 31 of its 92 counties promptly adopted the new levy. Michigan authorized the Detroit school district to impose an income tax on corporations and individuals. Louisiana provided an income tax deduction for federal income taxes.

Corporate Income Taxes

Income tax rates on corporations were raised in Indiana (which

also imposed a supplemental corporation income tax) and also in Maine. New Jersey imposed a supplemental corporation income tax as well as one on savings institutions. Montana made permanent its temporary tax and eliminated a temporary decrease. Kansas eliminated the federal income tax as a deduction, and Alaska increased the tax rate on financial institutions.

Arkansas made financial institutions subject to its income and franchise tax and repealed the tax on capital stocks of such institutions. Connecticut made domestic insurance companies subject to its franchise tax. Georgia applied its income tax to banks; Minnesota continued its temporary rates on banks until January 1, 1974. Oregon made all business trusts subject to its corporation income tax. Utah extended its income and excise taxes to national banks, and a bank excise tax was imposed in Wyoming. Nebraska reduced its corporation income tax rate from 3.75 percent to 3.25 percent.

Special Sales Taxes

Delaware (temporarily) and Arkansas increased motor fuel taxes, and North Dakota imposed an excise tax on jet fuel. Connecticut authorized the levy of a gasoline tax by transit districts. Louisiana repealed its lubricating oils tax.

The cigarette tax rate was increased in Colorado. Iowa levied a new tax on little cigars at cigarette tax rates. Arizona reduced its tax stamps discount, and Kansas levied a privilege tax on distributors of tobacco products.

Tax rates on distilled spirits, beer and wine were increased in Indiana, while Minnesota reduced its rate on distilled spirits. Georgia authorized municipalities and counties to impose a local excise tax on the sale of malt beverages.

Other Taxes

Increased relief from property tax burdens in the form of credits and exemptions continued to grow. By the fall of 1973, all states had some form of relief, twenty-five in the nature of circuit-breakers for all or some classes of household heads.

Estate taxes were increased in Oklahoma, reduced in Wisconsin, and newly imposed in New Mexico. Utah increased exemptions for estate tax purposes.

Indiana increased the license tax on certain motor vehicles. Minnesota imposed a new excise tax on employers, based on the taxable compensation paid by them to employees.

Montana increased the maximum oil and gas conservation assessment and levied an extraction tax on all minerals. Louisiana increased its gas severance tax rates. Oregon temporarily increased its forest products harvest tax. Pari-mutuel tax rates were increased in Nebraska.

Boarding fees in airports were dealt a fatal blow when a federal bill prohibiting the collection of head taxes on persons traveling in air commerce was signed by the President. It becomes effective on December 31, 1973.

TAX COLLECTIONS IN FISCAL 1972

State and local tax collections by state and by source are reported and analyzed in relation to potential collections in 37 statistical tables. In some cases, nonrecurring or windfall amounts are included in collections; and, thus, normal collections are inflated. In others, tax rate or base changes may have been effective for only a part of the fiscal year. No attempt is made to note all such instances.

Tax Collections and Unutilized Potential

Total tax collections increased from \$96.6 billion in 1971 to \$110.4 billion in 1972, an increase of 14.2 percent. Increases by type of tax are listed in Table F. As would be expected, the more responsive sources show the greatest gains, a result of the favorable economic growth rates in 1972. These include the corporate and individual income taxes and the death and gift taxes. Taxes based on consumption or expenditure and property values showed slightly below-average gains followed by license taxes.

Total unutilized potential increased by \$2.5 billion (14.7 percent) to \$19.6 billion in 1972 (Table G). Highest percentage growths were in relatively minor taxes. Most significant dollar growth was in property and individual income taxes. Only in the severance tax was there an actual decline in unutilized potential.

