IDENTIFIERS Consumer Expenditure Survey; United States

ABSTRACT

This bulletin presents detailed income and expenditure data for 1984 from the interview component of the ongoing Consumer Expenditure Survey. Data in this bulletin are for the urban population. Text tables include the following: (1) annual expenditures of urban consumer units, and percent change in consumer expenditures, Interview Survey and Consumer Price Index, 1983 and 1984; (2) percent change in real consumer expenditures, real gross national product, unemployment rate, and Consumer Confidence Index, 1980-84; (3) income and expenditure indexes for selected Standard Metropolitan Statistical Areas (SMSAs), 1982-83; (4) annual mean expenditures of urban husband and wife consumer units classified by income before taxes and number of earners; (5) population age 65-74 and 75 and over, selected years, 1980, and projected 2000-40; (6) selected characteristics and shares of total expenditures of the population 65-74 and 75 and over; (7) income and attitudes toward income, 1982; and (8) average annual income and expenditures by income quintile and expenditure quintile. Charts show the following: average annual expenditures for day care and baby sitting by consumer units age 25-34, 1980-84; average annual expenditures for cable television and percent reporting, 1980-84; and percent distribution of total expenditures of consumer units with reference person over 65. Reference tables cover the following: selected characteristics and annual expenditures of urban consumer units, 1984, classified by quintiles of income before taxes, quintiles of total expenditures, income before taxes, age of reference person, size of consumer unit, composition of consumer unit, number of earners in consumer unit, housing tenure and by race of reference person, and region of residence. Appendices comprising about half the document provide the following: (1) a glossary; (2) a discussion of survey methods; and (3) tables giving selected characteristics and annual expenditures of urban consumer units, classified by selected SMSAs in four regions of the United States, 1980-81 and 1982-83. Survey, 1984

ing Consumer Expenditure Survey

ing Consumer Expenditure Survey, begun in 1980, represents a continuation of a long-established program. BLS has been gathering information on spending patterns and living costs for nearly a century—since the beginning in 1888-91. For the past half century, the survey has been the primary source of data for the periodic revision of the Consumer Price Index, next scheduled for 1985. The new survey incorporates major methodological improvements introduced in 1972-73 when the Bureau abandoned its traditional diary survey based primarily on recall by survey participants. The new survey consists of two separate components, each with its own questionnaire: 1) a quarterly Interview survey in which each of the consumer units in the sample is visited by an interviewer every 3 months over a 12-month period; and 2) a Diary survey in which consumer units are asked to complete a diary for two consecutive 1-week periods.¹

The Interview survey for both components of the survey was carried out by the Bureau of Economic Analysis under contract to the Bureau of Labor Statistics. The Interview survey obtains data on the types of expenditures respondents can be expected to recall for a period of 3 months or longer. These would include relative expenditures, such as those for property, automobiles, and major appliances, and those which occur on a regular basis, such as rent, insurance, and clothing. The Interview survey also obtains data on expenditures on services.

The Diary survey is designed to obtain detailed data on frequently purchased items, such as food and beverages, both at home and in eating places; household supplies; nonprescription drugs; and personal care products. These items are less likely to be recalled accurately by respondents over longer periods of time. Expenditures incurred while away from home overnight or longer are excluded from the diary.

The data presented here represents the data collected in the Interview component for 1984. Data for 1982-83 were published early in 1986. (See *Consumer Expenditure Interview Survey, 1982-83*, Bulletin 2246.) The data for 1980

¹ For the definition of a consumer unit. The terms "household," "family," and "family unit" are used interchangeably throughout this text.

through 1983 covered only the urban population. Beginning in 1984, coverage was reinstated for the entire civilian noninstitutional population, both urban and rural. However, urban data are being published first so that users will have a 5-year series of urban data. Data for the total population for 1984 will be issued later. In the future, only data for the total population will be published.

The expenditure and income data from the Interview survey are presented in nine reference tables. These tables show the 1984 average expenditures for the urban population tabulated by selected socioeconomic characteristics. In addition, appendix C contains eight tables for 1980-81 and 1982-83 that show the average expenditures of consumer units in selected Standard Metropolitan Statistical Areas.

Interpreting the data

Several factors should be considered in interpreting the expenditure data, especially when relating averages to individual circumstances. First, the averages are for the total urban population whether or not a purchase was made. Not all consumer units purchased cars or major appliances or paid for health insurance during the survey period. The average expenditure for an item in the sample is generally considerably lower than the expenditure by those consumer units that purchased the item. The less frequently an item is purchased, the greater the difference between the average for all consumer units and the average of those purchasing the item. For instance, table 1 shows average expenditures for new cars and trucks of about \$1,080, since only about 10 percent of the consumer units purchased a new vehicle. However, the cost for those who did make the purchase was almost \$10,800. Even if such purchases were spread over individual consumer units may have spent more or less than the average. Income, age of family members, geographic location, and individual preferences are among the factors which influence expenditures. Even within a group of similar characteristics, there may be significant variation.

Second, expenditures reported here are the direct out-of-pocket expenditures of consumer units for the particular component. Indirect expenditures may be significant, may be reflected elsewhere. For example, rental contracts often include utilities. Renters with such contracts would record no direct expense for utilities and, therefore, appear to have lower utility expenses. Some costs are paid by employers or insurance companies. For example, co-

members whose employers pay for health insurance or life insurance have lower direct expense for these items than those who pay the entire expense themselves.

approximately 60 to 70 percent of detailed expenditures are covered in the interview survey. More aggregated expenditure estimates for food and other items account for an additional 20 to 25 percent of total expenditures.

from the Interview are nonprescription drugs, household supplies, personal care items. The Interview survey must be integrated with the Diary to provide a complete picture of detailed expenditures.

Results of Interview survey results, 1984

Consumer buying habits, as measured by the share of total expenditures for each major component, generally do not vary much over a 1-year period unless there is a major change in economic conditions. However, the small movements can add up to a significant movement over time. Year-to-year variation in the data may occur as the result of surveying a sample of the population rather than the entire population. A comparison of the 1984 with 1983 confirms the similarity in the share of total expenditures for each component. Although component shares are relatively stable year to year, there may be substantial changes in the dollar amount spent on components.

Expenditures increased almost 11 percent from 1983 to 1984. The largest increases among expenditure components were for cash contributions, public transportation, and vehicle purchases (text table 1).

For most components, expenditure increases exceeded price increases as measured by the Consumer Price Index (CPI). The only decline was for gasoline and motor oil, which mirrored the decline in prices for that component. Expenditures rose more slowly than prices for education and tobacco and smoking supplies (text table 1).

Public transportation expenditures increased 12 percent from 1983 to 1984. Gasoline expenditures continued to decline while expenditures for vehicle purchases and other operating expenses continued at a high rate. Public transportation increased 21 percent, mostly due to large increases in expenditures for air fares (29 percent)² (text table 1).

Even though homeowners and renters spent about the same share of total expenditures for total housing, renters spent a higher share for

shelter—21 percent compared to 16 percent for homeowners. Renters, on the other hand, spent a higher share for utilities—11.7 percent vs. 6 percent; household operations, 2 percent vs. 1 percent; and public transportation, 4 percent vs. 3 percent (table 8).

Text table 1. Annual expenditures of urban consumer units, and percent change in expenditures, Interview survey, and Consumer Price Index, 1983 and 1984

Item	1983	1984	Percent
			CE
Income before taxes	\$23,126	\$24,578	6.3

Cash contributions	588	740	25.9
Personal insurance and pensions	1,777	2,023	13.8
Life and other personal insurance	265	302	14.0
Retirement, pensions, Social Security	1,513	1,721	13.7

¹ CPI for all items and homeownership are not conceptually comparable.

² Estimated; adjusted to match interview survey components.

share of total expenditures spent on health care was about 8 percent for the age group 65-74 and over 13 percent for those 75 and over. By contrast, those under 25 spent only 2 percent of their total budget on health care (table 4).

