ABSTRACT

This annual Student Outcome and Achievement Report (SOAR) report presents information about how well Maryland high school graduates have done in the initial year of college. The SOAR system collects information about the college performance of new high school graduates, including remedial work needed, grades in English and mathematics courses, and cumulative grade point average. The report draws on combined sets of data to examine the relationship between student academic performance and experiences in high school and how well they did in their initial year in college. The first section of the report examines the differences in college performance for students who completed a college preparatory curriculum in high school and those who did not. The second section contains the results of a multiple regression analysis that seeks to identify the factors that best predict first-year college performance. The third section examines trends in data over the past 6 years, and the final section presents the four-year graduation and transfer rates of students from Maryland community colleges and the 6-year graduation rates of students from public four-year institutions in the state on they basis of whether or not they took a college preparatory course of study in high school. (Contains 35 tables.) (SLD)

INTRODUCTION

The General Assembly passed legislation in 1988 that required the Maryland Higher Education Commission "to improve information to high schools and local school systems concerning the performance of their graduates at the college level."

In 1990, the Commission established the Student Outcome and Achievement Report (SOAR) to fulfill this mandate. In addition to providing information that can be used for tracking student outcomes at the state level, SOAR was intended to be a tool to help local educators with the evaluation of high school preparatory programs, curriculum development, counseling, and the establishment of education policy. This is the 10th consecutive year in which county superintendents and high school principals have received annual reports of how well students from their particular schools performed at the college level. All public two- and four-year campuses in Maryland and 11 state-aided independent institutions currently participate in SOAR.

The high school graduate system of SOAR collects information about several aspects of the college performance of new high school graduates: remedial work needed in math, English and reading; grades in their first math and English courses; and cumulative grade point average. In order to provide a better understanding of the factors that influence collegiate academic performance, the Commission began in 1996 to include data about students' high school experiences. This information was supplied by The College Board, which administers the Scholastic Assessment Test (SAT) and the American College Testing Program (ACT).

Students who take the SAT or ACT complete a comprehensive questionnaire asking about their high school performance and experiences as well as family and background characteristics. Included are the courses they have taken in various subjects and their grades, the years studied in specific academic areas, whether they were enrolled in honors classes, and their grade point average and rank in class. This information has been matched to the SOAR data.

This report draws on the combined sets of data to examine the relationship between students' academic performance and experiences in high school and how well they did in their initial year in college. Specifically, it looks at students who graduated from a Maryland high school in the 1999-2000 school year who enrolled at a Maryland college or university during the 2000-2001 academic year. The Commission also examined the long-term graduation and transfer patterns of students who enrolled at public colleges and universities in fall 1994 through 1997 based on the SAT and ACT information. This analysis, which provided additional insight into the factors which impact college success, was performed by linking student records in the Commission's enrollment and degree systems with those from the expanded SOAR files in corresponding years.

The report contains four sections. The first examines the differences between the college performance of students who did or did not complete a college preparatory curriculum in high school. The second contains the results of a multiple regression analysis which seeks to identify the factors that best predict first-year college performance. The third examines trends in the data over the past six years. The fourth presents the four-year graduation and transfer rates of students from Maryland community colleges and the six-year graduation rates of students from public four-year institutions in the State on the basis of whether or not they took a college preparatory course of study in high school.

Limitations of the Data

These are the limitations inherent in the SOAR data:

1. No information could be collected about the high school experiences of students who did not take the SAT or ACT. Hence, 29 percent of the first-year college students were not included in this study. Most of these individuals attended community colleges, which have open-door admissions.
2. The information on high school experiences is collected through a questionnaire completed by students when they take the SAT or ACT. Hence, its accuracy depends on the veracity of those completing the questionnaire. An ACT study of the reliability of self-reported data compared to transcript information found that students were truthful in supplying information about their courses and, to a lesser extent, their grades.
3. The content of courses taken in specific subject areas may vary among schools and even within a school.
4. Information is reported only about high school graduates who enrolled at Maryland colleges and universities. More than one-third of Maryland high school graduates who enroll in college attend out-of-state. The percentage of graduates who choose an out-of-state institution varies among jurisdictions, and the absence of data about the performance of these individuals may impact the results.
5. Prior to 1997-1998, the definition of remediation was determined by each college and university. Campuses had different policies with regard to the identification and placement of remedial students, including the use of a wide assortment of tests and cut-off scores. Hence, remediation rates were not comparable across institutions. By fall 1997, all Maryland community colleges had agreed to adopt uniform standards for assessing students and placing them in college-level courses, based on recommendations from the faculty in reading, writing, and mathematics. This involved the standardization of tests and cut-off scores. This agreement was fully implemented by all community colleges by fall 1998. However, some two-year institutions put these policies into practice earlier than others. Consequently,