The greatest tax increases from 1971 to 1972 were registered in the New England and the Middle Atlantic regions, followed closely

by the SREB and Mountain states regions. A review of columns 3 and 6 of Table H indicate that the first two named regions took advantage of a large part of their rising potential to collect taxes. Their unutilized potential increased only 4.9 and 7.3 percent, respectively. On the other hand, the SREB and Mountain states regions failed to take comparable advantage of their even faster rising tax potentials. Personal income in these latter two regions grew by 11.1 percent and 11.9 percent, respectively, while in the New England and Middle Atlantic regions the growth was 7.5 percent and 6.5 percent, respectively. The Pacific states made average use of their moderately rising potential.

The following analysis discusses tax collections and over-and underutilization by tax source. The reasons for diversity in tax collections and relative utilization usually can be accounted for by differences in the different rates, coverage (breadth of base), and/or administrative practices. Unutilized potential results if rates and below-average bases are relatively narrow, and/or the tax is poorly administered. Overutilization results from high rates, broad bases, and/or vigorous administration.

The General Sales Taxes (Tables 1 and 13)

The base utilized for general sales taxation varies greatly from state to state. In many cases, broad exemptions are offset by high rates. For example, 15 states exempt food for home consumption, and these states apply relatively high rates. In addition to complete exemption of food from the tax base, the District of

Columbia and Louisiana have special lower rates, and North Dakota has a limited exemption for milk and meat products. Thirty states have full or limited exemptions for drugs and medicines.¹⁰ Other states either exempt or tax at special lower rates many items of manufacturing machinery, pollution control facilities, and other items related to agricultural and industrial production.

Practices vary in the taxation of services and tangible goods such as gasoline, liquor, public utility bills, and admissions which may be taxed under selective sales taxes. Sometimes they are taxed under both general and special levies.

Four states¹¹ did not employ a general sales tax in 1972. Twenty-one states had significant revenues from local sales taxes. As of January 1, 1973, twenty-six states permitted one or more of their local governments to levy a local sales tax. Most widespread use of the local sales tax is found in Alabama, California, Illinois, Oklahoma, Tennessee, and Texas.

Revenue from the general sales taxes for all states increased by \$20,292 million to \$2.5 billion in 1972, while unutilized potential grew by \$364 million to \$2.5 billion (Table I). Revenue

Source: Table 1; and, Kenneth E. Quindry, State and Local Revenue Potential, 1971, Table 1.

grew by 14.0 percent and unutilized potential by 16.7 percent. Increases in collections were led by the New England states (Connecticut) and the SREB states (Tennessee and Texas, in particular, because of increased rates, but all states showed considerable growth). As expected, unutilized potential was relatively low in these areas. Both collections and unutilized potential were affected in the Middle Atlantic states by a decline in collections in Pennsylvania. The Mountain states made relatively good use of their increased potential, but the North Central and Pacific states did not take equal advantage of their greater potential.

Data contained in Table 13 indicate that per capita collections in 1972 were highest in the Pacific states, followed by the Middle Atlantic and the SREB states, while collections per \$1,000 of personal income were highest in the Pacific states followed by the SREB and the Mountain states. If all states not applying the average rate per \$1,000 of personal income had done so, the rankings would have remained virtually unchanged.

The Selective Sales Taxes (Tables 2 and 14)

Data are presented in Tables 2 and 14 on major selective sales taxes and one category of all other selective sales taxes. The most productive are those taxes on alcoholic beverages, tobacco products, insurance, and public utilities. Sales of these goods, except insurance, are usually included in the general sales tax base. Insurance premiums are taxed by special premiums taxes.

For purposes of this study, net profits from publicly owned utilities and from state owned liquor stores were combined with state

and local taxes. The assumption is that such profits are in lieu of taxation, and the profits contribute to the general funds of state and local governments.

Utility profits were computed by subtracting current operating expenses, including interest on debts, from current operating revenues. By the same token, current expenses were subtracted from gross revenues to reach a net profits figure for state-owned liquor stores. Profits from municipal liquor stores in South Dakota and North Carolina were not included because data were not available.

Alcoholic beverage, cigarette, and insurance sales taxes are employed in all fifty states. One state (Massachusetts) did not report revenue from a public utility sales tax.

