ABSTRACT

Compiled by an independent research organization for the House Select Committee on Children, Youth, and Families, the 92 tables in this 1987 report update the committee's 1983 assessment of the conditions in which American children and their families live. These tables, which constitute a concise statistical summary of the most recent national data, provide information about: population; family environment; income; education; health and health-related behavior; behavior and attitudes; and selected government programs affecting children. The 1983 report identified what appeared to be dramatic shifts in families' social and economic conditions and living arrangements. This report demonstrates that these trends have made an imprint on the demographics of U.S. society and continue to create rigorous new challenges for American families. In some areas, pressures are intensifying. Included are comments of a minority of the committee which are in disagreement with the view that the trends indicated by the statistics are permanent and which point out positive trends in the data. U.S. CHILDREN AND THEIR FAMILIES: CURRENT CONDITIONS AND RECENT TRENDS, 1987

INTRODUCTION

In 1983, the Select Committee on Children, Youth, and Families began an assessment of the conditions in which American children and their families live. Our first report portrayed in detail the social and economic circumstances of American families. Now, at the outset of the 100th Congress, we have updated that assessment with "U.S. Children and Their Families: Current Conditions and Recent Trends, 1987."

This is a report card on where we stand as a nation in terms of families' financial status, housing arrangements, and the educational and health status of our youth. Four years ago, we identified what appeared to be dramatic shifts in families' social and economic conditions and living arrangements. What this report demonstrates beyond a doubt is that these trends are not temporary phenomena. They have made a permanent imprint on the demographics of our society and they continue to create rigorous new challenges for American families. In some areas the pressures are intensifying.

This report shows, for example, that:

In 1982, 5.8 million families with children were headed by single women. By 1986, the number of female-headed families increased by nearly a quarter of a million. One out of four children under 18 now lives in a single-parent household.

In 1982, we noted that nearly a majority of young children lived in households where both parents, or the only parent present, worked. Today, that is a fact for a majority of Ameri-

can children 5 years old or younger. When the decade began, 39 percent of married mothers with infants under age one were in the workforce. By 1986, a majority of these mothers with infants were in the labor force.

In 1982, we noted that the poverty rate for children had increased by nearly one-third between 1970 to 1981, from 15 percent to about 20 percent. In 1985, more than 20 percent of all

children remain impoverished.

Progress in reducing infant mortality has slowed dramatically. Black infants continue to die at nearly twice the late of white infants, and the gap has widened over the past five vears.

Low-income children suffer disproportionately in their health status, with higher rates of chronic disability, and lower utilization rates of medical and dental services.

The new data also reveal signs of progress:

Student SAT scores, rebounding in 1982 after a steady slide since the early sixties, continue to show modest increases through 1985.

While drug use among high school seniors remains high, it has declined steadily between 1981 and 1985; cocaine use, however, continues to rise.

In 1985, 67 percent of all black elementary school children lived in families where one or both parents finished high school, up by nearly one-third since the beginning of the 1980s.

This compilation is not intended to be comprehensive, nor does it use every statistical series available. It includes only those data for which there are reasonably reliable national measures. Nevertheless, it should be noted that national data often mask regional and local differences.

By adding a great deal of new information, this report presents a clearer and more comprehensive picture of this nation's children and families than was possible before. We have included previously unavailable data on Hispanic children, foster children, adopted children and children with various health and mental health problems, and children's health insurance coverage.

Yet, the dearth of solid, national statistics on these and many other groups of children, such as Native American children, children of immigrants, handicapped children, and children of homeless and displaced families, continues to make the development of

responsive policies affecting these groups difficult.

Beginning with our first report, the knowledge gathered by the Select Committee on Children, Youth, and Families has added measurably to the information base of the Congress, and has sharpened substantially the debate on problems facing America's children, youth and families. The evidence of the past four years alone signals changing circumstances that demand intelligent and creative responses from families, institutions, and government at all levels. We hope that this new report, which confirms profound changes in the lives of American families, will further enhance our ability to make sound policy choices.

ACKNOWLEDGEMENTS

The Committee wishes to thank Child Trends, Inc. for compiling this report. Child Trends is a not-for-profit research organization dedicated to improving the scope, quality, and use of statistical in-

formation about children and families.

The preparation of this report was made possible by Grant No. SES-8501616 from the National Science Foundation, for support of activities aimed at "Improving the Basic Research Potential of Federal Statistics on Children, Youth, and Families," and by supplementary support provided by the Office of the Assistant Scretary for Planning and Evaluation of the U.S. Department of Health and Human Services.

GEORGE MILLER,
Chairman,
DAN COATS,
Ranking Minority Member.

POPULATION

1. Number of Children by Age, Race, and Spanish Origin. The total number of children has fallen since the early 1970s but is projected to rise somewhat in the coming decade. The number of preschool children has increased since 1980, but is projected to begin decreasing by the year 2000. The number of elementary school-aged children continues to be low compared with 1960, but will increase through the year 2000. The number of secondary-school aged youth will continue to decline through 1990, but then increase by the turn of the century. The number of black children is expected to rise between 1985 and 2000. Spanish-origin children, now 10 percent of all children, will climb to 13 percent by the year 2000. Children under 18, as a percentage of the total U.S. population, have declined from comprising more than a third of the population in 1985 to just over a quarter of the population in 1985.

8

2. Number of Births. Although the fertility rate has remained low in recent years take previous table), the annual number of births has risen -- fluctuating between 3.6 and 3.7 million since 1980 -- as the children of the baby boom have grown up and become parents themselves.

Births (in thousands)

	1950	1955	1960	1965	1970	1975	1980	1981	1982	1983	1985

3. Fartility Rates. After the post-World Mari II bely boom, fartility rates fell dramatically among both non-whites and whites. Since the 1970s, these rates have shown relatively little change. The fartility rate rameins higher among non-whites. The fartility rate of Hispanic women is about 50 percent higher than that of non-Hispanics.

5. Sirths to Unmarried Women. The rete of childbirth among unmarried women (births per 1,000 unmarried women aged 15-44) has more than doubled since 1950. In addition, the number of unmarried women has increased substantially. Hence, the number of bables born outside marriege is more than five times higher now than in 1950. While the number of birthe to unmarried women has fase, the number of births to married women has declined. Thus, the proportion of children born to unmarried women has been riesing. Among blacks, nearly six in ten births now occur to unmarried women, despite a decline in the rate of births to black unmarried women. The proportion of sil births to unmarried women accounted for by teening mothers has declined since 1970.

"Since 1980, these numbers have been produced by a new method. This change has increased estimates of childbearing to unmarried women, particularly among older women. Since younger women eccount for the majority of all bitths to unmarried women, the overall effect of the new method has been small, increasing the estimated number of bitths to unmarried women in 1980 by 1.5 percent. (National Center for Health Statistics, Monthly Vital Statistics, Report, "Advance Report of Final Natelity Statistics, 1880," Vol. 11, NO. 8, Supplement.)

Note: The Bureau of the Census defines a <u>family</u> as a group of two or more persons residing together and related by birth, marriage, or adoption. A <u>household</u> consists of all those persons who occupy a housing unit. It includes related family members, and all unrelated persons, if any. A person living alone in a housing unit or a group of unrelated persons sharing a housing unit is counted as a household. A non-family <u>household</u> consists of a person or persons maintaining a household while living alone or with nonrelatives only. A <u>householder</u> is usually the person, or one of the persons, in whose name the home is owned or rented. If there is no such person in the household, the householder can be any adult household member. Labor force tabulations based on the civilian population only; data may not agree with published data due to differences in weighting procedures.

Source: Household data are from the U.S. Bureau of the Census. "Household and Family Characteristics: March 1984," <u>Current Population Reports</u>, Series P.20, No. 398, Table A; and unpublished data from the Current Population Survey, U.S. Bureau of the Census.

7. Female-Headed Families. The <u>number</u> of families with children under 18 has been increasing, especially those headed by females. The proportion of families headed by women has risen among both blacks; and whites but remains substantially higher among blacks.

	Number of Families	With Child	<u>ren Under</u>	<u> 18 (in pi</u>	llions)

	of the Census.

