ABSTRACT

In describing this media management system, which currently serves 84 public schools (K-12) in four rural counties east of Sacramento, this report suggests that the computer is a practical solution for film libraries trying to keep pace with increased use while not reducing their expenditures for purchasing and repairing film stock. The major parts of the description include the creation of its film catalog, film booking procedures and computer programs, equipment (present and future), and a five-year projection (1978-1983). Also discussed are the main entry and/or record size, the alliance of the system with the computer department, the potential for interfacing with the system, other computerized film booking operations, and the secrets of financing this computerized management system. Appendices present input worksheets, the subject headings used, the system's media catalogs, various examples of ICR (input, confirmation, and rejection) reports, and other data sheets. (JD)

THE PLACER MEDIA MANAGEMENT SYSTEM
or
USING THE COMPUTER IN THE SMALL FILM LIBRARY

Background

The Educational Film Center, as a unit of the Placer County Office of Education in Auburn, California, currently serves 84 public schools (K-12) in four rural counties east of Sacramento. It operates under a joint powers agreement with Nevada, Sierra and Alpine counties. It has a separate agreement to exchange high school films with film libraries in El Dorado, Amador and Calaveras counties to serve high schools.

The potential number of teacher borrowers is approximately 1,500 for the counties of Placer, Nevada, Sierra and Alpine. In order to keep the file size as small as possible, not all teacher's names are entered, just those who actually do borrow, or about 1,300.

The original file for film titles was estimated to be about 2,500 entries, but has increased to about 4,500 due to duplicate copies, the need to supply books that accompany children's literature films, and the need to inventory three-dimensional models and a-v hardware for loans and insurance purposes.

The origin of the Placer County Office media collection began about 1953, when state funding made possible the establishment of a large regional collection of library books, media (including films), a-v equipment, repair services, and professional and clerical staffing to serve public school students. Federal funding beginning with NDEA Title III in 1958, and with ESEA Title III in 1965, made possible the enlargement of the materials base even with the increase in student population. State funds dried up in 1964-5. Districts had been contributing only a small portion to this service, and were unwilling to replace the entire amount needed when federal funds were being diminished in the late 1960's.

When the impact of increased labor costs and inflation in cost of materials was put with the lessened funding base, county office media collections throughout California began collapsing. Again and again the

low cost items (children's books, filmstrips, records, study prints) were placed in schools, and staff was reduced in county offices. The demise of such a major service caused serious thinking to occur about the continuance of regional or county-wide 16mm film collections. Districts began increasing contributions -- but invariably staff salary increases and increased purchase costs chewed into and exceeded the increased contribution. When school populations and film use ascended, and labor was needed to supply service to them, it was rapidly seen that one new employee's salary and benefit package could drastically reduce the funds available for purchasing and repairing film stock.

The problems of keeping a film collection and serving an increased audience had to be examined. The bulk of tasks in a film library are repetitive, monotonous, and can be readily time-studied. So growth of clerical staffing can be projected. Some tasks may be unnecessary and eliminated, and some staff may be 'featherbedding,' but when these items have been halted, staff will have to increase as circulation services increase, if tasks are done manually. The computer can allow an escape from this truism -- at least for a while. Therefore, if a new employee would consume a \$10,000 salary outlay, why not consider what \$10,000 could purchase in computer development to perhaps halt future additional staff growth.

The Placer Media Management System

The only computer around the Placer County Office of Education in 1968 was a fairly new one, an NCR 100, replacing financial posting machines, checkwriters, ledger cards in boats, etc. It had a 16k capacity (we now have a 32k capacity). It could use paper/card stock of various sizes and carbons. It was 300 baud to keep us on inexpensive phone lines, and to make allowance for the unknown quality of many-year-old phone lines and diverse small phone companies criss-crossing the mountain area of these rural counties. (Baud is a unit of one dot per second used in measuring the speed of signaling in telegraphic code.)

When a programmer and a data console operator began work there was so much to do in the business office they were swamped for two years. Staff was added -- who were able to clear up the excess work, and when they appeared ready for another task, that's when they were contacted about putting the film catalog data into the computer. They agreed that

when the catalog was in a brand-new issue, that was the time to input it on to a computer tape. (The reader can see right here that the key-punch card was out-of-date.)

The Main Entry and/or Record Size

This is the crux of your planning. You have to put into the computer everything you expect to ever get back to you on a printed form. The programmer will say he has a 'record length' of 180 digits or some number, so you begin using these digits up, with 47 or so for title, 6 for each subject heading, etc. The annotation and the vendor information will take you well past the first 180, the second 180, and into the third 180. We determined, to keep the bulk of the finished catalog within reason, to limit the annotation to five lines. A sample of the main entry we ended with, and have been satisfied with for five years is shown in APPENDIX A, page AA, (buff). The 1st Record listing is illustrated on page 3a.