Expenditures for other lodging and household operations increased far more than the corresponding CPI components. All components of other lodging, except property taxes, increased sharply. The increase in household operations was due to the large increase in domestic services—in particular, housekeeping services and day care expenditures.

1980-84
 At 5 years of Consumer Expenditure Surveys are available, the data are available to analyze trends at both the aggregated and detailed expenditure

Expenditures. In the aggregate, consumer expenditures tend to reflect economic conditions. A commonly accepted measure of these conditions is the change in the real gross national product (GNP), that is, the change in the total output of the economy adjusted for inflation.

During the 1980-84 period, changes in consumer expenditures reflected the economic conditions of that period. Year-to-year percentage changes in expenditures by consumers, derived by deflating total expenditures by the CPI-U, are presented in text table 2. Also presented for each of the 5 years is the percentage change in real GNP, provided by the Bureau of

Percent change in real consumer expenditures, real gross national product, unemployment rate, and Consumer Confidence Index, 1980-84

Percent change from preceding year		Unemployment rate	Consumer Confidence Index (1970 = 100.0)
Real consumer expenditures (CE)	Real GNP		
n.a.	-0.2	7.1	67.0
-4.9	1.9	7.6	71.3
-3.0	-2.5	9.7	55.9
5.6	3.4	9.6	81.3
6.1	6.6	7.5	93.9

Economic Analysis of the Department of Commerce, the unemployment rate, and the Consumer Confidence Index published by the Consumer Research Service of the Conference Board.

During 1982, the height of the recessionary period, the decline in real expenditures mirrored the decline in real GNP. This low point was also reflected in the high unemployment rate and in the pessimistic outlook revealed by the Consumer Confidence Index.

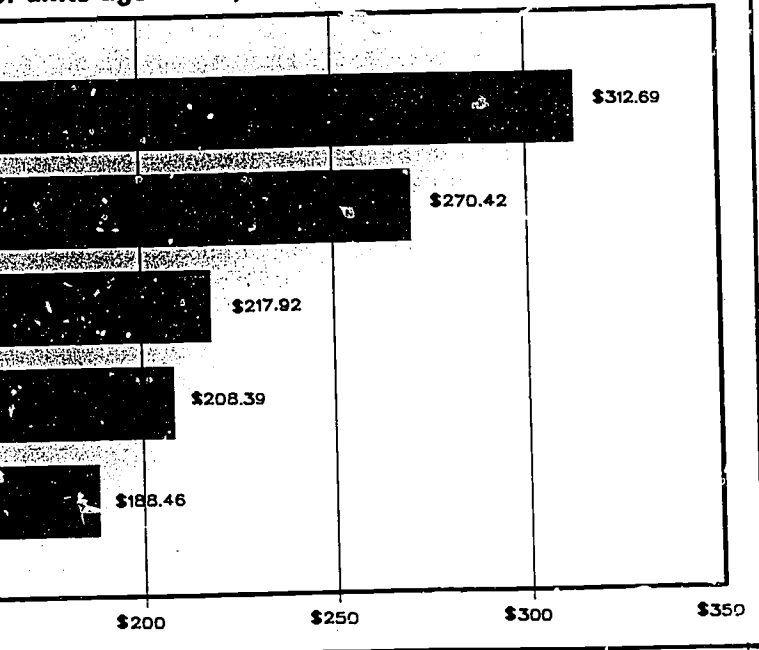

Real consumer expenditures and real GNP reflected the dramatic recovery in 1983 and 1984. Real expenditures rose slightly more than real GNP in 1983 and 1984, and the unemployment rate declined by 1984. With these changes came a resurgence of consumer optimism about future economic conditions, as measured by the jump in the Consumer Confidence Index from the low of almost 56 to almost 94 in 1984.

Selected expenditure items. In following the trend of consumer expenditures, the usual levels of aggregation of components—food, housing, transportation, entertainment, etc.—frequently obscure changes in detailed items and expenditures. For example, despite increasing expenditures for transportation in 1980, expenditures on gasoline and motor oil have shown a downward trend. This trend can be attributed to the fall in gasoline prices over the period and the use of more fuel-efficient automobiles. Contributions for retirement and Social Security showed a large increase over the period. This increase was offset in part by the rise in the Social Security contribution rate and the increase in the retirement income level to which the rate applies.

Although the number of detailed items reported in the survey is too large to be shown in this bulletin, two of these items, day care and baby sitting, and television, show how a continuing survey picks up changes which are obscured at the level of aggregation feasible to print. Chart 1 shows that annual expenditures for day care and baby sitting by consumer units in which the reference person was age 25 to 34 have increased from less than \$200 in 1980 to over \$300 in 1984. Chart 2 shows the large increase in mean expenditures for cable television from about \$30 in 1980 to almost \$100 in 1984. This increase is similar to the increase in the percentage of people in the survey who reported expenditures for cable television. The percent reporting doubled from 1980 to 1984.

In 1984, home computers were separated from other business-type equipment for home use (typewriters and calculators), so information on the trend in purchases of this item will soon be available. In 1984, 4 percent of all units reported purchasing home computers. Eight percent reported purchasing video cassette recorders. Data for these items can be obtained from unpublished tapes or from unpublished tables.

Average annual expenditures for day care and baby sitting for units age 25-34, interview survey, 1980-84

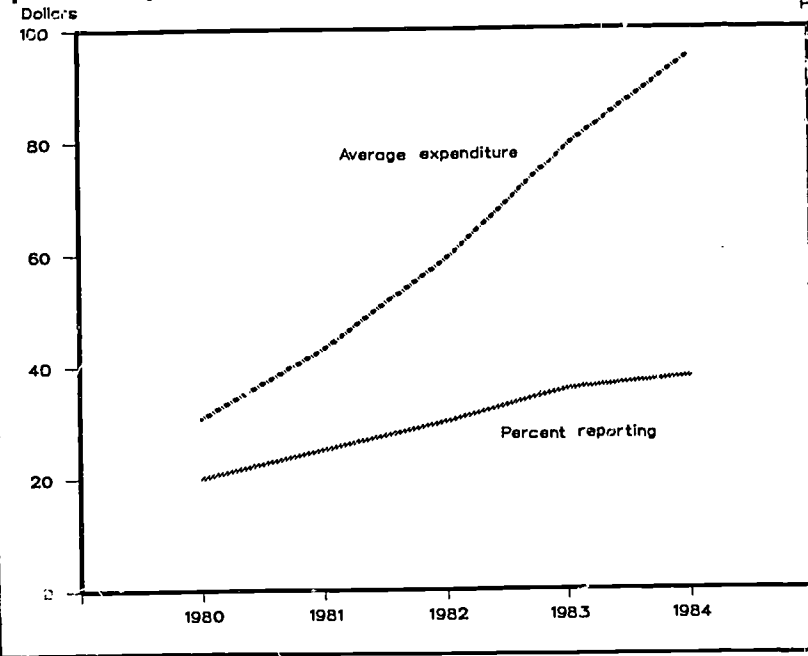

Expenditures in selected metropolitan areas

At this time, BLS is publishing data for individual Standard Metropolitan Statistical Areas (SMSA's) from the ongoing survey.³ Text table 3 shows 1982-83 expenditure indexes for selected SMSA's as compared to the U.S. average. Expenditures vary among metropolitan areas not only because of differences such as the prices of goods and services and family income, but also because of demographic differences such as the age of the head of household, climate, consumer tastes, family size, etc. For example, the average age of the consumer unit reference person is 38 years in Anchorage compared to 34 years in Buffalo.

As would be expected, the variation in income and expenditure levels among metropolitan areas is quite large. Average total expenditures in Dallas were 50 percent above the U.S. average, while those in Pittsburgh were 16 percent below the U.S. average. Dallas and Pittsburgh also showed the highest and lowest levels of expenditures, respectively.