8. <u>Metropolitan and Central City Residence</u>. Forty-six percent of all children under 18 years of age who live with one or both parents live in the suburbs of metropolitan areas. Black children are sore than twice as likely as white children to live in the central cities of metropolitan areas. Hispanic children are highly concentrated in the major metropolitan areas, but they are more likely than black children to be living in the suburbs.

Hetropolitan and Central City Residence, Harch 1986

	Number of Children (in thousands)	Percent Distribution

9. Residence in Owned Housing. Rented Housing, and Publicly Subsidized Housing. A 65 percent majority of U.S. children under 18 live in housing that is owned by their parents or snother household member. However, whereas nearly 70 percent of white children live in owned housing, approximately 60 percent of both black and Hispanic children live in rented housing. One in six black children and one in 18 Hispanic children lives in publicly subsidized housing. A majority of the 2.4 million children living in public housing are black or Hispanic. (Children living in owned housing are also assisted, but through the tax system.) White children make up 88 percent of the 39.4 million children who live in housing owned by a parent or other household member.

FAMILY ENVIRONMENT

1. Family Living Arrangements. As of 1986, nearly 15 million young people -- or close to 24 percent of all children under 18 -- were living in a single parent family with either their mother or father. Another 8 million young people were living with step-families, adoptive parents, relatives other than their biological parents, or with non-relatives. Nevertheless, nearly two-thirds were living with both of their biological parents.

U.S. Children Under 18, 1986

Both biological parents	40.2	64\$
Nother only	13.2	21
Fathar only One biological parent and	1.6	3
one stepparent	5.5	9
Two adoptive parents	0.7	1 2
Grandparents or other relatives Fostar parants, other non-relatives,	1.3	2
or in group quarters	_0.3	<⊥
Total	62.8	100\$

Source: Calculated from unpublished data from March 1986 Current
Population Survey data, U.S. Bureau of the Census. Proportions
adopted and living with remarried parents were estimated from
the 1981 child Health Supplement to the National Health Interview
Survey and tha 1982 National Survey of Family Growth.

 Number of Parents. The proportion of children living with just their mother has risen among whites and blacks, but remains higher among black children. About 40 percent of all black children live in two-parent families and nearly one in fifteen lives with neither parent.

U.S. Children Under 18 (percent_distribution)

Note: Children living with two parents include those living with a parent and stepparent and those living with adoptive parents. Children living with neither parent include those living with relatives other than their parents, with non-relatives, or in group quarters. The small number of persons under 18 maintaining their own households are not included.

Source: U.S. Burezu of the Census, <u>Statistical Abstract of the United States</u>, 1982-83, Table 76; <u>Current Population Reports</u>, Series P-20, No. 380, Harital Status and Living Arrangements: March 1982; and unpublished data from the Current Population Survey, U.S. Bureau of the Census.

3. Children Living with Their Nothers Only. The increese in the number of children living only with their mothers has been due to an increese in marital disruption and births to unmarried women. The number of children living with e divorced mother more than doubled between 1970 and 1986, while the number living with an unmarried mother increesed by e factor of six. (Some of the latter change is due to improvements in survey coverage and data coding.) The number living with a widowed mother fell by more than one third. Since 1982, the growth in the number of children living with divorced end separated mothers appears to have slackened off. The growth in the number of children born and raised out-of-wedlock has continued, but may have begun to slow in 1985.

4. Children Living With Their Fathers Only. Although children are still far more likely to live with their mothers than with their fathers after a divorce or hirth outside of marriage, the number living with their fathers only has more than doubled in the last 15 years. As of 1986, more than a million and a half young people were living with their fathers only.

5. Number of Children Per Family. The proportion of all families with 4 or more children has fallen sharply. There has been a corresponding rise in the proportion of families with no children or only one child. Similar changes took place for black families and families of Spanish origin, as for non-minority families, except that the proportion of black families with no children first fell bafora rising again in the mid 1970s.

NA

No children 1 child 2 children 3 children

4 or more children

Note: "Own children" includes biological, adopted, and step-children. The figures represent a oross-section of families at a given point in time, and as such do not reflect tha distribution of families by the number of children they will ultimately have. For example, while 85 of families had no children in 1981, many of these families previously had or subsaquently will have one or more children. Because the wast majority of U.S. families are white, the percent distributions for white families are very close to those for all families and so are not shown separately. The 1960 data for blacks include other races as well; the majority are black. Persons of Spanish origin may be of any race.

Source: U.S. Bureau of the Cansus, <u>Statistical Abstract of the United States</u>, 1982-53, Table 70; <u>Statistical Abstract of the United States</u>, 1986, Table 64; <u>Current Population Reports</u>, Series P-20, No. 388, "Household and Family Characteristics: March 1983" aarliar reports, and unpublished data from the Current Population Survey, U.S. Bureau of the Cansus.

6. Education of Parents. The level of educational etteinment among parents of school-aged children has been rising, with especially drametic increases among blacks. The educational level of bleck parents still legs behind that of whites, however. Wearly 60 percent of Hispanic etudents have parents who have not completed high school.

Date on Hispanio students not available for earlier years.

7. Children With Hothers in the Labor Force. The proportion of children with mothers in the labor force has increased dramatically over the last decade and en laft. However, only a slight increase occurred between 1985 and 1986. As of 1986, half of all children under 6 -- and more than 60 percent of those aged 6-17 -- had mothers who were working, or looking for work outside the home.

Percentage of Children With Mothers In Labor Force

8. Children With Hothers who Work Full Time. Full Year. Of all children under 18 living with their mothers, 27 percent had mothers who worked full time, full year during 1984; 37 percent had mothers working less than full time, full year is and 33 percent had mothers who were not in the labor force for the entire year. Children in two-quent full lies were less likely to have a mother who worked full time, full year (25 percent) then children in mother-only families (32 percent). Additionally, younger children were less likely to have mothers who worked full time, full year then older children, with only 1 in 5 preschool children having a mother who worked full time all year in 1988. Hispanic children were the most likely to have a mother who worked full time throughout the force. Black children were the most likely to have a mother who worked full time throughout the year, while "hite children were the most likely to have a mother who was applyed less then full time, full year.

10

9. Trands in Full Time and Part Time Employment of Mothers. It is still the case that a sejority of mothers with children under 18 ere not working full time is 9 given point in time. However, the proportion who are currently working full time has grown from 29 percent in 1975 to 41 percent in 1986. Among those with school-seed children, the proportion working full time increesed from 38 to 48 percent, while for those with children eged 3-5, it grew from 27 to 39 percent. The greetest growth in full-time employment, however, has been among mothers whose youngest child is under 3. For these women, the proportion working full time increesed from 19 to 30 percent. The proportions of rithers who work pert time have slee been increesing, but sore modestly.

6-17 years, total	495	52\$	62\$	68\$	69\$
Total with children under 18	405	45\$	545	615	61\$

Note: Date are for Merch of each year. Marriad mothers are currently merried women with children under 18 and husbands present in the household. Children are defined as "oun" children or the householders, which includes etep- end adopted children, but excludes nisces, nephews, grandchildren, or foster children. The lebor force comprises all percons classified as employed or unsemployed. This table is perent besed, whereas Table 7 is child besed and includes children from single-perent households.

Source: Hayghe, Howerd. "Rise in mothers' lebor force activity includes those with infente." <u>Honthly Labor Review.</u> Vol. 109, No. 2, pp. 43-45, February 1986, Teble 3, p. 45, and unpublished data from the Bureau of Labor Statistics.

11. Employment of Married Mothers and Sinels-Farent Mothers. Married mothers with school-aged children ere lass likely to be working outside the home than single-perent mothers. Among those with children aged 2-5, differences are in the same direction, but meller. Among mothers of infents, the difference is reversed: merried mothers of infents. The labor force participation rates of black merried mothers are considerably higher than those of white married mothers, especially at the preschool ages. Among single-person mothers, on the other hand, black women are generally less likely then white women to be in the labor force.

12. Mother's Marital Status and Employment. Divorced and separated mothers are more likely to be in the labor force than are married mothers, although the differences have become smaller in recent years. Separated and divorced mothers are also more likely to be unemployed. Never-married mothers, on the other hand, are less likely than married mothers to be in the labor force, and yet, when in, they are especially apt to be unemployed. Regardless of marital status, mothers with older children are more likely to be in the work force and less likely to be unemployed than those with children under six.