What the library world calls 'main entry,' the programmer calls 'first record,' so hence forth the words will be used interchangeably. The 1st record size is such that it can be used for library books, and small media, too, so readers should not exclude that possibility. The 'main entry' contains fields (empty spaces, for you initiates) for:

- o 6 numbers which alphabetize the item,
- o a letter to denote which county film library has the item,
- o a letter to allow 'restriction' to certain borrowers,
- o 6 numbers to give the 'call number,'
- o a number to give copy number,
- o a number to give 'how many items make up the set' (as 2 reels, or 4 filmstrips),
- o 6 fields of subject numbers each is 6 digits long. These are further coded (see SUBJECT HEADINGS),
- o 3 numbers for time, 1 letter for color, 2 numbers for production date (last two digits of year),
- o a title line, 49 characters long,
- o 5 lines of annotation, each 47 characters long,
- o 4 numbers for Purchase Order detail,
- o 6 letters for Vendor name,
- o 4 numbers for Cost of item,
- o 4 numbers for month/year of purchase,
- o and several other fields which are being reexamined. Originally planned to show replacement/repair costs, damage count etc., these have not been meaningful. Plans now call for noting a) purchased under special funding (as 92-142), or b) ESEA Title IV-B (and thus available to parochial schools), c) latent-edge numbered items, and d) video-taping rights were purchased, etc.

From this main entry the computer can take any of the above fields (assuming you would want to have programming done for it) and sort it into an array. Reports requested to date include:

- o alpha list of titles (sorted by a number (computer number), due to the unusable abc arrangement when computers do their own alphabetizing and come to commas, apostrophes, dashes, etc.).
- o number list of call numbers,
- o number list of call numbers, showing all copies, for taking shelf-rack inventory,
- o alpha list, sorted by which county film library holds the title,
- o number list, sorted by which county film library holds the title,
- o number list of production dates (are holdings relevant to school subjects),
- o number list of subject heads,
- o number list of subject heads, sorted by first digit code (see SUBJECT HEADINGS),
- o alpha list showing every field (called FIRST RECORD report),
- o call-number list showing every field,
- o alpha list, showing all copies, with cost, vendor, date of purchase,
- o summary report of total number of items in the library, and the total dollar investment.

The First Program: The Film Catalog

Once the fields and record length of the lat record were established, one film center employee (who was not a trained typist, nor with any interest in computers) began typing the catalog onto the console (a typewriter that used what looked like a 7-inch audio tape instead of paper). That tape was then transmitted, at high speed, into the computer and ended up on a disc pack. This disc was purchased (\$400) and the tape too (\$20), by the film center. They will hold data for many years. The tape is used over and over, whereas the disc is updated in spots.

By inserting new film purchases, deleting discards, and asking the computer to sort on the Control Number (which alphabetizes it), and then sub-sort on the first digit in the subject heading field (see SUBJECT HEADINGS), catalogs can be generated for various grade levels, or for inter-county use.

Subject headings. The field for one subject heading is six digits long. The first digit is assigned to be the one which triggers the version of the catalog in which the film gets printed. A '1' gets assigned to the K-8 catalog, a '2' gets printed in the K-8 and 9-12 catalog, a '3' gets

printed in only the 9-12 catalog. The agreement with El Dorado, Amador and Calaveras is for the loan of only high school films.

The next two digits trigger a new heading to appear on the top center of the page. This notes major 'chapter' breakdowns in the subject section of the catalog. The next two digits note the sub-topics along the left margin, under which films are listed. The last digit allows opportunity for various clues. These can be studied by referring to APPENDIX A, page AM, (pink).

A partial list of all subject headings presently in use is shown in APPENDIX B, page BA. We used quick massive input system to get all subjects tied down to their appropriate film titles. A sample of that form is not included. A similar one we now use is shown in APPENDIX A, page AC, (buff).

Inter-county films. As mentioned earlier, the film libraries in Amador, Calaveras and El Dorado county offices of education share their secondary-level films with Placer. Sometimes the films duplicate titles held by Placer. In that event, the call-number for these holdings need to be input, and need to be extracted onto the master for printing the secondary catalog. The input sheet is shown in APPENDIX A, page AD, (green). The media catalog page showing these inter-county film codes is shown in APPENDIX B, page BB.

Deleted films. Yearly, staff examines the film collection for damage, out-of-date content, and low usage. Films are removed from the collection to allow room on the racks for new items. Only seven digits need to be input to the computer to remove all trace of the film out of the catalog program and out of the booking program. The input sheet is shown in APPENDIX A, page AE, (canary).

Audit routines. The programmer wrote many audit routines into the catalog. The computer will check the subject heading fields, and if all of them have been left empty, it will pump out this film on a report for staff to examine and make needed remedies. This audit eliminates the possibility of a film title appearing in the annotated section of the catalog, but not in the subject section. For those of you with more sophisticated awareness, you can occasionally desire to not list a film in any school catalog, as the CHP film on emergency childbirth procedures; in this case you deliberately do not fill in any subject heading fields. The film does not get printed in any school catalog, but is printed on all

in-house reports for shelf inventory, for vendor/cost insurance policies, etc.).

Another audit routine checks the annotation field, and if one has not been entered, the notation "NO ANNOTATION" is printed in its place. When editing the annotated section prior to having masters printed for the press, these lines are noted and annotations are prepared whenever possible.

