ABSTRACT

In this report, demographic, social and economic data for the population of Spanish origin and its subcategories (Mexican, Puerto Rican, Cuban, Central and South American) in the United States are tabulated. Specific information is provided concerning such characteristics as age, sex, residence, educational attainment, income, employment, occupation, marital status, selected family characteristics, and population size and distribution. Findings include the following: (1) 42% of all persons of Spanish origin were under 18 years old; (2) the median age for persons of Spanish origin is 22 years old, as opposed to 30 years old for the non-Spanish population; (3) there was a greater proportion of single men than single women in Spanish communities; (4) persons of Spanish origin 25 years old and over were still at a lower educational level than persons of non-Spanish origin; (5) the proportion of unemployed among people of Spanish origin was significantly higher than the proportion of unemployed in the general population; (6) the reported incomes of Spanish men were significantly lower than the incomes of men not of Spanish origin; and (7) in 1976, 23% of all Spanish families were living below the poverty level. Numerous charts and tables list characteristics of the Spanish population and, in some cases, compare present findings to those of the 1970 Census. Definitions of all terminology and a description of sources and reliability factors of this survey are provided in a detailed appendix. (WI)

Persons of Spanish Origin in the United States: March 1977

INTRODUCTION

This report presents demographic, social, and economic data for persons of Spanish origin in the United States. These data were collected in March 1977 by the Bureau of the Census as a supplement to its monthly Current Population Survey (CPS).

The report contains specific information on the population of Spanish origin and its subcategories: Mexican origin, Puerto Rican origin, Cuban origin, Central and South American origin, and other Spanish origin. Some of the characteristics presented for the Spanish origin population are age, sex, residence, educational attainment, income, employment, occupation, marital status, and selected family characteristics.

POPULATION SIZE AND DISTRIBUTION

Of the 11.3 million persons of Spanish origin in the United States in March 1977, about 6.5 million reported themselves as being of Mexican origin, about 1.7 million of Puerto Rican origin, about 700,000 of Cuban origin, about 900,000 of Central or South American origin, and about 1.4 million of other Spanish origin. The largest concentration of persons of Spanish origin was in New York State and the five Southwestern States (tables A, B, L, and 1).

CHARACTERISTICS OF PERSONS

Age. Presumably because of higher fertility, the Spanish origin population in March 1977 included a substantially larger proportion of young persons than did the population not of Spanish origin: about 42 percent of all persons of Spanish origin were under 18 years old, as compared to 30 percent for persons not of Spanish origin. Also, the proportion of Spanish persons 65 years old and over was only about 4 percent, as compared with 11 percent for the population not of Spanish origin.

Furthermore, the youthfulness of the Spanish population in the United States is substantiated by the median age (the age at which half of the population is older and half is younger). The median age for persons of Spanish origin in March 1977 was 22 years compared with a median age of 30 years for the population not of Spanish origin (tables C, 2, and 3).

Table A. Spanish Origin Population by Type of Spanish Origin

(Numbers in thousands)

Type of Spanish origin	Number	Percent
Total.....	11,269	100.0
Mexican.....	6,545	58.1
Puerto Rican.....	1,742	15.5
Cuban.....	681	6.0
Central or South American.....	872	7.7
Other Spanish origin.....	1,428	12.7

Marital status. Because women generally marry at younger ages than men, there was a greater proportion of single men (34 percent) than of single women (27 percent) among persons of Spanish origin 14 years old and over in 1977. The proportion of Spanish origin men who were single had not increased significantly since 1970: about 32 percent of Spanish men 14 years old and over reported themselves as being single in 1970 compared with 34 percent in March 1977.

About equal proportions of Spanish women as of Spanish men were classified as presently married. But women of Spanish origin were more likely to be reported as divorced (6 percent) than were Spanish origin men (4 percent).

The lower age-specific mortality rates of Spanish females probably accounts for the substantially higher percentage of widowed Spanish females (6 percent) relative to widowed Spanish males (2 percent) (tables D, 5, and 6).

Education. In March 1977, persons of Spanish origin 25 years old and over were still at a lower educational attainment level than were persons of that age group who were not of Spanish origin. About 18 percent of all Spanish persons in that age group had completed less than 5 years of school, but only 3 percent of persons not of Spanish origin had completed less than 5 years of school. Moreover, only about 40 percent of persons 25 years old and over of Spanish

unprompted completed 4 years of high school or more, as compared with 66 percent of persons not of Spanish origin.

Younger adults of Spanish origin, however, show significant improvement over their elders in educational attainment; about one third of persons of Spanish origin 25 to 34 years old had completed 4 years of high school, while only one fifth of Spanish persons 45 to 64 years old had done so.

In 1977, there was a disparity in educational attainment between the ethnic categories of Spanish origin: about 23 percent of Mexican-origin persons 25 years old and over had completed less than 5 years of school, yet only about 11

percent of persons of Cuban origin of that age range had completed less than 5 years of school (tables E, 7, and 8).

Employment and occupation. The proportion of employed among Spanish origin persons was significantly higher than the proportion of unemployed in the general population in March 1977. About 41 percent of all Spanish origin persons in the civilian labor force were unemployed, as compared with 8 percent of the total population in the civilian labor force.

There was some evidence that the unemployment rate of Spanish origin women (13 percent) was different from that

*Resident population excluding persons in institutions and Armed Forces in barracks.

¹Resident population.

Estimates in this table (as well as in the rest of this report) are based on sample data and hence are subject to sampling errors. If a census were conducted the chances are about 68 out of 100 that the census result would be contained in the one-standard-error interval given in this table. See the section "Source and Reliability of the Estimates" for more information on standard errors and confidence intervals.

