ABSTRACT

The "Education Statistics Quarterly" gives a comprehensive overview of work done across all parts of the National Center for Education Statistics (NCES). Each issue contains short publications, summaries, and descriptions that cover all NCES publications, data products and funding opportunities developed over a 3-month period. Each issue also contains a message from the NCES on a timely topic and a featured topic with invited commentary. This issue's featured topic is "Third International Mathematics and Science Study-Repeat" and contains the first three articles: (1) "Pursuing Excellence: Comparisons of International Eighth-Grade Mathematics and Science Achievement from a U.S. Perspective: 1995 and 1999" (Patrick Gonzales, Christopher Calsyn, Leslie Jocelyn, Kitty Mak, David Kastberg, Sousan Arafeh, Trevor Williams, and Winnie Tsen); (2) "Invited Commentary: Lessons from the Third International Mathematics and Science Study--Repeat" (Margaret Cozzens and Susan H. Fuhrman); and (3) "Invited Commentary: TIMSS-R: Innovation in International Information for American Educators" (David P. Baker). The second section, "Elementary and Secondary Education," includes: (4) "Changes in High School Vocational Coursetaking in a Larger Perspective" (David Hurst and Lisa Hudson); (5) "Key Statistics on Public Elementary and Secondary Schools and Agencies: School Year 1997-98" (Lee M. Hoffman); (6) "Early Estimates of Public Elementary and Secondary Education Statistics: School Year 2000-2001" (Lena McDowell); (7) "Monitoring School Quality: An Indicators Report" (Daniel P. Mayer, John E. Mullens, and Mary T. Moore); (8) "Advanced Telecommunications in U.S. Private Schools: 1998-99" (Basmat Parsad, Rebecca Skinner, and Elizabeth Farris); and (9) "A Primer for Making Cost Adjustments in Education" (William J. Fowler, Jr. and David H. Monk). The following section, "Postsecondary Education," includes: (10) "Undergraduates Enrolled with Higher Sticker Prices" (John B. Lee); (11) "From Bachelor's Degree to Work: Major Field of Study and Employment Outcomes of 1992-93 Bachelor's Degree Recipients Who Did Not Enroll in Graduate Education by 1997" (Laura J. Horn and Lisa Zahn); and (12) "Degrees and Other

Reproductions supplied by EDRS are the best that can be made from the original document.

Awards Conferred by Title IV Participating, Degree-Granting Institutions: 1997-98" (Frank B. Morgan). The final section, "Crosscutting Statistics," contains: (13) "Digest of Education Statistics: 2000" (Thomas D. Snyder and Charlene M. Hoffman). (Contains 25 tables and 17 figures.) (SLD)

Education Statistics Quarterly National Center for Education Statistics 1990 K Street NW Washington, DC 20006

Visit the NCES Web Site — http://nces.ed.gov

The NCES Web Site provides information about NCES, as well as access to a wide range of publications and data sets about education in the United States and other nations.

Reach NCES staff

Each article in the *Quarterly* lists the name and e-mail address of the NCES staff member who can answer questions about the content. It is also easy to contact any member of the NCES staff from the NCES Home Page. Under "NCES Quick Links," select "NCES Staff Directory"; then click on the first letter of the person's last name.

Obtaining NCES publications and data products

- While supplies last, you can get a single copy of most NCES publications (including the Quarterly) at no cost.
 Call toll-free 1-877-4ED-PUBS (1-877-433-7827) or write Education Publications Center (ED Pubs)
 P.O. Box 1398
 Jessup, MD 20794-1398
- If you need more than one copy or supplies have been exhausted, you can purchase copies of many NCES publications from the Government Printing Office (GPO). Visit the GPO Internet bookstore at http://bookstore.gpo.gov, call GPO at 202-512-1800, or send a fax to 202-512-2250.
- If you have Internet access, you can print copies from our Web site (http://nces.ed.gov).

Editorial Note

National Center for Education Statistics

The National Center for Education Statistics (NCES) fulfills a congressional mandate to collect and report "statistics and information showing the condition and progress of education in the United States and other nations in order to promote and accelerate the improvement of American education."

EDUCATION STATISTICS QUARTERLY

Purpose and goals

At NCES, we are convinced that good data lead to good decisions about education. The *Education Statistics Quarterly* is part of an overall effort to make reliable data more accessible. Goals include providing a quick way to

- identify information of interest;
- review key facts, figures, and summary information; and
- obtain references to detailed data and analyses.

Content

The *Quarterly* gives a comprehensive overview of work done across all parts of NCES. Each issue includes short publications, summaries, and descriptions that cover all NCES publications and data products released during a 3-month period. To further stimulate ideas and discussion, each issue also incorporates

- a message from NCES on an important and timely subject in education statistics; and
- a featured topic of enduring importance with invited commentary.

A complete annual index of NCES publications will appear in the Winter issue (published each January). Publications in the *Quarterly* have been technically reviewed for content and statistical accuracy.

General note about the data and interpretations

Many NCES publications present data that are based on representative samples and thus are subject to sampling variability. In these cases, tests for statistical significance take both the study design and the number of comparisons into account. NCES publications only discuss differences that are significant at the 95 percent confidence level or higher. Because of variations in study design, differences of roughly the same magnitude can be statistically significant in some cases but not in others. In addition, results from surveys are subject to

nonsampling errors. In the design, conduct, and data processing of NCES surveys, efforts are made to minimize the effects of nonsampling errors, such as item nonresponse, measurement error, data processing error, and other systematic error.

For complete technical details about data and methodology, including sample sizes, response rates, and other indicators of survey quality, we encourage readers to examine the detailed reports referenced in each article.

How Americans Measure Up: Assessing the Knowledge and Skills of Children and Adults

This issue of the *Education Statistics Quarterly* highlights the 1999 Third International Mathematics and Science Study–Repeat (TIMSS–R), which focuses on the mathematics and science achievement of eighth-grade students in participating nations. TIMSS–R is but one of an extensive set of NCES assessment surveys that collectively measure a wide variety of knowledge and skills in populations ranging from toddlers to adults. In addition to collecting data from "tests," these surveys collect contextual data about home, school, and societal factors that may affect participants' performance. By providing objective measures of achievement in connection with related factors, these surveys offer invaluable guidance for policy reform efforts. A number of these surveys also place the achievement of Americans in an international context by including results from other countries; such international surveys are conducted in cooperation with international organizations.

New Data on America's Youngest Learners

The Early Childhood Longitudinal Study (ECLS) is designed to provide information about America's youngest learners by collecting information from two cohorts—the kindergarten class of 1998–99 (ECLS-K) and the birth cohort of 2001 (ECLS-B). ECLS-K began collecting data on a nationally representative sample of about 22,000 American kindergartners in fall 1998 and will follow these children through the fifth grade. ECLS-B will follow a nationally representative sample of about 15,000 children born in 2001 from 9 months of age through the first grade. Both ECLS-K and ECLS-B include periodic assessments of children's cognitive, social, emotional, and physical development.

Focus on U.S. Elementary and Secondary Students

At the heart of the NCES assessment program is the congressionally mandated National Assessment of Educational Progress (NAEP), also known as "the Nation's Report Card." For about 3 decades, NAEP has reported on what American elementary and secondary students know and can do in academic subjects. NAEP conducts both long-term trend assessments and main assessments. *Long-term trend assessments* cover several core subjects, providing national and regional data on changes in student achievement over the decades. Most recently, about 30,000 students took part in the 1999 long-term trend assessment in reading, mathematics, and science. Another long-term assessment in the same subjects is scheduled for 2003. *Main assessments* collect data about a large number of subjects, including reading, mathematics, science, writing, civics, U.S. history, geography, and the arts. In addition to providing results at the national and regional levels, many main assessments provide state-level data for those states that choose to participate (47 states participated in 1996). Main assessments generally involve about 130,000 students. In 2000, mathematics, science, and reading were covered by main assessments; U.S. history and geography are scheduled for the next main assessments, to be conducted in 2001.

Comparisons of U.S. Students to Those of Other Countries

The 1999 TIMSS–R, a successor to the 1995 TIMSS, focuses on the mathematics and science achievement of eighth-grade students. The original TIMSS collected data from fourth-, eighth-, and twelfth-graders in 41 countries, while TIMSS–R collected data from eighth-graders in 38 countries. TIMSS–R allows the United States to compare the achievement of its eighth-graders in the 1995 TIMSS to the achievement of its eighth-graders 4 years later. The performance of U.S. fourth-graders relative to those of other nations in 1995 can also be compared to the performance of U.S. eighth-graders relative to those of the same nations 4 years later.

The Civic Education Study (CivEd), conducted in 1999, measures ninth-graders' knowledge and attitudes about democratic practices and institutions. In addition to allowing comparisons of U.S. students with those of 27 other participating countries, CivEd results are also invaluable for understanding U.S. students' attitudes about democracy, national identity, international relations, and social cohesion and diversity.

The new Program for International Assessment (PISA) is designed to monitor, on a regular 3-year cycle, the achievement of 15-year-old students in three subject areas: reading literacy, mathematical literacy, and scientific literacy. In each assessment cycle, PISA will focus on one of the three subject areas. The first assessment cycle, for which data was collected in the United States in spring 2000, focuses on reading literacy. Results are expected to be available beginning in late 2001.

In spring 2001, the Progress in International Reading Literacy Survey (PIRLS) will collect data on the reading literacy of 9-year-olds. PIRLS is planned as a regular international assessment to be conducted every 4 years, allowing for the measurement of trends over time.

Measures of Skills That Adults Need to Function in Society

NCES has conducted assessments of U.S. adult literacy since 1985. The 1992 National Adult Literacy Survey (NALS), administered to over 13,000 American adults, measured a variety of literacy skills, including the ability to understand and use information in connected texts, the ability to locate and use information in other types of documents, and the ability to apply arithmetic operations to numbers in printed materials. Building upon NALS, the 2002 National Assessment of Adult Literacy (NAAL) will provide an indication of the nation's progress in adult literacy since 1992.

Also planned for 2002 is an international survey of adult skills, the Adult Literacy and Lifeskills (ALL) survey. While ALL is designed to assess the adult literacy skills that were assessed by previous international studies, it also aims to go beyond previous studies by including a broader range of lifeskills than were previously assessed. The results will allow comparisons of U.S. adults with adults in other countries.

FEATURED TOPIC: THIRD INTERNATIONAL MATHEMATICS AND SCIENCE

STUDY-REPEAT

Pursuing Excellence: Comparisons of International Eighth-Grade Mathematics and Science Achievement From a U.S. Perspective: 1995 and 1999

no service a service

⁻ Patrick Gonzales, Christopher Calsyn, Leslie Jocelyn, Kitty Mak, David Kastberg, Sousan Arafeh, Trevor Williams, and Winnie Tsen

This article was originally published as the Highlights From the Third International Mathematics and Science Study-Repeat (TIMSS-R). The sample survey data are from TIMSS-R.

The 1999 Third International Mathematics and Science Study–Repeat (TIMSS–R) is a successor to the 1995 TIMSS and focuses on the mathematics and science achievement of eighth-grade students in participating nations. It provides a second data point in a regular cycle of international assessments of mathematics and science that are planned to chart trends in achievement over time, much like the regular cycle of national assessments in this nation, such as the National Assessment of Educational Progress (NAEP).

The 1995 TIMSS assessed the mathematics and science performance of U.S. students in comparison to their peers in other nations at three different grade levels. The 1995 TIMSS assessments revealed that U.S. 4th-graders performed well in both mathematics and science in comparison to students in other nations, U.S. 8th-graders performed near the international average in both mathematics and science, and U.S. 12th-graders scored below the international average and among the lowest of the TIMSS nations in mathematics and science general knowledge, as well as in physics and advanced mathematics.

Thirty-eight nations chose to compare the mathematics and science performance of their students in 1999. TIMSS-R allows the United States to compare the achievement of its eighth-graders in the original TIMSS to the achievement of its eighth-graders 4 years later. It also provides an opportunity to compare the relative performance of U.S. fourthgraders in 1995 to the relative performance of U.S. eighthgraders 4 years later, in 1999. TIMSS-R includes a videotape study of eighth-grade mathematics and science teaching in seven nations, a voluntary benchmarking study for 27 U.S. states and districts, and a linking study between NAEP and TIMSS-R. Through these components, TIMSS-R has collected information on schools, curricula, instruction, lessons, and the lives of teachers and students to understand the educational context in which mathematics and science learning takes place.

Performance in the United States is presented relative to that of other nations that participated in each assessment. Comparisons are made between the 38 nations that participated in TIMSS–R in 1999; between the 23 nations that participated in both TIMSS and TIMSS–R at the eighth-grade level; and between the 17 nations that participated at the fourth-grade level in TIMSS and at the eighth-grade level in TIMSS–R. Following are highlights of the findings presented in the complete report.

The Mathematics and Science Achievement of Eighth-Graders in 1999

Comparisons of mathematics and science achievement in 1999 are made between the 38 nations that participated in TIMSS–R.

- In 1999, U.S. eighth-graders exceeded the international average of the 38 TIMSS–R nations in mathematics and science.
- In mathematics, U.S. eighth-grade students outperformed their peers in 17 nations, performed similarly to their peers in 6 nations, and performed lower than their peers in 14 nations in 1999 (figure 1).
- In science, U.S. eighth-grade students outperformed their peers in 18 nations, performed similarly to their peers in 5 nations, and performed lower than their peers in 14 nations in 1999 (figure 1).
- Of the five mathematics content areas assessed in 1999, U.S. eighth-graders performed higher than the international average in *fractions and number sense*; *data representation, analysis, and probability*; and *algebra*. They performed at the international average of the 38 TIMSS-R nations in *measurement* and *geometry*.
- Of the six science content areas assessed in 1999, U.S. eighth-graders performed higher than the international average in *earth science, chemistry, life science, environmental and resource issues, and scientific inquiry and the nature of science.* They performed at the international average of the 38 TIMSS–R nations in *physics.*
- In 1999, the United States was one of 34 TIMSS–R nations in which eighth-grade boys and girls performed similarly in mathematics. In four nations, eighth-grade boys outperformed eighth-grade girls in mathematics.

In 1999, the United States was one of 16 TIMSS–R nations in which eighth-grade boys outperformed eighth-grade girls in science. In 22 nations, no difference between the achievement of eighth-grade boys and girls was found.

The Mathematics and Science Achievement of Eighth-Graders Between 1995 and 1999

Comparisons of mathematics and science achievement between 1995 and 1999 are made between the 23 nations that participated at the eighth-grade level in both TIMSS and TIMSS–R.

- Between 1995 and 1999, there was no change in eighth-grade mathematics or science achievement in the United States (figures 2 and 3). Among the 22 other nations, there was no change in mathematics achievement for 18 nations, and no change in science achievement for 17 nations.
- Across the five mathematics content areas in common¹ between TIMSS and TIMSS–R, there was no change in achievement for eighth-graders in the United States and most of the other 22 nations.
- Across the four science content areas in common² between TIMSS and TIMSS-R, there was no change in achievement for eighth-graders in the United States and most of the other 22 nations.
- U.S. eighth-grade black students showed an increase in their achievement in mathematics over the 4 years. They showed no change in their achievement in science over the same period. U.S. eighth-grade white and Hispanic students showed no change in their mathematics or science achievement between 1995 and 1999.
- There were no changes in mathematics and science achievement for U.S. eighth-grade boys and girls between 1995 and 1999.

The Mathematics and Science Achievement of the 1995 Fourth-Grade Cohort in 1999

Because both TIMSS and TIMSS–R used nationally representative samples of students in a particular grade, the 1995

10

¹TIMSS and TIMSS-R had the following mathematics content areas in common: fractions and number sense; measurement; data representation, analysis, and probability; geometry; and algebra.

²TIMSS and TIMSS-R had the following science content areas in common: *earth* science, *life science, physics,* and *chemistry*.

Figure 2.—Comparisons of eighth-grade mathematics achievement, by nation: 1995 and 1999

¹Designated LSS because only Latvian-speaking schools were tested.

²Lithuania tested the same cohort of students as other nations, but later in 1999, at the beginning of the next school year.

³Difference is calculated by subtracting the 1995 score from the 1999 score. Detail may not sum to totals due to rounding.

NOTE: Data are for the eighth grade in most nations; see the complete report for details. Parentheses indicate nations not meeting international sampling and/or other guidelines in 1995, 1999, or both years; see the complete report for details. The international average is the average of the national averages of the 23 nations with approved sampling procedures. The tests for significance take into account the standard error for the reported differences; thus, a small difference between the 1995 and 1999 averages for one nation may be significant while a large difference for another nation may not be significant. The 1995 scores are based on rescaled data.

SOURCE: Previously published as figure 18 on p. 33 of the complete report that this article summarizes (Pursuing Excellence: Comparisons of International Eighth-Grade Mathematics and Science Achievement From a U.S. Perspective: 1995 and 1999 [NCES 2001–028]).

TIMSS fourth-graders and the 1999 TIMSS–R eighthgraders represent the same group (or "cohort") of students at two different points in time. These students' performance in 1995 can be compared to their performance in 1999. However, direct comparisons between the 1995 fourthgrade TIMSS assessment and the 1999 eighth-grade TIMSS–R assessment are complicated by several factors, including differences in the content areas assessed and the questions that can be asked between the two grade levels. Therefore, comparisons between TIMSS fourth-graders and TIMSS–R eighth-graders are based on their performance relative to the international average of the 17 nations that

participated in fourth-grade TIMSS and eighth-grade TIMSS-R.

- The mathematics and science performance of the United States relative to this group of nations was lower for eighth-graders in 1999 than it was for fourth-graders 4 years earlier, in 1995.
- Among the 16 other nations, the mathematics performance of Canada relative to this group of nations was higher for eighth-graders in 1999 than it was for fourth-graders 4 years earlier, in 1995; the mathematics performance of the Czech Republic,

Pursuing Excellence: Comparisons of International Eighth-Gra

¹Designated LSS because only Latvian-speaking schools were tested.