Printing the catalog masters. Once the data was in, and masters for the printing room were possible, (it took only 15 minutes for a 200-page catalog of masters to be printed), there was no way to stop dreaming about what other wonders the computer could do for the film center. To compare: the task of hand typing such a catalog would take weeks, and be riddled with transposed call numbers, dropped lines, films listed in no subject categories at all, etc., see APPENDIX B, pages BC and BD.

Printing can-lid labels. The catalog printing program allowed printing data onto formats other than just a paper list.

Self-adhesive labels, with permanent sticking ability, were printed for each film can lid. The label repeated the full title, order number, annotation, producer, time, production date, and grade level (all of which are also printed in the catalog); it proved to be very valuable in answering questions at the counter, and in informing teachers as to the film's content when a can had no descriptive matter from the producer, or had the can bent so badly it was replaced. A sample is illustrated below.

See APPENDIX A, AF, for the input sheet for can-lid labels.

and tapes were obtained free, in exchange for a finance program of Placer's. Because they were not complex, nor atuned to third or fourth generation equipment, nor using terminals in off-site buildings, the programs were not usable. The programmer's summer vacation through Oregon, and a days per diem to stop by OTIS (Oregon's Total Information System) brought back a goal. A \$50 investment obtained their programs, with language in something unusable. A swap of work with another programmer brought a vague translation -- and two years later serious results were on a trial piece of paper.

The original planning looked to the future -- of using light pens to check films back in to the library, of off-site terminals, of additional small-county inter-library loans and union catalog needs; of changing delivery schedule annually; of changing length of loan periods (1 day to 14 at present); of creating innumerable documents for governing board reporting; for maintaining history files of loan activities and allowing on-line inquiry into innumerable sub-programs; of security systems to give only valid inquirers access into management programs. Also, input from computer and curriculum personnel and the author considered:

- the ability to print via terminal, via a small local printer, and at the main computer, as report length, and paper format dictate;

- the capacity to use opscan forms direct from teacher (bypass labor needs at film center);

- that horizons may call for serving junior colleges, parochial schools, and/or participate in large multi-agency loan agreements;

- the potential for pupil self-selection of learning materials;

- the ability to input holdings of other libraries (as the collections of El Dorado, Amador and Calaveras, which are listed in the printed catalog, and appear in some inquiry programs, even though the booking operation is not presently conducted on films from other libraries. If those libraries so desired, however, it would be a simple matter to open their film titles to the booking program, and a terminal at their sites would allow all to use the data base, and the programs of the PMMS. The field lengths of the main entries, the call numbers, and the subject headings have considered this possibility.)

The computer was too loaded down with financial volume to add the film

booking work, so the Educational Film Center staff prepared input sheets with school names, teacher names, delivery day schedules, route sequences, etc., and during some weeks the computer staff found an hour to get it on to tape and disc. See APPENDIX A, page AH, (pink), and APPENDIX B, pages BE and BF. Input for number of copies of each title owned, and vendor cost, was made.

There was at least a year delay, and no known date was stated for resolution. A major confab of the programmer, his boss, the author and her boss brought about a new appreciation -- the programming of the calendar and how it would function was stymieing the programmer. It was agreed to contact an expert, to foot a \$200 or so consultation; this got us rolling, and booking began.

A parallel manual operation was planned, work steps were PERTed, but somehow we couldn't figure out how to locate the labor to get all the data that was captured on the Wheeldex system on to the computer, and still operate our daily runs and shipments. The decision was made to just begin in March -- and we did. When the manual system said to ship this, and the computer said to ship it somewhere else, we followed the manual system. We looked forward to the beginning of June and the end of school, for we knew we could get on the same track if we could get the computer to have all the teacher requests. The March-June experience allowed us to see the accuracy of the programs, the printing of labels, of delivery reports, of overdue reports, etc. -- and to find out the labor that was needed for the new system.

By August, 1977, we had input our new purchases, deleted old items, run masters, printed new catalogs, signed up new borrowers, and begun a new school year totally on computer.

Ordering a film. The programmer developed a sample order form outlining the data that would be needed to activate the booking process. It was felt it would be similar to an opscan order sheet when we would be switching to that and that training of teachers would be a simple task. A copy of the order form, the MEDIA BOOKING WORKSHEET can be found on the next page.

Many meetings were held to train one person at each site. Attendance was voluntary and sporadic. Trips were made to locations throughout the several counties to train, plead, answer inquiries, etc. Staff at the film center did massive editing of the worksheets. After more training

sessions and returning all worksheets to teachers (to have them scan the corrections just as they expect their students to do) to prompt them to improve, we finally halted editing -- to let them get the built-in responses that they had used a weekend date, or a holiday, or a wrong film number, or a wrong school number, etc.

Frustration was high -- but somewhat successful. Staff returned to editing sheets and contemplates another weaning period immediately.

The data on each sheet is typed at the terminal onto a cassette tape, later sent via phone to the computer and the answers get pumped out immediately on to the paper scroll on the terminal. This is a terminal.