Note: Data are for March of each year. The labor force comprises all persons classified as employed or unemployed. Employed persons are those at work in a job or business, or who have a job or business from which they are temporarily absent due to such factors as illness, vacation, and labor disputes. Uner-loyed persons are those who do not have a job or business but have made apecific efforts to find a job in the last four weeks, or are waiting to return to an old job or report to a new one.

13. Child Care Arrangements. Children under five years of age with employed mothers are more likely to be cared for outside their own home in recent years, particularly if their mothers work full-time. Much of the increase in out-of-home care has been due to increase in the use of group care centers or of.care provided in the home of non-relatives.

27

Note: Data are based on survey questions that asked only about care arrangaments for youngest child in the family, if that child was under five years of age. Percentages have been recalculated after removal or cases in "Don't know" category.

14. Adopted Children. In 1981, nearly 1.3 million children -- 2 percent of the total child population under 18 -- were living with adopted parents (i.e., with biologically unrelated adults who had legally adopted them). Families that adopted unrelated children were disproportionately of white, non-minority ethnic background. .arly three-quarters of these children were adopted at birth or during the first year of their lives. Hore than 85 percent were living with two adoptive parents; but 11 percent were living with only one adoptive parent (usuall) as a result of the disruption of the adoptive parent amriage; and 3 percent, with one adoptive parent and one stepparent.

*White children born out-of-wedlock and raised by their biological mothers are shown as a comparison group because adopted children are pradominantly white and most were born out-of-wedlock. These children are also included under the "All Non-Adopteds" group. The number of black children born out-of-wedlock and raised by their mothers is relatively large and the socioeconomic circumstances of the children are extremely poor. Thus, inclusion of these children in the second comparison group would have exagerated the comparative advantages of the adopted group.

Note: As defined here, "adopted children" does <u>not</u> include children who live with a biological parent and a stepparent, even if the child has been legally adopted by the stepparent.

Source: Analysis by Child Trends, Inc. of public use data from the Child Health Supplement to the 1981 National Health Interview Survey. Data collected by the National Center for Health Statistics, Division of Health Interview Statistics.

15. Faster/Substitute Care. Over a quarter of a million children were in foater/aubstitute care during 1984. Turnover im such case is high: nearly equal numbers, about 180,000, entered and left care during the year; and the median length of time in foater/aubstitute care was 17 months. Foater oare children are disproportionately hisok; they are distributed throughout the range of ages, but tend especially to be in their adolescent years. The numbers of children awaiting adoption, in non-finalized adoptive homes, and completing adoption during the year are roughly equal. Adopted children and those about to be adopted are disproportionately young — half are under 6 years of age. Those awaiting adoption tend to be acceptate older.

National Estimates of Children in State Foster/Substitute Care and Adoption Systems, 1984

*Data on the number of children adopted only cover those children adopted through state systems. They exclude children volety the responsibility of private agencies or placed independently.

Note: Total numbers are estimates derived from the 1984 Voluntary Cooperative Information System Substitute Care Population, which is used for reports to Congress under PL 96-272, the Adoption Assistance and Child Welfare Act of 1980. Ethnic and age braskdowns are calculated from sotual unweighted numbers of children in each category in the reporting states.

Source: Unpublished analyses of FT 1984 child welfare data from the Voluntery Cooperative Information Systems (VCIS) of the American Public Welfare Association (APWA).

INCOME

1. <u>Median Family Income</u>. When corrected for infletion, the median family income of children living in families rose from 1964 into the early 1970s, reaching a high of \$30,501 in 1973. The median was relatively stable through the rest of the 1970s, but begen to fell between 1979 and 1980, concurrent with recessions in the national economy. The recent decline turned eround in 1984, elthough in real terms the median family income of children in 1985 remained below the levels of 1980, 1975 and 1970. Children living in husband-wife families enjoy roughly three times the family income of children in mother-only families.

31

2. Median Family Income By Race and Spanish Origin. The median family income of white children is helf-egain se much se that of children of Spenish origin, and twice that of black children. Some of the overall income difference between blook end white children is due to the greeter proportion of black children living in mother-only families. Between 1979 and 1985, the medien family income of children in all types of families declined, when messured in constant dollars. The relative declines were sepecially large for Spanish origin children in husband-wife families, and for black children in mother-only families.

Median Family Income of Related Children Under 18, 1979, 1985

Mote: Related children under 18 include biological, etep-, end edopted children of the householder, end eny other children releted to the householder by blood, marriage, or adoption. The mediane are based on children (see notes, previous table). The ostagory "Spanish origin" includes persons of Mexicon, Puerto Ricen, Cubzn, Central or South American, and other Spanish origin. Origin is determined by saking "What is (this person's) origin or descent?" Persons of Spanish origin may be of any race. Mother-only families are those having a female householder with no husband present. Constant dollers calculated on the besis of the Consumer Price Index, U.S. Bureau of the Census, unpublished date for 1985.

U.S. Bureau of the Ceneus, Current Population Reports, Series P23, No. 114, Table 42, and unpublished data from the U.S. Bureau of the Ceneus.

Š

3. Children in Fowerty. Children are more likely than any other age group to be living in poverty -- more than one in 5 children lives in poverty. The proportion of children who are poor declined aharply in the 1960s; it reached a low of 18.1 percent in 1969. Rises in the rate of poverty in the 1970s and into the 1980s corresponded with periods of recession in the national economy. Since 1983 the rates have again declined alightly, except for Hispanic children. Black and Hispanic children are especially likely to be living in poverty. The poverty rates of children in female-headed families are especially high, varying between 51 and 56 percent since 1970. The proportion of elderly who are poor declined during both decades, and continued to decline into the 1980s.

4, <u>Proportion of Children Receiving Aid to Families With Dependent Children</u>.

After rising in the 1960s and early 1970s, the proportion of U.S. children receiving AFDC has stabilized. One in 9 children receives some assistance from AFDC.

Percentage of Children Under 18 Years of age Receiving AFDC

1960 1970 1975 1980 1981 1982 1983 1984 1985

Percentage 3.75 10.15 12.15 11.95 11.35 11.15 11.45 11.35 11.45

Note: Data are for December of each year.

Source: U.S. Bureau of the Census, <u>Statistical Abstract of the United States. 1982-3</u>, Tables 27 and 554; <u>Statistical Abstract of the United States. 1986</u>, Tables 25 and 643; <u>Cursat Population Reports</u>, P25, No. 985, Table 1, and unpublished data from the Office of Family Assistance, DHMS.

5. AFDC Fligibility. Primary eligibility for receiving AFDC is determined by a means test based on income and the absence or incapacity of a parent. Among children sligible because of income, out-of-wedlock birth has replaced divorce and separation as the leading basis for eligibility. Together, these causes are the basis for eligibility for 55 percent of AFDC faziles.

AFDC Eligibility by Basis (percent distribution)

Basia for Family Elicibility	1969	1975	1979	1981	1982	1983	1984
Divorce/separation Out-of-wedlock Father deceased Father unemployed Father inospacitated Other	27.45 27.9 5.5 4.6 11.7 22.9	48.0% 31.0 3.7 3.7 7.7 5.9	44.78 37.8 2.2 4.1 5.3 5.9	41.85 43.8 1.5 5.1 4.1 3.7	39.6\$ 46.5 .9 6.0 3.5 3.5	38.5% 44.3 1.8 8.7 3.4 3.1	38.25 46.4 1.9 8.6 3.6

Note: Eligibility for 1969-1982 is based on resson for father absence.

AFDC children with absent mothers (about 15) are included in "other" category. Eligibility for 1983-1984 is based on reason for atsence of either parent.

6. Mon-Cash Benefits. While childhood poverty persists, the character of poverty is affected by the availability of a number of non-cash benefits. One-quarter of households with children 0-18 receive one or more of the four main means-tested non-cash benefits -- free or raduced-price achool lunches, food atamps, Hedicaid, and subsidized rantal housing. The proportions of households raceiving each benefit, as wall as receiving any of these benefits, have changed little in the last few years.