International average of 23 nations

²Lithuania tested the same cohort of students as other nations, but later in 1999, at the beginning of the next school year.

518

³Difference is calculated by subtracting the 1995 score from the 1999 score. Detail may not sum to totals due to rounding.

NOTE: Data are for the eighth grade in most nations; see the complete report for details. Parentheses indicate nations not meeting international sampling and/or other guidelines in 1995, 1999, or both years; see the complete report for details. The international average is the average of the national averages of the 23 nations with approved sampling procedures. The tests for significance take into account the standard error for the reported differences; thus, a small difference between the 1995 and 1999 averages for one nation may be significant while a large difference for another nation may not be significant. The 1995 scores are based on rescaled data.

Italy, and the Netherlands relative to this group of nations was lower; and the mathematics performance of the 12 other nations was unchanged.

Among the 16 other nations, the science performance of Hungary and Singapore relative to this group of nations was higher for eighth-graders in 1999 than it was for fourth-graders 4 years earlier, in 1995; the science performance of Italy and New Zealand relative to this group of nations was lower; and the science performance of the 12 other nations was unchanged.

Teaching and Curriculum in 1999

It is too early in the process of data analysis to provide strong evidence to suggest factors that may be related to patterns of achievement on TIMSS–R. However, differences in teaching and curriculum between the United States and other TIMSS–R nations were noted.

According to their teachers, in 1999 U.S. eighthgrade students were less likely than their international peers to be taught mathematics by teachers with a major or main area of study in mathematics, but as likely as their international peers to be taught

Invited Commentary: Lessons From the Third International Mathematics and Science Study–Repeat

Margaret B. Cozzens, Vice President and Chief Academic Officer, Colorado Institute of Technology, and Susan H. Fuhrman, Dean, Graduate School of Education, University of Pennsylvania (Co-Chairs of the U.S. TIMSS–R Technical Review Panel)

This commentary represents the opinions of the authors and does not necessarily reflect the views of the National Center for Education Statistics.

Pursuing Excellence: Comparisons of International Eighth-Grade Mathematics and Science Achievement From a U.S. Perspective: 1995 and 1999 (Gonzales et al. 2000) is a welcome addition to our growing knowledge base about mathematics and science performance and education in the United States. This report presents results from the second installment of the Third International Mathematics and Science Study (TIMSS)—the TIMSS–Repeat (TIMSS–R). TIMSS–R is the most comprehensive international comparative study of its kind, assessing eighth-grade students in 38 countries around the world in mathematics and science and collecting background information on students, schools, teachers, and curricula 4 years after its widely cited predecessor, TIMSS.

Hopeful Lessons From the TIMSS-R Achievement Data

In a nutshell, what TIMSS–R tells us is that U.S. eighthgraders are about average in mathematics and science compared to students in other countries. For example, compared to students in the five other G-8 countries that participated in the study,* U.S. students performed below students in Japan and Canada, while testing on a par with students in England and the Russian Federation (in one or the other subject) and above those in Italy. The U.S. results have not changed significantly since the first TIMSS study took place in 1995. We were in the middle then, too, at the middle grades.

Although perhaps we may have to wait a bit longer to see the effects of education reform reflected as statistically significant improvements in achievement in international studies, there are several hopeful lessons or messages from TIMSS–R that we can take away now. Primary among these lessons is that *children learn what they are taught*. According to the TIMSS–R findings, our students tend to perform better in the content areas that get the most attention in the curriculum. In mathematics, the content areas that are taught with the most frequency to the most students are the three areas in which U.S. students outperformed their international peers: fractions and number sense; data representation, analysis, and probability; and algebra. On the other hand, our students performed only at the international average in geometry and measurement, the two content areas that the study shows are emphasized the least. In many ways, this is very good news for our teachers and our education system. Children are, in fact, learning what they are being taught. However, these results also serve as a reminder that curriculum matters a great deal. We need to carefully consider the sequence and coherence of what we teach and to find ways to incorporate the more rigorous topics, currently underrepresented, into our classroom instruction.

Two other hopeful lessons from TIMSS-R relate to student differences and the exploration of whether any one group of students systematically outperforms another group of students. As in TIMSS 4 years ago and the more recent NAEP trend report (Campbell et al. 2000), there was no achievement gap evident between U.S. boys and girls in mathematics in the eighth grade. This is a positive finding. However, TIMSS-R did find an achievement gap favoring boys in science in the United States; thus, important questions are raised about why U.S. students consistently perform similarly in mathematics but not in science and about what factors cause the gender gap in science. Another hopeful finding is that, between TIMSS and TIMSS-R, black students' performance improved significantly in mathematics. Without making light of this important finding, we also need to remember, however, that it is not enough for any one racial or ethnic group to better itself. Differences between the groups must also cease to be significant, reflecting increasing equity in students' opportunities to learn and access to qualified teachers and rigorous curriculum. TIMSS-R shows that the gap between black students and white students has narrowed but still exists.

^{*}The Group of Eight (G-8) countries are recognized as the world's major industrialized countries. All the G-8 countries except France and Germany participated in TIMSS-R.

Instructive Lessons From the TIMSS-R Contextual Data

In addition to important insights into achievement,TIMSS–R also provides information on what occurs in eighth-grade mathematics and science classrooms around the country information such as how time is spent in the classroom and what qualifications teachers bring to the classroom. We take away several important messages and lessons from these data, as well. Although further analyses are needed about the relationship of these variables to achievement, their importance, even as descriptors, cannot be overstated. They provide important clues about the many, simultaneous factors that can enable quality learning in U.S. schools.

One of the indications from TIMSS-R is that more time could be spent in U.S. classrooms on instruction—time that the study suggests is currently being spent on other activities. For instance, TIMSS-R results show that U.S. students spend significantly more time in class on homework than does the average student in the study. Our eighth-graders are much more likely than their international peers to discuss their mathematics homework in class and to begin their homework assignments as part of their regular class work. The point here is not that students are getting too much or too little homework—the relationship between the time students spend doing homework and their achievement is debatable, after all. The point is that, in the United States, we give up more classroom time to activities that are intended for individual practice than nearly every other nation that participated in the study. By moving homework back into the home, we can reclaim precious minutes for active instruction.

Another lesson for instructional practice may be in the finding that the practices of *demonstrating how to do mathematics problems* and of *setting students to work on worksheets and textbook exercises* are much more common in the United States than in other countries. In other countries, students are more likely to work on project-oriented work of the type recommended by the National Council of Teachers of Mathematics in their well-known 1991 standards for mathematics teaching (National Council of Teachers of Mathematics 1991). One of the concerns among people working in education today is that teaching styles in the United States still tend to focus on demonstration of ideas and individual work rather than on facilitation of learning and collaboration among students. These data suggest that we still have progress to make in this area. We expect that the results from the TIMSS–R Videotape Classroom Study of teaching practices in the United States and six other countries will shed some additional light on this issue.

TIMSS-R also provides a status report on the need for a competent, caring, and content-knowledgeable teacher in every classroom. While we have many competent and caring teachers in the United States, TIMSS-R data show that we are comparatively lacking in content-knowledgeable teachers. U.S. students are less likely than their peers to have teachers who have degrees in the subject areas they teach. For instance, the TIMSS-R results show that almost three-quarters of students in other countries have mathematics teachers with a degree in mathematics, compared to less than half of students in the United States. Instead, U.S. students are much more likely to have mathematics teachers with a general education degree. Although the picture is slightly better in science, U.S. students still are more likely than their international peers to be taught by teachers with a general education degree and far less likely to have a teacher with a degree in physics. While the education community focuses on establishing and supporting high academic standards for all students, it must also encourage and provide the necessary supports for teachers to achieve those same high standards. Students deserve teachers who have a deep and conceptual understanding of specific content areas, which they are, in turn, able to share with students in the classes they teach.

Finally, at the same time that TIMSS–R suggests (or, rather, reminds us of) the importance of qualified teachers, it also shows us that *U.S. teachers have few opportunities for professional interaction*. According to the results, U.S. eighth-graders have mathematics and science teachers who spend, on average, only one class period per year observing another teacher's practice and only one or two periods being observed. Reform literature has long emphasized that teachers need regular opportunities to work with and learn from one another in meaningful ways. One hopeful finding from TIMSS–R is that U.S. science teachers with fewer than 5 years of teaching experience reported more opportunities, approximately three per year, to observe other teachers. This is a step in the right direction.

Our Neighbors to the North

One final set of findings from TIMSS-R merits a mention in our commentary and, perhaps, further exploration in secondary analyses. Although U.S. students did not show significant improvement in their mathematics or science performance between TIMSS and TIMSS-R, Canadian students did-in both subjects. Since the Canadian education community faces some of the same issues that we doworking within a large, federal system that supports local control and with increasingly diverse and needy student populations-there may be lessons to learn from our neighbors to the north about what factors may have accounted for their demonstrated increases. Although there clearly is no "silver bullet" or magic formula that can be picked up and copied, even from a country with which we have some things in common, it would be useful to explore the Canadian situation in more depth.

Looking Toward the Future

As the new administration continues to take shape, education clearly has emerged as a key issue, one that saw the first attention and action from our new President. In addition to the President's "Leave No Child Behind" plan, two other legislative proposals for the reauthorization and funding of the Elementary and Secondary Education Act have been put forth. Collectively, these plans, with varying levels of emphasis, address the need for early literacy, accountability in schools, and strategies for helping schools at risk of failing their students. At a time when our lawmakers are focused on selecting and on allocating funds for such programs and strategies, TIMSS–R reminds us that curriculum, instruction, and teacher preparation are crucial pieces of this picture—inseparable from and as worthy of immediate attention as any other aspect of education reform. Without getting more content-trained teachers into the classroom; without providing teachers with opportunities to interact with their colleagues to improve their pedagogical skills and perceptions of themselves as a part of a professional community; without examining what and why we teach—we will not be able to reduce existing educational disparities and meet the needs of our students who, when given the opportunity, can learn as well as any other students.

In the end, TIMSS–R is a means to an end. If we choose to use this study as the resource that it is, we can begin to make the kinds of changes necessary for our children to reach standards of achievement as high as any in the world. Going back to that first lesson from TIMSS–R and following our children's example, we, the American education community, should learn what we have been taught.

Invited Commentary: TIMSS–R: Innovation in International Information for American Educators

David P. Baker, Professor of Education and Sociology, The Pennsylvania State University

This commentary represents the apinians of the authar and does nat necessarily reflect the views of the National Center for Education Statistics.

The Internationalization of Information About American Education

The last 2 decades have witnessed the wholesale internationalization of the information used to make American education policy. Discussions and debates about educational performance in the United States among politicians, policymakers, and the general public routinely make reference to information from international comparisons of American education with that of other nations. Numerous important and sweeping proposals for the reform of American K–12 education over the past 2 decades have been aimed at national education problems brought to light through widely publicized cross-national comparisons of education organization and student performance. These international comparisons have not only shaped the national agenda, but are increasingly part of the dialogue about education at the state and local levels.

Over the last 20 years, an accumulating series of international studies have redefined in scope, sophistication, and data availability the influence of international information on American education policymaking. This process started in the early 1980s, when the Second International Mathematics Study (SIMS), which was followed by the Second International Science Study (SISS), served as a point of departure for the influential 1983 report A Nation at Risk. This report, in turn, set an education reform agenda for the following decades. During this period, a large international study of student reading performance, a study of levels of adult literacy across nations, an international study of civic education (with results just released), systemic comparisons among Organisation for Economic Co-operation and Development (OECD) nations on a wide array of education statistics, and a number of other international studies and accompanying data sets have provided a steady stream of international information with which to compare numerous aspects of American educational performance.

It is fitting that this period of internationalization has culminated in two of the largest and most technically sophisticated international studies ever attempted. The Third International Mathematics and Science Study² (TIMSS) of 1995 and the recently released Third Interna-

The Strengths of TIMSS and TIMSS-R Data

TIMSS–R and its predecessor, TIMSS, are remarkable for a number of reasons related to the internationalization of American education policy and data. First, the process of internationalization has led to greater direct control by national statistical agencies in international studies, with important consequences for the quality of the data and their use in education policymaking.

The main responsibility for the design, quality control of data, and dissemination plans for TIMSS and TIMSS-R belongs to ministry-level statistical agencies-in the United States, the U.S. Department of Education's National Center for Education Statistics (NCES) and its institutional partner for these studies, the National Science Foundation (NSF). These government agencies, working within the international collaborative network of the International Association for the Evaluation of Educational Achievement (IEA), have raised world standards for quality in international studies. Thus, TIMSS and TIMSS-R are more sophisticated than previous IEA studies in terms of their national samples, assessments of achievement, and supplementary data. These studies have elevated to new levels a number of earlier innovations developed in IEA studies-for example, the IEA "Opportunity to Learn" measures of the extent to which curricula are actually implemented in the classroom. By further developing these earlier IEA innovations in the measurement of implemented curricula, TIMSS and TIMSS-R have not only collected higher quality data, but have also made sophisticated measurement of curricula standard for future studies of achievement.

Second, increased national and international funding and institutional support for both TIMSS and TIMSS–R translate into greater incorporation of innovative data collection strategies than ever before. For example, the collection of video data from classrooms started with just 3 nations in TIMSS, but expanded to 7 out of the 38 nations in TIMSS–R. Adding these innovative sources of data

collection to more tried-and-true survey methods broadens the informational scope of these studies and provides qualitatively different information. Moreover, these innovations offer a testing ground for the incorporation of new approaches to data collection into future domestic studies by NCES. Furthermore, the overall conception of TIMSS–R is innovative, as it is the first international study to rigorously assess change in mathematics and science performance across national populations of students over 4 years.

Third, intensive internationalization of education information has sparked interest among various American state and local policymakers in comparing subnational units with other nations. The past 2 decades have seen a rising demand for direct comparisons of individual states and local school districts with other nations on educational standards and performance levels of students. TIMSS-R is by far the most ambitious and innovative international study in this respect, as it includes a Benchmarking Project of 27 states, districts, and consortia of districts across the United States. By undertaking the exact same assessment tests in representative samples, states and districts can compare themselves on an international scale. This offers a number of exciting possibilities for international analysis of policy questions within and across U.S. states and districts.

Fourth, although less prominently reported than the results on national levels of mathematics and science achievement, TIMSS and TIMMS–R offer an abundance of other information about schooling, classroom processes, and students that will contribute to a rich understanding of education across nations. These data allow for extensive secondary analyses of TIMSS–R that will greatly add to the overall impact of this study. For example, the use of the TIMSS–R achievement assessments will be enhanced by

- further analyzing the role of national attributes of the mathematics and science implemented curricula in explaining cross-national achievement;
- exploring the changing dynamics across nations of the effects of students' family resources and school resources in determining mathematics and science achievement levels;
- tracing the changing role of gender across nations and its relationship to achievement; and
- examining the influence of national differences in education governance, such as decentralization, on between-classroom quality in pedagogy and achievement.

Lastly, both TIMSS and TIMSS–R include a larger number of nations and differing types of education systems than did past international studies. TIMSS includes 40 nations (Belgium was reported as two separate education systems, for a total of 41 national units). TIMSS–R includes 38 nations, including 26 that participated in the TIMSS eighthgrade study. Among the nations in TIMSS–R, most regions of the world are represented, as are most types of education governance structures. Unfortunately, the poorest nations are missing, as is China, with the world's largest single education system. But in general this data set provides U.S. educators with a wide array of national contexts with which to address many comparative issues.

Data provided by TIMSS–R represent a real treasure for the comparative assessment of education—in terms of general descriptive information on achievement and related facts that have already been reported, as well as additional information from more in-depth analyses that will appear in the near future. Several decades ago, notions about U.S. schooling relative to that of other nations were based mostly on speculation. Recent international studies such as TIMSS–R change all of that; speculation has given way to actual empirical fact. Like TIMSS, TIMSS–R increases the opportunities for NCES and NSF to help the American public and educators consider American education from an international perspective.

The Usefulness of TIMSS-R Data for Policy Discussions

There are a number of ways that the data from TIMSS-R can enrich our understanding of U.S. mathematics and science education from an international perspective. Unlike indicator data (such as those in OECD's Education at a Glance series), which provide sets of national indicators on various aspects of education, the cross-sectional data from TIMSS-R are derived from national samples of students, their teachers, and their schools. The analytic possibilities of having micro-data across nations are near limitless. Further, like the National Assessment of Educational Progress (NAEP), TIMSS-R includes state-of-the-art assessment of achievement (there is a NAEP/TIMSS-R Linking Study planned). But TIMSS-R offers more than NAEP by making it possible to analyze the achievement of students relative to pedagogical practices in their classrooms, the implemented curricula they receive, and the qualities of their teachers. All this, of course, is doable from a cross-national perspective, making TIMSS-R a very powerful analytic tool for education policy discussions in the United States

An example of this analytic power is the opportunity that the TIMSS-R data provide to take initial findings and build on them to conduct in-depth secondary analyses on complex policy issues. For instance, one of the early descriptive findings from TIMSS-R shows that only 4 out of 10 U.S. students have mathematics teachers who were trained in mathematics as their main field of study in college, while in the total international sample the proportion is 7 out of 10. This so-called "out-of-field" teaching has been identified as a potential problem for the quality of instruction in the United States, and the TIMSS-R data will allow further analyses on how much of the achievement gap between nations can be accounted for by cross-national differences in the training of teachers. These data will also enable more detailed analysis determining to what degree certain characteristics of national systems, such as national standards for the mathematics curriculum, can diminish any detrimental effects of large proportions of out-of-field teaching in other nations. This is just one example of many possible ways that analysis of the extensive data in TIMSS-R will help improve mathematics and science achievement in the United States.

Any discussion of the analytic potential of the TIMSS–R data for policy analysis must address the originating purpose of the study: to examine national achievement change over the 4-year period following the TIMSS assessment in 1995. And there are some interesting results on educational change for American educators to consider. By and large, the results indicate that there is little change in the level of American students' achievement in mathematics and science from TIMSS to TIMSS–R. And, for the most part, this is true among other participating nations in the study. It is useful to speculate on the potential reasons behind a lack of change over this period.