The on-line time to send the tape and get the responses is about 7 seconds per film requested. The computer has so much activity going on it that we are not currently on-line for many hours a day. By fall 1978, with the computer update that is planned, we will be on-line much more.

Ordering a film and a book. A small number of children's picture books have been filmed directly from the pages. These books are usually the outstanding award winners for the year (the Caldecott Award). Due to the quality of these books, and their sizeable motivation in the early grades in interesting children in reading, or in seeing that tales can be put on paper with words, these books have been greatly used in schools. Now that films are available it is possible for a teacher to interest an entire class in wanting to read, or to repeat through reading, the lovely film experience. The Educational Film Center has made it a practice when purchasing such a film, to also purchase several books that match it, and to ship both to a teacher. Originally the teacher needed to make two separate orders to receive both. Now, a computer program will automatically schedule the book, when the film is ordered.

The individual confirmation card to the teacher for the book carries the note 'AUTO BOOKING.'

Inquiry programs. The programmer has created many inquiry programs for use on-line, to locate answers to phone and walk-in traffic. To obtain access to one of these programs requires three keys be depressed on the terminal's keyboard, usually mnemonic to the topic of interest. Typing MBK, for 'media booking, keyboard,' allows a film to be booked instantly. The program 3-letter codes, the input requested (usually the film's call number or a date, or a school and teacher number), and the computer's instant response on to the paper scroll are demonstrated on the following five pages.

INQUIRY CODES

MBK Media Booking Keyboard Input
MBKM Media Booking Keyboard Input (Modified)
MBT Media Booking Tape Cassette Input [No sample given]
MBTM Media Booking Tape Cassette Input (Modified)
MAV Media Availability Code Changes, and Listing
MBA Media Booking Activity
 All copies or specific copy
 All dates or specific beg-end date
MCD Media Calendar Display
 Displays available and non-available days
 All months or specified beg-end month-yr
MOC Media Other Counties
 PCOE copies available
 Other counties/media no. if available
MTA Media Title and Annotation
MSB Media Subject Numbers
MYC Media Vendor and Cost (Purchase dates) [Will also show
 latent-edge numbering and or video-tape rights]
MRT Media Returns Tape
 Provides a "Returns" tape cassette for EFC
CMD Conversational Mode with Central Data Processing Operator
(SPECIAL) Performs Special Media Booking for last minute requests.
 (By-passing normal two-day lead time for booking, thus
 film staff is responsible for manually creating Delivery
 Labels, noting on Delivery Report, etc.)

Samples of these inquiry programs (the key strokes the film-staff types into the terminal are underlined), as they are printed out on the paper scroll of the terminal, follow this page. These could also be printed on cathode-ray tube, and save the expense of the thermal paper.

The Individual Confirmation Card

Each film requested has a response back to the teacher placing the order. The manual system had provided this one-to-one response, and teachers found they relied on it to develop their day's lesson. They would insert the confirmation in their lesson-plan book, as a reminder to pick it up, to schedule the projector and screen, etc. The programmer had not expected to have individual replies, thinking the one long listing per school (see the ICR, in APPENDIX B, page BG) would be sufficient; however teachers indicated they did too need individual responses. The individual reply is shown below:

	P.C.O.E.-E.F.C. MEDIA BOOKING

The delivery label. As films are pulled from the racks to be sent to a school, staff has two matching sets of documents, the Delivery Report (each school for the day has one), and the Delivery Labels. The film is pulled, the Delivery Label is stuck on the can lid. This label, in contrast to the larger one mentioned earlier, has semi-permanent adhesive, and is made of a rubber-type material -- all of which is designed to make removal a one-step operation. It stays on the can only for the duration of the loan.

11-266* 73-	RT 2-02	11-18-77
LEGEND OF JOHNNY APPLESEED		
DIAMOND VALLEY		10103
KARRASCH	9000010	U-05
RETURN DATE: MON, NOV 28, 1977		

Date on this card, again, includes everything needed to type into the terminal, should a loan need to be cancelled, or extended to the borrower. The label also has a 'usage' count, which increments by one for each loan. At the end of 9 loans, staff/puts this film through the electronic inspection and cleaning machine.

The computer resets the counter to '0' and begins to increment again.

Reports the school receives. Samples of the reports mentioned below are in APPENDIX B.

	APPENDIX Page
o Input, Confirmation and Rejection Report (by school). This is the carbon of the one kept in-house.	BG
o Delivery Report This is the carbon of the one kept in-house.	BH
o Return Report This is the carbon of the one kept in-house.	BI
o Media Activity Report (by school) This is not available yet, but will show film use per teacher.	

Reports found to be useful in-house. Samples of the reports mentioned below are in APPENDIX B.