Expenditure data for 1980-81 and 1982-83 are published by SMSA because the sample was selected from the 1980 census. The definition of SMSA was changed by the Office of Management and Budget in 1980. Hence, the person population counts that can be derived from the 1980 census bulletin may vary from the Census Bureau population estimates because of this definition. A redesigned CE sample based on the 1980 census is being introduced in 1986. The new sample will be used beginning with 1986 data.

Chart 2. Average annual expenditures for cable television and percent reporting, interview survey, 1980-84

Expenditures for housing, Dallas 60 percent above the average and Pittsburgh 16 percent below the average. Dallas also showed the highest levels of expenditures for apparel and transportation, 81 and 70 percent above average, respectively. Anchorage had the second highest level of total expenditures, 44 percent above average, and high levels of expenditures for housing and transportation, 25 percent above average. Anchorage also had the highest level of entertainment expenditures, 112 percent above average.

Shown in appendix tables C-1 through C-8 are expenditures and income levels for consumer units in selected Standard Metropolitan Statistical Areas for 1982-83 and 1984-85. SMSA data for 1984-85 will be shown when BLS publishes the 1984-85 data.⁴

The SMSA expenditure data shown in text table 3 and appendix tables C-1 through C-8 are not measures of cost-of-living differences among metropolitan areas. Cost-of-living studies require that costs be estimated for bundles of goods and services that provide equal levels of satisfaction to consumers in each metropolitan area. In practice, this would require pricing a similar bundle of goods and services in each metropolitan area. Tables in this bulletin show actual expenditures and income levels.

⁴ Due to the small SMSA sample sizes, at least 2 years of data are necessary to produce reliable estimates at the level of detail shown.

Income and expenditure indexes for selected Standard Metropolitan Statistical Areas, interview survey, 1982-83¹

¹ Calculated by dividing the SMSA average expenditures or income by the U. S. average and multiplying by 100.

Standard level of living among areas or to the government services provided by different tax levels.

Women and family expenditures

The Bureau of Labor Statistics has long recorded the participation of women in the labor force. Increasingly during the past quarter century, married women have made significant contributions to the work force and to their families' incomes. Income and employment data from the Census Bureau's Current Population Survey have shown a dramatic rise in women's contribution to the family economic position. Earnings of working wives account for about 28

percent of family income. Fifty million women are now in the labor force, 27 million are gainfully employed wives, and nearly 15 million are mothers as well as wage earners. The labor force participation rate for women with children under 6 is 53 percent. This rate increases to almost 80 percent as the age of children increases to 17.⁵

Data from the 1984 Interview survey were used to compare expenditures of husband-and-wife consumer units where 1) the husband is the only earner, 2) both husband and wife (and no other CU member) are earners (text table 1).

⁵ Howard Hayghe, "Rise in Mothers' Labor Force Activity Includes Those With Infants," *Monthly Labor Review*, February 1986, pp. 43-45.

Annual mean expenditures of urban husband and wife consumer units classified by income before taxes and number of earners, Interview survey, 1983-84

Earners by income group	Size of consumer unit	Age of reference person	Number of consumer units (thousands)	Income before taxes ²	Total expenditures	Food and alcoholic beverages	Housing ³	Apparel and services	Transportation	Health care	Personal insurance and pensions

Units with less than \$10,000 income are not shown separately because they are severely affected by reported income.
 Expenditures of income are calculated from complete income reporters; see glossary for definition.

³ Includes shelter, utilities, housefurnishings, domestic services, and child care.
⁴ Includes personal care, reading, education, tobacco and smoking supplies, cash contributions, and miscellaneous.

show that, for all consumer units, expenditures are higher when both husband and wife are earners, except for food, health care, and "other" expenditures.⁶ Review of the characteristics of these consumer units suggests that demographic variables besides earner status affect spending patterns. Consumer units where both husband and wife are earners are on the average smaller, have fewer members, a higher average income, and a higher level of education.

expenditures at the same income level. In looking at the table, the differences in expenditure levels and relative shares of expenditures between units with one earner are larger than the differences of expenditures and shares within units with two earners. There seems to be an indication that the effect of the wife's working tends to move the family into a higher income class where it will tend to exhibit the spending pattern of that income class.⁷

Because of the interaction of these factors, it takes more elaborate analysis to determine the effect of the wife's working on the distribution of expenditures. The differences in the expenditure distribution are those likely to be associated with family size, such as food. Some, such as transportation, are likely to be associated with earner status. The factor that is generally considered to be most influential is income. Text table 4 provides the data for looking at the effect of income on expenditures. "Other" includes personal care, reading, education, tobacco and smoking supplies, miscellaneous expenditures, and cash contributions.

Expenditures and income of the elderly

Projections indicate that the elderly will constitute an increasing share of the total population. Text table 5 shows the projected growth of the population through 2040 for the age groups 65-74 and 75 and over.

⁷ These results are similar to those reported by Elizabeth Waldman and Eva Jacobs, researchers who used data from the 1978 Current Population Survey and the 1972-73 Current Population Surveys (CE) to examine the labor force participation and family expenditures of working wives. See Elizabeth Waldman and Eva Jacobs, "Working Wives and Family Expenditures," *American Statistical Association, 1978 Proceedings of the Social Statistics Section*.

Population age 65-74 and 75 and over, selected years, 1980 and projected

Year	65-74		75 and over	
	Number (thousands)	Percent of total population	Number (thousands)	Percent of total population
.....	15,647	6.9	10,061	4.4

.....	25,968	10.0	25,418	7.3
.....	20,228	9.4	46,414	12.2

the Census, *Demographic and Socioeconomic Aspects of Aging in the United States*, Series P-23, pp. 5-18.

65 and older has been the oldest age class for which CE data have been collected. Even though those 65 and over are often viewed as a homogeneous group, the characteristics, incomes, and spending patterns of the youngest and oldest population within that group are actually quite different. To obtain additional information on the elderly, 1984 data for those age 65 and over have been divided into age 65 to 74 and 75 and over (table 4). Also, data for the years 1982-83 have been tabulated for these two age groups and for those 65 and over and are shown in appendix D.

Table 6 compares selected data for the two age groups and summarizes differences in income, characteristics, and spending patterns. Data from text table 4 (p. 22) are used in the following analysis comparing the two

Selected characteristics and shares of total expenditures of the population age 65-74 and 75 and over, interview survey, 1984

Item	65-74	75 and over
Taxes	\$16,815	\$12,442
Expenditures	15,873	11,196
Characteristics:		
Home owners	.6	.2
Vehicle owners	1.4	.8
Home owners:		
Age	20	5
Mortgage	56	62
Assets	24	33
Shares of total expenditures (percent):		
.....	13.0	13.6
.....	4.8	3.5
.....	30.5	35.5
.....	19.2	12.9
.....	8.4	13.3

The mean income before taxes of the 65-74 age group is more than twice as high as the income of those 75 and over. The largest component of income for both groups is Social Security, private, and government retirement income, but it accounts for 53 percent of the income of the 65-74 age group, compared to 63 percent for the 75-and-over group. Wages and salaries make up about 27 percent of the income of the 65-74 group, which indicates that the reference person or spouse is still working. For those 75 and over, it is 10 percent of the income.

Their spending patterns are also quite different (chart 3). Consumers in the 65-74 age group spent almost 22 percent more on housing than those 75 and over. However, as a share of total expenditures, housing accounted for 13 percent of the share of the older group's expenditures. The expenditures share for utilities, and public services was also higher for the 75-and-over group, although the amount spent was less than that of those age 65-74. The average expenditure on owned dwellings was more than one-third higher for the 65-74 age group than for the older class. This can be attributed to higher levels of home ownership and a higher percentage of consumer units still paying on their mortgages for the 65-74 age group. About 76 percent of those age 65-74 owned their homes, compared to 67 percent of the oldest group, and 20 percent of those 65-74 were still owed on their mortgage, compared to only 5 percent of the oldest group. Large differences were also shown for property taxes, for which the average expenditures of those 65-74 were 33 percent more than those of the 75 and over, indicating that more of the younger group owned their own homes, owned more expensive houses or lived in areas with higher property taxes.