*Arizona, Colorado, and New Mexico.

Table C. Total and Spanish Origin Population by Broad Age Groups and Type of Spanish Origin

Age	Total	Spanish origin						Not of Spanish origin ¹
		Total	Mexican	Puerto Rican	Cuban	Central or South American	Other Spanish	
Median age, years	29.2	21.7	20.8	20.4	37.7	25.8	20.9	29.6
PERCENT								
Under 5 years old	7.2	12.4	13.3	12.8	1.3	11.7	11.9	6.9
18 years old and over	69.8	57.7	56.2	54.2	73.8	63.2	57.4	70.4
65 years old and over	10.4	4.1	3.6	2.8	11.2	2.3	5.6	10.7

of men of Spanish origin (11 percent) while the labor force participation rate differed between men and women of Spanish origin about 73 percent of Spanish origin men were in the civilian labor force as compared with only 44 percent of Spanish women. This rate differential was dramatic for some of the ethnic subcategories of Spanish origin. For example, about 81 percent of Mexican origin men were in the labor force in comparison with only 43 percent of Mexican origin women, and the labor force participation rate for Puerto Rican origin men was 72 percent compared with 40 percent for Puerto Rican origin women.

Occupational characteristics of employed Spanish origin persons differed somewhat markedly from that of the overall employed population. For instance, although 16 percent of all employed persons in the civilian labor force were professional and technical workers, only 8 percent of the Spanish origin labor force were so employed, and the proportion of employed persons of Spanish origin working as managers and administrators (5 percent) was significantly lower than for the overall population (11 percent). However, the proportion of Spanish persons working as operatives (e.g., garage workers and attendants, produce packers, manufacturing clerks) was greater (26 percent) than for similarly employed persons in the overall population (15 percent).

The occupational distribution of Spanish persons also varied by sex. Although about 7 percent of Spanish men

were employed as managers and administrators, only 3 percent of Spanish women were in those professions; about 29 percent of employed women of Spanish origin were working in clerical or similar occupations, compared with only 6 percent of employed Spanish men.

Additionally, within the population of Spanish origin differences existed in the occupational distribution. For instance, the proportion of Mexican origin men working as farm workers (7 percent) was much larger than for Puerto Rican men (1 percent), and there was some evidence that the proportion of Puerto Rican origin men working in service occupations was larger (19 percent) than the proportion of Mexican origin men employed in that type of occupation (13 percent) (tables I, 9 and 10).

Income of persons. In the CPS of March 1977, most men of Spanish origin 14 years old and over reported having income in 1976, but this income was substantially lower than the income for men not of Spanish origin. Median income in 1976 for Spanish origin men 14 years old and over with income was about \$7,080 compared with about \$9,580 for men not of Spanish origin.

Furthermore, a significantly smaller proportion of Spanish men were in the upper end of the income distribution compared with men not of Spanish origin. Only about 14 percent of Spanish origin men 14 years old and over had incomes of over \$15,000 in 1976, but the corresponding proportion for men not of Spanish origin was twice as high,