	APPENDIX Page
o Input, Confirmation and Rejections - Received Sequence. This lists all items as typed on to one day's tape.	BJ
o ICR - Media Number Sequence This sorts the items into an orderly array.	BK
o ICR - This is a tally of the day's input.	BL
o ICR - This sorts the above ICR's into individual schools by route sequence of our mail slots. A copy goes to each school that placed an order. This is printed in carbon, one to the school, one for in-house.	BG
o Delivery Report - This lists what is being shipped to a school on a given day. Staff picks the shelves the day before delivery, using this list. This is printed in carbon, one to the school, one for in-house.	BH
o Overdue Report - This summarizes all items that are overdue.	BM
o Return Report - This lists what is to be picked up at a school on a given day. This is printed in carbon, one to the school, one for in-house.	BI
o Unavailability - Lists which films are not able to be booked, and why.	BN

- o Extract Error - An audit program to keep us alert to upcoming bookings that need to be cancelled. BQ
- o Spool File Listing - The tape of a day's shipments, which the computer types out on to the terminal's cassette tape. It is kept, until the films are returned. BP
- o Cancel Bookings BQ
- o Media Activity Report - This monthly report shows circulation per title (also available per copy), and shows turn-down per title (or per copy). BR

Labor Comparisons

To manually book, in alpha order, on Wheeldex, approximately 30,000 to 36,000 items during the months of mid-August through May 30, took about 8 hours of labor a day. This would include locating the Wheeldex card, determining if there was an available date within the teacher's time constraints, recording the transaction twice, splitting the multi-carbon form, filing its parts in drawers or envelopes, and distributing envelopes on to mail slots.

To do this work on the computer takes 2 hours of typing on to a cassette tape at a terminal (low volume days might take only 30 minutes), and 20 to 45 minutes of 'on line' (on the phone with the cassette talking to the computer, with responses being typed out on the terminal's paper scroll). The format work is done in the a.m., the latter in the p.m.

The paper products (the Delivery Reports (pick lists), the individual teacher confirmation cards, the Overdue Report) are printed the following a.m. Because the pick lists are all sorted by the computer into school, route, and film number, labor is saved over the manual system. The clerical staff indicates the remaining work of pulling films from the racks is able to be accomplished even faster and more accurately due to Delivery Reports being typed (not hand-written numbers and letters). Samples of these are in APPENDIX B, pages BH, BI, and BJ.

The individual confirmation cards are sorted (by the computer) by day of week/and route sequence (the same as the mail slots are). This job of putting confirmations on shelves is less than in the past due to a) automatic sorting, and b) elimination of envelopes and labeling them. Each school receives a summarized list of their teacher confirmation cards. See APPENDIX B, page BK.

A task that has been added is that of dialing the computer, running

the cassette tape of requests for films into it and obtaining a yes or no response. This is done in the p.m. and consumes anywhere from 20 to 50 minutes, for 200 to 500 individual film requests.

Other tasks and their estimated time of completion are: 1) Scanning all teacher-written orders (there are a great number of errors due to teachers' orders not adhering to the exact week day that their school gets delivery. Much training has been given, but as the delivery day is changed yearly (to rotate the Monday school holidays and the resultant lack of film deliveries), teachers need assistance. The old manual booking system had this same problem. This task takes 20 minutes daily. 2) Checking Return Reports for items which have not been returned from schools, inserting the spool listing tape on to the terminal and typing a caret before those few items which were not returned. The tape then is run on-line to the computer and all film loans are canceled except those with the caret. While on line, the films which have been damaged, lost, newly received, overdue, etc., are coded into the computer, to immediately alert it to whether or not a film is 'available' to be booked, or not. The Overdue Report is cumulated daily in the computer, and printed. Individual overdue notices to schools, teachers, principals, etc. are still being prepared manually. This new pattern of checking Return Reports never takes as long as the old way of matching the carbon slip on the film can to the original slip in our file. All of the sorting and filing tasks associated with the old slips have been eliminated. We keep the Return Reports in a notebook, as sorted by the computer (in route sequence). These tasks take about 2 hours daily, almost precisely what the tasks of checking the paper-work for returned films took by the manual system.

The film staff find the computer is valuable in that every transaction is available on computer sheets, readily seen by any of them. Everyone is able to answer telephone calls and personal inquiries, having access to the same data.

All told, what has the work load done to staffing. It has reduced it by one-half an employee. Four and a half employees used to be involved in purchasing, booking, shipping, receiving and previewing for 36,000 to 40,000 circulation (as well as preparing all input for the computer). Staffing is now four employees, and equalling or bettering the circulation. The circulation could be increased by 5,000 or 10,000 items with only part-time staff need occurring in the inspection/rewinding operation. Films

are returned with or without rewinding; those needing it are rewound and simultaneously inspected, taking an average of 3 minutes each. As the optical scanner will be used for inputting teacher requests for films, the typing of orders on to tape should lessen labor needs, depending upon the breadth of teacher acceptance of preparing the opscan forms.