Cigarette tax rates vary from a high of 21 cents per package of 20 in Connecticut to a low of 2 cents in North Carolina. Of the fifty states, twenty-seven have rates of 12 cents or above, and only two (Illinois and Nebraska) fail to collect above-average amounts per \$1,000 of personal income. Over 40 percent of the unused potential is found in the SREB states because of extreme low rates in Kentucky, North Carolina, and Virginia. About one-third of the states supplement cigarette tax revenues with taxes on other tobacco products.

Total collections and unutilized potential as presented in Table J increased approximately equally from 1971 to 1972 (10.5 and 10.3 percent, respectively). The Middle Atlantic region states reduced their unutilized potential by increasing revenues by 11.0 percent. The North Central and the Pacific regions increased

revenues only mildly and as a consequence unutilized potential increased substantially.

Death and Gift Taxes (Table 3)

State death taxes usually have graduated rates. States employ various exemption policies in regard to persons, charitable contributors, and types of property. Additionally, some states impose a death and gift tax solely for the purpose of reclaiming the federal credit for state imposition of the tax. Other states employ an additional estate or inheritance tax, or both. Fifteen states levy a gift tax.¹²

Five states use the estate "pickup" tax only;¹³ two states use an estate tax only;¹⁴ two states use an inheritance tax only;¹⁵ two states use an inheritance, estate, and "pickup" tax;¹⁶ seven states use an estate and "pickup" tax;¹⁷ and, one state (Nevada) has no death or gift tax. The diversity of the taxes used is no more

TOTAL	9,929	10,971 10.5	2,103	2,320 10.3

Source: Tables 2 and 12; and, Kenneth E. Quindry, State and Local Revenue Potential, 1971,
Tables 2 and 12.

important than the rate and base structure in garnering revenues from death and gift taxes.

Over 95 percent of the unutilized potential, but only 35 percent of collections from death and gift taxes, were found in the SREB and North Central states in 1972. No unutilized potential was found in the Northeast or the Middle Atlantic states. The SREB states alone had almost half of the unutilized potential of \$295 million but only 15 percent of the total collections of \$1,292 million.

The Property Taxes (Tables 4 and 15)

As in past years, property taxes continued to be used more intensively in the New England and Midwest regions of the United States. Only 16 percent of the total U. S. collections were registered in the SREB states in 1972 (but almost 70 percent of the unutilized potential).

Property taxes remained the largest source of state and local tax revenue in 1972 as in past years. While it showed the largest absolute growth from 1971 to 1972 of any tax source (\$4.2 billion), its percentage growth was less than that for general sales and individual and corporate income taxes and a few minor taxes.

The tax burden, however, is not quite as great and increasing to the degree indicated by the data. All fifty states have some form of property tax relief; about two-thirds of the states finance all or a part of the relief at the state level. Property tax collections are not reduced at the local level by state financed relief,

but state tax collections are inflated by collections to finance local relief.

Because of complex and diverse homestead relief, selective credits, exemptions of all or a part of personal property (especially intangibles), selective exemptions to encourage industrial development, policies in regard to tax exempt institutions, and such, it is impossible to characterize bases or rate structures. The quality of administration and assessment of property taxes are also influential in their effects on tax collections in several states.

As with previous revenue sources, unutilized potential is related to growth in the common denominator (personal income) and the growth in collections. Regions for which tax collections grew at a lower rate than personal income had an increase in unutilized potential (see Table K). The New England states and the Pacific states had an actual decline in their relatively insignificant amounts of unutilized potential. In three regions (North Central, SREB, and Mountain) percentage increases in unutilized potential exceeded growth in collections.

The Individual Income Taxes (Tables 5 and 16)

Six states¹⁸ did not employ an individual income tax in 1972. Four states¹⁹ restricted the tax to selected income sources. Forty states employed a broad-based income tax, and ten of these²⁰ permitted

¹⁸ Florida, Nevada, South Dakota, Texas, Washington, and Wyoming.

¹⁹ Connecticut, New Hampshire, New Jersey, and Tennessee.

²⁰ Delaware, New York, Pennsylvania, Michigan, Missouri, Ohio, Alabama, Kentucky, Maryland, and California.