Obviously, 4 years is a relatively short time, and probably most prudent observers of education systems would not expect much national change, even though significant reforms in mathematics and science education are taking hold. However, emerging NAEP results show evidence of long-term (over 10 years or more) increases in mathematics achievement among U.S. students. The TIMSS–R findings illustrate how difficult it is to change the relative performance of nations in these two academic subjects. Indeed, over a 20-year period, the general relative international standing of American eighth-graders in mathematics and science—as assessed by SIMS and SISS in the early 1980s as well as by TIMSS in 1995 and TIMSS–R in 1999—has not changed. The news for education reformers both here and in other nations is that whatever the underlying factors behind a nation's relative performance may be, they are difficult to change in ways that will improve overall national levels of achievement over a short period of time.

Lastly, another way to think about the stability of national achievement levels over time is to consider the fact that there has been substantial convergence in educational practice across nations in recent decades. Both historians and sociologists of worldwide macro-trends in schooling report evidence of a marked trend toward convergence across national systems on similar ways of organizing and managing schooling. This is not to say that national differences do not exist-they clearly have in the past and still do today-but there is evidence of substantial borrowing and modeling of general educational processes from one nation to another. Somewhat ironically, large and widely publicized international studies like TIMSS-R may actually increase this trend, as the data from such studies provide clearer understandings across nations of what each nation does in its classrooms and schools.

The TIMSS–R study is an impressive achievement in international cooperation that will enhance the level of information about schooling in the United States and elsewhere. Like other recent complex, rich international data generated by NCES and its institutional partners, TIMSS–R will continue to provide informational benefits to the American public for years to come.

Changes in High School Vocational Coursetaking in a Larger Perspective

— David Hurst and Lisa Hudson

This article was originally published as a Stats in Brief. The dato ore from two High School Tronscript Studies—one conducted in conjunction with the High School and Beyond (HS&B) Longitudinal Study—as well as from the Notionol Industry-Occupational Employment Motrix of the U.S. Bureau of Lobor Statistics (BLS).

From the 1980s to the mid-1990s, high school vocational coursetaking declined as academic coursetaking increased (Levesque et al. 2000). Increases in high school graduation requirements (Medrich et al. 1992) and long-term trends for higher skill levels in the labor market (Rosenthal 1995) are two potential factors related to the rise in academic coursetaking. The decline in vocational coursetaking is not as easy to evaluate. First, vocational education includes course offerings ranging from computer programming to welding; the overall decline in vocational program areas. Second, changes in coursetaking occurred during a period

in which the labor market underwent pronounced changes that may have affected students' decisions to complete specific vocational courses. This Stats in Brief takes a closer look at vocational coursetaking trends, examining them in light of labor market changes.

Changes in Vocational Coursetaking

While increased academic requirements may have resulted in some students having less time to take vocational courses, students' predominant method for accommodating additional academic credits seems to have been to increase the total number of credits they earn rather than sacrifice

Figure 1.—Average number of Carnegie units accumulated by public high school graduates, by type of coursework: 1982 and 1998

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Longitudinal Study of 1980 Sophomores (HS&B-So:1980/1982), "High School Transcript Study"; and 1998 High School Transcript Study (HSTS).

vocational courses. In 1998, students earned an average of 18.3 academic Carnegie units,¹ 4.0 more academic credits than students earned on average in 1982 (figure 1). At the same time, students earned 3.5 more *total* credits in 1998 (25.1 credits) than in 1982 (21.6 credits). In contrast, students earned 0.7 fewer credits in the vocational curriculum in 1998 (4.0 credits) than in 1982 (4.7 credits).

Another way to examine changes in vocational coursetaking is to compare the percentage of high school graduates who follow various curricular paths. This analysis shows that the primary shift in coursetaking between 1982 and 1998 was from a general education curriculum to a college preparatory curriculum, with a relatively small decline in the percentage of students concentrating in vocational education compared to changes in the other areas.² Between 1982

¹In secondary education, 1 Carnegie unit is awarded for the completion of a course that meets one period per day for 1 school year, or the equivalent. All student data included in this Stats in Brief refer to public high school graduates.

²A concentration in vocational education is defined as the completion of 3 or more credits in a single vocational program area such as *business*. A college preparatory curriculum includes the completion of at least 4 credits in English; 3 credits in mathematics at the algebra 1 level or higher; 2 credits in biology, chemistry, and/or physics; 2 credits in social studies with at least 1 credit in U.S. or world history; and 2 credits in a single foreign language. A general education curriculum meets neither of these criteria. Students meeting the criteria for both a vocational concentration and college preparatory curriculum are counted in both groups; therefore, the percentages sum to more than 100.

and 1998, the percentage of students who completed a vocational concentration declined from 33.7 to 25.0, or by 8.7 percentage points (figure 2). Over the same time period, the percentage of students completing a college preparatory curriculum increased from 8.7 to 38.9, or by 30.2 percentage points, and the percentage completing a general education curriculum declined from 58.2 to 42.6, a decline of almost 16 percentage points (not shown in figures).

So while a smaller percentage of students completed a vocational concentration in 1998 than in 1982, the decline is relatively small given other changes in coursetaking. Moreover, most vocational program areas did *not* experience a decline from 1982 to 1998.³ The overall decline in the percentage of students completing a vocational concentration was due primarily to declines in the two largest vocational areas—*trade and industry* and *business* (figure 2). While the percentage of students concentrating in *personal and other services* was also smaller in 1998 than in 1982, relatively few students concentrated in this area in either year. In contrast, the percentages of students concentrating in *health care, technology and communications, food service and hospitality*, and *child care and education* were *higher* in

23

NOTE: Detail may not add to totals due to rounding.

³This analysis does not examine the *protective services* vocational program area because less than 0.1 percent of students concentrated in this area in 1982 and 1998.

Figure 2.—Percentage of public high school graduates concentrating (accumulating 3 or more credits) in various vocational programs: 1982 and 1998

NOTE: Students may have concentrated in more than one program.

SOURCE: U.S. Department of Education, National Center for Education Statistics, High School and Beyond Longitudinal Study of 1980 Sophomores (HS&B-So:1980/1982), "High School Transcript Study"; and 1998 High School Transcript Study (HSTS).

1998 than in 1982, although the percentages of students concentrating in these areas remained comparatively small. The percentages of students concentrating in *agriculture and renewable resources* and *marketing and distribution* were about the same in 1998 as they were in 1982.

Vocational Coursetaking and Occupational Trends

One factor that may influence a student's decision to concentrate in a specific vocational area is labor market demand; students may be more likely to concentrate in vocational areas that prepare them for occupations with increasing job opportunities. Although the labor market influences on vocational enrollment are likely to be complex (e.g., the accuracy of students' perceptions of labor market demand is unknown), it is nevertheless useful to examine changes in vocational education in light of changes in the labor market.

Figure 3 presents the percentage change in the number of jobs in specific occupations between 1983 and 1996; the vertical line represents the average percentage change for all occupations during this time period.⁴ At least some of the

⁴Note that figure 3 presents the percentage change rather than numerical change. Some of the occupational groups with high rates of growth account for a relatively small share of all jobs. The assumption made in this Stats in Brief is that changes in course enrollments are most likely to be influenced by occupational growth rates, even if the total number of jobs in those occupations is small compared to other occupations.

Figure 3.—Percentage change from 1983 to 1996 in number of jobs, by occupational grouping

¹Excludes health service occupations; homemaker-home health aides; child Care workers; food preparation and service occupations; and cosmetologists and related workers. ²Excludes secretaries, typists, and teacher aides.

NOTE: The Bureau of Labor Statistics (BLS) provided the occupational employment estimates, although the composition of several BLS categories was modified for this analysis to better match the classification of vocational education courses used by the National Center for Education Statistics (NCES). Standard errors for the BLS categories (not listed here) were estimated based on the relative standard errors from the BLS National Industry-Occupational Employment Matrix, the primary source of data for these occupational employment estimates.

SOURCE: U.S. Department of Labor, Bureau of Labor Statistics, National Industry-Occupational Employment Matrix 1983–96 Time Series.

change in student concentration in specific vocational areas appears to coincide with these changes in occupational employment. As noted above, child care and education, health care, food service and hospitality, and technology and communications were vocational areas in which the percentage of students concentrating was higher in 1998 than in 1982. Consistent with these changes, the occupational groupings of child care workers and teacher aides, health service occupations, food preparation and service occupations, and technicians and related support occupations experienced higher-than-average growth rates between 1983 and 1996.

Further, the two vocational areas that largely account for the overall decline in the percentage of students concentrating in vocational education—trade and industry and business—roughly correspond to precision production, craft, and repair occupations and secretaries and typists,⁵ both of which experienced below-average growth rates between 1983 and 1996.⁶

^SThe occupations of secretaries and typists were pulled out of administrative support occupations to highlight the main occupations for which business vocational education programs prepare students. The more general category of administrative support (excluding secretaries and typists), which includes a number of clerical occupations, experienced about average growth between 1983 and 1996.

⁶The other vocational area in which fewer students concentrated in 1998 than in 1982, personal and other services, roughly corresponds to cosmetologists and related workers, which also appears to have experienced below-average growth since 1983. However, there is not enough statistical evidence to determine if the growth rate of cosmetologists and related workers is significantly different from the total growth rate of all occupations.

In the two remaining vocational areas, the link to the labor market is not as apparent. The percentage of students concentrating in *marketing and distribution* was statistically no different in 1998 than in 1982, while *marketing and sales occupations* grew at a higher-than-average rate between 1983 and 1996. About the same percentage of students concentrated in *agriculture and renewable resources* in 1998 as in 1982, although *agriculture, forestry, fishing, and related occupations* experienced a decline relative to other occupations between 1983 and 1996. This broad occupational group, however, consists of farmers and other farm occupations, which made up about half of *agriculture, forestry, fishing, ang related 2000* (NCES 2000–0

group, however, consists of farmers and other farm occupations, which made up about half of *agriculture, forestry, fishing, and related occupations* in 1996, as well as a variety of other occupations, such as veterinary assistants and gardening workers. While farmers and other farm occupations have declined over the past 2 decades, other occupations in this group have generally experienced average growth or better (not shown in figures). Thus, to the degree that courses in *agriculture and renewable resources* are relevant to occupations related to agriculture but not necessarily farming, enrollment trends may be consistent with occupational trends, remaining at roughly stable levels.

Conclusion

The decline in vocational coursetaking from 1982 to 1998 is relatively small compared to increases in academic coursetaking. The potential tradeoff between academic and vocational coursetaking seems to have been mitigated by students taking more courses overall and fewer courses in the "general" curriculum. Further, the decline in vocational concentration was due primarily to declines in the *trade and industry* and *business* program areas. These vocational areas roughly correspond to occupations that have experienced below-average growth rates since the early 1980s. In addition, the four vocational program areas in which a larger proportion of students concentrated in 1998 than in 1982 prepare students for occupations that have experienced above-average growth rates. These findings suggest that changes in vocational coursetaking may at least in part reflect responses to labor market trends.

Key Statistics on Public Elementary and Secondary Schools and Agencies: School Year 1997–98

Lee M. Hoffman

This article is based on a section of the report of the same name (the section "Characteristics of Public Schools and Agencies"). The universe data are from the NCES Common Core of Data (CCD).

Introduction

The tables in this report provide basic information about public elementary and secondary schools and education agencies during the 1997–98 and 1996–97 school years. The data describe the numbers and types of these institutions, their students, and their staff. The purpose is to make this information easily accessible through a number of summary tables presented in print and on the Internet.

and the part of the second of the second

Data sources for this report

The statistics were collected through the Common Core of Data (CCD) survey system. The CCD reports data provided voluntarily each year by the education agencies of the 50 states, the District of Columbia, the Department of Defense Dependents Schools (overseas), and five outlying areas. The system includes the "Public Elementary/Secondary School Universe Survey" and the "Local Education Agency Universe Survey," which are the major focus of this report. Data from the "State Nonfiscal Survey of Public Elementary/ Secondary Education" are also used in some analyses.

General focus of this report

The CCD collects information about the full range of local education agencies, including those that typically offer some services other than the direct instruction of students. The same is true for schools; the CCD includes regular and specialized schools, and those with and without student membership. This discussion is limited to the 50 states and the District of Columbia (collectively referred to as "the states"). The tables in the full report include data for the Department of Defense Dependents Schools (overseas), American Samoa, the Commonwealth of the Northern Mariana Islands, Guam, Puerto Rico, and the U.S. Virgin Islands; however, these data are excluded from the U.S. totals. In general, the following groups are the focus of the tables and discussion:

regular school districts: locally administered education agencies that are directly responsible for instruction (including components of supervisory unions). This excludes supervisory and special service education agencies, and those operated by the state or federal government.

- regular schools: those primarily offering a regular academic curriculum, although specialized curricula may be included as well. This excludes schools whose primary offering is vocational, special, or alternative education.
- with membership: schools and districts that report at least one student in membership. Membership is the number of students enrolled on October 1 or the school day closest to that date.

Students attending class in more than one school must be reported with a single school on the CCD; the same is true for education agencies. Thus, some schools that do offer instruction are reported with no membership. This is most likely to occur with vocational, special, or alternative schools in which students presumably take classes while being reported under a regular "home" school. Figure A illustrates this.

General Trends Since 1980-81

Between the 1980–81 and 1997–98 school years, a number of school districts were consolidated, and the number of public school students grew by almost 13 percent (table A). This growth in enrollment was accompanied by a smaller increase in the number of schools (4 percent), with the result that schools and districts served, on average, more students in 1997–98 than in 1980–81. The pupil/teacher ratio, however, dropped by almost two students per teacher.

Types and Numbers of Agencies and Schools in 1997–98

There is no standard organizational structure for public elementary/secondary education from state to state. Most students do attend regular elementary or secondary schools within traditional school districts. However, state education systems vary in how they deliver and manage instruction and provide the other specialized services that support instruction.

Education agencies

Across the United States there were 16,394 local education agencies in 1997–98 (figure A). Both the District of Columbia

Figure A.—Types and numbers of local education agencies and schools: School year 1997–98

SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Public Elementary/ Secondary School Universe Survey" and "Local Education Agency Universe Survey," 1997–98.

Table A.—Numbers of education agencies, schools, and students: 1980-81 and 1997-98

1980-81	1997-98	17-year change
15,912	14,805	-7.0 percent
2,569	3,116	+21.3 percent
85,987	89,508	+4.1 percent
475	515	+8.4 percent
18.7	16.8	-1.9 pupils
40,877,481	46,127,194	+12.8 percent
	1980-81 15,912 2,569 85,987 475 18.7 40,877,481	1980-81 1997-98 15,912 14,805 2,569 3,116 85,987 89,508 475 515 18.7 16.8 40,877,481 46,127,194

NOTE: All districts in 1980–81 are compared with regular districts in 1997–98 to compensate for expansion of CCD coverage after 1980–81. "Average student" ratios include districts and schools with and without membership, and do not agree with average school and district sizes reported elsewhere.

SOURCE: U.S. Department of Education, National Center for Education Statistics: (1996) Digest of Education Statistics: 1996 (NCES 96–133) and (1997) Digest of Education Statistics: 1997 (NCES 98–015); Common Core of Data (CCD), "Public Elementary/ Secondary School Universe Survey" and "Local Education Agency Universe Survey," 1997–98.

and Hawaii consist of a single, regular school district; there were 14,805 regular school districts nationwide in 1997–98. A small proportion of these—378—did not report any students enrolled for that year. About 1 in 10 education agencies, or a total of 1,589, were specialized organizations. These included regional education service agencies, which typically provide testing, program management, specialized student services, research and evaluation, or similar services other than direct regular instruction, and supervisory unions, through which a single district provides administrative services for several smaller ones. Agencies operated directly by the state (for example, residential schools for the deaf or blind) and by federal agencies were also in this category.

Schools

There were 89,508 public elementary/secondary schools in 1997–98. Of these, 82,660 were regular schools while 6,848 were primarily directed toward vocational, special, or alternative education. A total of 1,877 schools reported having no students in membership.

As previously noted, the CCD directions state that when students attend multiple schools they be reported for only one (this avoids duplicating student counts). Typically, the enrollment is attributed to the student's regular school, with the result that many active special, vocational, and alternative schools are shown as having no students. For example, figure A shows that almost two-thirds of the vocational schools were reported with no students.

Table B, however, indicates that the numbers of special, vocational, and alternative schools actually increased somewhat between 1993–94 (the first year of the *Key Statistics* report series) and 1997–98. Growth was greatest among the alternative schools, which increased by almost 48 percent in this time. However, the numbers of vocational and regular schools grew by about 3 percent and the number of special education schools increased by almost 7 percent.

Content of the Tables

The complete report includes tables from two school years, 1997–98 and 1996–97. The more current data are presented first. Tables 1 through 14 and 30 through 43 include information about the public schools and education agencies. They cover numbers, size (in terms of pupils), urbanicity (ranging from large city to rural), and grades served.

Tables 15 through 24 and 44 through 53 provide information about student characteristics and outcomes. This includes the distribution of students by grade level, the distribution by various racial/ethnic groups, the numbers eligible for free lunch, and the numbers with special education Individualized Education Programs (IEPs). There is also information about the numbers of students completing high school. The student data are broken out by school or district urbanicity or by school instructional level, where appropriate.

The last tables, 25 through 29 and 54 through 58, report the numbers of teachers and other school staff. These tables focus on pupil/teacher ratios and ratios of teachers to administrators and teachers to support staff.

Data sources: The following components of the NCES Common Core of Data (CCD): "Public Elementary/Secondary School Universe Survey," "Local Education Agency Universe Survey," and "State Nonfiscal Survey of Public Elementary/Secondary Education," 1993–94, 1996–97, and 1997–98.