Percentage of Households With Children 0-18 Receiving Benefit

Benefit Program	1979	1980	1981	1982	1984
Free or reduced-price achool lunches* Food Stamps Medicaid** Subsidized housing***	18.75 11.8 12.1 12.5	20.9\$ 13.1 12.7 12.9	20.85 13.5 13.0 13.8	21.5\$ 14.0 12.7 14.1	21.45 13.3 12.7 14.4
One or more of the above benefits	23.4	25.0	25.0	¥4	**

Based on households with children 5 to 18 years old.
Based on children covared by the program rather than children actually ractiving a Madicaid-paid service during the year.
Based on households in rantar-occupied housing.

č

7. Child Support. Barely one third of women with children under 21 whose fathers are absent receive child support payments from the absent fathers. The average seconts received ere smill smong mil froups and have declined from 1978 to 1981 (after adjusting 'i're inflation' for ell groups except college graduates. Both the likelihood of support and the amount of support received are highest when the mother is legally divorced, is white, or has a college education.

8. Sources of Income of Families With Children. Among two-perent families, the serninge of wives here become increasingly importent es a source of family income, sepecially for blacks. Public sesh trenefers ere e minor source of income for two-perent families of all ethnic groups. Among female-heeded families, the sernings of the householder here increased in importance, while public cash trenefers here decreased, especially for Spenieh origin femilies. Reverthelese, public cash tranefers etill make up a substantial portion of the income of female-heeded families.

9. Quintile Shares of Aggregate Family Income of Families with Children. The aggregate share of the income of families with children that is received by the lowest income quintile of families was only a percent in 1984, compared with 42 percent for the highest income quintile. Between 1967 and 1984 the eggregate income share of the lowest quintile of families has fellen steedily. This has been the case for all families and for black, white, and Spenish origin families.

EDUCATION

1. School Enrollment. The number of children enrolled in echool declined between 1970 end 1984, reflecting the decline in the school-eged population. The total number enrolled is expected to rise sherply, incressing from 45.1 million in the fell of 1985 to 47.9 million in the fell of 1993, due to incresses in the number of birthe in recent years. Elementery and secondary enrollment trands are expected to contrast charply, however, with enrolleente in the lower gredee increesing while those in the upper gredee continue to Sell. The proportion enrolled in private echoole hee increesed elightly since 1980. The proportion of preschool children enrolled in nursery or other echoole rose sherply during the 1970s, but hee leveled off in the 1980s.

	Enrollment in Schools

జ్ఞ

2. Preprintry Enrollment. The number of 3 - 6 year olds enrolled in nursery and kindergarten programs increased from about 4.3 million in 1970 to about 6.3 million in 1986, a 48 percent increase. Preprintry enrollment is expected to climb to more than 7.1 million by 1993. The growth in the number of 3-year-olds enrolled has been particularly dramatic, with the number enrolled in public schools nearly tripling, and the total enrolled increasing by 144 percent, between 1970 and 1986.

<u>Fdition</u>, 1986. Table 1.3. For details of projectic nethodology, see <u>Projections of Education</u>
<u>Statistics to 1992-1993</u>, 1985.

3. High School Graduation Ratio. The proportion of students graduating from high achool on time rose until 1970. It has been in the 70-75 percent range for the past 25 years. The ratio has been consistently slightly higher for girls.

Ratio of High School Craduates per 100 Persons 18 Years of Age

	1950	1955	1960	<u> 1965</u>	1970	1975	1980	1983	1984	1985
Total Male Female	55.5 52.4 58.6	63.1 60.3 65.8	72.2 69.7 74.7	70.8 69.6 72.1	76.9 75.8 78.2	74.2 72.4 75.9	72.0 69.6 74.4	73.3 72.0 74.7	74.4 na na	74.0 na

Note: The graduation ratio equals the number of high school graduates divided by the resident U.S. population aged 18 for that year. (The denominator includes Armed Forces overseas in 1950-1955.) The graduation ratio does not represent the proportion who will ultimately complete high school. For example, in 1981 the proportion of persons aged 25-34 who reported that they had completed four years of high school or more was 85.65 (U.S. Bureau of the Cennus, <u>Current Population Reports</u>, Series P20, No. 374, Table 6-3). However, the graduation ratio does approximate the proportion who graduate from high school on time, and reflects chenges over time and group differences.

প্ৰ

4. High School Dropout and College Entrance. High school dropout rates are relatively high among students with low cognitive test performance; of low accio-economic status; and from non-Asian minority backgrounds. Seniors who enter post-secondary education within two years tend to have opposite characteristics. They tend to have high test accres; to be of high socioecondmic status; and to come from Asian or non-minority backgrounds. They are also disproportionately female, and are likely to have taken an academic program in high school. Some 12 percent of high school atudents with high test scores have not gone on to post-secondary education within 2 years of high school graduation.

5. Educational Programs for the Handicapped. Between 1976-77 (the beginning of state data collection) and 1988-35, the total number of handicapped children served by education programs for the handicapped increased by about 17 percent. The total number of all students, on the other hand, declined by about 11 percent. The number of students receiving special education in the category of learning disability has increased 130 percent, and the number receiving special services as the result of serious emotional disturbance has increased 31 percent. Other categories experienced little change or declines. Declines in the numbers served in some ostegories are partly due to the decrease in the overall size of the achool-aged population.

7. Reading Achievement. Since 1970-71, reading proficiency acores have increased modestly for the three age groups tested: 9-, 13-, and 17-year-olds. The geins for blacks have exceeded those for whites, but scores for blacks remain considerably lower in comparison with whites. The reading proficiency of girls has been consistently above that for boys by a modest amount.

1 1.

8. <u>Mathematics Achievement</u>. After declining in the mid 1970s, the level of achievement in mathematics of 13-year-olds rose in the early 1980s. Methematics achievement of 17-year-olds also declined in the 1970s, but had not recovered by 1981-82. Achievement levels of 3-year-olds have not changed over this period. Although blacks continue to trail whites at all ages, 13-year-old blacks have made greater gains than 13-year-old whites. The performance of boys is nearly equal to that of girls at ages 9 and 13, but boys accre somewhat higher at age 17.

Note: Mational Assessment test results are besed on national probability samples of students at the specified get levels. Different tests were used for each sge, so comparison between agg groups for any given year i not appropriate. Data in the top part of the table are based on items comparable over all three assessments; data in the lower part, on items comparable over the last two assessments. Consequently, comparison across years for any given group is appropriate. In this analysis, white, black and Hispanio are non-overlapping categories.

Trends and annual, Report No. 13-MA-Ol Cherver, Colorado: Education Commission of the States, April, 1983), sables 1-1; and Direct of Education, Statistics, 1985-86, U.S. Department of Education, Table 21.

R

9. Scholastic hetitude Tojt Scoras. In 1982, average SAT accrea turned up slightly for the first time since 1963. Further increases in both mathematics and verbal accrea have occurred in recent years. Memower, average levels are atill considerably below those obtained in the early 1960s. Hales accre substantially higher than females on mathematics, and, since 1976, slightly higher on the verbal test. Although blacks continue to accre lower, on the average, than whites, the gap has marrowed somewhat in recent years. The accres of other race and ethnic groups are intermediate between those of blacks and whites, with the exception of Asian/Pacific students who accre exceptionally high on the mathematics portion.

Moress results from the Mational Assessment of Educational Progress are based on probability samples of U.S. students, SAT averages are based on self-selected sub-groups of the student population. Thus, changes over time in SAT averages may be at least partly due to changes in the number and composition of students taking the tests. It is the case, however, that Mational Assessment also found declines in high-level reading skills end in student knowledge in areas such as science, citizenship, literature, and music during the 1970s.

HEALTH AND HEALTH-RFLATED BEHAVIOR'

1. Prenatel Care. As of 1984, one birth in 20 was to a mother who received either late care or none at all. During the early 1970s, there was a substantial increase in the proportion of pregnant women receiving early prenatal care. The increase was especially marked among black women. Since 1978, however, there has been virtually no reduction in the percentage of pregnant women receiving late or no prenatal care. Black women remain less likely to receive early care than white women. Hispanic women, especially those of Puerto Rican origin, are less likely to receive early care than non-Hispanic women.

*Data for Hispanic women are available for 1978, but because they are based only on 17 reporting states and account for only an estimated 60% of all Hispanic or Spanish origin births in 1978, these data are not shown.