District of Columbia	135	141 4.4	60	70 16.7
TOTAL	37,852	42,132 11.3	4,823	5,623 16.6

Source: Table 4; and, Kenneth E. Quindry, State and Local Revenue Potential, 1971, Table 4.

one or more local jurisdictions to employ local taxes (including local business income taxes). Thirty-five of the states employ progressive rate structures and five²¹ flat rates. Personal deductions and exemptions vary, though conformity to federal regulations both in the base (with modifications) and in exemptions and deductions is becoming standard.

Productivity of the income tax is influenced by rate structures and deduction and exemption policies. It is also influenced by the level and the distribution of taxable income. In some states low income families and individuals are fully exempted from tax liability or their liability is low because of relatively high personal deductions and exemptions and low rates at the low end of the rate schedule. If a large number of taxpayers are in the low income class, the yield is low. Conversely, a large number of middle and high income taxpayers provide high tax capacity. Table 35 lists the percentage of families by federal adjusted gross income class by state.

SREB states continue to make less use of the individual income tax than do other regions, largely because two large states, Florida and Texas, do not apply the tax in any form. However, Maryland employs the tax rather effectively both at the state and the local levels. Kentucky, North Carolina, and South Carolina have reasonable income tax yields, but below-average.

²¹ Illinois, Indiana, Nebraska, Ohio, and Pennsylvania.

According to data in Table L, revenue gains were greatest in the New England and Pacific states and least in the SREB states. Two regions, the Middle Atlantic and the Pacific states increased revenues sufficiently to reduce unutilized potential. Unutilized potential grew significantly in the SREB and the Mountain regions due to the significant growth in personal income and the failure to increase yield from this tax source correspondingly.

The Corporate Income Taxes (Tables 5 and 17)

After a one year decline in revenues because of a business slump, corporate income tax collections increased again in 1972 over 1971. The 28.7 percent increase in collections produced an increase to \$5.09 from \$4.75 per \$1,000 of personal income. For all states, unutilized potential remained almost constant, increasing only to \$1,278 thousands from \$1,263 thousands.

In analyzing state performances, somewhat the same procedures should be followed as was used for individual income taxes. Tax bases are being standardized along federal lines. The use of federal depletion allowances, investment credits, and depreciation practices is becoming common. The formulas for apportioning income to states still vary. Differences in revenue potential and relative use of this source usually hinge on rate schedules. The relationship of business income to personal income provides a limitation to the present analysis.

The North Central states showed the greatest percentage growth in revenues largely because 1972 was the first year for which Ohio collected revenue from this source. Because of this unutilized

TABLE L

STATE AND LOCAL INDIVIDUAL INCOME TAXES, COLLECTIONS AND UNUTILIZED POTENTIAL
BY REGION, 1971 AND 1972, WITH PERCENTAGE CHANGE

Region	Collections (amounts in millions)			Unutilized Potential (amounts in millions)		
	1971	1972	Percentage Change	1971	1972	Percentage Change

Mountain States	477	603	26.4	245	340	38.8
Pacific States	1,659	2,249	35.6	554	494	(10.8)
District of Columbia	130	137	5.4	-	-	-
TOTAL	11,872	15,234	28.3	5,064	5,938	17.3

Source: Table 5; and, Kenneth E. Quindry, State and Local Revenue Potential, 1971, Table 5.

potential for the region decreased (Table M). In the SREB states, Florida collected revenue from this source for the first time. In spite of the significant increase in revenue, unutilized potential grew significantly, but the growth was surpassed by that in the New England, the Middle Atlantic, and the Mountain regions.

License and Motor Fuel Taxes (Tables 6, 7, and 8)

License taxes are reported in three categories: state alcoholic beverage licenses (Table 6), motor vehicle license taxes including local vehicle and driver's license fees (Table 7), and other license taxes (Table 11).