Alliance With the Computer Department

The computer that serves the financial reporting needs for the 29 school districts in Placer County, and will be serving the class scheduling, attendance and test-scoring needs, is the one that serves the Educational Film Center. How did the Center capture the attention of the computer personnel, when other needs were pressing their time? By being like a grain of sand in an oyster -- beginning years before these other interests began expressing their need; by entering the clattering domain of the computer room when other groups felt excluded by the noise, the language, and the personnel; by providing the computer programmer with transportation to sites where similar computer equipment is doing a lousy effort of the job you want done, or where much more exotic equipment is doing an outstanding job of the sort you want done; by taking a basic course in programming in the language used by the computer in your building; by having a programmer who likes to be challenged to get his small computer to work so efficiently that it handles a large job that others thought couldn't be handled; by writing letters to a few agencies that are doing work similar to your desired end product and asking for programs to be donated or sold, and then having some genius translate the language of those programs to the language you need; by being patient -- waiting six years for fruition of the goal. Why so long? You must remember that your film center is far down on the list of priorities of your employer, and you have no dollars to pave the way. What you get, for months on end, is actually the moonlight hours of a dedicated programmer who is much more challenged by the intriguing problems of your film center than he is by the worn-out and repetitive problems of budgets which he has spent twenty years on already. So, your needs are the ones which he wants to work on. But moonlight hours are few, and unpaid, so it will take a long time. Again. Be patient.

Expect days when your programmer is depressed. His boss will have clamped down on this time, and restructured other office priorities which

ensure that programming work on your film booking is firmly deemphasized. This will especially be true when the federal or state government alters Social Security formulas, hourly wage scales, demands W-2 forms, etc., and he has to draft line after line of changes into his once perfect budget programs.

The Dedicated vs. Non-Dedicated Computer

Remember that the dedicated computer can do your one present task, but that it is the non-dedicated computer that can take on new tasks (which will no doubt arise in the future), and that probably costs less even in the short run. The dedicated computer has a limited number of push buttons, and they do only set tasks. The non-dedicated computer has a full typewriter and calculator keyboard and has the potential of Bach for developing/solving tasks that can be performed.

The qualities to look for in a computer operation to the author's way of thinking, are: a) time allotments per work day that you will be on the computer (this need not be rigid though, as 9:02 a.m. daily); b) time allotments per work day for the printer to print your work; c) easy rapid communication, and physical presence, if needed, of the programmer and your staff; d) short time span of 'no man's land' (this is the gap between when a teacher orders and when the film can be delivered. The PMMS gap is two days; e) fast repairs on computer equipment; f) fast remedies on flaws in the programs (during the first year of operation small amazing things arise. No doubt, with a less capable programmer, or one who tries to invent all of his own programs rather than working from other well-developed programs (as OTIS, which we used), there would be a lot of teeth-gnashing problems which would be major operations to remedy.

These several qualities are seen to not be just the piece of equipment, but the people and the programs as well.

Equipment - Present and Future

Optical scanner. The intent of the computer department in the Placer County Office of Education is to capture data at school sites, and have it go through very few human operations which might alter or eliminate data. The film order form developed to replace the old manual multi-carboned form is a printed form that the teacher will print numbers on (somewhat similar to arabic numbers) in set areas, and which will then be fed into the optical scanning machine. It will 'read' where pencil lead has been

deposited and translate this into the computer as a request for a film. Schools have many student's tests graded this way. The machine can switch from doing one job to another rapidly, so that it can be shared for a number of functions with other educational departments.

The CRT. The terminal presently in use is the NCR 260, which has one tape drive, one full keyboard, and a thermal paper roll (scroll) like a desk-top adding machine. The paper can be halted from being printed on, if a written reply is not needed, yet a scroll a day is being consumed, currently. At a cost of \$2.50 a scroll, a television-tube display machine (called a CRT, for cathode-ray tube) is being considered for those jobs where no hard-copy is needed as it could pay for itself in two years. The terminal has capacity for a second tape drive to be installed. This could allow the computer to quickly dump a lot of data on to a cassette tape, and then allow film staff time to examine the data slowly -- and not tie up the computer in an 'on-line' state.

The light pen. Checking films back in, after they have completed a loan, was a several hour operation under the manual system. Under the computer system, the capacity to have a light pen glance over a printed tape and release a loan is appealing for its labor-saving qualities. To date, neither the program nor the equipment is operational in PMMS.

The on-site terminal. Districts in Placer County are beginning to obtain computer terminals using regular phone lines that makes possible immediate response to a teacher who types in a requested film order. It also makes possible the individualized instruction of pupils, who may soon be selecting their own materials for instruction by typing in requests. Additionally, at a time when printing costs are making film catalogs in printed form cost from \$6 to \$10 each, and when a microfiche catalog is difficult to retrieve items from rapidly, the computer terminal can display catalog data, in video or printed form, and only those portions called for need to be displayed. That makes for a savings of many thousands of dollars in print costs. Because districts are purchasing terminals to have access to budget, attendance accounting and test-scoring data that is stored in the same computer, districts are not having to purchase a terminal just to ask about one film.

Potential For Interfacing With The Placer Media Management System

The rural counties north and south of Placer County are smaller, and

less developed in computer sophistication. Several of them are now considering obtaining small computers. If they settle on an NCR they would have access immediately to all the programs on school financial record keeping, on class scheduling, on attendance accounting, on test scoring, and on film booking. These programs were written under tax-payer's money, so they are free to other agencies supported by tax-payers' dollars. That makes it desirable to seriously consider adopting a computer that has a battery of programs that will set a computer facility up quickly. Districts can be guaranteed a bug-proof service rather quickly, and inexpensively, provided the county can hire capable employees to be in charge of the operation.