Source: National Center for Health Statistics, Health, United States, 1982, Table 24; Honthly Vital Statistics Report, Vol. 31, No. 8 Supplement, November, 1982, Tables 13, 20, Vol. 35, No. 4 Supplement, July 1986, Table 25, and unpublished data. Birth figures for Hispanic women in 1984 are based on data for 23 States and the District of Columbia which report Hispanic origin of the mother on the birth certificate. These states accounted for 90 percent of the Hispanic pupulation in 1980. Hispanic data for 1980 from: Honthly Vital Statistics Report, Vol. 32, No. 6, Supplement Sept. 1983, Table 13 (based on 22 states).

2. Franatal Care and Maternal Characteristics. More than three-quarters of the woman who had babies in 1984 initiated prenatal cere during their first triesster. Teenaged sothers were less likely than older mothers to receive prenatal cere in the first three months of their pragmencies and sore likely for receive care in the third triesster or no prenatal cars at all. Mothers with less than a high-school education were less apt to get sarly prenatal care than sothers with sore education. Late prenatal care and the total lack of care were also more common among unsarried mothers in comparison with married mothers, and saong blacks in comparison with whites.

. . .

3. Low Birth Weight. There has been a slight decline in the proportion of childran born with a low birth weight, but essentially no decline in the proportion born with an extremely low birth weight. Black children continue to be twice as likely to be born with a low birth weight. Puerto Rican in children are mora likely to be of low birth weight than children from other Hispanic groups or non-Hispanic children.

	Percentage of Live Births Less Than 1500 And Less Than 2500 Grams

*Date for Hispanic women are available for 1978, but because they are based only on 17 reporting states and account for only an estimated 60% of all Hispanic or Spanish origin births in 1978, these data are not shown.

Note: Prior to 1979, low birth weight and extremely low birth weight were defined as weighing 2,500 srams or less and weighing 1,000 rrams or less, respectively. In 1979, the definition was changed so that low birth weight was defined as weighing less than 2,500 grams and axtranely low birthweight as weighing less than 1,500 grams. The pounds and ounces equivalents to these figures are as follows:
2,500 grams or less = 5 lbs. 9 oz. or less;

2,500 grams or less = 5 lbs. 9 oz. or less; 1,500 grams or less = 3 lbs. 5 oz. or less; Lass then 2,500 grams = 5 lbs. 8 oz. or less; Less then 1,500 grams = 3 lbs. 4 oz. or less.

November, 1982, Tablea 13, 20, Vol. 35, No. 8 Supplement, 1984,
Table 25, and unpublished data. Birth figures for Hispanic in 1984
women are based on data for 23 States and the District of Columbis
which report dispanic origin of the mother On the birth certificate.
These states accounted for 90 percent of the Hispanic population in
1980. Hispanic data for 1980 from: Honthly Vital Statistics Report,
Vol. 32, No. 6 Supplement, 58ept. 1983, Table 13 (based on 22 states).

4. Birth weight According to Mother's Age and Race. Very young mothers are the most likely to bear a low birth weight baby. The incidence of low birth weight declines when childbearing women are in their twenties and early thrites, after which the proportion of low birth weight babies rises agein. Despite an overall decline in the incidence of low birth weight, children born to young and black mothers remain disproportionately likely to be of low birth weight.

Leub, "Trande in child abuse and juvenile delinquency," unpublished menuscript, May, 1985, citing the Public Health Service, National Center for Health Statistics, Yital Statistics of the United States, Yol. II Moriality, Part A, verious years; and unpublished date provided by the National Center for Health Statistics.

8. Deaths Among Children and Youth from Disease and Accidents. Health conditions among infants account for most mortality prior to adolescence. By adolescence, about as many young people die from accidents and violence as from diseases and health conditions. Death rates are generally higher among black children and youth than among white young people, with the most notable disparities cocurring in infancy and young adulthood. In both the first year of life end the 15-24 age group, dash rates for blacks due to diseases and health conditions are approximately twice as high as those for whites. Among youth 15-24, whites have higher non-disease-related death rates because they are at greater risk of dying in motor vehicle accidents.

9. Homicide Deaths Amons Children and Youth. Homicide retee smong children end youth hewe leveled off or declined in the 1980s, with the decline for older youth (15-24 years of age) being the most pronounced. Overell, however, murders of children and youth continue to be much more common now than they were two or three decades ego. Homicide retes are highest for older the declessents and young edults. Among children, the retes ere higher for infente end preschoolers then for school-eged children. The rates for mele youths ere about 3 times the retes for female youths among whites, end 4 times higher among blecks. The retee for bleck youth ere 3 to 6 times higher them those for white youth. Deepite recent declines, homicide rates for young bleck meles remain estremally high.

10. Deaths Among Teensgars Due To Hotor Vehicle Accidents, Homicide, and Smiride. In 1984, there were nearly 7,400 deaths due to motor vehicle sociatents among teensgare aged 12-19. This was alightly more than the number in the preceding year, but considerably less than the 10,600 teen deaths due to eutomobile sociates recorded in 1979. Death retes (deaths per 100,000 persons im the age group) for motor vehicle sociates involving teensgars have also generally been lower in recent years. Revartheless, the number of teen deaths in 1954 due to motor vehicle sociates represented twice the number of teen deaths due to homicide end suicide combined. Death rates ettributable to motor vehicle sociates is increase sharply with age in the teen years, es young people become sligible for licensee and do more driving.

11. Teen Suicide. Nearly 1,900 teenagers aged 12-19 took their own lives in 1984. The suicide rate of teens aged 15-19 has more than doubled since 1960, although most of the increase had taken place by 1978. Among subgroups, only black females have a rate in 1984 that is less than twice the 1960 rate. Suicide rates are higher for dider teenagers than for younger teens, for males than for females, and for whites than for blacks.

12. Officially Reported Child Maltreatment. The total number of reports of child maltreatment and to child protective service agencis has risen sharply from 669,000 in 1976, when the collection of such statistics on a national basis began, to 1.7 million in 1984, Rates of reported maltreatment per 1,000 children have also risen. Among children reported to be maltreated, the leading type of mattreatment is neglect (the deprivation of necessities). Minor physical injuries are next in frequency. Children reported to be maltreated are disproportionately young (preschool see) and non-while

*Figures for 1985 do not include maltreatment reports from Puerto Rico, the Virgin Islands, and the Trust Territories. **Percent for type of maltreatment adds to more than 100 because a child

Hispanic Other

may be reported as maltreated in more than one way.

Note: The number of reports of maltreatment in a year exceeds the number of children maltreated by an unknown percent because of duplicate cases -- children for whos two or more reports of maltreatment are on record. Increases over time in reports of child maltreatment could be due to better reporting practices (especially improvements instigated by legislation mandating such reports in some states), to actual increases in levels of maltreatment, or both. The validity of either explenation cannot be determined from the data. Moreover, many cases of maltreatment go unreported. Consequently, levels of actual maltreatment and of reported reported reported cases are substantisted upon investigation by child protective services agencies. However, states differ considerably in thail definition of substantiation, and it is possible that some unsubstantiated cases of involve actual maltreatment can that do involve actual maltreatment cases and not).

g

13. Communicable Disagres. Many communicable diseases that were once cosson to childhood have been eradicated or greatly reduced in frequency. The annual incidence of reported messles cases, for exemple, hes fallen from 245 cases per 100,000 U.S. citizens in 1960, e few years before e vaccine for messles became aveilable, to just over 1 case per 100,000 in the 1980s. The gual of totelly eliminating messles has not been attained, however. And some domaunicable diseases of childhood, such as chickenpox, hew yet to be conquered.

Number of Reported Cases of Specific Diseases Per 100,000 Persons in U.S. Population

Disease	1960	1965	1970	1975	1980	1981	1982	1983	1985	1985*

Pertussis	9	4	2	1	1	1	1	1	1	1
Humps	na	កន	56	28	4	2	2	2	1	1
Chickenpox	na.	D2	n8	78	97	100	94	100	138	n s

*Provisional data.

Note: Data are based on oases of notifiable diseases reported to state and territorial health egancies and thence to the Centers for Disease Control (CDC) in Atlants. Completeness of reporting varies greatly, insauch as not all cases receive medical cere and not all treated conditions are reported. State less and regulations mendete disease reporting, but reporting to the CDC by states and territories is voluntary.