Alcoholic Beverage Licenses (Table 6). Licenses taxes are placed by the state on sellers, handlers, and producers of alcoholic beverage products in every state except Hawaii. Localities in several states also collect revenue from this source, and this must be considered in assessing the relative use of alcoholic beverage license taxes. Local collections are included with other license taxes in Table 11. Publicly owned liquor stores (in 19 states) are not entirely subject to all license fees. In several states, pockets of prohibition and abstinence restrict revenue productivity.

Revenue from this source for all states grew by 10.6 percent, from 1971 to 1972, to \$136 million. Over 60 percent of the \$13 million increase was in an SREB state (Florida). Elsewhere there was only minor net change.

Unutilized potential increased by 10.3 percent to \$44.6 million, from 1971 to 1972, with a reduction of 4.5 percent in the SREB states.

Source: Table 5; and, Kenneth E. Quindry, State and Local Revenue Potential, 1971, Table 5.

Tax potential grew, but utilization decreased (increasing unutilized potential by 47.8 percent) in the Pacific states. In the Mountain states, Colorado was responsible for increased revenues as the potential rose, limiting the growth of unutilized potential to mildly above-average.

Motor Vehicle Licenses (Table 7). Unutilized potential for motor vehicle related taxes in Tables 7 and 8 were computed using average collections per registered motor vehicle multiplied by the number of registered vehicle by state.

Differences in the rates of automobiles to trucks and busses may cause state variations in collections. Automobile license fees, however, far outweigh fees from other types of motor vehicles in all states.

The relative productivity of this source may be explained in additional ways. Some states secure motor vehicle uses revenue more heavily from fuels or property taxes in lieu of a vigorous effort in collecting license fees. Two states (California and Georgia) apply the general sales tax rate to motor fuel sales. Widespread use of local license fees is indicated in twenty-one states (ten among the SREB states and six in the North Central). Revenue from this source increased to \$3.3 billion, a growth of 6.3 percent while unutilized revenue increased to \$529 million, an increase of 37.1 percent. The increase in both revenue and unutilized potential was approximately equal in all regions.

Motor Fuel Taxes (Table 8). Motor fuel taxes are gallonage taxes based on sales of gasoline and other fuels used to propel or

otherwise operate combustion engines. The statistics for this tax are logically grouped with motor vehicle users taxes even though it may also be appropriately labeled a selective sales tax.

A gasoline tax is, with one exception, supplemented with motor fuels taxes for diesel fuels and low-pressure gas used to propel motor vehicles. The tax is generally restricted to fuels used on public highways, though a few states now apply a tax to aviation and motor boat fuels. Some states also levy taxes on motor oils and lubricants as well as petroleum inspection fees.

Fuels used for nonhighway purposes are either not taxed initially or the tax is partially or wholly refunded. Practices differ in refund policy as well as for discounts on evaporation and spillage. Rate differences, however, account for most variations in productivity of this source.

Rates vary from a high of 10 cents per gallon in Connecticut to 5 cents per gallon in Texas. Thirty states have a rate in excess of 7 cents and only two less than 7 cents.

Collections increased to \$7.3 billion in 1972 from \$6.7 billion in 1971, a growth of 9.1 percent, while unutilized potential grew by 15.5 percent to \$388 million in 1972. Revenue growth was greatest in the New England states where unutilized potential decreased by 81.2 percent. The SREB states were second in revenue growth and last of the six regions in growth of unutilized potential.

Severance Taxes (Table 9)

Severance taxes are imposed upon the value of natural resources as they are severed from the land or water. They may be applied in

lieu of or in addition to property taxes on the value of the severed products. Because some states have no significant extractive industries, value of severed products is a better relative measure of revenue potential than personal income. To compute revenue potential, the average tax rate per \$1,000 of severed products was multiplied by the value of severed products for each state.

Severance taxes are most practicable and profitable in states having high concentrations of oil and gas production. States having extensive production of coal, timber, fish, sand, gravel, and such are less inclined to impose production taxes because of the low profitability of the industries. Nonetheless, both Kentucky and Tennessee have recently adopted coal severance taxes. Louisiana, Oklahoma, and Texas are unique in their ability to exploit this source. However, California, Illinois, and Pennsylvania with large oil industries have failed to utilize this source of taxation extensively. In Minnesota, taxation of iron ore extraction is relatively remunerative. In some cases, dependence on severance taxes helps to explain underutilization of other tax sources.