Early Estimates of Public Elementary and Secondary Education Statistics: School Year 2000–2001

Lena McDowell

This article was originally published as an Early Estimates report. The universe data are from the NCES Common Core of Data (CCD). Technical notes and definitions from the original report have been omitted.

The Early Estimates System

The early estimates system is designed to allow the National Center for Education Statistics (NCES) to publish selected key statistics during the school year in which they are reported. The source of universe statistical information about public elementary and secondary education is the Common Core of Data (CCD)—data collected annually by NCES from state education agencies. For most CCD surveys, these data are reported to NCES from March 2001 through September 2001, after which they undergo NCES and state editing and are adjusted for missing data. (High school graduate and fiscal data are reported a year later than student and teacher data.) In contrast, the estimates included in this report were reported in December of 2000 for the 2000–01 school year.

In early October 2000, survey forms were sent to each state education agency. States were asked to complete the form and return it by mail or facsimile (fax). States that had not responded by mid-November were contacted by telephone. All data were checked for reasonableness against prior years' reports, and follow-up calls were made to resolve any questions. When states did not supply a data item, NCES imputed a value. These values are footnoted in the tables. If one or more states required an imputed number, then the national total for that item is marked as imputed. Any state early estimate that indicated a change of greater than 10 percentage points more or less than the national growth rate was replaced with an adjusted early estimate. That is, the estimate was calculated using the same method as that employed to impute missing data.

Forty-five states, the District of Columbia, and two outlying areas participated in the 2000–01 "Early Estimates of Public Elementary/Secondary Education Survey." The estimates reported here were provided by state education agencies and represent the best information on public elementary and secondary schools available to states at this stage of the school year. They are, however, subject to revision. All estimates for the five nonreporting states and the three outlying areas were calculated by NCES. (Arizona, California, New Jersey, Virginia, Washington, America Samoa, Guam, and Puerto Rico did not return the completed survey form.) NCES also estimated missing data items for a number of reporting states.

The tables in this publication include three kinds of data. "Reported" data are previously published figures. "Preliminary" data have not been published previously by NCES; for these, data collection is complete, and processing and data adjustments are through all but the final stage of review. "Estimated" data are those for the current (2000–01) school year.

Estimated data for the current school year are of three types: estimates derived by the states for NCES (most of the data are of this type); early actual counts reported by individual states; and imputed or adjusted estimates developed by NCES using a combination of state-specific and national data.

Highlights

The estimates in this publication are key statistics reported during the 2000–01 school year. They include the number of students in membership, teachers, and high school graduates for public elementary and secondary schools, and total revenues and expenditures for the operation of public elementary and secondary schools. Highlights of these statistics include the following:

- There were approximately 47.2 million prekindergarten through grade 12 students in the nation's public elementary and secondary schools in fall 2000, compared with 46.9 million in fall 1999.
 Student membership has increased by 1.5 million since fall 1996 (table 1).
- Public school students were taught by an estimated
 3.0 million teachers in school year 2000–01 (table 2).
- The student membership and teacher count data show a pupil/teacher ratio of 16.0 for grades prekindergarten through 12 for public schools in school year 2000–01 (table 7).
- An estimated 2.5 million public school students graduated from high school in the 1999–2000 school year. In the 2000–01 school year, 2.5 million students are expected to graduate from high school (table 3).

- Revenues for public elementary and secondary education in fiscal year (FY) 2000 are estimated to be \$364.0 billion, and they are expected to rise to approximately \$384.7 billion in FY 2001 (table 4).
- Current expenditures for public elementary and secondary education for FY 2001 are estimated to be \$333.8 billion, an increase of 4.6 percent over the FY 2000 estimate of \$319.2 billion. The per pupil expenditure is anticipated to be \$7,079 per student in membership for the 2000–01 school year (tables 5 and 7).

Data sources: The NCES Common Core of Data (CCD):"Early Estimates of Public Elementary/Secondary Education Survey," 2000–01;"State Nonfiscal Survey of Public Elementary/Secondary Education," 1996–97 through 1999–2000; and "National Public Education Financial Survey," 1996–97 through 1999–2000.

¹Data imputed by NCES based on previous year's data.

²Early estimate number reported by state, adjusted by NCES.

³Actual count reported by state.

NOTE: All school year 2000–01 data are state estimates, except where noted. Estimates are as of December 2000. Some data may have been revised from previously published figures.

¹Data imputed by NCES based on previous year's data.

²Data include adjusted estimates by NCES for a few specific local revenues, based on current-year data.

³Actual amount reported by state.

NOTE: All fiscal year 2000 and fiscal year 2001 data are state estimates, except where noted. Estimates are as of December 2000. Details may not sum to totals due to rounding. Some data may have been revised from previously published figures.

¹Data imputed by NCES based on previous year's data.

²Data include imputations by NCES for food services and/or enterprise operations.

³Actual amount reported by state.

NOTE: All fiscal year 2000 and fiscal year 2001 data are state estimates, except where noted. Estimates are as of December 2000. Details may not sum to totals due to rounding. Some data may have been revised from previously published figures.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data: "Early Estimates of Public Elementary/Secondary Education Siurvey," 2000–01, and "National Public Education Financial Survey," 1996–97 through 1999–2000.

 $\frac{36}{1000}$ education statistics quarterly – volume 3, issue 1, spring 2001

Table 6.–	-Reported student membership and number of teachers, and estimates of revenues, expenditures, and pupil/teacher ratio, for public elementary and
	secondary schools, by state, for grades prekindergarten through 12: School year 1999–2000/Fiscal year 2000

Monitoring School Quality: An Indicators Report

Daniel P. Mayer, John E. Mullens, and Mary T. Moore

This article was originally published as the Executive Summary of the Statistical Analysis Report of the same name. The numerous data sources are listed at the end of this article.

This report explores why some schools may be better than others at helping students learn. It responds to a recommendation made by the congressionally mandated Special Study Panel on Education Indicators that the National Center for Education Statistics (NCES) produce reports identifying and discussing indicators of the health of the nation's educational system (Special Study Panel on Education Indicators 1991). This report is designed for policymakers, researchers, and others interested in assessing the strength of our schools. While it is relevant for those interested in standards or accountability, it is not about test scores and is not a guide for education reform movements.

More specifically, the report's primary goals are to

- review the literature on school quality to help policymakers and researchers understand what is known about the characteristics of schools that are most likely related to student learning;
- identify where national indicator data are currently available and reliable; and
- assess the current status of our schools by examining and critiquing these national indicator data.

School Characteristics Related to Student Learning

The research described in this report indicates that school quality affects student learning through the training and talent of the teaching force, what goes on in the classrooms, and the overall culture and atmosphere of the school. Within these three areas, this report identifies 13 indicators of school quality that recent research suggests are related to student learning and reviews the national data showing the current status of our schools. These indicators are summarized in figure A. The figure illustrates that these school quality factors can affect student learning *both directly and indirectly*. For example, school context characteristics like school leadership can have an impact on teachers and what they are able to accomplish in the classroom, and this in turn may influence student learning. In addition, various teacher-level attributes can affect the quality of the classroom and, in turn, student learning. Traits at each of these levels can also directly affect student learning.

Teachers

Substantial research suggests that school quality is enhanced when teachers have high academic skills, teach in the field in which they are trained, have more than a few years of experience, and participate in high-quality induction and professional development programs. Students learn more from teachers with strong academic skills and classroom teaching experience than they do from teachers with weak academic skills and less experience. Teachers are less effective in terms of student outcomes when they teach courses they were not trained to teach. Teachers are thought to be more effective when they have participated in quality professional development activities, but there is no statistical evidence to evaluate this relationship.

SOURCE: Originally published as figure ES.1 on p. ii of the complete report from which this article is excerpted.

Classrooms

To understand the effectiveness of classrooms, research suggests that it is necessary to understand the content of the curriculum; the pedagogy, materials, and equipment used; and the conditions under which the curriculum is implemented. Students appear to benefit when course content is focused and has a high level of intellectual rigor and cognitive challenge. Younger students, especially disadvantaged and minority students, appear to learn better in smaller classes. Nationally representative data on the process of schooling, now becoming available for the first time, will further our understanding of the role of these factors in determining school quality.

School context

How schools approach educational leadership and school goals, develop a professional community, and establish a climate that minimizes discipline problems and encourages academic excellence clearly affects school quality and student learning. For three reasons, however, the effect of school-level characteristics is more difficult to ascertain than the effect of teachers and classrooms. First, even though they are integral to a school, these characteristics are difficult to define and measure. Second, their effect on student learning is likely to be exerted indirectly through teachers and classrooms, compounding the measurement problem. And last, with some exceptions, reliable schoolrepresentative information about these indicators of quality is minimal. These difficulties should not overshadow the importance of collecting such data to learn more about how these characteristics operate and affect student learning through teachers and classrooms. The preponderance of national, regional, and local efforts to develop quality schools heightens the benefits that would be derived from additional refined and reliable school-representative measures of school characteristics.

Availability and Quality of Indicator Data

The quality of existing data on these three types of indicators varies (table A). Where the dimension being measured is straightforward, or if it has been measured for an extended period of time, the data are high quality. Where there is little information about a particular important facet of an indicator, the data quality is moderated in some aspect. And where the indicator is more complex than the data, the quality is poor. For a few indicators, concrete statistical evidence of an association with learning is thin, even though experts agree that these indicators should show changes in student learning.

The indicators of teaching assignment, teacher experience, and class size each represent straightforward concepts and are easy to measure, and the data on these indicators are high quality. In addition, data on teacher experience and class size have been collected over several decades, further ensuring their quality. Data on teacher academic skills are also high quality, albeit less straightforward. While the academic skills of teachers are only one aspect of teaching ability, standardized tests that measure the academic skills of future teachers are quite advanced and have consistently shown links to student learning.

Data on indicators of professional development, course content, technology, discipline, and academic environment are moderate in quality. National data collection efforts pertaining to these indicators are relatively new, and these dimensions of schools are more complex than the data currently collected. Consequently, data on professional development are limited and provide little insight into important principles of successful professional development programs. National data on indicators of course content and academic environment are based primarily on course titles and are consequently too vague to be high quality. Current

Table A.—Quality of national school quality indicator data

High quality	Moderate quality	Poor quality
Teaching assignment	Professional development	Pedagogy
Teacher experience	Technology	Goals
Teacher academic skills	Course content	School leadership
Class size	Discipline	Professional community
	Academic environment	

SOURCE: Originally published as table ES.1 on p. iii of the complete report from which this article is excerpted.

data on technology primarily measure the availability of hardware and access to the Internet and provide too little information on the instructional role of technology in the classroom. Nationally representative data on school discipline incidents and on school discipline policies are well defined, but administrators may underreport their discipline problems. In addition, there are limited data documenting a link to student learning, the implementation of discipline policies, and their perceived fairness.

Only poor-quality data are available on teachers' pedagogy, school leadership, school goals, and professional community. These indicators are complex and therefore more difficult to measure, and historically they have not been prominent in national data collection efforts. It is difficult to isolate and measure critical elements of pedagogy because the teaching process consists of a complex set of interactions between students, the teacher, and the curriculum. Measuring human actions, incentives, and opinions to estimate the effects of school-level attributes such as leadership, goals, and professional community is an equally complex task.

As a group, the teacher-focused measures of school quality are less complex and have been collected for some time. School-level attributes of quality are nearly the opposite. We have more reliable information on indicators with highquality data, while indicators with lower quality data provide an incentive and direction for improved national data collection. Nine indicators have high- or moderatequality data and describe the current status of school quality.

Current Status of School Quality

The academic skills of teachers

Students learn more from teachers with strong academic skills (Ballou 1996; Ehrenberg and Brewer 1994, 1995; Ferguson 1991; Ferguson and Ladd 1996; Mosteller and Moynihan 1972), but graduates whose college entrance examination scores are in the top quartile are *half* as likely as those in the bottom quartile to prepare to teach (9 vs. 18 percent) (Henke, Chen, and Geis 2000). Teachers in the top quartile are more than *twice* as likely as teachers in the bottom quartile to teach in private schools (26 vs. 10 percent) and are less than *one-third* as likely as teachers in the bottom quartile to teach in high-poverty schools (10 vs. 31 percent). Furthermore, graduates in the top quartile who teach are *twice* as likely as those in the bottom quartile to leave the profession within less than 4 years (32 vs. 16 percent) (Henke, Chen, and Geis 2000).

Teaching assignment

Middle and high school students learn more from teachers who hold a bachelor's or master's degree in the subject they are teaching (Darling-Hammond 2000; Goldhaber and Brewer 1997; Monk and King 1994), but out-of-field teaching occurs with regularity (Bobbitt and McMillen 1994; Henke et al. 1997; Ingersoll 1999; Lewis et al. 1999).

Teacher experience

Studies suggest that students learn more from experienced teachers than they do from less experienced teachers (Darling-Hammond 2000; Murnane and Phillips 1981; Rivkin, Hanushek, and Kain 1998). As of 1998, the highest poverty schools and schools with the highest concentration of minority students had about *double* the proportion of inexperienced teachers (those with 3 or fewer years of experience) than schools with the lowest poverty (20 vs. 11 percent) and lowest concentration of minority students (21 vs. 10 percent).

Professional development

Experts agree that high-quality professional development should enhance student learning (Choy and Ross 1998; Mullens et al. 1996; U.S. Department of Education 1999), but data permitting an analysis of the relationship are not yet available. In 1998, 99 percent of the nation's public school teachers had participated in some type of professional development program within the past 12 months (U.S. Department of Education 1999). However, most teachers participated in these activities for only 1 to 8 hours, or for no more than 1 day. Teachers with 3 or fewer years of experience were more likely (Lewis et al. 1999) to have reported participating in an induction program in 1998–99 than in 1993–94 (65 vs. 59 percent).

Course content

Research shows that as students take higher level academic courses they learn more (Raizen and Jones 1985; Sebring 1987). From 1982 to 1998, there was an increase in the percentage of students enrolling in higher level mathematics and science courses (National Center for Education Statistics 2000). High school graduates in 1998 were more likely than their 1982 counterparts to take more advanced mathematics courses, such as algebra II, trigonometry, precalculus, and calculus. In science, the

trend is similar. High school graduates in 1998 were more likely to take chemistry II or physics II and physics I and chemistry I (National Center for Education Statistics 2000). Despite these encouraging signs, the experience is not reflected equally among racial/ethnic and income groups. In 1998, white and Asian/Pacific Islander high school graduates were usually more likely than black, Hispanic, and American Indian/Alaska Native students to complete advanced academic level mathematics and the highest level science courses (National Center for Education Statistics 2000). Students from low-income families were less likely than students from higher income families to be enrolled in a college preparatory track through which they would be more likely to take such courses (Green et al. 1995).

Technology

Research suggests that student learning is enhanced by computers when the computers are used to teach discrete skills (President's Committee of Advisors on Science and Technology, Panel on Educational Technology 1997). Computer availability and usage are increasing in schools (Anderson and Ronnkvist 1999). In 1999, there was an average of 6 students for each computer, up from a 125 to 1 ratio in 1983 (Coley, Cradler, and Engel 1997; Williams 2000). Internet access existed at 95 percent of public schools in 1999, up from 35 percent in 1994 (Williams 2000). Internet access is likely to be used most if the computers are in instructional rooms. Over half (63 percent) of all instructional rooms (classrooms, computer or other labs, and library media centers) had access to the Internet in 1999, up from 3 percent 5 years before (Williams 2000). For schools with high concentrations of poverty (more than 70 percent eligible for free or reduced-price lunch), 39 percent of all instructional rooms had Internet access compared with 62 to 74 percent for schools with lower concentrations of poverty (Williams 2000).

Class size

Researchers have found that greater gains in student achievement occur in classes with 13 to 20 students compared with larger classes, especially for primary-grade disadvantaged and minority students (Krueger 1998; Mosteller, Light, and Sachs 1996; Robinson and Wittebols 1986). In 1998, the average public elementary school class had 23 students (Lewis et al. 1999). Large-scale efforts to reduce class size may result in negative consequences if, as was the case recently in California, large numbers of unqualified teachers are hired because there are not enough qualified teachers available to staff the smaller classes (Bohrnstedt and Stecher 1999).

Discipline

Researchers have found that a positive disciplinary climate is directly linked to student learning (Barton, Coley, and Wenglinsky 1998; Bryk, Lee, and Holland 1993; Chubb and Moe 1990). Research also suggests that the most effective policies to reduce the incidence of offenses in a school vary according to the targeted behavior. To reduce serious incidents, including drug offenses, only a policy of severe punishment seems to be effective (Barton, Coley, and Wenglinsky 1998). Serious violent crime incidents occurred in 10 percent of all public schools in 1996-97 (Kaufman et al. 1999). The level of school-related criminal behavior changed little between 1976 and 1997, and no differences in victimization rates were found between white and black high school seniors in 1997 (National Center for Education Statistics 1999). However, the percentage of middle and high school students who fear attack or other bodily harm while at school has been on the rise. In each year from 1989 to 1995, a larger proportion of black and Hispanic students than white students feared attacks at school, and the percentage of black students who feared for their safety nearly doubled between 1989 and 1995 (Kaufman et al. 1999).

Academic environment

Students learn more in schools that emphasize high academic expectations (Bryk, Lee, and Holland 1993; Chubb and Moe 1990), and academic expectations have been on the rise (National Center for Education Statistics 1998). The percentage of public school districts with graduation requirements that meet or exceed the National Commission on Excellence in Education (NCEE) recommendations (4 years of English, 3 years of mathematics, 3 years of science, 3 years of social studies, and a half year of computer science) increased from 12 to 20 percent between 1987-88 and 1993-94 (National Center for Education Statistics 1998). A common criticism of the NCEE recommendations is that they only specify the number of courses to be taken, not their rigor. But there is evidence that increasing numbers of students have been enrolling in more difficult courses. From 1982 to 1998, there was an increase in the percentage of students enrolling in higher level mathematics and science courses (National Center for Education Statistics 2000).