in 1997-1998, there were some remaining differences among institutions in testing and placement policies that could affect the comparability of remediation rates at the community colleges. Nonetheless, by 1998-1999, there was comparability of remediation across community colleges. This is important, since more than 90 percent of the remediation in higher education in the State takes place at two-year institutions. Public four-year institutions in the State that offer remedial courses continue to use an assortment of tests and cut-off scores.

6. Some students require additional assistance in mathematics before moving into a college credit-bearing course. There are at least two reasons why such placement may be necessary. First, students are required to earn three credits in high school mathematics. Two of those credits must include work in algebra I and geometry. Not all students take algebra II, yet that is the course that will likely prepare them for college mathematics. Some students may believe that they have taken algebra II when they have actually taken two years to complete algebra I. Second, some colleges and universities admit students who have not completed algebra II. When that occurs, those students may also require additional assistance in mathematics.

COLLEGE PERFORMANCE OF CORE AND NON CORE STUDENTS

The academic performance of students in their first year of study at a Maryland campus was examined in terms of whether they did or did not take a college-preparatory course of study in high school. Students who did complete a college-recommended curriculum were called "core" in this report; all others, "non core". Students were assessed on the basis of their need for remedial assistance in math, English and reading; grades in their first English and math courses, and cumulative grade point average. The information was presented by institution, jurisdiction, gender and race (Tables 1 to 12).

The categorization of students as "core" or "non core" depended on whether the student completed a course of study that closely fit the freshmen admissions requirements of the University System of Maryland (USM). To be included as "core", a student had to have taken all of the following in high school:

- 4 or more years of English
- 3 or more years of mathematics
- 3 or more years of social science or history
- 2 or more years of natural science
- 2 or more years of foreign languages

Students who did not fulfill this exact curriculum were deemed "non core." USM's requirements differ very slightly from those above: students must take two years of a laboratory science, have two or more years of the same foreign language, and complete

three specific math courses: two years of algebra and one of geometry. Integration of these additional requirements into the "core" definition was not possible because of the nature of the SAT/ACT data.

As in previous years, core students in 2000-2001 performed better than non core students on every measure of college academic achievement. Fewer core students required remedial assistance in math, English and reading. Core students also earned higher grades in their initial math and English courses in college and had higher grade point averages after their first year. With a few exceptions, core students outperformed non core students regardless of the county or region in which they attended high school, the specific college or university at which they were enrolled, or on the basis of race or gender. The results were very comparable to those of the last six years.

These findings are strengthened by an ACT analysis, which showed that core students in Maryland earned higher composite test scores than have their non core counterparts during the past five years. ACT used a somewhat different definition of "core" than the one adopted in this study.

Remediation

Considerably more non core students (38 percent) than core students (27 percent) needed remedial assistance in math. Substantially more non core students (25 percent) than core students (15 percent) required remediation in English, and more non core students (25 percent) than core students (16 percent) needed help in reading.

Of the core students at the community colleges, 46 percent required remedial help in math and 25 percent in English and reading. Of the non core community college students, 54 percent were assessed for remediation in math, 36 percent in English, and 34 percent in reading. Baltimore City Community College led the two-year institutions in the proportion of core and noncore students requiring remedial assistance in English and reading and was among the highest in the percentage of those needing help in math.

Twelve percent of the core students at public four-year campuses were assessed as needing math remediation, as were 9 percent in reading and 8 percent in English. Of the non core students, 17 percent required help in math, 11 percent in reading and 9 percent in English. Among the public four-year institutions, the four historically black colleges and universities and Towson University represented the largest share of the students needing remediation.

Both core and non core students from Baltimore City had the highest remediation rates in English and reading of the "service delivery areas" (major jurisdictions) in the state, followed by students from Prince George's County. Remediation in math for both core and non core students in Baltimore City, Prince George's County, Susquehanna (Cecil

and Harford Counties), the Upper and Lower Eastern Shore, and Western Maryland was above the State average.