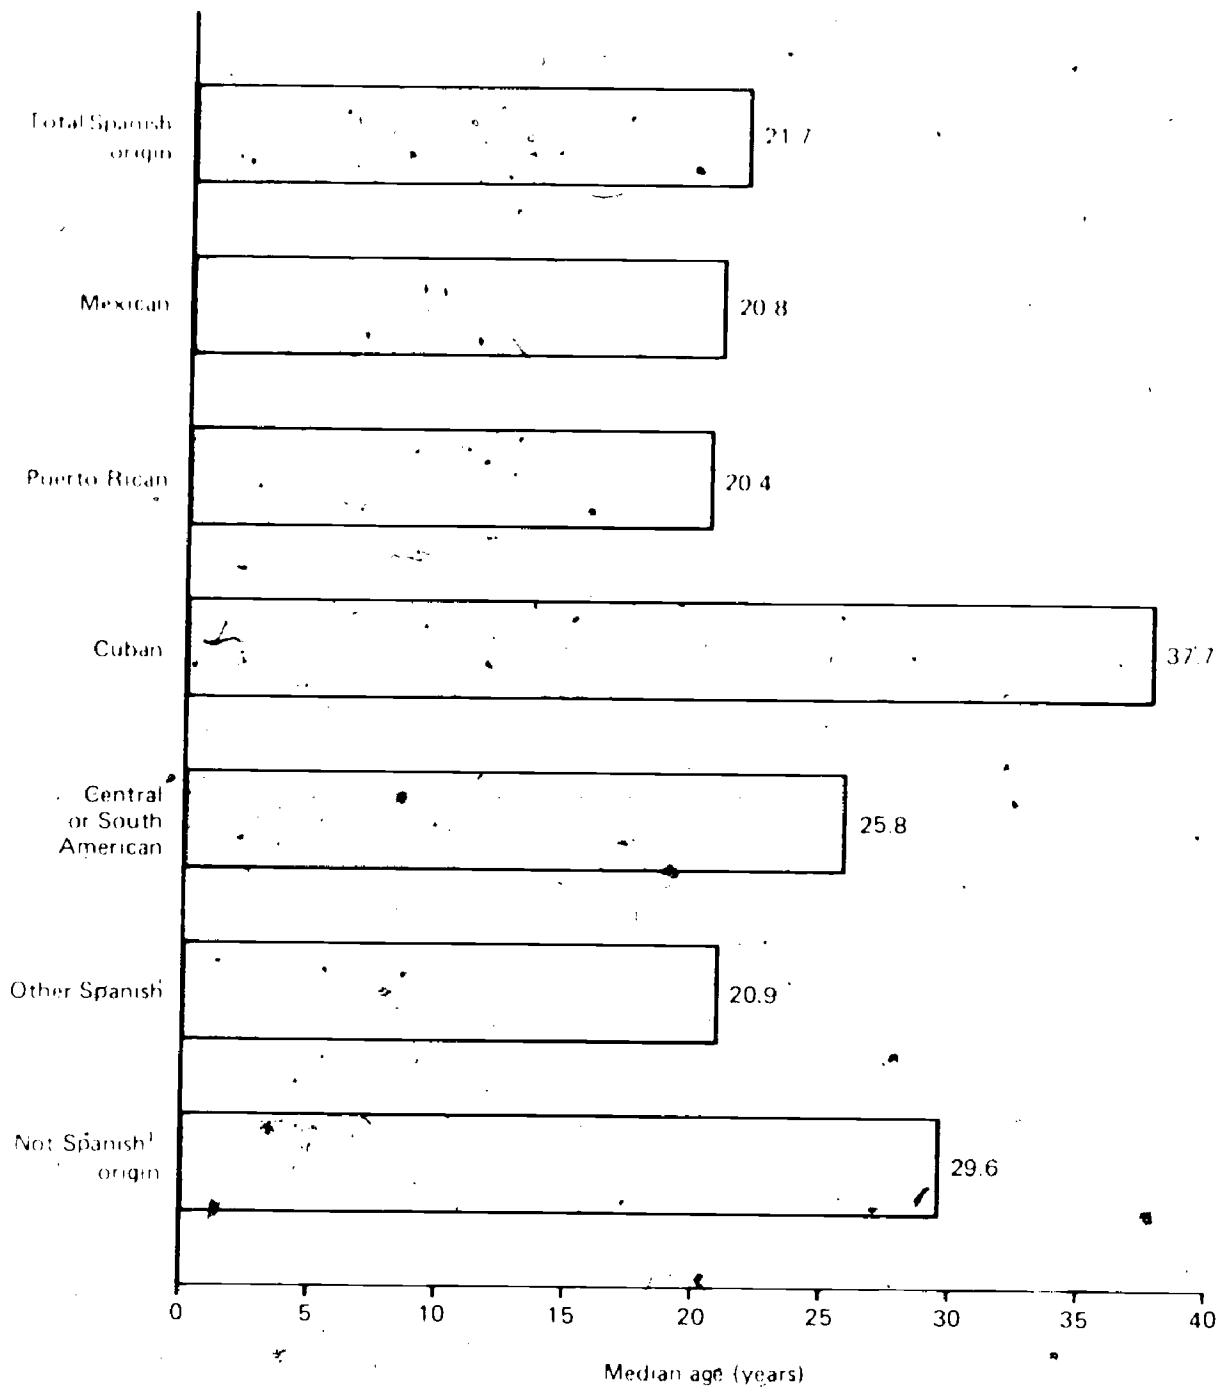

Table D. Marital Status of Persons of Spanish Origin 14 Years Old and Over by Type of Spanish Origin and Sex

FIGURE 1

Median Age of Persons by Spanish Origin and Type of Spanish Origin

¹ Includes persons who did not know or did not report on origin.

78 percent (among the population of Spanish origin with income in 1976) had equivalently low incomes than their counterparts of Spanish origin (1 percent).

Spanish origin women did not fare as well in terms of income as Spanish origin men in 1976; the median income of Spanish women with income in 1976 (about \$3,099) was only one-half that of Spanish origin men (\$7,090). Also, although 36 percent of Spanish origin men had incomes less than \$5,000, about 67 percent of women of Spanish origin had incomes below this amount in 1976. In addition, about 2 percent of men of Spanish origin had incomes of \$25,000 or more, but only about 0.1 percent of Spanish origin women had incomes at that level.

Differences in income levels were also noticeable by type of Spanish origin. Even though the median income of Mexican origin women was considerably different from the median of Puerto Rican men, Puerto Rican women had a substantially higher median income in 1976 than Mexican origin women (\$3,930 versus \$2,923). And, although about 1 out of 5 Puerto Rican women with income in 1976 had an income under \$5,000, about 1 out of 3 Mexican origin women had an income under \$5,000.

Both men and women of Spanish origin residing in metropolitan areas had, on the average, higher incomes than

Spanish persons living in non-metropolitan areas. Specifically, Spanish men residing in metropolitan areas had a median income of \$7,363 in 1976 as compared with a median of \$2,790 for Spanish men in non-metropolitan areas. Similarly, the median income of Spanish women living in metropolitan areas was \$4,327 compared with a median income of \$2,122 for Spanish women living outside metropolitan areas.

Finally, the higher the educational level, the more the income they tended to receive—and this is true for persons of Spanish origin. Spanish persons with 4 years or more of college had a median income in 1976 of \$11,436, but those with only 3 years of elementary school had a median income of \$6,297 (table G and L-17).

CHARACTERISTICS OF FAMILIES

Family composition and size. In March 1977, there were 26 million families of Spanish origin in the United States. About 1 million were husband-wife families, and about 6,000,000 (or out of 10) of all Spanish families were maintained by a woman of Spanish origin with no husband present.

The proportion of Spanish origin families maintained by a woman differed substantially by type of Spanish origin. For

the broad occupation group of "Farm workers" and "Service workers" were the largest groups. In fact, these two groups combined made up more than 50 percent of all employed persons of Spanish origin.