Average expenditures for transportation accounted for 19 percent of the total expenditures of those age 65-74, compared to 13 percent of the total expenditures of those 75 and over. The average expenditures by the 65-74 age group were over 50 percent higher than those of the older group. Much of the difference can be attributed to a higher level of vehicle ownership, 81 percent, by those aged 65-74, compared to 59 percent by those 75 and over. It is also likely that vehicles are used more frequently by the older group, further reducing their transportation expenditures.

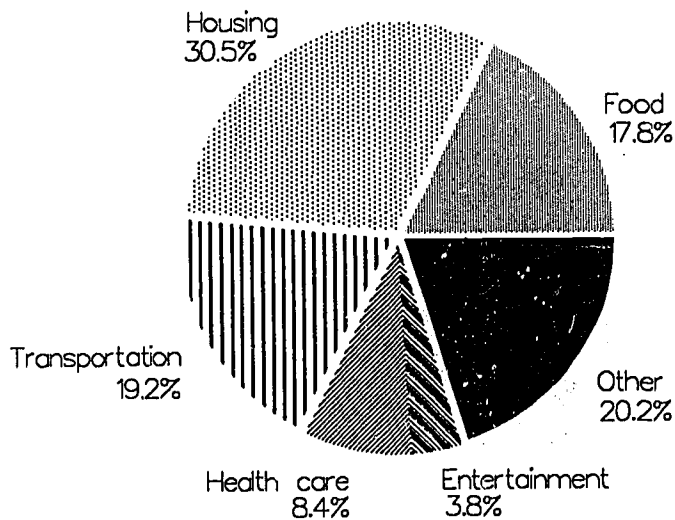

Both the mean expenditures for health care and the health care share of total expenditures are higher for the 75 and over age group than for the 65-74 age group. Health care accounts for 13 percent of the total expenditures of those 75 and over compared to 8 percent of the total for those 65-74.

Consumer attitudes towards income needs

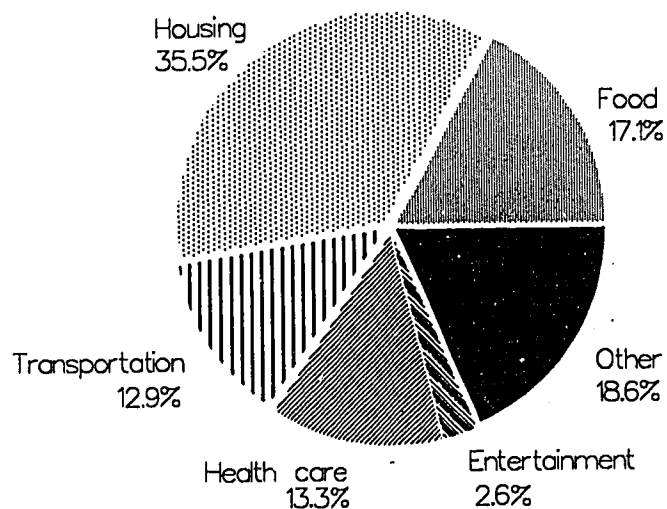

In 1982, a question concerning how much income a consumer unit would need to make ends meet was included in the Interview portion of the CE. Although only 1 year of data is available, the results may be of interest. The question, "How much more income would you need to live comfortably?" was one of the recommendations of the 1980 Expert Committee on Family Budgeting. The question was designed as a possible method for identifying the level of income

Percent distribution of total expenditures of CU's with reference person over 65, Interview survey, 1984

Age 65-74

Age 75 and over

Consumer units need to achieve a certain living standard.⁸ The question where you do now and meeting the expenses you consider necessary, will be the smallest income (before any deductions) you (and your family) need to make ends meet? Asked only in the fifth interview, the question was dropped when plans to revise the Family Budget program were discontinued.

From the "income need" question and actual income were compared whether the responses to the questions varied by income group, age of consumer unit, and region of the country. For the purpose of this variable, "enough," was defined as the percentage of consumer units whose income was greater than or equal to their reported needed income.

Comparing the results for each of the groups by age, region, and consumer unit size, the majority of the groups felt their incomes were sufficient to meet their needs. Committee on Family Budget Revisions. *New American Family Budget Standards*. New York: Wisconsin-Madison: Institute for Research on Poverty (New York, Center for the Study of Poverty at Columbia University, May 1980), p. 54.

make ends meet. However, when the comparison is based on income before taxes, as shown in text table 7, significant differences between actual income and income needed were reported in each of the income groups. Survey responses are shown in text table 7.

Text table 7. Income and attitudes towards income, Interview survey, 1982

Income	Income before taxes	Income "needed"	Difference
All consumer units	\$22,805.9	\$18,219.0	\$ 4,586.9
Less than \$5,000	2,609.5	7,822.1	-5,212.6
\$5,000 - \$9,999	7,250.8	10,139.5	-2,888.7
\$10,000 - \$14,999	12,184.5	13,022.6	-838.1
\$15,000 - \$19,999	17,038.3	14,670.4	2,367.9
\$20,000 - \$29,999	24,566.9	20,011.7	4,555.2
\$30,000 and over	44,837.0	29,131.7	15,705.3

Note: Data are for complete income reporters.

income groups clearly indicated a large disparity between income the previous year and that needed. Only 25 percent of the units in the ne group had thought they had enough income to meet their needs. 91 percent in the top income group (\$30,000 and over) thought they income.

Income vs. Income ranking

Consumer units by expenditures rather than income may present a picture of the longer run economic position of consumers.⁹ Many consumers in the lower income groups have large self-employment, farm, or other losses which may be temporary. Hence these groups include some whose expenditure patterns are similar to those with higher incomes whose their income for a particular period places them in the lower income group.

and 2 group consumer units by income quintiles and by total expenditures. Quintiles of income before taxes are defined by ranking complete income reporters¹⁰ in ascending order according to the level of total before-tax income reported by the consumer unit. The ranking is then divided into five equal groups. For the expenditure quintiles, consumer units are ranked by total expenditures.

Average annual income and expenditures by income quintile and expenditure quintile, Interview survey, 1984

Income	Lowest 20 percent	Second 20 percent	Third 20 percent	Fourth 20 percent	Highest 20 percent
Income before taxes	\$ 3,555	\$10,783	\$19,276	\$30,361	\$58,637
Expenditures	11,328	13,884	18,963	25,551	40,932
Income before taxes	7,459	14,635	21,800	31,327	47,567
Expenditures	5,846	11,694	17,380	25,480	50,263

9. The use of the data in this way is related to the "permanent income hypothesis." See M. Friedman, *Theory of the Consumption Function* (Princeton, Princeton University Press for National Bureau of Economic Research, 1957), p. 221.

10. See the appendix for definition of complete income reporter.

expenditures in the same way as by income. In both tables, income reporters are not ranked and are shown separately. The data from the expenditure tables are summarized in text table 8. The data show that the average total expenditures of consumer units in the lowest expenditure quintile are substantially higher than the average of those in the lowest income quintile. Conversely, the average income of consumer units in the lowest expenditure quintile is well above that of those in the lowest income quintile.

These results confirm the expectation that the expenditures of the lowest income quintile may be somewhat distorted by the relatively high expenditures of some consumer units.