A greater percentage of African Americans than other races needed remedial help. Of the African-American students who completed a college preparatory curriculum, 43 percent required remediation in math, 34 percent in reading and 30 percent in English. A majority of non-core African American students (56 percent) were assessed for remediation in math, half were in reading, and 45 percent in English.

Grade in First Math Course

Core students statewide earned an average grade of 2.5 (on a 4.0 scale) in their first math course in college, compared to 2.4 for non core students. A slightly greater percentage of core students (81 percent) achieved a "C" or better than did non core students (78 percent). Core students who attended high school in Prince George's County had the lowest initial college math grade of any jurisdiction (2.3). Western Maryland core students had the highest (2.9).

Women tended to earn noticeably higher math grades than did men, both among core and non core students. The math grades of African Americans (2.2 for core students and 2.1 for non core students) lagged behind those of other ethnicities. Nonetheless, more than two-thirds of African American students (73 percent of the core and 68 percent of the non core) achieved at least a "C" in their first math course.

Grade in First English Course

Core students in Maryland attained an average grade of 2.7 in their initial English course in college, compared to 2.5 for non core students. A substantial majority of both core (88 percent) and non core students (85 percent) attained a "C" or better in the first college English course. The lowest English grades in any major jurisdiction for core students were received by those who attended high schools on the Upper and Lower Eastern Shore (2.5). The highest English grades for core students were attained by those in Western Maryland schools (2.9).

Both core and non core women earned sharply higher grades in their first English course than did their male counterparts. The grades of African Americans lagged behind those of other races among both core and non core students. Nonetheless, 85 percent of the African Americans in the core category achieved a grade of "C" or better, as did 80 percent of the non core students.

Grade Point Average

Statewide, core students earned a cumulative grade point average in college of 2.6, compared to 2.4 for non core students. The averages earned by students who attended high school in Baltimore City (2.3 for core and 2.0 for non core) were the lowest in the

State. The grade point averages of women, both core and non core, exceeded those of men. African-American students had lower grade point averages (2.2 for core and 2.0 for non core) than those of other races.

FACTORS AFFECTING COLLEGE PERFORMANCE

An examination was made of the relationship between the high school experiences and background characteristics of students and their performance in college. The intention was to identify factors that might help to predict college success, thus helping high school teachers and guidance counselors to advise students better on preparation for higher education.

Method

A multiple regression analysis was conducted, using the first math and English grades and cumulative grade point average as measures of collegiate performance and 66 items on the SAT questionnaire plus some SOAR demographic data as indicators of high school experiences or student background. The ACT information, which was used in differentiating between core and non core students, was not included in this particular part of the study because the comparatively small number of students who took this test could have distorted the results.

Four steps were employed in the analysis. The first was to build a model from the existing data that would contain only relevant variables--those that were good predictors of college performance. A stepwise selection approach was implemented. The only variables that were retained were those that met the standard .05 significance criterion for each of the college performance variables. This process eliminated the great majority of the variables representing high school experiences and background attributes. The second step was to calculate a correlation coefficient between each college performance variable and each high school experiences variable (and a coefficient among each of the high school experiences variables). The third step was to conduct a multiple regression analysis entering all of the high school experiences variables simultaneously and examining their relationship with each of the college performance variables separately. If a high school experiences variable did not achieve a *t* significance level of .05 on the multiple regression analysis and did not have a correlation coefficient of at least .1 in its relationship with the college performance variable, it was eliminated. The fourth step was to implement another series of multiple regression analyses, one for each of the college performance variables. The remaining high school experiences variables were entered individually in order of its strength. The results are displayed in Tables 13, 14 and 15.

The factors which, by themselves, emerged as the best predictors of college performance ($t < .05$) are as follows in the order of their strength:

First Math Grade	High School Grade Point Average SAT Math Score Whether Student was Enrolled in Honors Math Course Average Grade in High School Math Courses Race Gender
First English Grade	High School Grade Point Average SAT Verbal Score Average Grade in High School English Courses Whether Student Was Enrolled in Honors English Course Gender Race
Grade Point Average	High School Grade Point Average SAT Verbal Score SAT Math Score Average Grade in High School English Courses Race Whether Student was Enrolled in Honors Math Course Gender Whether Student Took British Literature Course

For the seventh consecutive year, the best predictor of college performance by far for all three variables was student high school grade average. The SAT math scores, the student's average grade in high school math courses, and whether the student was enrolled in an honors math course were among the good predictors of the first college math grade. The average grade in high school English courses, the SAT verbal score, and enrollment in a high school honors course in English provided an excellent indication of how students would perform in their initial college English course.