The second broad occupation group, "Retail sales workers," was the next largest group employed.

Table 3 shows the distribution of employed persons by sex and type of Spanish origin. The data show that the proportion of men to women

employed was about the same for each of the four types of Spanish origin.

There were, however, some differences in the type of employment.

White-citizen Spanish origin persons were more likely to be employed in retail trade, service industries, and farm work.

Black-citizen Spanish origin persons were more likely to be employed in

construction, transportation, and agriculture.

Persons of other Spanish origin were more likely to be employed in

construction, transportation, and agriculture.

Persons of Central or South American origin were more likely to be employed in construction, transportation,

and agriculture.

Table 4 gives the distribution of employed persons of Spanish origin by sex and residence.

The data show that the proportion of men to women employed was about the same for each of the four types of Spanish origin.

White-citizen Spanish origin persons were more likely to be employed in retail trade, service industries, and farm work.

Black-citizen Spanish origin persons were more likely to be employed in construction, transportation,

and agriculture.

Persons of other Spanish origin were more likely to be employed in construction, transportation,

and agriculture.

Persons of Central or South American origin were more likely to be employed in construction, transportation,

and agriculture.

Table 5 gives the distribution of employed persons of Spanish origin by sex and family income.

The data show that the proportion of men to women employed was about the same for each of the four types of Spanish origin.

White-citizen Spanish origin persons were more likely to be employed in retail trade, service industries, and farm work.

Black-citizen Spanish origin persons were more likely to be employed in construction, transportation,

and agriculture.

Persons of other Spanish origin were more likely to be employed in construction, transportation,

and agriculture.

Persons of Central or South American origin were more likely to be employed in construction, transportation,

and agriculture.

Table 6 gives the distribution of employed persons of Spanish origin by sex and type of Spanish origin.

The data show that the proportion of men to women employed was about the same for each of the four types of Spanish origin.

White-citizen Spanish origin persons were more likely to be employed in retail trade, service industries, and farm work.

Black-citizen Spanish origin persons were more likely to be employed in construction, transportation,

and agriculture.

Persons of other Spanish origin were more likely to be employed in construction, transportation,

and agriculture.

Persons of Central or South American origin were more likely to be employed in construction, transportation,

and agriculture.

Residence. Table 7 gives the distribution of employed persons of Spanish origin by sex and residence. The data show that the proportion of men to women employed was about the same for each of the four types of Spanish origin.

White-citizen Spanish origin persons were more likely to be employed in retail trade, service industries, and farm work.

Black-citizen Spanish origin persons were more likely to be employed in construction, transportation,

and agriculture.

Persons of other Spanish origin were more likely to be employed in construction, transportation,

and agriculture.

Persons of Central or South American origin were more likely to be employed in construction, transportation,

and agriculture.

1. Includes Central or South American origin and other non-pedist origin.
2. Includes persons who did not answer or did not report an origin.

In 1976, Spanish families maintained by a man had a higher median income, (\$11,800) than did Spanish families maintained by a woman, (\$5,100); this was noticeable throughout the income distribution of Spanish families. For instance, about 36 percent of Spanish families maintained by men had incomes of \$15,000 or more, while only 7 percent of Spanish families maintained by women had incomes at that level. At the lower end of the income scale, the proportional differences were reversed; only 4 percent of male-maintained Spanish families had incomes under \$3,000, but 19 percent of female-maintained Spanish families had incomes under that amount.

As expected, the less the education of adults, the less the family income. In March 1976, for Spanish origin families in which the person maintaining the family reported less than 8 years of school completed, the median family income was

only \$7,900; but the median income of Spanish families in which the corresponding person had completed 4 years of high school was \$13,200; and the median family income of families in which the person maintaining the family had completed 4 years of college or more was about \$20,000.

Spanish families residing in the Nation's metropolitan areas were more likely to be affluent than Spanish families living outside metropolitan areas. The median income in 1976 of Spanish families living in metropolitan areas was \$10,600 compared with a median of \$9,100 for Spanish families living outside metropolitan areas (tables J and 25-30).

Poverty status. In 1976, about 600,000 families of Spanish origin (23 percent of all Spanish families in the Nation) were living below the poverty level.

² Includes persons who did not know or did not report on origin.

Of Spanish families below the poverty level, the majority, about 517,000, had related children under 18 years old as members of the family. The average number of children in these families was about 2.8 children per family.

Lack of high school education for adults in the family characterized Spanish origin families in poverty status. In about 420,000 Spanish families below the poverty level (about 71 percent of all Spanish families at this level), the person maintaining the family was not a high school graduate.

In addition, a large proportion of families maintained by a woman of Spanish origin were below the poverty level. Of the approximately 500,000 families of this type in the Nation, about 275,000, or 1 out of 2, were below the poverty level (tables K, 31, and 32).

COMPARABILITY OF DATA WITH THE 1970 CENSUS

An estimate of 9.1 million persons of Spanish origin was obtained from the 1970 Census of Population, compared with an estimated 11.3 million persons of Spanish origin obtained from the March 1977 CPS. This difference between the 1970 census and the March 1977 CPS estimates of persons of Spanish origin occurred mostly because of:

1. **Survey procedures.** Although "the 1970 census used both self-enumeration and direct interviews to collect data

on persons of Spanish origin, the March 1977 CPS was done entirely by direct interviews (much by telephone).

2. **Mexican origin categories.** The 1970 census question on Spanish origin had only one category denoting Mexican origin, whereas the March 1977 CPS had four categories for Mexican origin.