Future improvements in weighting methods

Analysis of the results from the first few years of the CE survey revealed problems with the weighting procedure—the method by which the sample of interviewed households is made to represent the population. The current procedure is similar to that used in other large household surveys, such as the current Population Survey. It is composed of four steps. The objective of the first three steps is to assign a weight to each sample household that reflects the sample design, but also field subsampling and the unavailability of some sampled households for interview. The function of the fourth step, principal-person weighting—is to incorporate the most recent Census Bureau population data by detailed age, sex, and race categories into a final adjustment of sample weights, thereby ensuring that the surveys are representative of the characteristics of the population sampled.

Two problems were noted in this final step. It was found that, in some cases, the age, sex, and race population estimates from the CE survey varied significantly from the Census data and, further, that demographic estimates from the Diary and Interview surveys were often inconsistent with each other.

As a result of a major theoretical and applied research effort, BLS developed a new procedure for the fourth step. The procedure, called generalized raking, was developed from an algorithm originally proposed by statisticians at the Census Bureau. Its application will considerably narrow the differences between the consumer unit counts of the two surveys. Once outside peer review has been completed, BLS plans to use the new weighting method for the publication of forthcoming consumer expenditure data. While the procedure changes the number of consumer units, the impact on mean expenditures is small. The precise form of the new weighting method will be described when it is introduced. Further details on the current and proposed procedure are given in appendix B.

Appendix A. Glossary

ary is divided into four sections: 1. Characteristics, 2. Expenditures, and personal taxes, and 4. Addenda.

Characteristics

Age of the reference person.

Complete income reporters. The distinction between complete and incomplete reporters is based in general on whether the respondent provided values for all sources of income, such as wages and salaries, self-employment income, and Social Security income. Even complete income reporters may not have reported a full accounting of all income from all sources. In the current survey, the "at-the-board zero income reporting" was designated as invalid, and the unit was categorized as an incomplete reporter. In all tables, inferences are for complete income reporters only.

Classification of consumer unit. The classification of interview families according to the relationship of other family members to reference person; (2) age of reference person; and (3) combination of relationship to reference person and age of children. Stepchildren and adopted children are included as the reference person's own children.

Consumer unit. A consumer unit comprises either: (1) all members of a household who are related by blood, marriage, adoption, or other legal relationship; (2) a person living alone or sharing a household with others or as a roomer in a private home or lodging house or in permanent living quarters in a hotel or motel, but who is financially independent; or (3) two or more persons living together who pool their income to make joint expenditure. Financial independence is determined by the three major expense categories: Housing, food, and other living expenses. To be considered financially independent, at least two of the three major expense categories have to be reported by the respondent.

Consumer unit member, 14 years or older, who reported having worked during the 12 months prior to the interview date.

Years of formal education of the reference person. The number of years of formal education of the

reference person on the basis of the highest grade completed. If enrolled in school at the time of the interview, the grade being attended is the one recorded. For those reporting the extent of their education are classified under no schooling reported.

Housing tenure. The family's principal place of residence during the 12 months prior to the interview date. "Owner" includes families living in their homes, cooperatives, or condominiums, apartments or townhouses. "Renter" includes families paying rent for their homes. Families living rent free in lieu of wages.

Income before taxes. The total money earnings and selected money receipts during the 12 months prior to the interview date. See section 3 of this glossary for a complete definition of the components.

Income after taxes. Income before taxes less personal taxes which include federal income taxes, state and local taxes, and other taxes. See section 3 of this glossary for a complete definition of the components.

Metropolitan Statistical Areas (MSA's) and Standard Metropolitan Statistical Areas (SMSA's). The general concept of a MSA and a SMSA is one of a population nucleus, together with adjacent communities which have a high degree of economic and social integration with that nucleus. MSA's are defined by the Office of Management and Budget as a standard for Federal agency use. The preparation and publication of statistics relating to metropolitan areas. The term MSA went into effect June 30, 1983, replacing the previous term SMSA.

Number of sample interviews. Number of interviews is the actual number of interviews used to compute the estimates. Estimates for a calendar year are based on interviews from five calendar quarters since respondents provide information for the 3-month period prior to each interview. An estimate of the number of consumer units can be obtained by dividing by 5 (quarters) for the average.

Number of vehicles owned. The number of automobiles, trucks, vans, motorcycles, trailers, and planes, owned by members of the consumer unit, including vehicles used partially for business, but excluding those used exclusively for business.

n. The civilian noninstitutional urban population of the United States that portion of the institutional population living in the following quarters: Boarding houses, housing facilities for students and workers, in hospitals and homes for the aged, infirm, or needy, permanent live-in hotels and motels, and mobile home parks.

of income before taxes. For each time period represented in the tables, income reporters are ranked in ascending order according to the level of *before-tax income* reported by the consumer unit. The ranking is then divided into five equal groups. Incomplete income reporters are not ranked and are reported separately.

of total expenditures. For each time period represented in the tables, income reporters are ranked in ascending order according to the level of *total expenditures* reported by the consumer unit. The ranking is then divided into five equal groups. Incomplete income reporters are not ranked and are reported separately.

race of the reference person of the consumer unit. All families are in two racial groups, black and "white and other." The "other" group includes such races as American Indians, Alaskan natives, and Asians and Alaska Natives.

reference person. The first member mentioned by the respondent when asked for the name of the person or one of the persons who owns or rents the unit. It is with respect to this person that the relationship of other consumer unit members is determined.

Data are presented for four major regions—Northeast, Midwest, South, and West. Consumer units are classified by region according to the address at which the family was residing during the time of their participation in the survey. The regions comprise the following States:

Northeast—Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont.

Midwest—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin.

South—Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

West—Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming.

consumer unit. The number of persons whose usual place of residence, at the time of the interview, is the sample unit.

Urban population. All persons living in Standard Metropolitan Statistical Areas (SMSA's) and in urbanized areas and urban places of 2,500 or more persons in SMSA's. Urban, defined in this survey, includes the rural population of SMSA's.

2. Expenditures

The transaction cost, including excise and sales taxes, of goods and services acquired during the interview period. Expenditure estimates include expenditures for gifts, but exclude purchases or portions of purchases assignable to business purposes. Also excluded are periodic credit payments on goods or services already acquired. The full cost of expenditures is recorded even though full payment may not have been made at the time of purchase. The order of the expenditures listed here follows the order of expenditures in the reference tables.

Food at home refers to the total cost of food spent at grocery stores and food stores during the interview period for consumption at home. It is calculated by multiplying the number of visits to a grocery or other food store by the average amount spent per visit. It excludes the purchase of prepared food items.

Food away from home includes all meals (breakfast, lunch, brunch, dinner) at restaurants and carryouts plus meals (breakfast or lunch) on board, meals as pay, special catered affairs such as weddings, bar mitzvahs, confirmations, and meals away from home on trips.

Alcoholic beverages includes beer and ale, wine, whiskey, gin, and other alcoholic beverages.

Owned dwellings includes interest on mortgages, property taxes, insurance, refinancing and prepayment charges, ground rent, expenses for property management/security, homeowners insurance, fire insurance, flood insurance, and other coverage, landscaping expenses for repairs and maintenance contracts (including periodic maintenance and service contracts), and expenses for materials for owner-performed repairs and maintenance for dwellings maintained by the consumer unit, but not dwellings maintained for rental. Mortgage principal payments are repayments of loans and are not included in addenda.

Rented dwellings includes rent paid for dwellings, rent received for dwellings, and other expenses.

Other lodging includes all expenses for vacation homes, schools, hotels, motels, cottages, trailer camps, and other lodging while on vacation.

Fuel, utilities, and public services includes natural gas, electric power, wood, kerosene, coal, bottled gas, water, garbage and trash collection, maintenance, septic tank cleaning, and telephone charges.

Domestic services includes babysitters, day care tuition, care of children, and other domestic and other duties.

Household expenses includes termite and pest control products, moving and freight expenses, repair of household appliances and other equipment, reupholstering and furniture repair, rental and repair of hand tools, and rental of other household equipment.