Summary

School quality needs to be defined, assessed, and monitored if we are to ensure the existence of quality schools (Special Study Panel on Education Indicators 1991). This report highlights 13 indicators of school quality that recent research suggests may be related to student learning and identifies where and why more precise measures are needed. These indicators fall into three categories: the characteristics of teachers, the characteristics of classrooms, and the characteristics of schools as organizations. Research suggests that students learn more from teachers with high academic skills and teachers who teach subjects related to their undergraduate or graduate training than they do from teachers with low academic skills and teachers who teach subjects unrelated to their training. In addition, students, on average, learn more from teachers with 3 or more years of teaching experience than they do from teachers with less experience. Though the research is less conclusive regarding professional development, experts agree that participation in high-quality professional development should lead to better teaching. At the level of the classroom, research suggests that students benefit from a focused and rigorous curriculum, time spent using computers, and being in smaller classes. We still need to learn more about the relationship between pedagogy and student learning. At the school level, a school's goals, leadership, faculty, discipline policy, and academic environment are all indicators of school quality. Student learning, however, is thought to occur primarily as a result of students' interaction with teachers, other students, and the curriculum, and the link between learning and these factors is not firmly established for all of these indicators.

Better measures are needed to accurately monitor the status of school quality, especially for indicators of pedagogy, school leadership, goals, and professional community. Furthermore, certain important facets of professional development, course content, technology, academic environment, and discipline are missing. Finally, even when quality data are available, they lose their value if they are not appropriately defined and kept up to date. Moreover, even though experts would agree that certain indicators should show changes in student learning, there is not always concrete statistical evidence to support their supposition; improving the data collected on the dimensions of schools thought to be associated with school quality should help us better understand the relationship of these indicators to student learning.

The findings documented in this report, like all research, are time sensitive and part of an iterative process. The status of schools as identified by indicators with high-quality data is changing rapidly and will need to be continually updated. As research on school effectiveness proceeds, indicators with only poor-quality data will need to be improved to understand the complete picture of school quality as recommended by the Special Study Panel on Education Indicators for NCES.

Advanced Telecommunications in U.S. Private Schools: 1998–99

- Basmat Parsad, Rebecca Skinner, and Elizabeth Farris

This article was ariginally published as the Executive Summary af the Statistical Analysis Repart af the same name. The sample survey data came primarily fram the "Survey an Advanced Telecammunicatians in U.S. Private Schaals: 1998–99," canducted thraugh the NCES Fast Respanse Survey System (FRSS). Other data saurces are listed at the end af this article.

Background

Throughout the past decade, there have been a number of federal, state, and private initiatives to expand computer and Internet use in schools. These initiatives have been rooted in the national technology goals to make computers accessible to every student, connect every classroom to the Internet, integrate educational software into the curriculum, and train teachers to integrate technology into the classroom (U.S. Department of Education 1998). In 1994, the National Center for Education Statistics (NCES) launched a series of annual surveys to track changes in the availability of computers and Internet access in public schools.

In fall 1995, NCES also conducted a survey of advanced telecommunications in private schools to provide baseline data on computer and Internet availability, and allow for comparisons with public schools (Heaviside and Farris 1997). To revisit the issue of computer and Internet availability in private schools and measure changes since 1995, NCES, through its Fast Response Survey System (FRSS), administered a second nationally representative survey of advanced telecommunications in private schools during the 1998–99 school year.

Specifically, the 1998–99 survey focused on (1) computer and Internet availability, including the extent to which those resources were available for instruction; (2) selected issues in the use of computers and the Internet, including instructional use of those resources, provision of teacher training, technical support for advanced telecommunications use, and barriers to the acquisition and use of advanced telecommunications; and (3) the Education-rate discount (E-rate) program and other external support for advanced telecommunications in schools.

Computer and Internet Availability in Private Schools

Making available sufficient and adequate hardware is a critical first step toward ensuring student access to computers. In the 1998–99 school year, private schools reported six students per computer (including computers used for administrative purposes), a lower level of availability than

the four to five students per computer recommended by some technology experts (President's Committee of Advisors on Science and Technology 1997). Considering availability for instructional purposes, there were 8 students per *instructional* computer in private schools. Among private schools with Internet access, there were 15 students per *Internet-connected* instructional computer.

Private schools have made considerable strides in computer and Internet availability since 1995. Examples include the following:

- The number of students per computer (including computers used for administrative purposes) fell from nine in fall 1995 to six in the 1998–99 school year.
- The proportion of private schools connected to the Internet increased from 25 percent in 1995 to 67 percent in 1998–99. An additional 13 percent of private schools indicated they had plans for Internet connection by the end of 2000; if these plans are realized, then about 80 percent of all private schools are currently connected or will have Internet connections by the end of 2000. However, 19 percent of private schools reported not being connected to the Internet and having no plans to be connected.

Availability of the Internet for instruction

School-level access to the Internet does not reflect the extent to which that resource might be available for instruction. Therefore, private schools also reported on the number of instructional rooms with Internet connections, types of connection, and the extent to which the World Wide Web (WWW) and electronic mail (e-mail) were available to various members of the school community. Findings from the 1998–99 survey indicate the following:

- Twenty-five percent of all instructional rooms in private schools were connected to the Internet in the 1998–99 school year, compared with 5 percent in fall 1995.
- Although dial-up connections were the most common means of connecting to the Internet in 1998–99 (65 percent of private schools with Internet access

46

reported using such connections), private schools have increased the availability of higher speed connections using dedicated lines.

About two-thirds of private schools reported having e-mail or WWW availability. However, e-mail was more likely to be available to administrators than teachers and least likely to be available to students.

Differences in computer and Internet availability by school characteristics

Comparisons on the availability and use of computers and the Internet were focused mainly on differences by religious affiliation and instructional level of the school. The results of the 1998–99 survey indicate the following:

- Nonsectarian schools had fewer students (six) per instructional computer than Catholic (eight) or other religious schools (nine). While Catholic schools were more likely than nonsectarian or other religious schools to be connected to the Internet (figure A) and to report having e-mail and WWW availability, nonsectarian schools reported a higher proportion of instructional rooms with Internet access.
- Secondary schools were more likely than elementary or combined schools to be connected to the Internet and to report the availability of high-speed connections using dedicated lines. They were also more likely to report that e-mail and the WWW were available to students. Among schools with Internet access, moreover, the ratio of students per instructional computer with Internet access was lower at secondary and combined schools than at elementary schools (figure B).

Use of and School Support for Advanced Telecommunications in Private Schools

Issues in advanced telecommunications that have become increasingly important within recent years relate to whether teachers and students are making use of available advanced telecommunications, and the extent to which schools have support mechanisms in place to encourage effective use of those resources.

Use of advanced telecommunications by students and staff

The results of the 1998–99 survey indicate the following:

Forty-five percent of all private school teachers in the 1998–99 school year regularly used computers and/or advanced telecommunications for teaching. Among private schools with Internet access, virtually all reported some use of e-mail and the WWW by students, teachers, and administrative staff. However, relatively fewer schools reported that these Internet capabilities were used to a large extent; for example, 31 percent reported that students used the WWW to a large extent and 24 percent indicated that teachers used this resource to a large extent.

School support for computer and Internet use

To explore the issue of school support for computer and Internet use, the survey asked whether schools (1) offered or participated in various types of advanced telecommunications training for teachers, (2) used various approaches to encourage teacher participation in technology training, and (3) provided technical support for advanced telecommunications use. The 1998–99 survey data indicate the following:

- Sixty-four percent of private schools offered or participated in some type of advanced telecommunications training for teachers, with the most common type of training being in the use of computers. About half of the schools offered or participated in training on the integration of technology into the curriculum, and 43 percent provided training on the use of the Internet.
- Of the schools that offered or participated in some type of technology training, 55 percent left it up to teachers to initiate the training, while fewer schools either mandated the training (16 percent) or actively encouraged teacher participation through incentives (22 percent).
- Most private schools (80 percent) indicated that one or more individuals were primarily responsible for supporting advanced telecommunications in the school. Of these schools, 41 percent indicated that the technology coordinator or other technical staff helped teachers to integrate technology into the curriculum to a large or moderate extent, and 42 percent reported that network technical support was provided to a large or moderate extent.

E-rate and Other External Support for Advanced Telecommunications in Private Schools

Expanding the use of advanced telecommunications comes with high costs, and private and public schools often have to rely on a range of support (including federal and private sources) to address their technology needs. Therefore,

Figure A.—Percent of private schools with Internet access, by selected school characteristics: School year 1998-99

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System, "Survey on Advanced Telecommunications in U.S. Private Schools: 1998–99," FRSS 68, 1999.

schools were asked about the support for advanced telecommunications from various sources during the 1998–99 school year. Results include the following:

- Private schools indicated that they received support from several sources for advanced telecommunications in the school, including various federal programs (ranging from 2 to 15 percent of private schools) and business or industry (22 percent of private schools).
- The most frequently cited source of support was parents or other community members (57 percent of private schools), although the survey did not collect data on the extent of such support. Relatively few private schools (13 percent) reported support for advanced telecommunications from the E-rate program.

The E-rate program is designed to make telecommunications services more affordable to all eligible schools and libraries. The program provides discounts (ranging from 20 to 90 percent) that can be used for internal connections, telecommunications services, and Internet access (Bare and Meek 1998). The 1998–99 survey findings indicate the following:

About one-fourth (24 percent) of all private schools applied for the 1998 E-rate program. Catholic schools were more likely than other religious and nonsectarian schools to apply for the 1998 program; elementary and secondary schools were more likely to apply than combined schools; and schools with Internet access were more likely to apply than those without access.

NOTE: Data presented in this table are based on the number of schools with Internet access—67 percent of private schools.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System, "Survey on Advanced Telecommunications in U.S. Private Schools: 1998–99,"FRS5 68, 1999.

 When asked if they intended to apply or had already applied for the 1999–2000 E-rate program, 39 percent of all private schools indicated that they did, while 57 percent reported that they would not apply.

Selected Comparisons With Public Schools

Some of the gains made by private schools since 1995 have been comparable to those made by public schools. For example, the percentage point increase in private schools with Internet access between fall 1995 and the 1998–99 school year (42 percentage points) is comparable to increases for public schools (39 percentage points) during this period. Nevertheless, in the 1998–99 school year, private schools continued to be outpaced by public schools on some important indicators of the availability of advanced telecommunications—ratio of students to instructional computer, the proportion of Internet-connected schools, the proportion of instructional rooms with Internet

access, and types of Internet connection. Examples include the following:

- Compared with public schools, private schools reported more students per *instructional* computer (8 vs. 6) and, among schools with Internet access, more students per instructional computer with Internet access (15 vs. 12 students) (figure C).
- Private schools (67 percent) were considerably less likely than public schools (89 percent) to be connected to the Internet, and they also reported proportionately fewer instructional rooms with Internet access (25 vs. 51 percent).
- Private schools were less likely than public schools to report higher speed Internet connections; for example, among schools with Internet access, 21 percent of private schools compared with 65 percent of public schools were connected to the Internet using dedicated lines (figure D).

A Primer for Making Cost Adjustments in Education

William J. Fowler, Jr., and David H. Monk

This article was originally published as the Executive Summary of the Research and Development Report of the same name.

Research and Development Reports are intended to

- share studies and research that are developmental in nature;
- share results of studies that are on the cutting edge of methodological developments;
- participate in discussions of emerging issues of interest to researchers.

These reports present results or discussion that do not reach definitive conclusions at this point in time, either because the data are tentative, the methodology is new and developing, or the topic is one on which there are divergent views. Therefore, the techniques and inferences made from the data are tentative and are subject to revision.

Most people intuitively recognize geographic differences in costs and in measuring inflation. Efforts to compare the costs of exactly the same things in different geographic regions involve comparisons of the same "market basket" of goods in two geographic areas. The difference in the prices of the same market basket of goods is designed to reveal the differences in the cost of living in different geographic regions. Measuring cost differences in education, however, is difficult, since most of the costs are in personnel, rather than in supplies. This report attempts to explain the differences between education costs and expenditures, explain the differences in the "unit price" of teachers in different regions and differences over time in the level of inflation, examine existing indices that can be used to make judgments for these differences in costs, and outline a future plan of action to derive a precise, stable, and accurate index for school administrators and policymakers to use.

The Difference Between Cost and Expenditure

The cost of education can be defined as the minimum of what must be given up to accomplish some result. "Expenditure" is different from "cost" in that expenditures are not tied to results or outcomes and can exceed the minimum of what must be given up.

Education costs can be organized according to an allocation hierarchy where the lowest level is the unit cost of various inputs like teachers' time, space, and supplies. At the next level, there are costs that occur as the individual inputs are combined to form education services within classrooms and schools. Finally, at the uppermost level are the actual outcomes of schooling, where costs occur because of the presence of students with specialized needs of various kinds. Resource allocation decisions are made at each of these levels, and it is useful to keep them distinct because this can allow us to determine the relative magnitude of each source of cost.

Geographically Based Cost Adjustments

The purpose of a geographically based teacher price index is to determine the relative cost of engaging the services of comparable teachers. Some of the necessary components include teacher characteristics (level of experience, training, minority status, and gender), cost-of-living adjustments, regional amenities, employment amenities, nonteaching wages and employment opportunities in the region, union and collective bargaining, and demand for teacher quality. Several scholars have attempted to define a geographically based index. The Teacher Attribute Model is the result of Stephen Barro's (1994) approach. Barro did not strive to include all of the components outlined above in order to minimize the number of assumptions based on incomplete data. His estimate focuses on interstate comparisons and estimates what each state's average teacher's salary would be if the state employed teachers with the same average experience and training as that found in the nation as a whole.

Another approach has been characterized by McMahon and Chang (1991) as the "market-basket" approach. This approach does not focus on school personnel but rather on costs that are outside of the school's control, such as wages in other sectors of the economy and geographically based differences in the cost of living. One reason for this focus is to prevent a feedback loop rewarding schools that increase salaries. The basic components of this model include the value of housing, per capita income, the percent change in population for the preceding decade, and variables representing regions of the country. It can generate cost-ofliving indices at several levels of aggregation.

The hedonic model (Chambers 1998) is a more ambitious approach that deals explicitly with each of the influences

addressed by the models discussed above. The model is called "hedonic" because it is sensitive to whatever it is that teachers find attractive or unattractive about a given career opportunity. The Teacher Cost Index (TCI) (Chambers and Fowler 1995) is an example of this approach. Using Schools and Staffing Survey (SASS) data, it includes teacher characteristics (ethnicity, gender, education, and experience), working conditions (class size), and salary information. Other data sources, such as FBI crime statistics and U.S. Weather Bureau climate statistics, were used to assess regional amenities. Cost influences that the school has control over were statistically controlled while other influences were allowed to vary. The Geographic Cost-of-Education Index (Chambers 1998) is a more recent application of this approach. In this model, the index was broadened to include other types of inputs (school administrators and noncertified school personnel), and the range of data sources was widened. Both approaches run the risk of relying too much on potentially questionable data sources and assumptions.

The production function (PF) models are perhaps the most ambitious because they focus on the costs associated with actually realizing gains in educational performance. Unfortunately, a lack of adequate data and complete theoretical specifications for these PF models have hindered widespread practical use. However, in recent years these models have been applied to several states. For an example, see the application to New York in Duncombe, Ruggiero, and Yinger (1996). There also have been applications to Wisconsin and Texas.

A comparison of the three main models for geographically based cost adjustments (the Teacher Attribute, marketbasket, and TCI models) demonstrates that the indices are highly correlated, at over .70. Also, the more adjustments that are made, the more the degree of variation drops. Despite the high correspondence between these indices, there are certain geographic regions where there is disagreement between the indices. A comparison between the hedonic and cost-of-living (market-basket) models might indicate, for example, that this discrepancy is due to the region's attractiveness (such as San Francisco) or unattractiveness (such as nonmetropolitan Connecticut) to most teachers.

Cost Adjustments Over Time

Adjusting for regional cost-of-living differences is only one of the challenges to producing a cost-of-education index.

The other major challenge involves adjusting for cost-ofliving differences over time. Different deflators can lead researchers to different conclusions.

The most common way of measuring inflation is the market-basket approach used by the Consumer Price Index (CPI), where the cost of commonly purchased items is tracked over time. The School Price Index (Halstead 1998) is one example of this approach that uses the Urban component of the CPI, the CPI-U. Unfortunately, this index can only be used at the national level. There are many problems with applying the CPI approach to education, especially the change of relevant products over time (item substitution) and the uneven growth of inflation for different occupational areas. Education is one of those occupations that has been strongly influenced by changes in technology. This makes it difficult to track inflation since the supplies bought today (such as the computer or VCR) are not really comparable to the supplies of a few decades ago (such as the typewriter or projector). The second problem is that some occupational areas (such as medicine) have seen strong inflation, while other areas have not. Rothstein and Mishel (1997) argue that factors such as the increase in quality due to smaller teacher/student ratios have made inflation greater for education. Their solution is to use the Net Services Index (NSI), which measures inflation by focusing on labor-intensive components of the CPI similar to education. However, they acknowledge that while the NSI is an improvement, it still produces an underestimate.

A second approach, the Inflationary Cost-of-Education Index, modifies the hedonic TCI to include school administrators and noncertified staff. However, given data limitations, this only provides a 6-year inflation index during the years SASS was administered.

The Employment Cost Index also avoids the market-basket approach by measuring the rate of change in employee compensation, which includes wages, salaries, and employers' costs for employees' benefits. It covers all occupations with the exception of federal government workers and is used extensively by the Federal Reserve Board as a measure of inflation. It has an education subscale and has separate data on salaries as well as fringe benefits. Of all of the indices, this one is the most attractive because it avoids the pitfalls of item substitution found in the market-basket approach and has a large time frame (1981 to 1996) available.

Using Geographic and Inflation Deflators

Both geographic and inflation cost adjustments suffer from many flaws. Overall, there is correspondence between different geographic indices; however, for a particular geographic area the results can be dramatically different. Given the political nature of these adjustments, such discrepancies can be as problematic as they are informative. While the addition of more adjustments leads to a reduction of variability and arguably greater accuracy, policymakers' reluctance to use adjustments is understandable.