Other rural counties, without the need for a small computer, could, with a terminal and a small printer, phone in to get access to data in Placer's file of films (after input of their own unique shelving number) and could obtain masters for printing their film catalog, or could even obtain film booking of films in their own collection. This time-sharing is difficult to agree to, for the educational structure provides dollars for your own body of students, and does not allow dollars to explore how to serve other bodies of students.

Other Computerized Film Booking Operations in California or The West

When the author began to be interested in computers for library operations, the literature was scarce. One Australian had toured U.S. libraries and came to the miserable opinion that computers used in library settings were few and ineptly conceived. During the DAVI Convention in Portland (1969) the computer booking operation at Multnomah County, Oregon, was toured.

Late in 1973, LARC held a seminar at the Kellogg Center at Pomona where the programs at Shawnee Mission, Kansas (school library and book processing) and at OTIS (Oregon's Total Information Service, including film booking) were described along with an unexecuted program for the Los Angeles Unified School District. This drew four attendees. Since then, however, Alameda and San Mateo County Offices of Education have a program for film booking on a time-shared Honeywell computer. It does not prepare the masters for the catalog nor does it share that data with the booking program.

The Anaheim, California, Union High School District has a shared booking and a catalog program on computer. The Sacramento County Office

of Education houses a regional computer center which hopes to include media booking for a large number of educational agencies in the future.

The vendors RTI and Paulmar (both in Illinois) have dedicated computers designed to do little more than film/media booking. At a cost of over \$12,000 a year rental, these do not appear to be the low-cost item the small library is seeking.

The Monterey (California) County Office of Education has recently acquired the RTI equipment.

The Placer County Office of Education is proud of its Placer Management System because it has prepared sophisticated programs for a small computer making it capable of executing problems which others said could not be done. It is confident that the original problem solving conception, and the initial plans taking into account needs five years into the future, and its programs considering future equipment (as opscan, light pens, etc.) will be the criteria which keeps PMMS away from obsolescence, away from massive reprogramming costs, and away from user discontent.

Those of you who prefer to work in rural areas don't have to be satisfied with out-of-date technology. In fact, keep your eyes open, for the new home mini computers may just be the answer to your office needs in a year to two. The programmer here says the developments are truly amazing. He (like the rest of us?) wishes he were a young man just starting out, to be able to be involved with it all, with a fresh brain.

The Secrets of Financing The Computerized PMMS

[This portion of the report may only be comprehensible to a few county school office employees, and may apply only to California at that, and maybe only to small counties.]

The budget for a county office of education, in California, is made up of various parts. One includes income and expense of film libraries. Another covers income and expenses of administrative services. Because the computer portions of the office are covered under the administrative services part, it is possible to blanket a great many things under that, which remove them from having to be covered under the film library part. The income for the film library part is difficult to increase. The income for the administrative services can be a levied county-wide tax.

So, when all is said and done, if your film library budget no longer can cover employee costs and survive, look for a way to get the job done.

in some other budget. It makes for rollicking fun.

The Five-Year Projection - 1978-1983

The 1st Record program will continue to serve our needs for the foreseeable future with few changes. It needs to automatically count and reset the numerical value in box 25 of the 1st Record input sheet (see APPENDIX A, page AA, buff) for all the remaining copies of the title, when copies are added or deleted as shown by input in box 8.

Mirror. The 1st Record program 'mirrors' the annotation on the first copy entered, and duplicates it on to the next copy (if any) that is added. Occasionally a problem arises when we own a copy, buy a second, delete the first, keep the second (because of the 'mirror' effect, the annotation of the first copy will appear in the catalog and on the 1st Record), replace the first (and find there is now no annotation showing in the catalog nor on the 1st Record, because the 'mirror' only works one direction -- down -- it does not mirror up.) To solve this missing annotation, we have to input a change -- which calls for reentering the entire annotation, even though the very data needed is in the computer under the second copy.

Annotation. The five-line annotation is adequate; having originally been only four lines, staff is adept in extracting the essence of films into the five lines. As we do not have photo-reduction equipment we do not want the catalog to be too bulky. Too, another paper shortage, or price hike in paper could occur again.

Changing fields. Plans call for changing the array of fields on the 1st Record denoting replacement, repair, damage, to show latent-edge numbering, source of funding for purchase, etc.

Statistic reports. The booking program will have a number of statistical reports available, which are just now being created. These will tally number of films used, number of teacher borrowers; number of films turned down; number of films unavailable (and the reason therefore); number of films at start of year, available for booking, and at end of year; number of copies deleted, lost, or added; etc. Schools will be able to receive a listing of all films shipped, by teacher, to inform administrators of instructional practices, and curriculum coverage; or a listing by film title, perhaps showing it has been in their school again and again, perhaps necessitating some grade-level planning; films out to inter-agency loans causing conflicts with requests from school users, etc.