Textiles includes bathroom, bedroom, kitchen, dining room, and living room curtains and drapes, slipcovers and decorative pillows, and sewing machines.

Landscaping includes living room, dining room, kitchen, bedroom, and nursery porch and lawn and other outdoor furniture.

Carpets includes installation and replacement of wall-to-wall carpets, tile, and other soft floor covering.

Appliances includes refrigerators, freezers, dishwashers, stoves, ovens, washers, vacuum cleaners, microwaves, air-conditioners, sewing machines and dryers, and floor cleaning equipment.

Electronics/miscellaneous housewares includes small electrical kitchen appliances, portable heating and cooling equipment, china and other dinnerware, glassware, silver and other serving pieces, nonelectric cookware, and linens. Excludes personal care appliances.

Office household equipment includes typewriters, luggage, lamps, clocks, and other light fixtures, lawnmowers and gardening equipment, power hand and power tools, telephone answering devices, telephone modems, computers for home use, calculators, office equipment for home use, houseplants and house plants, rental of furniture, closet and wardrobe organizers, household decorative items, infants' equipment, outdoor equipment, and all miscellaneous furnishings.

Boys' apparel includes coats, jackets, sweaters, vests, sportcoats, slacks, trousers, slacks, shorts and short sets, sportswear, shirts, pajamas, nightwear, hosiery, uniforms, and other accessories.

Girls' apparel includes coats, jackets, furs, sportcoats, tailored blouses, vests, blouses, shirts, dresses, dungarees, culottes, slacks, pajamas, underwear, nightwear, uniforms, hosiery, and other accessories.

Children's clothing under 2 includes coats, jackets, snowsuits, underwear, pajamas, crawlers, sleeping garments, hosiery, footwear, and other accessories for children.

Footwear includes articles such as shoes, slippers, boots, and other similar footwear for children under 2 and footwear used for sports and recreation, including golf shoes.

Apparel products and services includes material for making clothes, alterations and repairs, patterns and notions, clothing rental, dry cleaning, sent out laundry, watches, jewelry, and repairs to jewelry.

Purchases (net outlay) includes the net outlay (purchase price minus

trade-in value) on new and used domestic and imported cars and trucks. Other vehicles include attachable campers, trailers, motorcycles, private planes, and boats.

Vehicle finance charges includes the dollar amount of interest paid for loans contracted for the purchase of vehicles described above.

Gasoline and motor oil includes gasoline, diesel fuel, and motor oil.

Maintenance and repairs includes tires, batteries, tubes, lubrication, coolant, additives, brake and transmission fluid, oil change, brake adjustment and repair, front-end alignment, wheel balancing, steering repair, shock absorber replacement, clutch and transmission repair, electrical system repair, exhaust system repair, body work and painting, motor repair, repair to engine system, drive train repair, drive shaft and rear-end repair, tire repair, and maintenance and service, and auto repair policy.

Vehicle insurance includes the premium paid for insuring cars, trucks, and other vehicles.

Public transportation includes fares for mass transit, buses, trains, taxis, private school buses, fares paid on trips for trains, boats, taxis, bus, and airlines.

Vehicle rent, licenses, and other charges include leased and rented trucks, motorcycles, campers, trailers, and aircraft, inspections, State and local registration, drivers' license fees, parking fees, towing charges, landings, docking fees, and tolls on trips.

Health insurance includes health maintenance plans (HMO's), Blue Cross, Blue Shield, commercial health insurance, medicare, medicare supplement insurance, and other health insurance.

Medical services includes hospital room and services, physician's services, service of practitioner other than physician, eye and dental care, lab tests, nursing, therapy services, care of convalescent or nursing home, and other medical care.

Prescription drugs and medical supplies includes prescription drugs, medical supplies, eyeglasses, supportive equipment, medical equipment for general use, and rental of medical equipment.

Fees and admissions includes fees for participant sports; admissions to sporting events, movies, concerts, plays; club membership, recreational lessons; and recreation expenses on trips.

Television, radio, and sound equipment includes television sets, video recorders, video cassettes, tapes, disks, disk players, video game hardware, video game cartridges, cable TV, radios, phonographs, tape recorders, tape players, sound components, records and tapes, musical instruments, and repair of TV and sound equipment.

Other entertainment supplies, equipment, and services includes indoor sports equipment, bicycles, trailers, campers, camping equipment, hunting equipment, fishing equipment, sports equipment, winter sports equipment, water skiing equipment, boats, rental and repair of sports equipment, photography

m, repair and rental of photo equipment, pets, pet services, veterinary toys, games, hobbies, and playground equipment.

Personal care includes wigs and hairpieces, electric personal care appliances, hair care services for females and males, and rent and repair of electric personal care appliances. (Personal care products are in the Diary.)

Reading includes subscriptions for newspapers, magazines, and book and club; and purchase of single copy newspapers and magazines, books, encyclopedias and other reference books.

Education includes tuition, fees, books, supplies, and equipment for public and private nursery schools, elementary and high schools, colleges and universities, and other schools.

Alcohol and smoking supplies includes cigarettes, cigars, pipe tobacco, cigars, tobacco, and other smoking products and accessories.

Financial services includes safety deposit box rental, checking account fees and bank services, legal fees, accounting fees, funerals, cemetery lots, union dues, occupational expenses, and finance charges other than for mortgage and

Contributions includes cash contributed to persons outside the consumer unit for religious, educational, charitable, or political organizations.

Endowment, annuities, and other personal insurance includes premiums for life and term insurance; endowments; income and other life insurance premiums for personal liability, accident and disability, and other types of insurance other than for homes and vehicles.

Government, pensions, and Social Security includes all Social Security taxes paid by employees; employees' contributions to railroad retirement, government pension, and private pension programs; retirement programs for the consumer unit.

Income and personal taxes

Income—the combined income of all consumer unit members 14 years old or older during the 12 months preceding the interview. The components of income are listed below. The order of the definitions of income and personal taxes is the order of presentation in the tables.

For the definition of *Complete income reporters* or *Quintiles of income* see section 2 of this glossary.

Income before taxes is the total money earnings and selected money received during the 12 months prior to the interview date. It includes the following components:

Wages and salaries includes total money earnings for all consumer unit members 14 years or older, from all jobs including civilian wages and salaries, military pay and allowances, piece-rate payments, commissions, tips, National Guard or Reserve pay (received for training periods), and cash bonuses,

before deductions for taxes, pensions, union dues, etc.

Self-employment income includes net business and farm income. It consists of net income (gross receipts minus operating expenses) from a sole proprietorship or unincorporated business or from the operation of a farm by a proprietor, tenant, or sharecropper. If the business or farm is a partnership, the appropriate share of net income is recorded. Losses are also recorded.

Social Security, private and government retirement includes the payments by the Federal Government made under retirement, disability insurance programs to retired persons, to dependents of insured workers, or to disabled workers; and (2) private pensions and annuities and benefits received by retired persons or their survivors, either directly from an insurance company.

Interest, dividends, rental income, and other property income includes interest income on savings or bonds; payments made by a corporation to its stockholders, periodic receipts from estates or trust funds; net income from the rental of property, real estate, or farms; and net income received from roomers or boarders.

Unemployment and workers' compensation, veterans' benefits includes income from unemployment compensation and workers' compensation, and veterans' payments including educational benefits but excluding retirement.

Public assistance, supplemental security income, food stamps includes public assistance or welfare, including money received from job training, supplemental security income paid by Federal, State, and local welfare agencies to low-income persons who are age 65 or over, blind, or disabled; and food stamps obtained.

Regular contributions for support includes alimony and child support, as well as any regular contributions from persons outside the consumer unit.

Other income includes money income from care of foster children, scholarships, fellowships, or stipends not based on working; and net income as pay.

Federal income taxes includes Federal income taxes withheld from pay during the survey year to pay for income earned in survey year plus additional taxes paid during the survey year to cover any underpayment or underwithholding of taxes in the survey year to the survey.