Lessons to Learn and Directions for Future Work

There are two primary goals for the future of geographic cost adjustments: improve the indices of cost variations and educate the public and policymakers about any progress that is made. The basic challenges are to make the indices generalizable across different levels (local, state, and regional), separate and distinguish influences that are controllable by the school, be careful of double counting when adding new adjustments, and address any political considerations.

The following are some guiding principles for policymakers to consider as they seek to take advantage of what has been learned about variations in the costs of education:

- Keep the indices as simple and understandable as possible.
- Strive to reach consensus about the extent to which you wish to make cost adjustments in full knowledge of the flaws that remain in the available tools.
- Keep in mind that not all adjustments are beneficial to all parties. Be particularly wary of flawed adjustments that benefit one set of political interests over others.
- Provide for gradual phase-ins. Consider "quasileveling up" strategies and take advantage of inflation, which includes annual natural increases.
- Place primary emphasis on supporting the further improvement of the available indices.

A more sophisticated index will allow policymakers to more accurately identify what costs are the results of regional differences and what changes in costs over time are the result of different decisions and factors. This will allow a more efficient allocation of education resources. Both the public and policymakers need to be informed of progress made in this area so the index can be better utilized and a consensus can be reached on the appropriate approach to measuring geographic and inflationary differences in education costs.

Undergraduates Enrolled With Higher Sticker Prices

[–] John B. Lee

This article was ariginally published as the Executive Summary af the Statistical Analysis Repart af the same name. The sample survey data are fram the NCES Natianal Pastsecondary Student Aid Study (NPSAS).

Introduction

This report investigates the reasons full-time, first-year undergraduates gave for choosing to enroll at higher sticker prices, how they paid their expenses, and the educational experiences associated with attendance. It also reviews how satisfied they were with their choice, how they rated their educational experience, how they paid for their education, and their first-year persistence.

For the purposes of this report, full-time, first-year undergraduates attending 4-year institutions are divided into three groups. First, "undergraduates with higher sticker prices" are those who faced at least \$12,000 in tuition and required fees before any tuition remission, discounts, or financial aid award in the 1995–96 academic year, regardless of institution control or Carnegie classification. Second, undergraduates with sticker prices below \$12,000 in the 1995–96 academic year attending public universities with the Carnegie classifications of Research Universities I or Research Universities II are the "undergraduates in public research universities." Third, undergraduates with sticker prices below \$12,000 in the 1995–96 academic year attending all other institutions are the "undergraduates in other 4-year institutions."

The tables provide data on full-time, first-year undergraduates with higher sticker prices. Comparisons are made with undergraduates attending public research universities with sticker prices below \$12,000. Undergraduates in public research universities with sticker prices below \$12,000 were

Figure A.—Percentage distribution of full-time, first-year undergraduates in 4-year institutions, by sticker price and Carnegie classification: 1995–96

NOTE: The variable for sticker price and Carnegie classification groups undergraduates attending 4-year institutions into one of three unique categories. First, "undergraduates with higher sticker prices" are full-time, first-year undergraduates who faced at least \$12,000 in tuition and required fees before any tuition remission, discounts, or financial aid award in the 1995–96 academic year, regardless of institution control or Carnegie classification. Second, undergraduates with sticker prices below \$12,000 in the 1995–96 academic year attending public universities with the Carnegie classifications of Research Universities I or Research Universities II are the "undergraduates in public research universities." Third, undergraduates with sticker prices below \$12,000 in the 1995–96 academic year attending all other institutions are the "undergraduates in other 4-year institutions."

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1995–96 National Postsecondary Student Aid Study (NPSAS:96), Undergraduate Data Analysis System.

chosen as a comparison group because many of these students show signs of being financially able to enroll at higher sticker prices. The third group of undergraduates those attending other 4-year public institutions and private institutions with sticker prices below \$12,000—is included in the tables, but not in the analysis.

Most of the undergraduates with higher sticker prices attended private, not-for-profit institutions, but some attended public institutions as out-of-state students. Twenty-one percent of all full-time, first-year undergraduates who attended 4-year institutions faced higher sticker prices (figure A).

Twenty-two percent of the full-time, first-year undergraduates who attended 4-year institutions enrolled in public research universities with sticker prices below \$12,000. In many states, public research universities with sticker prices below \$12,000 represent the most prestigious institutional choice available.

The source of data for this analysis was the 1995–96 National Postsecondary Student Aid Study (NPSAS:96). This data set provides a nationally representative sample of undergraduates enrolled in accredited postsecondary institutions. NPSAS:96 provides information about expenses and financial aid along with characteristics that distinguish undergraduates with higher sticker prices from those with sticker prices below \$12,000 in public research universities.

In addition, the report provides information from NPSAS:96 about student characteristics associated with full-time undergraduate persistence in the first year of enrollment. Persistence is defined as attending full time at the same campus for at least 8 months during the year.

Nearly all of the full-time, first-year undergraduates who faced higher sticker prices or sticker prices below \$12,000 in public research universities can be classified as traditional. Characteristics of traditional students include being single, younger than 24, and financially dependent on their parents. Also, the family incomes of the undergraduates attending institutions in the two institutional groups did not differ statistically (table A).

The percent of full-time, first-year undergraduates attending college out of state and the percent living on campus differentiated those who enrolled with higher sticker prices from those enrolling with sticker prices below \$12,000 in public research universities. Fifty-five percent of full-time, first-year undergraduates with higher sticker prices enrolled in institutions out of state compared with 19 percent of those with sticker prices below \$12,000 in public research universities. Further, 92 percent of the full-time, first-year undergraduates with higher sticker prices lived on campus compared with 74 percent of those with sticker prices below \$12,000 in public research universities.

Finances

Financial aid, work, and parental support are the three major sources of financial support for undergraduates in both groups. Financial aid was received by 79 percent of the full-time, first-year undergraduates with higher sticker prices compared with 69 percent of those with sticker prices below \$12,000 in public research universities (table B). Part of the difference can be accounted for by the difference in probability of receiving federally provided financial aid. Sixty-one percent of the full-time, first-year undergraduates with higher sticker prices received federal financial aid compared with 48 percent of those with sticker prices below \$12,000 in public research universities.

Full-time, first-year undergraduates with higher sticker prices were more likely to have received grants, loans, or work-study than were those with sticker prices below \$12,000 in public research universities. The most striking difference was noted for college work-study, which was received by one-third of the full-time, first-year undergraduates with higher sticker prices, compared with 7 percent of those with sticker prices below \$12,000 in public research universities.

The majority of full-time, first-year undergraduates in both groups worked while they attended school. Full-time, firstyear undergraduates with higher sticker prices were more

Undergraduates Enrolled With Higher Sticker Prices

Parents also provided financial support. Ninety-two percent of the full-time, first-year undergraduates with higher sticker prices received parental help compared with 80 percent of those with sticker prices below \$12,000 in public research universities.

Influences

Four influences differentiated full-time, first-year undergraduates with higher sticker prices from those with sticker prices below \$12,000 in public research universities (table C). First, one-half of the full-time, first-year undergraduates with higher sticker prices indicated that institutional reputation was a reason for enrolling compared with 41 percent of those with sticker prices below \$12,000 in public research universities. The second factor was receiving more financial aid. Twelve percent of full-time, first-year undergraduates with higher sticker prices indicated that the receipt of more financial aid was a reason for enrolling compared with 6 percent of those with sticker prices below \$12,000 in public research universities. Third, faculty reputation was identified as an influence by 7 percent of the full-time, first-year undergraduates with higher sticker prices compared with 2 percent of those with sticker prices below \$12,000 in public research universities. The fourth influence was the job placement rate. Five percent of the full-time, first-year undergraduates with higher sticker prices said job placement was an important consideration compared with 1 percent of those with sticker prices below \$12,000 in public research universities.

Four influences differentiated full-time, first-year undergraduates with sticker prices below \$12,000 in public research universities from those with higher sticker prices. First, 31 percent of full-time, first-year undergraduates with sticker prices below \$12,000 in public research universities

Table A.—Percentage distribution of full-time, first-year undergraduates in 4-year institutions according to selected student characteristics, by sticker price and Carnegie classification: 1995–96

*The variable for sticker price and Carnegie classification groups undergraduates attending 4-year institutions into one of three unique categories. First, "undergraduates with higher sticker prices" are full-time, first-year undergraduates who faced at least \$12,000 in tuition and required fees before any tuition remission, discounts, or financial aid award in the 1995–96 academic year, regardless of institution control or Carnegie classification. Second, undergraduates with sticker prices below \$12,000 in the 1995–96 academic year attending public universities with the Carnegie classifications of Research Universities I or Research Universities II are the "undergraduates in public research universities." Third, undergraduates with sticker prices below \$12,000 in the 1995–96 academic year attending all other institutions are the "undergraduates in attending all other institutions are the "undergraduates" attending all other institutions."

indicated that being close to home was an important influence compared with 17 percent of those with higher sticker prices. The second factor was low tuition. Ten percent of the full-time, first-year undergraduates with sticker prices below \$12,000 in public research universities indicated that low tuition was important compared with 1 percent of those with higher sticker prices. Third, 8 percent of those with sticker prices below \$12,000 in public research universities indicated that friends or a spouse attending the school influenced their decision to enroll compared with 3 percent of those with higher sticker prices. The fourth factor was the option to live at home, which was a reason given by 5 percent of the full-time, first-year undergraduates with sticker prices below \$12,000 in public research universities compared with 2 percent of those with higher sticker prices.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1995–96 National Postsecondary Student Aid Study (NPSAS:96), Undergraduate Data Analysis System.

compared with 13 percent of those with higher sticker prices.

Full-time, first-year undergraduates with higher sticker prices were also more likely to report that they often had social contact with the faculty than were those with sticker prices below \$12,000 in public research universities.

Satisfaction

Nearly all full-time, first-year undergraduates in both groups were satisfied with the social life and the sports and recreational activities on their campus (table E). However, full-time, first-year undergraduates with sticker prices below \$12,000 in public research universities were even more likely to be satisfied with the social life and the sports and recreational activities (94 and 96 percent, respectively) than were those with higher sticker prices (90 and 92 percent, respectively). Satisfaction with the academic experience was higher for full-time, first-year undergraduates with higher sticker prices than it was for those with sticker prices below \$12,000 in public research universities. Full-time, first-year undergraduates with higher sticker prices were more likely than those with sticker prices below \$12,000 in public research universities to be satisfied with availability of courses, instructors' ability, and class size.

Persistence

Multivariate analysis techniques were used to find that fulltime, first-year undergraduates with higher sticker prices were more likely to persist in their first year than were those with sticker prices below \$12,000 in public research universities. Further, the multivariate statistical techniques found that student characteristics did not explain the difference in persistence. Persistence is defined as attending

full time at the same campus for at least 8 months during the year.

Conclusions

Undergraduates attending institutions with sticker prices of \$12,000 or more and those with sticker prices below \$12,000 in public research universities include a high proportion of younger and academically prepared undergraduates. Differences in family incomes of full-time, firstyear undergraduates in the two groups were not significantly different.

Full-time, first-year undergraduates in the two groups had different reasons for attending their institutions. For example, a larger percentage of full-time, first-year undergraduates with higher sticker prices indicated factors such as institutional reputation, financial aid, and job placement as reasons for attending their institution compared with those with sticker prices below \$12,000 in public research universities.

From Bachelor's Degree to Work: Major Field of Study and Employment Outcomes of 1992–93 Bachelor's Degree Recipients Who Did Not Enroll in Graduate Education by 1997

- Laura J. Horn and Lisa Zahn

This article was ariginally published as the Executive Summary af the Statistical Analysis Repart af the same name. The sample survey data are fram the NCES Baccalaureate and Beyand Langitudinal Study (B&B).

Introduction

The analysis described in this report investigates the relationship between undergraduate major and early employment outcomes among 1992-93 college graduates who did not pursue graduate education within 4 years after earning their bachelor's degree (i.e., as of 1997). The analysis is based on the "Second Follow-up" to the 1992-93 Baccalaureate and Beyond Longitudinal Study (B&B:93/97), which tracks students who received a bachelor's degree in academic year 1992-93. Participants were first sampled and surveyed in their year of graduation as part of the 1993 National Postsecondary Student Aid Study (NPSAS:93). The "First Follow-up" (B&B:93/94) was conducted 1 year later and provided additional information. In 1997 (approximately 4 years after graduation), B&B participants were contacted again, for the "Second Follow-up." In both follow-up surveys, participants reported on many aspects of their employment.

The 1992-93 college graduates who did not pursue graduate education within 4 years after earning their bachelor's degree represented 70 percent of all graduates, and most entered the labor market immediately after finishing their degree. These college graduates entered a labor market in the midst of an economic recovery following a 2-year recession (Mishel and Bernstein 1994, p. 13). By 1997, the economy was strong and jobs were plentiful. Four years after most earned their bachelor's degree, nearly all college graduates who had not enrolled in graduate school were working full time. The findings of this study confirm what has been reported consistently in other studies about earnings: college graduates who major in the applied fields of engineering, business, computer science, nursing, and other health fields earn higher-than-average full-time salaries.

This study also examined other aspects of employment, including job stability, job benefits, and job satisfaction. Taking into account all these aspects along with salary, engineering and computer science stood out as the fields with the most consistent favorable employment outcomes for bachelor's degree recipients. In contrast, education and humanities and arts majors experienced the least favorable outcomes. Graduates of nursing, business, and engineering programs experienced greater-than-average job stability.

Results were mixed for social science and biological science majors. Those in social sciences reported lower-thanaverage salaries in 1994, but not in 1997. The opposite was true for those majoring in biological/interdisciplinary sciences: they reported average salaries in 1994, but in 1997 their salaries were lower than average. The salaries of mathematics/physical science majors did not differ from those of all graduates in either year, nor did the rate at which their full-time salaries increased between 1994 and 1997.

Field of Study

By far, the most popular undergraduate field of study was business. Over one-quarter (28 percent) of 1992–93 college graduates who did not attend graduate school by 1997 had majored in a business-related field (figure A). Following business, 15 and 13 percent, respectively, had majored in social sciences or humanities and arts. Nearly 1 in 10 had majored in education (9 percent), while approximately 7 percent had majored in engineering or architecture.¹

Consistent with historically gender-dominated fields, men were more likely than women to major in engineering (13 vs. 2 percent), computer science (4 vs. 2 percent), and business (32 vs. 24 percent), while women were more likely than men to major in education (13 vs. 4 percent), nursing (6 vs. 1 percent), and other health fields (4 vs. 2 percent).

Business fields tended to attract older college graduates: more than one-third of graduates age 30 or older when receiving their bachelor's degree had majored in business (35 percent), compared with just over one-quarter (27 percent) of those age 22 or younger. Asian/Pacific Islander college graduates were more likely than black, non-Hispanic graduates to favor engineering as a major. To further illustrate racial/ethnic group differences in undergraduate major.

¹Nearly all were engineering majors; less than 1 percent of all graduates majored in architecture. Henceforth, they are referred to as "engineering majors."

Figure A.—Percentage distribution of major field of study for 1992–93 bachelor's degree recipients who had not enrolled in graduate education by 1997

*Other includes agriculture, natural resources, forestry, textiles, home economics, law, library science, military science, leisure studies, basic/personal skills, industrial arts, precision production, and transportation.

NOTE: Details may not sum to 100 due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1992–93 Baccalaureate and Beyond Longitudinal Study, "Second Follow-up" (B&B:93/97), Data Analysis System.

a report based on the 1992 Integrated Postsecondary Education Data System "Completions Survey"(IPEDS-C:1992–93) also showed that black, non-Hispanic graduates were more likely than others to complete degrees in business management and less likely to earn degrees in education or health (Morgan and Broyles 1995).

1997 Employment Status and Occupation

Unemployment was not a problem for most 1992–93 college graduates who had not pursued graduate education. In 1997, within 4 years of graduating, just 2 percent were unemployed,² while almost all (86 percent) reported working full time. Compared with all graduates, business, engineering, and computer science majors were more likely to be employed full time (over 90 percent), while humanities and arts majors were less likely to work full time (79 percent).

Job stability, as measured by the percentage of graduates with any unemployment spells, the number of jobs worked

²As a point of comparison, the overall unemployment rate was 5 percent in 1997 (U.S. Department of Labor 1999, table 56).

	Average number Of jobs begun since graduation	Percentage with any unemployment since graduation	Number of months worked in April 1997 job ¹
Total	2.3	39.5	27.5
Bachelor's degree major			
Applied fields

ther ²	2.3	34.8	25.9

Table A.—Among 1992–93 bachelor's degree recipients who had not enrolled in graduate education by 1997, the average number of jobs worked, the percentage with any unemployment, and the average number of months worked at April 1997 job, by major field of study

¹Maximum possible is 52. Dates were bounded between 1/1/93 and 4/30/97.

²Other includes agriculture, natural resources, forestry, textiles, home economics, law, library science, military science, leisure studies, basic/personal skills, industrial arts, precision production, and transportation.

NOTE: Compared to all graduates, gray box = higher than average; white box = lower than average (p<0.05).

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1992–93 Baccalaureate and Beyond Longitudinal Study, "Second Follow-up" (B&B:93/97), Data Analysis System.

since bachelor's degree attainment, and the average number of months worked in the April 1997 job, was high for graduates who had majored in nursing, engineering, or business. Graduates in all three fields worked in fewer jobs than all graduates and had worked in their April 1997 job longer (table A). Nursing majors also were much less likely to report any spells of unemployment since earning their bachelor's degree. Conversely, those with majors in communications/journalism or humanities and arts fields worked in more jobs since graduation and fewer months in their April 1997 job than all graduates.