3. **Determining origin of children under 14 years old.** In the 1970 census the respondents themselves determined whether their children under 14 years old were or were not of Spanish origin. In the March 1977 CPS, children under 14 years old in a household were classified as of Spanish origin if either the household head or his wife was of Spanish origin.

4. **Sample size and variability.** The 1970 census information on persons of Spanish origin was based on a sample of 5 percent of the population; the March 1977 CPS information was based on a sample of about 1 in 800 persons. Sampling variability, therefore, also affected comparability of data for persons of Spanish origin between the 1970 census and the March 1977 CPS.

5. **Population growth.** Growth of the Spanish population is another reason why the 1970 census estimate of the number of persons of Spanish origin differs from that of the March 1977 CPS. Although birth, death, and migration data on persons of Spanish origin are not available nationally, nor can these data be, at present, precisely estimated, rough computations indicate an approximate rate of natural increase (excess of births over deaths) of about 1.8 percent

per year or 12.6 percent for the period between 1970 and 1977. Furthermore, net immigration from abroad could also have contributed significant growth. For example, in the 7-year period ending June 30, 1977, about 766,000 immigrants were admitted to the United States from all Spanish-speaking countries as permanent residents.

Thus, all told, population growth for the period from April 1970 to March 1977 may account for seven-eighths of the difference between the 1970 census and the March 1977 figures; the balance in the difference can be accounted for by the other reasons noted above.

Central or South American origin.....	1,508,866	872,000	¹ -42.2
Other Spanish origin.....	1,057,305	1,428,000	35.1

¹Decrease in the number of persons designated as of Central or South American origin between 1970 and 1977 may have occurred because of: (1) a shift to one of the four Mexican origin categories included in the March 1977 CPS, and (2) the replacement of self-reporting with direct interview.

NOTE

In the past the Census Bureau has designated a head of household to serve as the central reference person for the collection and tabulation of data for individual members of the household (or family). However, recent social changes have resulted in a trend toward recognition of more equal status for all members of the household (or family), making the term "head" less relevant in the analysis of household and family data. As a result, the Bureau is currently developing new techniques of enumeration and data presentation which will eliminate the concept of "head." While much of the data in this report are based on the concept of "head," methodology for future Census Bureau reports will reflect a gradual movement away from this traditional practice.

²⁴Based on persons of Spanish or other origin and Spanish origin families.

Appendix A

DEFINITIONS AND EXPLANATIONS

Population coverage. This report includes the civilian non institutional population of the United States and members of the Armed Forces in the United States living off post or with their families on post, but excludes all other members of the Armed Forces.

Symbols. A dash (-) represents zero or rounds to zero, and the symbol "B" means that the base for the derived figure is less than 75,000. Three dots (. . .) means not applicable, and "NA" means not available.

Rounding. The numbers in this report are in thousands. The figures may differ slightly from table to table since individual numbers were rounded to the nearest thousand without being adjusted to group totals. Similarly, individual percentages were rounded and parts may not always add to 100 percent.

Persons of Spanish origin. Persons of Spanish origin in this report were identified by a question that asked for self-identification of the person's origin or descent. Respondents were asked to select their origin (and the origin of other household members) from a "flash card" listing ethnic origins. Persons of Spanish origin, in particular, were those who indicated that their origin was Mexican, Puerto Rican, Cuban, Central or South American, or some other Spanish origin.

Five Southwestern States. Data provided in this report for the five Southwestern States refer to the States of Arizona, California, Colorado, New Mexico, and Texas.

Age. This classification is based on the age of the person at his or her last birthday.

Marital status. The marital status classification identifies four major categories: single, married, widowed, and divorced. These terms refer to the marital status at the time of the enumeration.

The category "married" is divided into "married, spouse present," and "married, spouse absent." A person was classified as "married, spouse present" if the husband or wife was reported as a member of the household, even though he

or she may have been temporarily absent on business or vacation, visiting, in a hospital, etc., at the time of the enumeration. The group "married, spouse absent" includes married persons living apart because either the husband or wife was employed and living at a considerable distance from home, was serving away from home in the Armed Forces, was residing in an institution, had moved to another area, had separated from their spouse because of marital discord, or had a different place of residence for any other reason.

Metropolitan-nonmetropolitan residence. The population residing in standard metropolitan statistical areas (SMSA's) constitutes the metropolitan population. Except in New England, an SMSA is a county or group of contiguous counties which contains at least one city of 50,000 inhabitants or more, or "twin cities" with a combined population of at least 50,000. In addition to the county, or counties, containing such a city or cities, contiguous counties are included in an SMSA if, according to certain criteria, they are essentially metropolitan in character and are socially and economically integrated with the central city. In New England, SMSA's consist of towns and cities rather than counties. The metropolitan population in this report is based on SMSA's as defined in the 1970 census and does not include any subsequent additions or changes.

Family. The term "family" as used in this report, refers to a group of two or more persons related by blood, marriage, or adoption and residing together; all such persons are considered as members of the same family. Thus, if the son of the head of the household and the son's wife are in the household, they are treated as part of the head's family. On the other hand, an unrelated lodger and his wife or an unrelated caretaker and his wife who are members of the household are considered as additional families, and not a part of the household head's family. The term "size of family" refers to the number of household members who are living together and are related to each other by blood, marriage, or adoption.

Spanish origin family. A Spanish origin family is defined as a family in which the head of the family is of Spanish origin.

Primary family. A primary family is a family that includes among its members the head of a household.