Source: Netional Center for Health Statistics, <u>Health: United States, 1982</u>, Table 26; <u>Health: United States, 1985</u>, Table 30. Oate for 198% and 1985 supplied by Centers for Disease Control, Division of Impunitation.

14. Immunization Among Preschool Children. Since 1975, the proportions of children aged 1-4 who have been immunized against each of several major childhood diseases have leveled off or declined. For mumps, the proportion immunized rose from 1975 to the early '80s, but now appears to have leveled off.

Percertage of Children 1-4 Immunized, According to Disease

15. Immunization Among Children Entering School. There has been notable progress since the late 1970s toward universal immunization of school-aged children, due largely to meat schools requiring proof of immunization as a condition of admission. By the time they enter a children and first-grade pupils have been immunized against each of the children diseases listed below.

Percentage of Children Entering Kindergarten or First Grade Immunized Against Specific Diseases, By School Year

Disease	1978-79	1979-80	1980-81	1981-82	1984-85

16. Parent Ratines of Children's Health Status. When U.S. perente ere seked to rate the nealth of their children on a scale from "sacollent" to "poor; eight out of tan children are described as being in very good or excellent health. Between 2 and 3 percent are rated in fair or poor health. Black ohlidren and children from low-income families are less likely to be described as being in excellent health — and more likely to be rated in fair or poor health — then non-minority children and those from more effluent femilies. The overall distribution of child health ratings has not changed significantly in recent years.

Note: The soals used in the Mational Health Interview Survey for overall rating of a subject's health was changed between 1981 and 1982 from a four-cotagory to a five-category soals. In addition, parents were no longer asked to compare the child with others of the same age and ear. Thus, ratings date from years prior to 1983 are not articity comparable to recent date.

17. Chronic Health Conditions in Childhood. Among perceitent health conditions thet are common in childhood, respiratory conditions such as chronic einweitis, chronic broachitis, bay fever end eathme are the most prevalent. Each of these conditions affects 3 te 4 million youngaters. Skin conditions; orthopedio, hearing, or epech impairments; end heart murmurs also effect lerge numbers of children end edclescente. Asthme stends out smong the most prevelent conditions because it is the leading cause of activity restriction in children, can be life threetening, end requires frequent medical care. Serious childhood diseases such se epilepsy end diebetes affect remailer but still substantiel numbers of young people.

1,11

Prevalence of Selected Chronic Health Conditions That ire Common in Childhood

Type of Condition	Estimeted Number of Ceses in Population Under 18, 1985	Humber Per 1,000 Children Up/er 18
Respiratory Conditions Chronio sinusitia Chronic bronchitia Hay fever or silergio	3.7 million 3.5 million	59.6 55.5
rhinitis without esthms Asthms Chronio disease of tunbils or adenoids	3.2 million 3.0 million 1.7 million	50.3 47.8 20.5
Skin Conditions Dermstitis Serious sone	2.8 M. 110n	44.5 27.2
Impairments Deformity or orthopedic impairment Hesring impairment Speech impairment Visuel impairment	2.1 million 1.2 million 1.0 willion 680 thousand	33.2 19.2 16.3
Other Conditions Heart muraure Higraine headsche Anemiee Epilepsy Disbstee	1.1 million 795 thousend 540 thousend 282 thousend 118 thouserd	10.8 16.9 12.7 8.6 4.5 1.9

Note: Chronic conditions es defined in the Metionel Health Interview Survey are conditione that either e) were first noticed 3 months or more refore the reference date of the interview; or b) belong to a group of conditions (including heart dissess, diabetes, and others) that are considered chronic regardless of when they began. The prevalence estimates are based on reporte by parents or other adult respondents in response to checklists administered in household interviews. Estimatis for conditione that effect fewer than 200,000 persone in the population may be somewhat unreliable due to small sample sizes.

18. Children, (th Limitation of Activity Due to Chronic Health Conditions. Approximately 3.2 million children under 18, just over 5 percent of the child population, are reported by their parents to have some form of activity limitation caused by a chronic health condition. About 2.3 million, or 3.7 percent of the child population, are reported to have a limitation in a major activity, that is, a condition that limits school attendance (for school-aged children) or ordinary play (for preschool children). Realth-related activity limitations are more frequent manny males than females; smong blacks than whites; and manny young people from low-income families than among those from more affilient families.

[&]quot;In the National Health Interview Survey, "limitation of activity" refers to a long-term reduction in a person's capacity to perform the average kind or amount of activities essociated with his or her age group. Attending school is considered the major activity for children 5-17 years of age, while ordinary play is the major activity for children under 5 years of age. Beginning with the 1982 survey, a question on attending special classes was added to the limitation requence for achool-eged children. Thus, comparisons with earlier data on the prevalence of limitations among children are not appropriate.

19. Physician Yisits. Children have averaged about 4 physician visits per child per year since the mid-1970's. More than three-quarters of all children have at least one physician contact over the course of a year. The number of physician visits per child per year rose between 1968 and 1975. The proportion of children with at least one visit per year also rose during that period. In recent years, there has been little change in the number of visits per year or in the interval since the last visit.

Number of Physician Visits Per Child Per Year and Interval Since Last Physician Visit. U.S. Children

1964 1975 1979 1980 1981 1983* 1985* Number of visits per child 3.7 4.2 4.1 4.4 4.1 4.3 4.2 Interval since last visit Percent_Distribution 67.0\$ 73.6\$ 75.6\$ 76.7\$ 76.2\$ 77.5\$ 77.9\$ 14.8 14.0 13.7 12.8 13.2 11.3 11.9 Less than one year One to less than two years 14.8 14.0 Two years or more 14.7 11.2 9.4

2. Alcohol. Ciearette, and Marijuane Use Japone Teanagers. About a third of all teanagers aged 12-17 report having used alcohol at least once in the past month. Sixteen purcent report cigarette use and 12 percent report cyt surjugans use during the same period. Use of all three substances increases absply from age 12 to 4ge 17. Whila the level of alcohol use by tasen has fluctuated since 1974, oigs-tte use has gradually declined, although there is some indication that the decline in teen smoking may be leveling off. Marijuane use has declined from pask levels receded in the late 1970a, but has not returned to levels recorded in the certy 1970a.

23. Alcohol and Drug Use Among High School Seniors. Two thirds of all high school seniors report drinking alcohol and a quarter report using earljuans in the past month. One in fifteen reports using cocaine. The use of nearly all drugs has declined in the last few years from peak levels reached in the lete 1970s or early 1980s. The use of cocaine has continued to rise, however.

24. Young People's Use of Psychological Services. In 1981, there were almost 3.5 million Young people seed 3-17 -- nearly 7 percent of the population of those ages -- who had ever received psychological counseling or therapy for an emotional, mental or behavior problem. The proportion of young people who had received psychological help increased with age, growing from 2 percent in the preschool years to about 9 percent in adolescence. Nearly two-thirds of the young people who had received counseling or therapy were males, and a majority came from disrupted families. The proportion of adolescents who had seen a psychological counselor or therapist within the last year nearly doubled between the late 1960's and 1981, with virtually all of the growth occurring among teens from single-parent families or stepfamilies.

25. Realth Insurance Coverage. Eight out of ten children under 18 were covered by some form of health insurance in 1958. Whereas more than 85 percent of children in two-perent families had health insurance coverage, only about two-thirds of those in single-perent femilies had coverage. Children living with divorced mothers were less likely to have coverage than children living with never-married mothers; the children of never-married mothers were twice as likely to be covered by Nedicaid as the children of divorced mothers. Thirteen percent of all children, and mearly half of those in families below the poverty live Nedicaid program, but 325 of all children living in families below the poverty level had no insurance of any kind.

BEHAVIOR AND ATTITUDES

1. Goals of college Frankern. When college freshmen are asked to rate the importance to them personally of various life objectives, just over 70 percent rate it "essential" or "very important" that they become "an authority in my field" and be "very well off financially." The proportion who deem it important to be financially successful has risen dramatically since the late 1960s. This is now the most popular goal among male freshmen and is endorsed by two-thirds of female freshmen as well. By contrast, the goal of "developing a meaningful philosophy of life" has dropped in popularity, decreasing 83 percent to 43 percent endorsement between 1968 and 1985. Freshmen of both sexes endorse career-oriented goals more strongly today than they did in the recent past, but changes along these lines have been more striking among females. On the other hand, sizable majorities of both sexes continue to consider it "very important" or "essential" to raise a family and help others who are in difficulty.