Opscan order form. The use of the optical-scan order form will be optional; this is because teachers have limited capacity for accepting change, and are undergoing trauma at accepting the current modifications to the 'traditional' manual booking system. It is hoped they will use the new form, through the encouragement that those orders will be processed first each day, before the tape input orders are. Some of the districts are purchasing a terminal in order to have access to the budget, the class scheduling, and the attendance accounting programs, and they will be urged to access films for their teachers via their terminal.

Alphabetizing multiple copies. Another problem which has begun occurring since we began booking is when we need to change the sequence of alphabetization of a film title. Formerly a change occurred, for all copies, with a single input record establishing a new Control Number. Now this change occurs, but only for one copy, which is not easy to edit, for most reports do not list all the copies owned of each film. Months down the line, a report of all copies will be listed, line-by-line, and the evidence shows that only one copy was moved to a new location.

Overdue problems. The manual work involved in locating overdues, inputting that data, and cancelling orders for teachers following the overdue user, and drafting the follow up correspondence to both the overdue user, the principal, and the teachers following up the overdue user had not decreased through the use of the computer. It comprises an hour or two daily. Plans call for programming changes toward not halting all bookings for an overdue, but to halt only for the period of one additional delivery sequence. The bulk of overdues will take care of themselves with this action, lessening manual input efforts. Notices to the teachers who will not be receiving the film due to its being overdue from the last user could be issued on the same card stock as the individual confirmation cards, lessening manual efforts. The same card stock could be used to print notices to borrowers that the item they were to have received has in fact become unavailable -- and the reason could be given, using the code messages currently in the program.

Inter-county posting system. Thought has been given to creating a posting system to allow those films coming in to the Educational Film Center from Amador, Calaveras and El Dorado to appear on the Delivery and Return Reports of the specific high school, and to appear on the Media Activity Report as a circulation. This would not be similar to the decision-

making role which the computer makes when booking a film, but would be a lesser transaction.

Checking films back in. Consideration of using the light pen to check films back into the collection needs to be continued. Staff currently takes the Return Report, manually checks each item as returned or not, and transmits this information to another staff who compares this information with the printed spool list, and undertakes to alter the spool tape to agree and transmit this data to the computer. This area of checking items back into the system may be the biggest time consuming task left in the film library process. A single slip of one key stroke on the spool tape and an item that is overdue is cancelled, and that usually means it is immediately booked to another borrower and then a chain of correcting operations has to be implemented. There seems to be no way to reinstitute the loan that, in truth, is overdue.

Printing on exception basis. Some of the in-house reports may need to be printed on an exception basis. In place of printing stacks of paper about all films, or all borrowers, efforts need to be spent on extracting the data only on films or borrowers with exceptional traits. Traits to be considered are:

- o Films with less than five uses, in a 6-month period.
- o Films with more than five uses, in a 6-month period.
- o Films with more than 11 turn-downs in a 3-month period.
- o Films on the Unavailability Report for more than a 1-month period, and the reason.
- o Borrowers who borrow 5 films or more, per week, 3 weeks in a row.
- o Schools which appear on the Overdue Report 3-weeks in-a-row or more.
- o The number of films booked monthly to '0500000' (the A-V Coordinator).
- o The films loaned to inter-county (Amador, Calaveras, El Dorado) which have caused turn-downs to E.F.C. regional borrowers.
- o Effectiveness of subject headings -- which films are blocked from use due to placement in a poor subject heading.
- o Effectiveness of annotations -- which films are little used due to unmeaningful paragraph.
- o Effectiveness of grade level placement -- are the actual borrowers above, below, or right at, the claimed grade level.

Preview system. A program for accommodating preview films, their correspondence, their bookings out to schools, their appearance on

Delivery and Return Reports, and on the Media Activity Report as a circulation needs to be considered. The RTI program in operation at the Monterey County Office of Education has the capacity for a preview program, though it is not in operation as of spring 1978.

Operating manual. A manual for the Educational Film Center personnel responsible for computer input to the PMMS program needs to be prepared, indicating each specific field on each input sheet, and what does occur when items are input correctly, and incorrectly. There is no computer programming knowledge in any of the Educational Film Center staff, thus input must be done by rote. Done in episodes, once or twice a year, it is difficult to retain the rote learning, and sometime knotty situations occur as a result.

Conclusion

The immediate prospect of fall 1978 is to have a larger capacity NCR computer, with four partitions, serving the needs of the school districts in Placer County. One of these partitions will be serving the film booking program almost full-time, so PMMS will be on-line much of the day. That will ease the get-ready-and-wait stance in use this year while waiting for our program to be 'brought up' in the computer room, or waiting until payroll warrants were processed to get time to go on-line.

All the topics considered in the section on FIVE-YEAR PROJECTION may not come to pass; and other unthought-of-yet topics may arise. But when we have considered some possible paths, we are more competent in making decisions about whether the path we are on is going where we want to go, or whether we are in need of a new path to follow, or maybe whether we need to be the trailblazer.