Household. A household consists of all the persons who occupy a housing unit. A house, an apartment or other groups of rooms, or single room, is regarded as a housing unit when it is occupied or intended for occupancy as separate living quarters; that is, when the occupants do not live and eat with any other persons in the structure and there is either (1) direct access from the outside or through a common hall or (2) a kitchen or cooking equipment for the exclusive use of the occupants.

A household includes the related family members and all the unrelated persons, if any such as lodgers, foster children, wards or employees who share the housing unit. A person living alone in a housing unit, or a group of unrelated persons sharing a housing unit as partners, is also counted as a household. The count of households excludes rooming houses, college dormitories, military barracks, institutions, and other group quarters. Inmates of institutions (mental hospitals, rest homes, correctional institutions, etc.) were not included in the 1972 survey.

Head of household or family. One person in each household (and in each family) is designated as the "head." The number of such persons, therefore, is equal to the number of households (or families). This person is usually the one regarded as the head by the members of the group. Married women are not so classified if their husbands are living with them at the time of the survey.

Primary individual. A primary individual is a household member living alone or with nonrelatives only.

Secondary individual. A secondary individual in a household is a person such as a guest, lodger, or resident employee (excluding primary individuals) who is not related to any other person in the household. All persons in group quarters who were covered in the survey are counted as secondary individuals even though a small number of them were living with relatives.

Unrelated individual. The term "unrelated individuals," as used in this report, refers to persons (other than inmates of institutions) who are not living with any relatives. An unrelated individual may constitute a one-person household, may be part of a household including one or more other families or unrelated individuals, or may reside in group quarters such as a rooming house. Thus, a widow living by herself or with one more other persons not related to her, a lodger not related to anyone else in the household, and a private household worker living in an employer's household with no relatives are examples of unrelated individuals.

Own children and related children. "Own" children in a family are sons and daughters, including stepchildren and adopted children, of the family head. "Related" children in a family include own children and all other children in the household who are related to the family head by blood,

marriage, or adoption. For each type of family unit identified in the CPS, the count of own children under 18 years old is limited to single (never married) children; however, "own children under 26" and "own children of any age," as the terms are used here, include all children regardless of marital status.

Years of school completed. Data on years of school completed in this report were derived from the combination of answers to two questions: (a) "What is the highest grade of school you have ever attended?" and (b) "Did you finish this grade?"

The questions on educational attainment apply only to progress in "regular" schools. Such schools include public, private, and parochial elementary and high schools (both junior and senior high), colleges, universities, and professional schools, whether day schools or night schools. Thus, regular schooling is that which may advance a person toward an elementary school certificate or high school diploma, or a college, university, or professional school degree. Schooling in other than regular schools was counted only if the credits obtained were regarded as transferable to a school in the regular school system.

Labor force. Persons are classified as in the labor force if they were employed as civilians, unemployed, or in the Armed Forces during the survey week. The "civilian labor force" is comprised of all civilians 14 years old and over classified as employed or unemployed.

Paid labor force. Persons are classified in the paid labor force if they were employed as wage and salary workers or self-employed workers during the survey week or were looking for work at the time and had last worked as wage and salary or self-employed workers.

Employed. Employed persons comprise (1) all civilians who, during the specified week, did any work at all as paid employees or in their own business or profession, or on their own farm, or who worked 15 hours or more as unpaid workers on a farm or in a business operated by a member of the family, and (2) all those who were not working but who had jobs or businesses from which they were temporarily absent because of illness, ~~bad weather~~, vacation, or labor-management dispute, or because they were taking time off for personal reasons, whether or not they were paid by their employers for time off, and whether or not they were seeking other jobs. Excluded from the employed group are persons whose only activity consisted of work around the house (such as own home housework, painting or repairing own home, etc.) or volunteer work for religious, charitable, and similar organizations.

Unemployed. Unemployed persons are those civilians who, during the survey week, had no employment but were

available for work, and (1) had engaged in any specific jobseeking activity within the past 4 weeks, such as registering at a public or private employment office, meeting with prospective employers, checking with friends or relatives, placing or answering advertisements, writing letters of application, or being on a union or professional register; (2) were waiting to be called back to a job from which they had been laid off; or (3) were waiting to report to a new wage or salary job within 30 days.

Occupation. The data on occupation of employed persons 14 years old and over refer to the civilian job held during the survey week. Persons employed at two or more jobs were reported in the job at which they worked the greatest number of hours during the week. The occupation groupings used here are mainly the major groups used in the 1970 Census of Population. The composition of these groups as shown in **1970 Census of Population, Volume I, Characteristics of the Population, Chapter C.** The categories used are combinations of detailed classifications.

Four occupation divisions. The major groups of occupations are arranged in four divisions as follows:

White collar: Professional, technical, and kindred workers, managers and administrators, except farm; sales workers, and clerical and kindred workers.

Blue collar: Craft and kindred workers, operatives, including transport, and laborers, except farm.

Farm workers: Farmers and farm managers, farm laborers, and farm supervisors.

Service workers: Service workers, including private household workers.

The sequence in which these four divisions appear is not intended to imply that any division has a higher social or skill level than another.

Year-round full-time worker. A year-round full-time worker is one who worked primarily at full-time civilian jobs (35 hours or more per week) for 50 weeks or more during the preceding calendar year.

Income. For each person in the sample 14 years old and over, questions were asked on the amount of money income received in the preceding calendar year. Although the income statistics refer to receipts during the preceding year, the characteristics of the person, such as age, labor force status, etc., and the composition of families refer to the time of the survey. The income of the family does not include amounts received by persons who were members of the family during all or part of the income year if these persons no longer resided with the family at the time of enumeration. On the other hand, family income includes amounts reported by

related persons who did not reside with the family during the income year but who were members of the family at the time of enumeration.