College graduates who had majored in applied fields³ were very likely to be employed in occupations related to their majors (table B). This was especially true for those majoring in nursing and other health fields, among whom 96 and 68

³Applied fields in this study are education, business, engineering/architecture, computer science, nursing, other health fields, social work/protective services, and communications/journalism.

percent, respectively, were employed as medical professionals. In addition, nearly three-quarters of education majors (74 percent) worked as teachers, and 60 percent of engineering majors as engineers.⁴ Similarly, 60 percent of social work/protective service majors were working in social service fields. There was an exception to this pattern, however, for communications/journalism majors, who were more likely than graduates in any other field to be working in service occupations (33 percent).

For academic fields,⁵ roughly one-quarter of college graduates with majors in either biological sciences or mathematics/physical sciences were working as teachers, and roughly the same percentage in both fields worked in

⁴Consistent with this finding, the National Science Foundation reports that 57 percent of engineering majors work in a job closely related to their degree 1 to 5 years after bachelor's degree attainment (National Science Board 2000, Appendix table 3-1).

^SAcademic fields include humanities and arts, biological sciences, mathematics and physical sciences, and social sciences.

¹For full labels of major fields, see table A.

²Other includes agriculture, natural resources, forestry, textiles, home economics, law, library science, military science, leisure studies, basic/personal skills, industrial arts, precision production, and transportation.

NOTE: Details do not sum to 100 because the "other" occupation group (1.4 percent) is not included. Gray boxes indicate the occupations with the highest percentage of graduates for a given major. If less than 50 percent, then two or more occupations (up to 50 percent) were identified.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1992–93 Baccalaureate and Beyond Longitudinal Study, "Second Follow-up" (B&B:93/97), Data Analysis System.

occupations related to research, science, or technical work. Social science majors, on the other hand, were likely to be employed in business occupations (32 percent), followed by service occupations (18 percent) and human and protective services (16 percent).

Full-Time Salaries

As shown in table C, college graduates with degrees in nursing or other health fields reported higher-than-average full-time salaries for their April 1994 job, compared with all graduates (\$34,194 and \$35,515, respectively, vs. \$26,464).⁶ The same applied to those who had majored in either engineering (\$32,217) or business (\$29,017). In contrast, education majors had lower-than-average 1994 full-time salaries (\$20,443),⁷ as did those with majors in

⁶The 1994 salaries are in 1997 dollars for comparability to 1997 salaries.

⁷It is possible that some of the salaries reported by education majors (73 percent of whom were working as educators) were for a 9-month academic year rather than a 12-month year.

social work/protective services (\$21,328), communications/ journalism (\$22,170), humanities and arts (\$22,359), and social sciences (\$23,166).

In 1997, with a few exceptions, similar salary patterns emerged. The exceptions were computer science majors, who earned a substantially higher-than-average 1997 salary (\$44,624 vs. \$34,310), and biological science majors, who earned a lower-than-average salary (\$28,760). In addition, communications/journalism majors no longer earned lowerthan-average salaries in 1997. For education majors, graduates not only reported lower-than-average salaries in *both* 1994 and 1997 but also experienced lower rates of salary increase than did all graduates.

Job Benefits and Job Satisfaction

With respect to their job held in April 1997, engineering majors reported very favorable outcomes and were generally very satisfied with their employment. For example,

	Full-time 1994 salary in 1997 dollars	Full-time 1997 salary	Percent increase in salary if full time in 1994 and 1997
Total	\$26,464	\$34,310	24.5

Table C.—Among 1992–93 bachelor's degree recipients who had not enrolled in graduate education by 1997, full-time salaries in 1994 and 1997, and for those employed full time in both 1994 and 1997, the average percent increase in salary between 1994 and 1997, by major field of study

*Other includes agriculture, natural resources, forestry, textiles, home economics, law, library science, military science, leisure studies, basic/personal skills, industrial arts, precision production, and transportation.

NOTE: Compared to all graduates, gray box = higher than average; white box = lower than average (p < 0.05).

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1992–93 Baccalaureate and Beyond Longitudinal Study, "Second Follow-up" (B&B:93/97), Data Analysis System.

engineering was the only field in which graduates were more likely than all graduates to report that their job both required a degree *and* had definite career potential (54 vs. 38 percent). Engineering majors also were more likely than all graduates to report that their jobs provided health insurance, paid vacations, retirement benefits, family leave, and outside job training (table D). Computer science majors also fared well with respect to job benefits: they were more likely than all graduates to report receiving health insurance benefits, paid sick leave, paid vacation, retirement, and family leave benefits. In contrast, humanities and arts majors were less likely than all graduates to report receiving any of the benefits reported in the survey, while education majors were less likely to report working in jobs that provided paid vacations.

Few differences were found across fields of study with respect to measures of job satisfaction in April 1997

(table E). Engineering majors and health (other than nursing) majors were more likely than all graduates to report being very satisfied with pay. Conversely, education and humanities and arts majors were less likely to be very satisfied with pay. Engineering was the only field in which majors were more likely than all graduates to report high satisfaction with coworkers, while computer science was the only field in which majors reported high satisfaction with working conditions more often than all graduates. Finally, education was the only field in which majors were more likely than all graduates to report being very satisfied with the challenge the job offered.

Gender Differences

The findings of the study illustrated substantial gender differences in earnings among 1992–93 bachelor's degree recipients who did not enroll in graduate school by 1997.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1992–93 Baccalaureate and Beyond Longitudinal Study, "Second Follow-up" (B&B:93/97), Data Analysis System.

These differences were more apparent in 1997, 4 years after most graduates had earned their bachelor's degree, than when graduates first entered the labor market. Looking at individual fields of study, in 1994 men with majors in business, computer science, communications/journalism, and social sciences earned higher salaries than women majoring in these fields. By 1997, men earned more than women in all fields of study except engineering, health (other than nursing), and humanities and arts (figure B).

In a multivariate analysis conducted separately for men and women, several factors, including age, race/ethnicity, and work experience, were associated with women's 1997 salaries, but not with men's salaries. Specifically, after controlling for related variables, including major field of study, women age 30 or older when they received their bachelor's degree earned higher salaries than women age 22 or younger at graduation, as did Asian/Pacific Islander women compared with white women, and women who did not work in any overlapping jobs compared with those who did. For men, on the other hand, only major field of study and institution attended (those attending doctoral-granting private not-for-profit institutions earned more than men in comparable public institutions) predicted their 1997 salaries. These results suggest that women may be subjected to greater scrutiny in entering and advancing in the labor market.

Finally, when asked why they took their 1997 jobs, women were more likely to report that they chose their job because it provided interesting work. In contrast, men were more likely to do so for the job's advancement opportunities or income potential.

Degrees and Other Awards Conferred by Title IV Participating, Degree-Granting Institutions: 1997–98

⁻ Frank B. Morgan

This article was ariginally published as the Summary of the E.D. Tabs repart of the same name. The universe data are from the NCES Integrated Pastsecandary Educatian Data System "Campletians Survey" (IPEDS-C) and "Cansalidated Survey" (IPEDS-CN).

Introduction

This report presents data on postsecondary degrees conferred by U.S. institutions during the 1997–98 academic year (July 1, 1997, to June 30, 1998). The data were collected through the U.S. Department of Education's Integrated Postsecondary Education Data System (IPEDS).¹ IPEDS collects, among other data, the number of degrees and awards conferred in each field of study by award level—ranging from postsecondary certificates requiring less than 1 year of study to doctor's and first-professional degrees² and certificates—and by race/ethnicity and gender of recipient.

Discipline divisions and fields of study are based on classifications delineated in the 1990 version (Morgan, Hunt, and Carpenter 1991) of the Classification of Instructional Programs (CIP) taxonomy. The CIP, developed and maintained by the National Center for Education Statistics (NCES), is the federally accepted standard for collecting, reporting, and interpreting postsecondary education program data.

This report focuses on institutions that (1) have a Program Participation Agreement (PPA) with the Department of Education and thus are eligible to participate in Title IV programs, (2) grant associate's or higher degrees, and (3) are within the 50 states and the District of Columbia. Title IV of the Higher Education Act of 1965 (as amended) establishes federal financial aid programs (e.g., Pell Grants, Stafford Loans) for students attending postsecondary institutions. Students attending institutions with a PPA may be eligible either to receive Title IV funds or to defer repayment of their loans.

²First-professional degrees are awarded after completion of the academic requirements to begin practice in the following professions: Chiropractic (D.C. or D.C.M.); Dentistry (D.D.S. or D.M.D.); Law (L.L.B., J.D.); Medicine (M.D.); Optometry (O.D.); Osteopathic Medicine (D.O.); Pharmacy (Pharm.D.); Podiatry (D.P.M., D.P., or Pod.D.); Theology (M.Div., M.H.L., B.D., or Ordination); or Veterinary Medicine (D.V.M.).

Of the 9,355 postsecondary institutions within the 50 states and the District of Columbia identified by IPEDS, a little less than half (4,455) are categorized as degree granting. Of these, 4,015, or 90.1 percent, are Title IV participating institutions and form the basis for this report.

Degrees Awarded

In the 1997–98 academic year, nearly 2.3 million degrees were awarded by America's Title IV participating, degreegranting institutions. Of the total number of degrees awarded, 24.3 percent were associate's degrees, 51.5 percent were bachelor's degrees, 18.7 percent were master's degrees, 2.0 percent were doctor's degrees, and 3.4 percent were first-professional degrees (table A).

Public institutions awarded the majority of degrees at all degree levels, except for first-professional degrees. Public institutions awarded 81.5 percent of associate's degrees, about two-thirds of bachelor's and doctor's degrees, and 54.8 percent of master's degrees. In contrast, public institutions awarded 39.7 percent of first-professional degrees (table B).

The majority of degrees in 1997–98 at the associate's, bachelor's, and master's levels continued to be awarded to women. Degrees awarded to women at the doctoral level represented 42.0 percent and at the first-professional level 42.9 percent (figure A and table B).

Nearly three-quarters (72.2 percent) of all degrees awarded in 1997–98 were awarded to white students, 19.8 percent were awarded to minority students, and 8.0 percent were awarded to nonresident aliens or individuals whose race/ ethnicity was unknown. These percentages, however, varied considerably by level of degree. For example, nonresident aliens received less than 4 percent of all associate's, bachelor's, or first-professional degrees, but they received 12.2 percent of all master's degrees and 24.6 percent of all doctor's degrees (table B).

The proportion of degrees awarded to minority students was highest at the associate's level (23.2 percent) and dropped at each successive degree level (except firstprofessional) through the doctor's degree; the minority

¹The "Completions Survey" (IPEDS-C) was sent to all institutions that award associate's or higher level degrees or postbaccalaureate or higher certificates and that have Title IV Program Participation Agreements with the Department of Education. Postsecondary institutions that award only less-than-4-year certificates or diplomas reported completions as part of the "Consolidated Survey" (IPEDS-CN). The "Completions" data file combines data from the two surveys so that a complete picture of the universe of participating postsecondary education institutions in the S0 states, the District of Columbia, and the territories is possible.

Table B.—Number and percentage distribution of degrees conferred by Title IV participating, degree-granting institutions, by level of degree, control of institution, gender, and race/ethnicity of recipient: 50 states and the District of Columbia, 1996–97 and 1997–98—Continued

¹Percent change in numbers from 1996–97 to 1997–98.

²First-professional degrees are awarded after completion of the academic requirements to begin practice in the following professions: Chiropractic (D.C. or D.C.M.); Dentistry (D.D.S. or D.M.D.); Law (L.L.B., J.D.); Medicine (M.D.); Optometry (O.D.); Osteopathic Medicine (D.O.); Pharmacy (Pharm.D.); Podiatry (D.P.M., D.P., or Pod.D.); Theology (M.Div., M.H.L., B.D., or Ordination); or Veterinary Medicine (D.V.M.).

NOTE: Percentages may not sum to 100 due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1997 and 1998 Integrated Postsecondary Education Data System, "Completions Survey" (IPEDS-C:96–97 and IPEDS-C:97–98) and "Consolidated Survey" (IPEDS-CN:FY97 and IPEDS-CN:FY98).

shares were 20.0 percent of bachelor's degrees, 15.3 percent of master's degrees, and 12.2 percent of doctor's degrees. (One-fifth [21.5 percent] of first-professional degrees went to minorities.) The drop was even more precipitous when blacks, Hispanics, and American Indians/Alaska Natives are examined separately from Asians/Pacific Islanders. Blacks, Hispanics, and American Indians/Alaska Natives received 18.8 percent of all associate's degrees in 1997–98, 14.1 percent of bachelor's degrees, 10.7 percent of master's degrees, 7.3 percent of doctor's degrees, and 11.9 percent of first-professional degrees (figure A and table B).

Degree Fields

In 1997–98, approximately 85 percent of all associate's degrees were awarded by 2-year institutions, with the remainder awarded by 4-year institutions. Over one-third of all associate's degrees at 2-year institutions were awarded in liberal/general studies and humanities, a field that generally permits transfers to 4-year institutions. Another one-third

were awarded in two occupational fields, business management and administrative services (16.0 percent) and the health professions and related sciences (16.1 percent). In 4-year institutions, 19.4 percent of associate's degrees awarded were in liberal/general studies and humanities, while 18.7 percent and 18.5 percent of associate's degrees were in the health professions and related sciences and in business management and administrative services, respectively. The percentages of associate's degrees conferred by 2-year and 4-year institutions were similar across all fields of study (table C).

Nearly one-fifth (19.3 percent) of all bachelor's degrees were awarded in business management and administrative services. Another 10.6 percent were awarded in the social sciences and history, while 8.9 percent were awarded in education. Bachelor's degrees in mathematics and the physical sciences comprised only 2.6 percent of all bachelor's degrees awarded (table D).

Figure A.—Percentage of degrees awarded to women and minorities, by level of degree: 50 states and the District of Columbia, 1997–98

*First-professional degrees are awarded after completion of the academic requirements to begin practice in the following professions: Chiropractic (D.C. or D.C.M.); Dentistry (D.D.S. or D.M.D.); Law (L.L.B., J.D.); Medicine (M.D.); Optometry (O.D.); Osteopathic Medicine (D.O.); Pharmacy (Pharm.D.); Podiatry (D.P.M., D.P., or Pod.D.); Theology (M.Div., M.H.L., B.D., or Ordination); or Veterinary Medicine (D.V.M.).

Source: U.S. Department of Education, National Center for Education Statistics, 1998 Integrated Postsecondary Education Data System, "Completions Survey" (IPEDS-C:97–98) and "Consolidated Survey" (IPEDS-CN:FY98).

About one-half (50.3 percent) of the master's degrees awarded were in two areas: education (26.7 percent) and business management and administrative services (23.6 percent). Awards in the health professions and related sciences and in engineering constituted the next highest number of master's degrees conferred (9.1 percent and 6.0 percent, respectively) (table D).

At the doctor's degree level, the highest percentage of degrees awarded in 1997–98 was in education (14.6 percent), followed by engineering (13.0 percent). The biological sciences/life sciences and the physical sciences accounted for 10.8 and 9.9 percent, respectively, closely followed by the social sciences and history (9.0 percent) and psychology (8.9 percent) (table D).

CROSSCUTIING STATISTICS

Digest of Education Statistics: 2000 Thomas D. Snyde

⁻ Thomas D. Snyder and Charlene M. Hoffman

This article was excerpted from the Foreword and Introduction to the Compendium of the same name. The sample survey and universe data are from numerous sources, both government and private, and draw especially on the results of surveys and activities carried out by NCES.

The 2000 edition of the *Digest of Education Statistics*, produced by the National Center for Education Statistics (NCES), is the 36th in a series of publications initiated in 1962. (The *Digest* has been issued annually except for combined editions for the years 1977–78, 1983–84, and 1985–86.) Its primary purpose is to provide a compilation of statistical information covering the broad field of American education from kindergarten through graduate school.

The publication contains information on a variety of subjects in the field of education statistics, including the number of schools and colleges, teachers, enrollments, and graduates, in addition to educational attainment, finances, federal funds for education, employment and income of graduates, libraries, and international education. Supplemental information on population trends, attitudes on education, education characteristics of the labor force, government finances, and economic trends provide background for evaluating education data.

In addition to updating many of the statistics that have appeared in previous years, this edition contains a significant amount of new material, including

- public school building deficiencies and renovation plans;
- distribution of high school completers, by selected characteristics;

- percent of high school dropouts, by income level, labor force status, and educational attainment;
- average proficiency in reading for eighth-graders, by selected characteristics and state;
- states with assessment programs in language arts, reading, and writing;
- enrollment and degrees conferred in women's colleges, by institution;
- total revenue of private not-for-profit degree-granting institutions, by source of funds and type of institution; and
- total expenses of private not-for-profit degreegranting institutions, by purpose and type of institution.

Participation in Formal Education

In the fall of 2000, about 68.0 million persons were enrolled in American schools and colleges (table A). About 4.0 million were employed as elementary and secondary school teachers and as college faculty. Other professional, administrative, and support staff of educational institutions numbered 4.4 million. Thus, about 76.4 million people were involved, directly or indirectly, in providing or receiving formal education. In a nation with a population of about 275 million, more than 1 out of every 4 persons participated in formal education.

Table A.—Estimated number of participants in elementary and secondary education and in degree-granting institutions: Fall 2000

(In millions)								
	All levels (elementary, secondary, and higher	Elementa	ry and secon	idary schools	Degree	-granting in	stitutions	
Participants	education)	Total	Public	Private	Total	Public	Private	
Total	76.4	59.1	52.5	6.6	17.3	13.1	4.2	
Enrollment ¹	68.0	53.0	47.0	6.0	15.0	11.6	3.5	
Teachers and faculty ²	4.0	3.3	2.9	0.4	0.7	0.5	0.2	
Other professional, administrative, and support staff	² 4.4	2.9	2.6	0.2	1.5	1.0	0.5	

¹Enrollment figures include students in local public school systems and in most private schools (religiously affiliated and nonsectarian). Elementary and secondary enrollment includes most kindergarten and some nursery school enrollment, but excludes preprimary enrollment in schools that do not offer first grade or above. Enrollment figures for degree-granting institutions comprise full-time and part-time students enrolled in degree-credit and nondegree-credit programs in universities, other 4-year colleges, and 2-year colleges that participated in Title IV federal financial aid programs.