Strong predictors of college grade point average, beyond the student's high school grade point average, were the SAT verbal and math scores, the average grade in high school English courses, and enrollment in courses in high school honors math and in British literature.

Gender and race were significant factors in determining college performance on all three of the variables--even after controlling for all of the other high school experiences and demographic factors. This is the seventh consecutive year in which gender emerged as a relevant predictor for all three variables and the second in which race impacted the variables. The first math and English course grades and cumulative grade point averages of women easily outpaced those of men in this study, while those of African Americans trailed other ethnicities.

TRENDS IN COLLEGE PERFORMANCE OF HIGH SCHOOL GRADUATES

Tables 16 to 33 present trends during the past six years in the performance of core and non core students in their first year of college study on the basis of major jurisdiction, higher education segment, and race and gender. Although SOAR information has been collected for 10 years, analyses on the basis of students' high school curricula have been conducted for only seven. In general, the figures show relative continuity in the performance of students.

Remediation

In each of the past six years, a greater percentage of students was assessed for remediation in math than in English or reading. In five of the six years, about one-fourth of the core students and between 36 percent and 41 percent of the non core students required remedial help in math.

A consistently high percentage of core community college students needed remediation in each of the years: between 38 percent and 46 percent in math, 19 to 29 percent in English, and 21 to 27 percent in reading. An even greater proportion of non core community college students required remedial assistance: between 49 and 56 percent in math, 31 to 41 percent in English, and 34 to 38 percent in reading. The percentage of core community college students who required remediation in math in the past three years has been the highest since this breakdown was initiated. This result may be due to the standardization of placement tests and cut-off scores at the two-year institutions. However, the proportion of core community college students who needed remedial assistance in English dropped in each of the past three years from 29 percent to 25 percent.

Students from Baltimore City and Prince George's County have consistently had among the highest remediation rates in math, English and reading of the major jurisdictions in Maryland. In addition, students from Western Maryland and Susquehanna schools have regularly exceeded most other jurisdictions in terms of a need for math remediation.

In each of the six years, a greater percentage of African Americans than other races required math, English and reading remediation in college. A particularly large percentage of African American students who did not take a college preparatory curriculum in high school needed remedial help. In five of the last six years, a majority of these students required assistance in math and at least 40 percent needed it in English. Forty percent or more of the noncore African American students needed remedial help in reading in all of the years.

Performance in First Math Course

A somewhat greater percentage of core students achieved a "C" or better than did non core students in their first math course in college in each of the six years; however, the difference between the two groups in 2000-2001 narrowed sharply from that of the previous year and was the smallest since the analysis began. The percentage of Prince George's County high students, both core and non core, who earned a "C" or better in their initial college math course has consistently been among the lowest in the State.

In each year, a markedly higher percentage of women than men achieved a "C" or above in their first college math course, both among core and non core students. Although African Americans have consistently trailed whites and Asians in the proportion who earned a "C" or better in math, two-thirds or more of the core African American students and more than 60 percent of the non core students received at least a "C".

Performance in First English Course

A substantial majority of both core and non core students earned a "C" or better in their first English course in college in the past six years. A greater percentage of core than non core students in each year achieved this grade, but the difference between the two has narrowed steadily from five to three percentage points in the past five years. Core students who attended Western Maryland high schools have consistently led the State in the proportion who earned a "C" or better in the first English class. In comparison, both core and noncore students in Montgomery County have continually trailed the State average.

A larger proportion of women, both core and non core, in each of the years achieved a "C" or better in the first English course than did men. More than 80 percent of the core African American students and more than three-fourths of the non core students earned at least a "C" in their initial college course in English in the past six years. However, while there was only slight differences between the races prior to 1997-1998, the proportion of both core and non core African Americans to earn a "C" or better noticeably trailed those of whites and Asians in the past four years.