2. Fost Hist School Plans of Hish School Seniors. Nearly 100 out of three high school seniors plan to earn a college degree, and more than one in three plans to attend graduate or professional school. The plans of males and females in 1985 are quite similar except that far fewer females plan to serve in the Armed Forces. Plans to attend a vocational or technical school, serve in the Armed Forces, or to graduate from a 2-year college program have not shown much change since 1975, while plans for graduation from a years of college and attendance at a graduate or professional school show marked increases, particularly among female seniors.

3. Daily activity Patterns of Rish School Saniors. Hearly three-quarters of high school seniors repo. that they watch television "elmost every day." Just over half say they read books, magazines, or newspepers on e daily basis. Whereas the proportion who report daily TV watching has remained fairly constant since 1977, the proportion who read every day has dropped by 11 percentage points. The proportion who report doing creative writing on a daily basis remained fairly constant she there 1977 and 1985, but at a much lower leval: about 6 percent of all seniors.

Daily activity patterns atill show autatantial sex differences, with more females reporting daily housework, reading, writing, musio-making, and time apent alone. On the other hand, more males report daily exercise or aports participation, getting together with friends informally, end riding around in e oar just for fun.

5. Trends in Pregnancy Rates. The proportion of U.S. teens becoming pregnent has risen over the past decede and a helf, largely because the proportion of sexually experienced teens has been increasing. Considering only females who are sexually experienced, the proportion who have become pregnent seems to have declined somewhat. The proportion having a birth has declined aubstantially each year, reflecting lower pregnancy rates and increased abortion rates.

Among all females 15-19, the percent each year:

	1970	1975	<u> 1980</u>	<u> 1984</u>
Becoming Pre_nant:	9\$	10\$	115	115

.

7. <u>Unranted Births</u>. Although the proportion of births unwanted at conceptior declined between 1970 and 1982, black mothers remained more likely than white mothers to report that their births were the result of unwanted pregnancies. The proportion of births resulting from unwanted pregnancies is essentially unchanged among outhers with fewer then twelve years of high school and is considerably higher for these mothers than for those with more education.

Percentage of Births Unwanted at Conception, 1976 and 1982

Reserved Hother Education of Hother 1976 1982 Total 12.05 107.5 Leas than 12 years 10.15 10.55 White 9.5 8.0 Tuelve Years 8.1ack 25.8 23.7 More then 12 Years 7.4 6.8

Note: In the Mational Survey of family Growth a pregnancy is defined as unwanted if the woman reports she did not want or probably did not want to have s(nother) baoy at some time and felt that way before becoming pregnant.

Source: National Center for Health Statistics, Advance Dats, No. 56, January 24, 1980, "Manted and Unwanted Births Reported by Nothers 15-43 lears of Age: United States, 1976," by E. Eokard and "Fertility Patterns: The Number, Timing and Wanteiness of Births, United States, 1982, "Vital and Haalth Statistics Export. Series 23, Data from the Kational Survey of Family Growth."

8. Preinancy Stating. The average number of months between births increased between 1970 and 1977, particularly smong older black me ners. Setween 1977 and 1984, however, births became somewhat wore closely spaced in all race and age categories. Young mothers continue to have more closely spaced births than older mothers.

Average Nonths Between Current Live and Previous Live Birth

Arc_a; Current		Thire		Blacks

Note: Data were reported by 37 states in 1970, by 43 states and the District of Columbia in 1977, and by 49 states and the District of Columbia in 1904.

Spacing refers to the interval between the present live birth and the previous live birth.

Scurce: National Center for Health Statistics, "Interval Between Birtha: United States, 1970-77," by E. Spratia, and S. Taffel, Vital and dealth Statistics, Series 21, No. 39, Table Q, and unpublished tabulations from the Division of Vital Statistics, National Soviet for health Statistics,

9. Abortion. The abortion rate (abortions per 1,000 women aged 15-44), and the abortion ratio (abortions per 1,000 live wirths plus abortions) increased until 1980 and them stabilized. A slight decline in 1984 is due to smaller numbers of younger women. After increasing rapidly during the 1970s, the number of abortions has elso stabilized.

ž

10. Family Roles. A majority of male high school seniors believe a preschool child suffers if the mother is employed. However, the proportions of both male and female seniors holding this view have declined since the mid-1970's. While both sexes support equal pay for equal work, girls feel more atrongly about this than do boys. Hale seniors are more likely then female exhlors to view the ...man's role as centered around the home.

11. <u>National Problems That Worry Youth</u>. When asked how often they worry about each of the national problems listed below, U.S. high school seniors are most spt to report worry shout crime and violence and drig abuse. Concern about crime has been on the decline, however. Concern about nuclear war has increased aince the mid-1970s, but appears to have reached a plateau. There has been a resurgence of concern about hunger and poverty in recent years, whereas worry about pollution, population growth, energy shortages, and loss of open land have been declining.

P. centage of High School Seniors Who Often Worry About Selected Issues, 1975-1985

12. Attitudes Toward Military Service in the Event of War. A mejority of male high school seniors say that, if they falt it were necessary for the U.S. to fight in some future wer, they would volunteer for all 'my service. Rowever, nearly a third say they would not volunteer, and 1; percent of male attidents say that, in their opinion, there is no such thing as a "necessary" wer. The proportion of males willing to volunteer is up sherply in recent years. Female students are much less likely to say they would volunteer, yet the proportion who would volunteer rose until 1984, while the proportion saying there is no such thing as a necessary wer has remained atable.

13. Religious Involvement of High School Seniors. The proportion of high school seniors who attend religious services once a week or more declined from 83 percent in 1980 to 35 percent in 1985. Aearly half of the 1985 seniors said they rarely or never attended church. The proportion who describe religion sa being very important in their lives has also declined since 1980, but not as sharply. Few changes in denominational preference have occurred since 1976. Baptists and Roman Catholica resain the largest denominations.

27

1. Juvenile arrest Rates. In 1985, there were approximately 102 arrests of tienagers aged 13-17 for every 1,000 teens in that age range. The juvenile arrest rate for FBI property index crimes, such as arson, auto theft, and burglary, was about 32 per thousand; and the rate for FBI violent index crizes, such as aggravated assault, robbery, and rape, about A per thousand. Between 1965 and 1975, the total teen arrest rate increased by 41 percent, while the arrest rate for violent crimes more than doubled. Since 1975, teen arrest rates have remained stable or declined slightly.

	Number of Arrests of Teens Aged 13-17 Per 1,000 Teens in the Population										
	1965	1970	1975	1980	1985	1985					
Total Arrests	73.5	97 4	103.9	101.0	7.8	101.8					
Total Index Crime Arrests*	26.9	33.2	40.0	38.2	34.7	36.4					
Property Index Crime Arrests	24.8	29.9	35.5	33.7	30.4	32.1					
Violent Index Crime Arrests*	2.1	3.3	4.4	4.5	4.2	4.3					

*Crimes covered in the FBI Property Crime Index include arson, autotheft, burglary, and larceny. Crimes covered in the FBI Violent Crime Index include aggravated asseult, murder, rape, robbery, and non-negligent manslaughter. The total Crime Index covers both types of crimes.

Fote: Arrest trends are an imperfect 1 'cator of underlying trends in juvenile crime rates. The likel sod that a crime will result in a recorded arrest depends on a number of factors, such as the propensity of victims to report crimes to the police, the police department's routine procedures for dealing with juvenile suspects, etc. Changes in these factors over time could distort the relationship between the number of arrests and the number of crimes committed. However, estimates of the volume of juvenile crime developed from National C see Survey victimization report data are compatible with the arrest ends presented above.

Source: Cook, P., and J. Laub, "The (Surprising) Stability of Youth Crime Rates," Journal of Quantilative Criminology, Vol. 2, No. 3, pp. 265-277, 1986; and unpublished data supplied by the same authors. Arrest statistics compiled by the Uniform Crime Reporting Program, Federal Bureau of Investigation, and adjusted for .pulstion coverage of reporting units.