State and local income taxes includes State and local income taxes withheld from pay during the survey year to pay for income earned in survey year plus additional taxes paid during the survey year to cover any underpayment or underwithholding of taxes in the survey year prior to survey.

Other taxes includes personal property and other personal taxes, including Social Security taxes for the self-employed paid in the survey year to cover any underpayment or underwithholding of taxes in the survey year.

here are not part of expenditures or income. They are provided for information.

Money receipts includes lump-sum payments from estates, trusts, sale furnishings, refunds from overpayment on Social Security, refunds from insurance policies, and refunds from property taxes.

Principal paid on owned property includes the reduction of mortgage on a mortgage obtained prior to the interview quarter for a home or any

other property. This is not included in homeowner costs but is considered as a payment of a loan.

Gifts of goods and services include gift expenditures: (1) clothing for women and males over 2 years old, and infants under 2 years old; (2) jewelry and watches; (3) small appliances and miscellaneous housewares; (4) blankets, sheets, and table linens; and (5) all other gifts. These items have already been counted as expenditures. Their values are given so they can be subtracted from the expenditure total. The value of consumption within the household is desired.

Appendix B. Survey Methods

Design of survey

The Consumer Expenditure Survey consists of two separate components: 1) a quarterly Interview panel survey in which each consumer unit in the sample is interviewed every 3 months over a 12-month period, and 2) a Diary or recordkeeping survey completed by the sample consumer units for two consecutive 1-week periods with the sample spread over a 12-month period. Each component has its own questionnaire and independent sample.

There are several features of the ongoing survey that should be noted. New units are introduced into the Interview sample on a regular basis as other units complete their participation. For the Interview survey as a whole, 20 percent of the sample is dropped and a new group added each quarter. This rotating sample is designed to improve efficiency in capturing changes in expenditure patterns. The Diary sample is a new sample each year. Another feature of the survey is that students living in college- or university-regulated housing report their expenditures directly while at school rather than being considered part of their parents' households.

The quarterly Interview survey collects detailed data on an estimated 60 to 70 percent of household expenditures. In addition, global estimates, that is, expense patterns over a 3-month period, are obtained for food and other selected items. These global estimates account for an additional 20 to 25 percent of total expenditures. In the Diary survey, respondents are requested to report all expenditures made during their 2-week participation in the survey. All data collected in both surveys are subject to Census and BLS confidentiality requirements, which prevent the release of respondents' identities or such geographic identifiers which lead to identification.

The quarterly Interview portion of the survey is designed to collect data on patterns of expense, household characteristics, and income. The expenditures reported by the survey are those which respondents can be expected to recall fairly accurately for 3 months or longer. Each sample household is interviewed once every quarter for five consecutive quarters. Data collected in each quarter are confidential so that annual estimates are not dependent upon the participation of a consumer unit for the full five quarters. Data collection activities are conducted on a continuous basis since October 1979.

At the initial interview, information is collected on demographic and family

characteristics and on the inventory of major durable goods of each consumer unit. Expenditure information is also collected in this interview, using respondent recall. It is used along with the inventory information solely for bookkeeping purposes, that is, to classify the unit for analysis and to prevent duplication of expenditures in subsequent interviews.

The second through fifth interviews use uniform questionnaires to collect expenditure information in each quarter. Wage, salary, and other income information and the employment of each household member is also collected in the second through fifth interviews. In the fifth and final interview, an annual supplement is used to obtain a financial profile of the household. This profile consists of information on the income of the household as a whole, including unemployment benefits, alimony and child support, and changes in assets and liabilities.

Households which moved away from their sample address between interviews were dropped from the survey. New households which moved into the sample address were screened for eligibility and included in the survey if four

Sample design

The samples for the Consumer Expenditure Survey are national random samples of households designed to be representative of the urban population. The eligible population is composed of all civilian noninstitutionalized persons. (See appendix A for a detailed definition of the population.)

The first step in sampling was the selection of primary sampling units (PSUs) which consist of counties (or parts thereof), groups of counties, or cities. The set of sample PSUs used for the survey is composed of 85 PSUs which have been previously defined and selected by BLS for the CEXS. In this part of the design represent only the urban part of the United States. The PSUs are classified according to the following four categories: "A" PSUs, which are 27 certainty areas (i.e., they are self-representing) and are primarily in metropolitan areas; 20 "B" PSUs, defined as metropolitan areas with a population of over 400,000; 22 "C" PSUs, defined as metropolitan areas with a total 1970 population of 400,000 or less; and 16 "D" PSUs, defined as small places in all nonmetropolitan areas. Since these PSUs were selected with a probability proportional to urban population and, therefore, do not

an rural population, it was necessary to supplement this design with PSU's (denoted as "E" PSU's) representing the rural population of the B, C, and D PSU's were selected using a controlled selection procedure a distribution across States and other stratifying characteristics. constraints in 1981, the rural areas outside of SMSA's (E PSU's) of the temporarily discontinued. These are included again beginning in

ing frame (that is, the list from which housing units were chosen) by new construction permits and techniques used to eliminate deficiencies in coverage in that census. All Enumeration Districts the 1970 census that failed to meet the criterion for good or available new construction and all ED's in nonpermit issuing areas are the area segment frame.

ew survey sample design is a rotating panel survey in which approximately 4,000 addresses are contacted in each of the five calendar quarters. bounding interviews, which are not included in estimates, and for (including vacancies), the number of usable interviews per quarter 4,800. Each quarter, one-fifth of the units interviewed are new to after being interviewed for five consecutive quarters, each panel is in the survey.

ates

rates continued at relatively high levels in 1984. There are two ories of nonresponse:

nonresponses include refusals, temporary absences, and noncontacts. and C nonresponses include housing vacancies, housing under construction with temporary residents, destroyed or abandoned housing units converted to nonresidential use.

nonresponses were considered to be "eligible" units since those units participate but either chose not to do so or could not be contacted. C nonresponses were not counted as eligible units since these addresses were vacant or no longer existed or were otherwise out of scope.

Analysis of response in the 1983 and 1984 interview surveys

Sample unit	1983	1984
Designated for the survey	32,784	33,658
Nonresponses	5,382	5,631
Units	27,402	28,027
Nonresponses	3,725	4,050
Selected units	23,677	23,977
Units interviewed	86	86

Table B-1 analyzes the levels of response of the housing units designated for interview in 1983 and 1984. Of the 28,027 housing units eligible for interview in 1984, 23,977, or 86 percent, were actually interviewed. This is the same rate as in 1983. Of the 33,658 designated for interview in 1984, 5,631, or 17 percent, were classified as type B or C nonresponses, up slightly from 16 percent in 1983.

Weighting

This section describes the current principal-person (PP) weighting methodology, discusses problems that have arisen using this methodology, describes a new generalized least squares (GLS) procedure designed to solve these problems that is being developed for implementation in subsequent releases of Consumer Expenditure Survey data.

Each sample household included in the survey represents a given number of households in the U.S. urban population, the universe the survey is designed to represent. This number is the sampling weight of the household. The weighting procedures followed for the Consumer Expenditure Survey initially assign a weight to each sample household which is the inverse of the probability of selecting the household. This weight is adjusted to account for field substitution when necessary.

The ultimate sampling unit and the unit of analysis for the survey is the consumer unit. Though the household and the consumer unit are usually different, some households contain more than one consumer unit. To obtain a weight for each consumer unit, the household weight is assigned to each consumer unit within the household, and these consumer unit weights are adjusted to account for the unavailability of some consumer units for interview. A final objective of the weighting procedures is to further adjust the consumer unit weight to match the population distribution of a selection of characteristics of the unit. For example, among characteristics for which the distribution is known with a high degree of precision for the universe are the number of persons in a set of units classified by age, race, and sex.