Number of earners. This number includes all persons in the family with \$1 or more in wages and salaries, or \$1 or more or a loss in net income from farm or nonfarm self-employment.

Poverty status. Families and unrelated individuals are classified as being above or below the poverty level, using the poverty index adopted by a Federal Interagency Committee in 1969. The index provides a range of income cutoffs, or "poverty thresholds," adjusted to take into account such factors as family size, sex and age of the family head, the number of children, and farm/nonfarm residence. The poverty cutoffs for farm families have been set at 85 percent of the nonfarm levels. These income cutoffs are updated every year to reflect the changes in the Consumer Price Index. The average poverty threshold for a nonfarm family of four was \$6,815 in 1976. For a detailed explanation of the poverty definition, see **Current Population Reports, Series P-60, No. 115 "Characteristics of the Population Below the Poverty Level, 1976."**

Median. The median is presented in connection with the data on age, years of school completed, and income. It is the value which divides the distribution into two equal parts, one-half of the cases falling below this value and one-half of the cases exceeding this value.

Mean. The mean (average) is presented in connection with data on number of persons per family, income of persons, and income of families. The mean number of persons per family is the value obtained by dividing the number of persons having the characteristic under consideration by the appropriate number of families. The mean income is the amount obtained by dividing the total income of a group by the number of persons, or families, in that group.

SOURCE AND RELIABILITY OF THE ESTIMATES

Source of Data

The estimates for the Spanish origin population presented in this report are based on data obtained in March of 1977 in the Current Population Survey (CPS) of the Bureau of the Census. The monthly CPS deals mainly with labor force data for the civilian, noninstitutional population. Questions relating to labor force participation are asked about each member 14 years old and older in each sample household. In addition, questions are asked monthly about ethnic origin for

all persons 14 years old and older. For March, in addition to the standard set of questions on labor force participation and Spanish origin, questions are asked about income, work experience, and mobility status.

The present CPS sample was initially selected from the 1970 census files and is updated continuously to reflect new construction where possible (see section "Nonsampling Variability" below). The monthly CPS sample is spread over 461 areas with coverage in each of the 50 States and the District of Columbia. A supplementary sample of housing units in 24 States and the District of Columbia was incorporated with the monthly CPS sample to produce the March 1977 data. The expanded CPS sample is located in 614 areas comprising 1,113 counties, independent cities, and

divisions in the nation. The 614 sample areas used in March include 461 areas from the monthly CPS and 153 supplementary areas.

The following table provides a description of some aspects of the CPS sample design in use during the referenced data collection period.

In order to obtain more reliable data for the Spanish origin population, the March CPS sample was enlarged to include all households from the November 1976 sample which contained at least one person of Spanish origin. This resulted in almost doubling the number of sample persons of Spanish origin. For this report, persons in the Armed Forces living off post or with their families on post are also included.

Description of the Current Population Survey

Time period	Number of sample areas	Households eligible		Housing units visited not eligible ²
		Interviewed	Not interviewed	
Supplemental sample ¹	153	8,500	500	1,500
August 1972 to present.....	461	45,000	2,000	8,000

¹These areas were chosen to provide coverage in each State and the District of Columbia.

²These are housing units which were visited, but were found to be vacant or otherwise not eligible for interview.

The estimation procedure used for the monthly CPS data involves the inflation of the weighted sample results to independent estimates of the civilian noninstitutional population of the United States by age, race (White, Black and other), and sex. Most Spanish origin persons are included in the White race. These independent estimates are based on statistics from decennial censuses, statistics on births, deaths, immigration, and emigration, and statistics on the strength of the Armed Forces. The estimation procedure for the data in the report also involves a further adjustment so that husband and wife of a household receive the same weight. Estimates of Spanish origin population for New York and the five Southwestern States, as given in tables B, 1, 4, 20, and 23 are derived from the Current Population Survey but ratio-estimated to independent controls for total State population.

The 1970 census data quoted in this report are obtained from the 1970 Census of Population (Persons of Spanish Origin, Volume PC(2)-1C) and are based on a 5 percent sample of the population of the United States.

Reliability of the Estimates.

Since the estimates in this report are based on a sample, they may differ somewhat from the figures that would have been

obtained had a complete census been taken using the same schedule, instructions, and enumerators. There are two types of errors possible in an estimate based on a sample survey: sampling and nonsampling. The standard errors provided for this report primarily indicate the magnitude of the sampling error. They also partially measure the effect of some nonsampling errors in response and enumeration, but do not measure any systematic biases in the data. The full extent of the nonsampling error is unknown. Consequently, particular care should be exercised in the interpretation of figures based on a relatively small number of cases or on small differences between estimates.

Nonsampling variability. Nonsampling errors in surveys can be attributed to many sources, e.g., inability to obtain information about all cases in the sample, definitional difficulties, differences in the interpretation of questions, inability or unwillingness of respondents to provide correct information, inability to recall information, errors made in collection such as in recording or coding the data, errors made in processing the data, errors made in estimating values for missing data, and failure to represent all units within the sample (undercoverage).