²Data for teachers and other staff in public and private elementary and secondary schools and colleges and universities are reported in terms of full-time equivalents. NOTE: Detail may not sum to totals due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, unpublished projections and estimates. (This table was prepared in August 2000.) (Originally published as table 1 on p. 11 of the complete report from which this article is excerpted.)

Elementary/Secondary Education

Enrollment

Since the enrollment rates of kindergarten and elementary school-age children have not changed much in recent years, increases in elementary school enrollment have been driven primarily by increases in the number of young people. Enrollment in public elementary and secondary schools rose 19 percent between 1985 and 2000.* The fastest public school growth occurred in the elementary grades, where enrollment rose 24 percent over the same period, from 27.0 million to a record high of 33.5 million in 2000. Secondary enrollments in public schools declined 8 percent from 1985 to 1990, but then rose by 19 percent from 1990 to 2000, for a net increase of 9 percent. Enrollment in private elementary and secondary schools grew more slowly than enrollment in public schools over this period, rising 7 percent, from 5.6 million in 1985 to 6.0 million in 2000. As a result, the percentage of students enrolled in private schools declined slightly, from 12 percent in 1985 to 11 percent in 2000.

NCES forecasts record levels of enrollment for the next several years. The fall 2000 public school enrollment marks a new record, and new records are expected every year through the early 2000s. Public elementary enrollment is projected to grow slowly through 2001 and then decline slightly, so that the fall 2010 projection is slightly lower than the 2000 enrollment. In contrast, public secondary school enrollment is expected to have an increase of 4 percent between 2000 and 2010.

Teachers

An estimated 3.3 million elementary and secondary school teachers were engaged in classroom instruction in the fall of 2000. This number has risen in recent years, up about 18 percent since 1990. The number of public school teachers in 2000 was 2.9 million, and the number of private school teachers was about 0.4 million. About 2.0 million teachers taught in elementary schools, while about 1.3 million were teaching at the secondary level.

The number of public school teachers has risen slightly faster than the number of students over the past 10 years, resulting in small declines in the pupil/teacher ratio. In the fall of 1999, there were 16.2 public school pupils per teacher, compared with 17.2 public school pupils per teacher 10 years earlier. During the same time period, the pupil/teacher ratio in private schools remained relatively stable. Data from the end of the 1990s suggest a continuation of the historical trend toward lower public school pupil/teacher ratios, which had been stable during the late 1980s and early 1990s.

The salaries of public school teachers, which lost purchasing power to inflation during the 1970s, rose faster than the inflation rate during the 1980s. The rising salaries reflected an interest by state and local education agencies in boosting teacher salary schedules and, to some extent, an increase in teachers' experience and education levels. Since 1990–91, salaries for teachers have generally maintained pace with inflation. The average salary for teachers in 1998–99 was \$40,582, about the same in constant dollars as at the beginning of the decade.

^{*}The 2000 enrollment data are based on projections.

Student performance

The national results that follow are based on the National Assessment of Educational Progress (NAEP) Long-Term Trend Assessment component (Campbell, Hombo, and Mazzeo 2000).

Reading. Overall, the reading achievement scores for the country's 9-, 13-, and 17-year-old students are mixed. Reading performance scores for 9- and 13-year-olds were higher in 1999 than they were in 1971. However, the 1999 scores were about the same as the 1984 scores. The reading performance of 17-year-olds was about the same in 1999 as it was in 1971.

Black 9-, 13-, and 17-year-olds exhibited higher reading performance in 1999 than in 1971. However, performance for all three age groups in 1984 was about the same as in 1999. The performance levels of white 9- and 13-year-olds also rose between 1971 and 1999. Separate data for Hispanics were not gathered in 1971, but changes between 1975 and 1999 indicate an increase among 9-, 13-, and 17-yearolds. There was no significant difference between the 1984 and 1999 reading performance of 9-, 13-, and 17-year-old Hispanics.

Mathematics. Results from assessments of mathematics proficiency indicate that 9-, 13-, and 17-year-old students improved their performance between 1973 and 1999. However, there has been no significant change for any of the three age groups since 1994.

White, black, and Hispanic students improved their mathematics performance between 1973 and 1999, among all three age groups. However, mathematics scores for white, black, and Hispanic 9-, 13-, and 17-year-olds did not improve between 1994 and 1999.

Science. Long-term changes in science performance have been mixed, though changes over the past 10 years have been generally positive. In 1999, science performance among 17-year-olds was lower than in 1970, but higher than in 1990. The science performance level of 13-year-olds in 1999 was about the same as the level in 1970 and in 1990. The science performance of 9-year-olds increased between 1970 and 1999, but there was no significant difference between 1990 and 1999.

The science performance of white 9- and 13-year-olds was higher in 1999 than it was in 1970. The performance score for white 17-year-olds was lower in 1999 than in 1970.

However, only the 17-year-olds had a higher score in 1999 than in 1990. Black 9- and 13-year-olds had higher science performance in 1999 than in the 1970s. The scores for black 9-, 13-, and 17-year-olds in 1999 were about the same as scores in 1990. The scores for 9-, 13-, and 17-year-old Hispanic children were higher in 1999 than in 1977. Scores for Hispanic 17-year-olds showed an increase between 1990 and 1999.

International comparisons. The results of the 1995 Third International Mathematics and Science Study (TIMSS) show that U.S. fourth- and eighth-graders compare more favorably with students in other countries in science than in mathematics. In mathematics, U.S. eighth-graders scored below the international average, falling below 20 of the 41 countries tested. Fourth-graders performed above the international average, scoring below 7 of the 26 countries tested, including Singapore, Korea, and Japan. Students at both the fourth- and eighth-grade levels scored above the international average in science. Eighth-grade students in the United States were outperformed by those in 9 out of 41 countries. Fourth-grade students once again compared more favorably with their international counterparts than eighth-grade students. Out of 26 countries that participated in the fourth-grade assessment, students in only 1 country outperformed the U.S. students in science.

The international standing of U.S. students was stronger at the 8th grade than at the 12th grade in both mathematics and science among the countries that participated in the assessments at both grade levels. U.S. 12th-graders performed below the international average and among the lowest scoring of the 21 countries on the assessment of mathematics general knowledge. U.S. students were outperformed by those in 14 countries, and outperformed those in 2 countries. U.S. 12th-graders also performed below the international average and among the lowest scoring of the 21 countries on the assessment of science general knowledge. U.S. students were outperformed by students in 11 countries, and they outperformed students in 2 countries. Our students' scores were not significantly different from those of seven countries, including France, Germany, Italy, and the Russian Federation.

Higher Education

Enrollment

College enrollment hit a record level of 14.5 million in fall 1998 and was expected to reach a new high of 15.1 million in 2000. Despite decreases in the traditional college-age population during the 1980s and early 1990s, total

81

enrollment increased because of the high enrollment rate of older women and recent high school graduates. Between 1990 and 1998, the number of full-time students increased by 10 percent compared to no increase in part-time students.

۰.

Faculty and staff

During the fall of 1997, there were 990,000 faculty members in degree-granting institutions. Making up this figure were 569,000 full-time and 421,000 part-time faculty. In 1992, full-time instructors generally taught more hours and more students than part-time instructors, with 61 percent of full-time instructors teaching 8 or more hours per week and two-thirds teaching 50 or more students. About 30 percent of part-time instructors taught 8 or more hours per week, and 30 percent taught 50 or more students.

White males constituted a disproportionate share of fulltime college faculty in 1997. Overall, about 55 percent of full-time faculty were white males. However, this distribution varied substantially by rank of faculty. Among full professors, the proportion of white males was 72 percent. The proportion was somewhat lower among the lower ranked faculty, with white males making up 39 percent of the lecturers.

Graduates, Degrees, and Attainment

The number of high school graduates in 1999–2000 totaled about 2.8 million. Approximately 2.5 million graduated from public schools, and less than 0.3 million graduated from private schools. The number of high school graduates has declined from its peak in 1976–77, when 3.2 million students earned diplomas. In contrast, the number of GED credentials issued rose from 342,000 in 1975 to 516,000 in 1999. The dropout rate also declined over this period, from 14 percent of all 16- to 24-year-olds in 1977 to 11 percent in 1999. The number of postsecondary degrees conferred during the 1999–2000 school year by degree level has been projected: 559,000 associate's degrees, 1,185,000 bachelor's degrees, 398,000 master's degrees.

The Bureau of the Census has collected annual statistics on the educational attainment of the population in terms of years of school completed. Between 1990 and 1999, the proportion of the adult population 25 years of age and over with 4 years of high school or more rose from 78 percent to 83 percent, and the proportion of adults with at least 4 years of college increased from 21 percent to 25 percent. During the same period, the proportion of young adults (25- to 29-year-olds) with 4 years of high school or more showed a small increase of about 2 percentage points, reaching 88 percent in 1999, and the proportion with at least 4 years of college rose from 23 percent to 28 percent.

Education Expenditures

Expenditures for public and private education, from preprimary through graduate school (excluding postsecondary schools not awarding associate's or higher degrees), are estimated at \$647 billion for 1999–2000. The expenditures of elementary and secondary schools are expected to total about \$389 billion for 1999–2000, while those of colleges and universities will be about \$258 billion. Viewed in another context, the total expenditures for education are expected to amount to about 7.0 percent of the gross domestic product in 1999–2000, about the same percentage as in the recent past.

Summary

The statistical highlights presented here provide a quantitative description of the current American education scene. Clearly, from the large number of participants, the number of years that people spend in school, and the large sums expended by educational institutions, it is evident that the American people have a high regard for education. Assessment data indicate that there have been improvements in the mathematics and science performance of 17-year-olds between 1990 and 1999. A high proportion of high school graduates are going on to college. Yet, wide variations in student proficiency from state to state and mediocre mathematics scores of American students in international assessments pose challenges.

Data Products

Data File: CCD National Public Education Financial Survey: School Year 1997–1998

The Common Core of Data (CCD) "National Public Education Financial Survey" provides detailed data on public elementary and secondary education finances for the 50 states, District of Columbia, and five outlying areas. Financial data are audited at the end of each fiscal year and then submitted to NCES by the state education agencies (SEAs) from their administrative records. This file provides data for fiscal year 1998 (school year 1997–98). The data set contains 56 records, one for each reporting state or jurisdiction. For each state or jurisdiction, the data file includes revenues by source (local, intermediate, state, and federal); local revenues by type (e.g., local property taxes); current expenditures by function (instruction, support, and noninstruction) and by object (e.g., teacher salaries or food service supplies); capital expenditures (e.g., school construction and instructional equipment); average number of students in daily attendance; and total number of students enrolled.

The data can be downloaded from the NCES Web Site either as an Excel file or as a flat file that can be used

with statistical processing programs such as SPSS or SAS. Documentation is provided in separate files.

For questions about this data product, contact Frank Johnson (frank_johnson@ed.gov).

To obtain this data product (NCES 2000–322), visit the NCES Web Site (http://nces.ed.gov).

Other Publications

The 1998 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1998, 1994, 1990, 1987, and 1982 High School Graduates

Eyal Blumstein, Nancy Caldwell, Jacqueline Haynes, Tom Krenzke, Judy Kuhn, Robert Perkins, Stephen Roey, Keith Rust, and Mark Waksberg

This report presents data from the 1998 High School Transcript Study (HSTS)—the latest in a series of transcript studies undertaken by NCES—and from previous studies in the series. In the 1998 HSTS, more than 25,000 transcripts of students who graduated in 1998 from public and nonpublic high schools were collected from a nationally representative sample of schools. The HSTS studies provide the Department of Education and other education policymakers with information about current and past student coursetaking patterns, as well as the relationship of coursetaking patterns to achievement, as measured by the National Assessment of Educational Progress (NAEP).

The tables in this report summarize the coursetaking patterns of students who graduated in 1998; the coursetaking patterns of their counterparts who graduated in 1994, 1990, 1987, and 1982; and the relationship of coursetaking patterns to grade 12 performance on NAEP. Also included in the report are an introduction to the tables; a description of the subject area taxonomy; directions for testing the significance of differences reported in the tables; and descriptions of the 1994, 1990, 1987, and 1982 studies. A companion volume, *The 1998 High School Transcript*

Study User's Guide and Technical Report (NCES 2001–477), provides details about how the 1998 HSTS was conducted and about how to use the data files.

The 1998 High School Transcript Study User's Guide and Technical Report

Eyal Blumstein, Nancy Caldwell, Tom Krenzke, Stan Legum, Judy Kuhn, Stephen Roey, Keith Rust, Mark Waksberg, Laura Coombs, and Jacqueline Haynes

The 1998 High School Transcript Study (HSTS) is the latest in a series of transcript studies undertaken by NCES. In this study, more than 25,000 transcripts of students who graduated in 1998 from public and nonpublic high schools were collected from a nationally representative sample of schools. The study provides the Department of Education and other education policymakers with information regarding current course offerings and student coursetaking patterns, as well as the relationship of coursetaking patterns to achievement, as measured by the National Assessment of Educational Progress (NAEP).

This publication combines information that in previous years had been divided into two publications: the *Data File User's Manual* and the *Technical Report*. It describes the procedures used to collect and summarize the 1998 HSTS data, provides information needed to use all the publicly released data files produced by the study, and discusses how the study is related to NAEP. A companion volume, *The 1998 High School Transcript Study Tabulations* (NCES 2001–498), provides extensive tables of study results.

Author affiliations: E. Blumstein, N. Caldwell, T. Krenzke, S. Legum, J. Kuhn, S. Roey, K. Rust, and M. Waksberg, Westat, Inc.; L. Coombs and J. Haynes, Intelligent Automation, Inc.

Entering Kindergarten: A Portrait of American Children When They Begin School: Findings From *The Condition of Education: 2000*

Nicholas Zill and Jerry West

In the fall of 1998, the Early Childhood Longitudinal Study, Kindergarten Class of 1998–99 (ECLS-K) began collecting data on the knowledge, skills, health, and behavior of a large and nationally representative sample of American kindergartners. In addition to interviews with parents, questionnaires to teachers, and abstracts of school records, the 1998 data collection included standardized, one-on-one assessments of about 19,000 kindergartners attending 940 public and private schools. ECLS-K will follow these children through the 5th grade.

This 30-page essay, originally published in *The Condition of Education: 2000*, summarizes information about the academic skills (reading, mathematics, and general knowledge), social skills and behavior, physical health, and interest in learning of American children at the time they enter kindergarten. It includes discussion of differences in skills, health, and behavior by age, sex, and family risk factors.

Author affiliations: N. Zill, Westat, Inc.; J. West, NCES.

Highlights From the Third International Mathematics and Science Study–Repeat (TIMSS–R)

Patrick Gonzales, Christopher Calsyn, Leslie Jocelyn, Kitty Mak, David Kastberg, Sousan Arafeh, Trevor Williams, and Winnie Tsen

The 1999 Third International Mathematics and Science Study–Repeat (TIMSS–R), a successor to the 1995 TIMSS, focuses on the mathematics and science achievement of eighth-grade students in participating nations. TIMSS–R allows the United States to compare the achievement of its eighth-graders in the 1995 TIMSS to the achievement of its eighth-graders 4 years later. The performance of U.S. fourth-graders relative to those of other nations in 1995 can also be compared to the performance of U.S. eighth-graders relative to those of the same nations 4 years later.

This eight-page brochure summarizes important findings from TIMSS–R. Comparisons of student achievement are made between the 38 nations that participated in TIMSS–R in 1999; between the 23 nations that participated in both TIMSS and TIMSS–R at the eighth-grade level; and between the 17 nations that participated at the fourth-grade level in TIMSS and at the eighth-grade level in TIMSS–R. The brochure also notes differences in eighth-grade teaching and curriculum between the United States and the other TIMSS–R nations.

Pocket Projections: Projections of Education Statistics to 2010

William J. Hussar

Each year, NCES publishes this pocket summary of the *Projections of Education Statistics*. The pocket summary provides the reader with key information extracted from the full report. Included are data on enrollment at all education levels, numbers of high school graduates, earned degrees conferred, classroom teachers, and expenditures for public elementary and secondary schools and institutions of higher education. This year's edition of *Pocket Projections* includes 1987–88 data as well as estimates for 1998–89 and projections for 2009–10.

Author affiliation: W.J. Hussar, NCES.

For questions about this pocket summary, contact William J. Hussar (william_hussar@ed.gov).

To obtain this pocket summary (NCES 2001–048), call the tollfree ED Pubs number (877–433–7827) or visit the NCES Web Site (http://nces.ed.gov).

Funding Opportunities

The AERA Grants Program

Jointly funded by the National Science Foundation (NSF), NCES, and the Office of Educational Research and Improvement (OERI), this training and research program is administered by the American Educational Research Association (AERA). The program has four major elements: a research grants program, a dissertation grants program, a fellows program, and a training institute. The program is intended to enhance the capability of the U.S. research community to use large-scale data sets, specifically those of the NSF and NCES, to conduct studies that are relevant to educational policy and practice, and to strengthen communications between the educational research community and government staff.

Applications for this program may be submitted at any time. The application review board meets three times per year.

For more information, contact Edith McArthur (edith_mcarthur@ed.gov) or visit the AERA Grants Program Web Site (http://aera.ucsb.edu).

The NAEP Secondary Analysis Grant Program

The NAEP Secondary Analysis Grant Program was developed to encourage education researchers to conduct secondary analysis studies using data from the National Assessment of Educational Progress (NAEP) and the NAEP High School Transcript Studies. This program is open to all public or private organizations and consortia of organizations. The program is typically announced annually, in the late fall, in the *Federal Register*. Grants awarded under this program run from 12 to 18 months and awards range from \$15,000 to \$100,000.

For more information, contact Alex Sedlacek (alex_sedlacek@ed.gov).