Thus, there are four basic steps in determining the weights for each consumer unit for which an interview is obtained. The first three of these are as follows:

1. The basic weight assigned to an address is the inverse of the probability of selection of the housing unit.
2. A weighting control factor is given to each interview if substitution was performed in the field.
3. After assigning the household weight to each consumer unit within the household, a noninterview adjustment is made for interviews for which data were not collected from consumer units in occupied housing units because of refusal to participate or because no one was home (type A nonresponse). The adjustment is performed within groups of consumer units classified by geographical area, tenure, family size, and race.

final step of the current principal-person (PP) weighting methodology is as follows:

The adjusted consumer unit weight is assigned to all persons in a unit, and these person weights are ratio-adjusted so that they add to the Census age/race/sex counts of persons. The adjusted weight of the "principal person" of the consumer unit is assigned to represent the consumer unit. The principal person is the female of a reference person and spouse or partner, or the reference person when no spouse is present. Male principal-person weights are further adjusted to compensate for a historical underrepresentation of single males in the CE and other large household surveys.

Due to the long use in Federal Government household surveys, principal-person weighting in the Consumer Expenditure Surveys resulted in numbers of persons in several age/race/sex groups substantially different from the Census counts when each person in a consumer unit was given the consumer unit weight. In addition, estimates of the total number of consumer units based on principal-person weights differed significantly between the Diary and Interview components. Some of these inconsistencies arose from different sampling procedures in the two surveys.

Some of the first problems include an 8-percent difference between the Interview survey and the population control data estimated by the Census Bureau in the number of black males in the urban U.S. population in 1981, and a 14-percent difference between the Interview survey and the Census data in the number of black women 14 to 24 years old. Inconsistencies between the Diary and Interview surveys can be seen by comparing the consumer unit counts estimated by principal-person weighting procedures in columns one and three of

Table B-2. To correct or eliminate these inconsistencies, the new generalized least squares methodology has been developed to perform the final step as follows:

1. Assigning each consumer unit within a household the adjusted consumer unit weight, an adjustment is made to the consumer unit weight, using the following technique, that

2. Assumes the sample is representative of the most recent Census or Current Population Survey (CPS) data on the age, race, and sex distribution of the U.S. urban population; and

3. Combines information from the Diary and Interview components of the survey in arriving at a single estimate for the size of each of a selection of consumer unit subpopulations defined by region of residence, sampling frame, tenure status, and family type.

4. Operates by minimizing the squared adjustments to the consumer unit weights generated from the first three steps, subject to:

a. The control condition that when members of each consumer unit are

- assigned the adjusted consumer unit weight, these persons sum to the Census/CPS population counts identified in a above; and
- b. The composition criterion that the adjusted consumer unit weights in the Diary and Interview survey components sum to the same total as each survey component for the set of consumer unit weights given in b above.

The results from the current and revised procedures are shown in

Table B-2. Diary and Interview survey population counts for selected types of consumer units by different weighting procedures, 1980-81

Consumer unit	Diary		Interview
	PP	GLS	PP
Total	70,040	67,187	68,295
One-person CU	20,086	17,931	18,219
Age of householder less than 25	8,239	7,100	7,408

As evident from columns two and four of table B-2, the GLS weighting procedure developed at BLS considerably narrows the difference between consumer unit counts in the displayed categories, while estimating total consumer units at a level slightly below that of the current principal-person methodology in the Interview survey component. It should be noted that the minor discrepancy remaining between the GLS totals for the Diary and Interview surveys is the result of computing these totals on a calendar basis, consistent with the timing of expenditures, as opposed to a collection basis, consistent with the timing of interviews to collect the data. This timing distinction is relevant only in the Interview survey, where consumer units report expenditures made in the month prior to the month of the interview.

As a result, some first-collection-quarter interviews refer to expenditures made entirely in the previous year and are deleted in the computation of calendar-year-basis statistics for a given year. Similarly, in computing year statistics, some interviews in the first-collection quarter of the year refer to expenditures made in the given year and are added to the totals in the computations. Weighting adjustment is performed on a collection basis, and totals computed on this basis for the two surveys are essentially the same for the classifications selected for composition by the GLS procedure, with the case in particular for the "Total" and "One-person CU" lines of

Further details on the GLS procedure and the empirical work done in comparing it with the current principal-person methodology are contained in the report *Consumer Expenditure Survey GLS Weighting Study* which is available from the BLS Division of Consumer Expenditure Surveys. The precise details of revising the weights will be described when the new weights are in

Collection and processing

Collection is carried out by the Census Bureau under contract with BLS. In addition to its collection duties, the Census Bureau is responsible for field editing, consistency checking, quality control, and transmitting the data to BLS. BLS performs additional review and editing procedures in preparing the data for publication.

Activities. Census data collection activities have been conducted on a national basis since October 1979 for the quarterly Interview survey. Due to differences in format and design, the Interview survey and the Diary survey are processed separately.

After completion by respondents and interviewers, the interview questionnaires are returned to the regional offices, where codes are applied to identify respondents by characteristics, expenditures, income and assets, and other items. Codes for type and model of automobile and trip destination. The data are keyed and transmitted to the Census Processing Center in Washington, D.C., for a computer preedit. Information on missing sections of questionnaires, corrections, and errors are transmitted back to the regional offices for review by the field staff through office review or interviewer followup. Corrections are keyed and transmitted to Washington, and again receive the computer preedit. This procedure continues until errors identified by the preedit disappear. Once a panel month's preedit is complete, selected data are transmitted to the next quarter's questionnaire. The current quarter's questionnaires are transmitted to the Data Preparation Division in Jeffersonville, Indiana, for editing and storage.

Questionnaires then go through another series of complex computer edits and adjustments which include the identification and correction of data irregularities and inconsistencies throughout the questionnaire. Other adjustments convert monthly vehicle payments into principal and interest using associated data on interest rate and term of the loan, eliminate business and other reimbursable expenses, apply appropriate sales taxes, and derive weights for individual respondents. In addition, demographic and work-experience items (except imputed when missing or invalid). All data changes and imputations are recorded on the Interview data file. Final tapes of the edited and coded data are transmitted monthly to BLS.

Bureau of Labor Statistics Activities. After receiving the data, BLS conducts an extensive review to ensure that severe data aberrations are corrected. This review includes a review of: Counts and means by region, family relationships, inconsistencies, and selected extreme values for expenditure and income categories; and a verification of the various data transformations performed by BLS. Cases of questionable data values or relationships are investigated by examining questionnaires on microfilm, and errors are corrected prior to the release of the data for public use.

Three major types of data adjustment routines—imputation, allocation, and time adjustment—are carried out to improve the estimates derived from the Interview survey. Data imputation routines account for missing or invalid data and affect all fields in the data base, except income and assets. Missing or invalid attributes or expenditures are imputed. Allocation routines are used when respondents provide insufficient detail to meet tabulation requirements. For example, combined group expenditures for fuels and utilities are allocated among the components of that group such as gas and electricity. Time adjustment routines are used to classify expenditures by month prior to aggregation of the data to calendar-year expenditures. Tabulations are made before the data adjustment routines to analyze the results.

Reliability of data

Sample surveys are subject to two types of errors, nonsampling and sampling. Nonsampling errors can be attributed to many sources, such as definition of the population, difficulties in the interpretation of questions, inability or unwillingness of the respondent to provide correct information, mistakes in recording or coding the data obtained, and other errors of collection, response, nonresponse, coverage, and estimation for missing data. The full extent of the nonsampling error is unknown though it is probable that the levels of expenditure generally underestimates because of difficulties with recall.

Sampling errors occur because observations are not taken from the entire population. The sample estimate and its estimated standard error enable the construction of confidence intervals used to perform tests of hypotheses. Data from 1980 through 1983 with coefficients of variation and other reliability statistics are available on request. However, since these are cell specific, these statistics are not extensive.