Grade Point Average

The cumulative grade point averages of core students have consistently exceeded those of non core students in each of the six years. Core students earned a 2.6 in the past two years and a 2.5 earlier, while the averages of non core students have steadily increased from 2.2 to 2.4. Core and non core students from Western Maryland and Frederick County have consistently had among the highest grade averages and have exceeded the State average in each year. In contrast, students from Baltimore City have continually lagged behind their Maryland counterparts, as have those in Prince George's County in most instances.

Women have consistently earned higher grade point averages than men during the six year period. The grade averages of African Americans have regularly trailed those of other races, both for core and non core students.

Factors Affecting College Performance

Of the 66 high school experience and background variables, the one that has been by far the best predictor of college performance is high school point grade average. This has been the strongest factor for all of the measures of college performance (first college math and English grade and college grade point average) in all of the seven years. No other item has come close to its predictive power, although several showed strength in six or more of the years. The SAT verbal score and average grade in high school English was effective in predicting students' first English grade and cumulative grade point average in all seven years. The SAT math score was an important predictor of students' first math grade in each of the seven years and of grade point average in six years. In six of the years, the average grade in high school math has provided a good forecast of students' performance in their initial math course in college. Gender has been a determinant on all three of the variables in all of the years.

GRADUATION RATES OF CORE AND NON CORE STUDENTS

The consistency with which Maryland students who took a college preparatory curriculum outperformed those who did not in their initial year of study raises the question of whether this pattern holds as well for longer term outcomes, such as graduation rates. Two recent studies by the U.S. Department of Education suggest that it does. A 1999 analysis of a national cohort of 10th grade students who were tracked for 13 years found that a solid academic background in high school, particularly in math, was the most important factor in the completion of a bachelor's degree. The study concluded that a core curriculum was most beneficial to African American and Hispanic students. A 2001 report concluded that students who completed a very rigorous course of study in high school and, to a smaller degree, those who completed a moderately rigorous curriculum were more likely to persist after three years than did those who had taken a minimal college preparatory curriculum or less.

To determine the extent to which Maryland students had the same experience, information from the Commission's enrollment and degree systems were matched with records from the expanded SOAR files, including the data supplied by the SAT and ACT. This type of analysis involved two additional limitations to those noted earlier in this report:

1. While SOAR collects annualized information (students who enrolled in the summer, fall and spring), the enrollment systems consist of a snapshot of those in attendance

at a point of time each fall. Hence, only students who entered college in the fall are included.

2. Statistics about the background and academic experiences of high school students have been part of the SOAR collection for just the past seven years. Therefore, it is possible to examine long-term students outcomes for only a few classes. These may not be representative. Additional and more extensive studies will be possible in future years as more information is collected.

Table 34 shows the percentage of new full-time freshmen at a Maryland public four-year college or university who enrolled directly from high school in fall 1994 and 1995 and who had earned a bachelor's degree from any public campus in the State within six years of matriculation. Tables 35 displays the percentage of first-time, full-time freshmen at a Maryland community college who enrolled directly from high school in fall 1994 to 1997 and who had either earned an associate degree or certificate from any two-year institution and/or transferred to any public four-year institution in the State within four years of entry. The graduation and graduation/transfer figures are presented on the basis of whether or not students had taken a college preparatory curriculum in high school. Breakdowns are provided by gender, race and major jurisdiction.

The results demonstrate that Maryland high school students who took a solid academic core of courses were more likely to earn a baccalaureate or to attain a community college degree or certificate or transfer to a four-year institution than were those who did not. In both the 1994 and 1995 cohorts, the six-year graduation rate for core students enrolled at public four-year institutions was 64 percent, compared to 57 percent for non core students. Likewise, nearly half of the full-time freshmen at Maryland community colleges who took a college preparatory curriculum in high school had earned a community college credential or had transferred within four years; this was the case for between 34 and 39 percent of the non core students in these years. However, the difference between the graduation/transfer rates of two-year students who took a college preparatory curriculum in high school and those who did not has steadily narrowed during the past four cohorts.

With few exceptions, the performance of core and non core students was consistent across gender, race, and major jurisdiction for students at both public four-year institutions and community colleges.

*Less than 0.5 percent

Notes: Salisbury, St. Mary's, College of Notre Dame, Johns Hopkins, Maryland Institute College of Art, St. John's and Washington College do not have remedial programs. UMCP, Frostburg, Loyola, McDaniel and Mount St. Mary's do not offer remediation in English and reading, and Capitol does not offer these programs in reading. McDaniel provided inaccurate data for math remediation.