15. Juveniles In Gustody. The juvenile population in custody in public correctional facilities in 1985 was 49,322, representing a 3 percent increase from 1979. These juveniles were predominantly male and four-fifths were 14 to 17 years old. Black youth were overrepresented, making up 37 percent of the juveniles in custody. Rearly three-fourths of those held in public facilities were committed (adjudicated for an offense or for treatment), 38 opposed to being detained or voluntarily committed.

^{**} Rate is per 100,000 juveniles in the population.
***The numbers for 1983 exclude 1,772 cases for which race and ethnicity were not reported.

욠

16. Labor Force Participation and Unemployment Among Techagers. About 38 percent of 16-17 year olds enrolled in achool were in the labor force in 1985, and 20 percent of these were unamployed. The rate of labor force participation is about twice as high among taens not anrolled in school as rong those who are annolled. White youth are nearly twice as likely to be in the labor force as are black youth. The rates for those of Spanish origin are intermediate. Labor force participation rates have fluctuated within a fairly narrow range from 1960 to 1985 -- from 34 percent to 48 percent for those who are annolled, and from 71 percent to 82 percent for those not annolled. Only among white females enrolled in school have the rates rises substantially. In contrast, rates of unamployment, have about doubled for nearly every population subgroup. The rates rose from about 10 percent to approximately 20 percent for those annolled in school, and from about 18 percent to marrly 40 percent for those not enrolled.

SELECTED GOVERNMENT PROGRAMS AFFLCTING CHILDREN

1. Aid to Families With Dependent Children (AFDC). The number of families in the AFDC program has been relatively stable since the mid 1970s, rising slightly during the research of 1980. The number of children per family has been falling. Consequently the number of children served has declined, but children still comprise two-thirds of all recipients. Benefits are not indexed and benefit levels have not kept up with inflation since the mid-1970s.

Average Honthly Recipients and Program Cost

	1965	1970	1975	1980	1981	1984	1985
Number of children Number of familles	3.3 mil. 1.1 mil.			7.6 mil. 3.8 mil.	7.1 mil. 3.6 mil.	7.1 mil. 3.7 mil.	7.2 mil. 3.7 mil.
Children per family	3.1	2.8	2.3	2.0	2.0	1.9	1.9
Total payments Current dollars	\$1.7 bil.	\$ 4.9 511.	\$ 9.2 bil.	\$12.5 bil.	\$13.0 bil.	\$14.4 bil.	\$14.9 bil
Constant (1985) dollara	\$5.8	\$13.6	\$18.4	\$16.3	\$15.4	\$14.9	\$14.9
Children as a percentage of recipients		73\$	71\$	68\$	68\$	66\$	67\$

Note: Data on number of recipients are for December of each year.

.

2. Teenage Hothers and AFDC. Between 1975 and 1984, the number of AFDC recipients under age 30 who were taenage mothers when thay bore their first child rose by nearly 100,000. However, the proportion of recipient mothers under age 30 who were teen mothers did not change over this nine-year period. Data for 1975 and 1984 indicate that nearly two-thirds of all AFDC recipients who were then under age 30 were teenagers when their first child was born. Likawise, estimates of the proportion of recipients of all ages who wer: teenagers when their first child was born show little change during this period. Since the Lotal AFDC program cost, unadjusted for inflation, increased between 1975 and 1984, the amount e pended on the households of teen mothers also rose in absolute terms; however, it declined after adjusting for inflation.

	1975	1984
Total mothers under age 30 receiving AFDC	1.588 mil.	1.765 mil.
Mothers under 3C receiving AFDC who were 19 or younger at the birth of thair first child	1.024 mil.	1.115 mil.
Proportion of mothers under age 30 receiving AFDC who became mothers at age 19 or younger	64\$	63\$
Proportion of all recipients who bacame mothers at age 19 or younger (estimated)	54.1\$	54.5%
Total AFDC costs expanded on households established by recipients who became mothers at age 19 or younger (estimated)	\$4.98 billion	\$7.85 billion
Total AFDC costs in 198% dollars	\$9.61 billion	\$7.85 billion

Note: Mother's age at first childbirth is calculated from the age of oldest child in the nasistance unit. To avoid calculation errors that would occur as first-born children you up and leave their mother's household, analyses were limited to mothers under age 30 at the time data were collacted. The proportion calculated to have been teenage mothers is likely to be underestimated because some teanaged mothers are not designated the caretaker. Cames in which the mother's age was unknown were deleted from both analyses. The proportion of all recipients astimated to be teenage others was calculated by assuming 43 percent of racipients over age 30 were teanagers when their first child was born. The resulting proportions - 5%.1 and 5%.5 percent - were then applied to total program coats for AFDC in each year.

Source: Tabulations by Kristin A. Moore, Child Trends, Inc., using unpublished data for 1984 from the National Integrated Quality Control System, provided by Wilbur Weder, Femily Support Administration, Office of Femily Assistance, Department of Health and Human Services.

Data for 1975 are from the 1975 AFDC Recipient Characteristics survey as reported in Mary Ann Schairer, JWK International Corporation, "Recearch on the Societal Consequences of Adolescant Childbearing: Public Assistance Costs, 1975 and 1977," Qualterly Progress Report to the Canter for Population Research, NICHD, for the 3-month period ending Dacember 31, 1980.

3. Average Monthly AFDC Payments. Average monthly AFDC payments vary widely among the states, the highest state paying more than five times the average of the lowest state. Variations are due to differences in average family size, amounts of other countable income, benefit levels, and other factors determined by the state. The average payment per recipient in 1982, when corrected for infilation, was barely above the level of 1965, and below the levels of 1970, 1975, and 1980. The median benefit for a family of four with no other income declined by 36 percent between 1970 and 1980.

4. <u>Medicaid</u>. The total cost of Medicaid (in constant dollars) has risen steadily since 1972. Children continue to account for approximately half of all Medicaid recipients, but their proportion of total Medicaid expenditures has fallen considerably since the early 1970s.

Note:

5. Fond Stame Pragram. Perticipation in the Food Steep program increased steadily during the late 1960 and 1970s, so it was estended from a pilot to a nationwide program. By 1982, nearly once person in ten participated in the program. Perticipation has declined by about it percent since 1982, however. Unlike ATPC, two-perent families are elimine for food steeps and benefits are indeed to increase with inflation.

9. Family Planning Services. The number of persons served in federally-supported family planning programs and federal appropriations for family planning services rose through the 1970s. A sharp decline in federal Title X appropriations in FY 1982 has been followed by fairly constant support at the new lower funding level. Support for family planning through Hedicaid has increased.

Family Planning Services: Farticipation and Costs

U.S. CHILDREN AND THEIR FAMILIES: CURRENT CONDITIONS AND RECENT TRENDS. 1987 ADDITIONAL VIEWS

We feel this report will be a valuable basis for future discussion of trends among American families, so we are pleased to sign this report. We would, however, like to add a few words of caution.

As with all statistical reports, what particular years are selected and the exact divisions of the numbers may cause variations in how the numbers may be utilized. For example, the percentage of married mothers with infants under age one who were in the workforce (39%) is interesting, but needs to be qualified by, to name a few examples, those working at home, those whose fathers may be home with the child when the mother is not, those who have parttime work, those who shift work, and those who have the baby with them while they are working. Without such qualifiers, statistics can be misused for political purposes.

We also strongly disagree with the comment in the introduction to this report that these statistics are anything near "permanent." Trends involving human decisions are not permanent: they are freewill decisions that can be altered. It is humorous to read past projections of American or world history based upon seemingly "permanent" facts of that time period. Certain trends, such as those of single-parent families and two-parent families with small children where both parents work outside the home, do create new challenges. We need to recognize those challenges, but we don't need to exaggerate to make the point.

Lastly we think that is worth drawing attention to the obvious fact that this report contains a lot of good news. For example, this report notes that poverty among children increased 1/3 from 1970 to 1981 but that increase has been virtually stopped since 1981 (0.6% increase in 4 years) in spite of such trends as the increasing number of single parent families and the economic readjustments in some parts of the country.

Infant mortality rates are continuing to drop among both blacks and whites. We need to do better but this is good news. SAT scores are up, drug abuse has declined, and more black children are living in families where one or both parents have finished high school.

This report will assist all of us in moving beyond rhetoric to dis-

cussing what the facts of American family life really are.