The value of severed products in the United States increased to \$31.6 billion in 1972, up from \$27.7 billion in 1971. This 14.1 percent increase can be compared with only a 3.4 percent increase in tax revenue and a 3.5 percent increase in unutilized potential.

Transfer Taxes (Table 10)

Transfer taxes include a range of tax levies from those on real estate transfers to levies on all transfers of wealth (mortgages,

stocks, bonds, etc.). Productivity of the tax is affected by the inclusiveness of the base as well as by the rates. New York is in an especially favorable position to garner revenue from its documentary tax. Over two-thirds of all state transfer taxes are collected in that state.

Attention should be called to the fact that taxes reported in Table 10 reflect only state collections. Many states levy only local taxes on both state and local taxes. Locally collected taxes are included in "Other and Unallocable" category of Table 11. The local use of this source is sometimes in lieu of state use.

Revenues grew by 32.9 percent between 1971 and 1972 to \$505 million, with 4.5 percent of the growth being in New York. The favorable performance of the housing and construction industries during these years caused revenues to flourish in other states. Unutilized potential grew by an even greater percentage than revenues; from \$241 million in 1971 to \$347 million in 1972, a percentage growth of 44.0 percent.

Miscellaneous and Other and Unallocable Taxes, Total Taxes (Table 11)

Two other tax sources merit brief mention. Pari-mutuel taxes are especially productive in a few states where the traditions of horse and dog racing are strong and primarily where there is extensive tourism. A few states still maintain legal prohibitions against race track betting. Some states have extended wagering to off-track betting.

State lotteries are now being used in six states and others are considering them. Improvements in administration and adjustments in prizes granted have vastly improved their productivity. Legal prohibition and lack of social acceptance still exist, however, in a large number of states.

CONCLUSION

In general terms, the data contained in Tables 1 - 11 indicate that both collections and unutilized potential have increased impressively. In most cases, unutilized potential is related to significant growth in personal income while the actual tax base increased at a lesser rate. In some regions, personal income grew at rates greater than in others. This tended to increase the unutilized potential faster unless tax rates and bases were expanded to correspond to the growth in personal income.

Total receipts of state and local taxes increased by 14.2 percent while personal income increased by 9.1 percent and unutilized potential by 15.3 percent.

Unutilized potential growth was greatest in the SREB and the Mountain states where personal income also grew at the fastest rates. The major tax source showing greatest growth in unutilized potential was the individual income tax, followed closely by the general sales tax and the property tax.

Relative tax burdens (Table 19) did not shift substantially by state from 1971 to 1972. Those states high in burdens in 1971 remained so in 1972. There were some minor shifts, however. For

example, Maine, Mississippi, and Vermont remained near the top in 1972 but were ranked (1) Vermont, (2) Maine, and (3) Mississippi rather than 2, 4, and 1 respectively, as in 1971. South Dakota fell from third to fifth in the rankings, and Maine rose from fourth to second. Least heavily burdened taxpayers were found in Alaska, New Jersey, and Ohio in both years.

Several things influence the ranking of tax burden. The computations do not reflect the distribution of incomes, only the total and the average amounts. Nor is there any consideration given to the amount of taxes nominally levied on taxpayers able to shift the tax burden to out-of-state residents. Tax exporting is significant in states employing severance taxes and in manufacturing states.

Table 36 lists tax capacity as a total of actual collections plus net unutilized capacity. Net unutilized capacity is the amount of underutilization of some tax sources less the amount of overutilization of other sources. Under- and overutilization is reported by tax source for the SREB states in Tables 20 through 34.

Nine states and three regions show a net overutilization of tax capacity in 1972 according to this measure. Overutilization was most common in the New England and Middle Atlantic states (five states and both regions). No SREB state overutilized its capacity in 1972. In fact, the general finding is that SREB states tend to use their capacity to a lesser extent than any other region.