Undercoverage in the CPS results from missed housing units and missed persons within sample households. Overall

undercoverage, as compared to the level of the decennial census, is about 6 percent. It is known that CPS undercoverage varies with age, sex, and race. Generally, undercoverage is larger for males than for females and larger for Blacks and other races than for Whites. Ratio estimation to independent age, sex, race, population controls, as described previously, partially corrects for the biases due to survey undercoverage. However, biases exist in the estimates to the extent that missed persons in mixed households or missed persons in interviewed households have different characteristics than interviewed persons in the same age, sex, race group. Further, the independent population controls used have not been adjusted for undercoverage in the 1970 census, which was estimated at 2.5 percent of the population with similar undercoverage differentials by age, sex, and race as is observed in CPS.

The approximate magnitude of two sources of undercoverage of housing units is known. Of the 83,000,000 housing units in the U.S., about 600,000 new construction housing units other than mobile homes are not represented in the CPS sample because they were assigned building permits prior to January 1970, but building was not completed by the time of the census (i.e., April 1970). Most conventional new construction, for which building permits were issued after 1969, is represented. About 290,000 occupied mobile homes are not represented in CPS; these units were either missed in the census or have been built or occupied since the census. These estimates of missed units are relevant to the present sample only and not to earlier designs where the extent of undercoverage was generally less. The extent of other sources of undercoverage of housing units is unknown but believed to be small.

Comparability with other data. Data obtained from the CPS are not entirely comparable with data obtained from the 1970 census. This is due to large parts of differences in interviewer training and experience and in differing survey processes. This is an additional component of error not reflected in the standard error tables. Therefore, caution should be used in comparing results between these different sources. See page 00 for more detail on the comparability of CPS and census data.

Caution should be used in comparing estimates from 1977, when the supplemental sample was used, to those from 1976 and earlier years. Some relatively large differences in estimates of population in metropolitan and nonmetropolitan areas have been observed between the 461 and the 614 area samples. These differences reflect a relatively large increase in variance on these estimates and do not represent actual changes in the population.

Sampling variability. The standard errors given in the following tables are primarily measures of sampling variability, that is, of the variations that occurred by chance because a sample rather than the whole of the population was surveyed. The chances are about 68 out of 100 that an estimate from the survey differs from a complete census

figure by less than the standard error. The chances are about 90 out of 100 that this difference would be less than 1.6 times the standard error and about 96 out of 100 that the difference would be less than twice the standard error.

* All the statements of comparison appearing in the text are significant at a 1.6 standard error level or better, and most are significant at a level of more than 2.0 standard errors. This means that for most differences cited in the text, the estimated difference is greater than twice the standard error of the difference. Statements of comparison qualified in some way (e.g., by use of the phrase "some evidence") have a level of significance between 1.6 and 2.0 standard errors.

Note when using small estimates. Summary measures (such as means, medians, and percent distributions) are shown in the report only when the base is 75,000 or greater. Because of the large standard errors involved, there is little chance that summary measures would reveal useful information when computed on a smaller base. Estimated numbers are shown however, even though the relative standard errors of these numbers are larger than those for the corresponding percent ages. These smaller estimates are provided primarily to permit such combinations of the categories as serve each user's needs.

Standard errors for data based on the decennial census. Sampling errors of all data from the 5 percent sample of the 1970 decennial census shown in this report are small enough to be disregarded. However, the standard errors for census data mentioned in the report are shown in table A-8.

Standard error tables and their use. In order to derive standard errors that would be applicable to a large number of estimates and could be prepared at a moderate cost, a number of approximations were required. Therefore, instead of providing an individual standard error for each estimate, generalized sets of standard errors are provided for various types of characteristics. As a result, the sets of standard errors provided give an indication of the order of magnitude of the standard error of an estimate rather than the precise standard error. Standard errors for estimates of persons of Spanish origin are classified by characteristic type. Type I characteristics are family or one person per household characteristics. Type II characteristics refer to some persons in a household (not one and not all) and consist of education (HE), Income (HI), and characteristics other than education or income (HN). Type III characteristics relate to most or all of the persons in a household. Table A-1 gives the characteristic type of estimates from each data table.

The figures presented in tables A-3 and A-4 are approximations to standard errors of various CPS estimates for persons of Spanish origin shown in this report. The figures shown in tables A-5 and A-6 are approximations to standard errors of total U.S. estimates. Estimated standard errors for specific characteristics cannot be obtained from tables A-4 and A-6 without the use of the factors in table A-2. These factors must be applied to the generalized standard errors in

order to adjust for the existence of these strata. To compute estimated sampling variances for the values of the characteristic, Table A-1 should be used to determine the relevant column of standard errors for the characteristic and the row, table A-2.

Two parameters are required to calculate the variance of the standard error for each type of characteristic presented in Table A-2. One parameter is needed to calculate the standard error of the estimate. A third parameter is the factor of Table A-2. This factor is used to calculate the standard error of the estimated mean, and depends upon the type of estimate, the estimated mean, and the given measure of variability of the data. These factors are given in table A-3. The factor of Table A-3 is multiplied by the standard error of the estimate to obtain the standard error of the estimated mean.

Table A-1. Characteristic Types for Each Data Table

Reference Table	Characteristic Type ^a	Reference Table	Characteristic Type ^b
A	II-E	II	II-E
B	II-E	III	II-E-I
C	II-E	IV	II-E-I
D	II-E or II-E-N (education)	V	II-E-I
E	II-E-N (other education)	VI	II-E-I
F	II-E	VII	II-E-I
G	II-E-I (agriculture or detected nonagriculture)	VIII	II-E-I
H	II-E	IX	II-E-I
I	II-E	X	II-E-I
J	II-E	XI	II-E-I
K	II-E	XII	II-E-I
L	II-E	XIII	II-E-I
M	II-E-N (education)	XIV	II-E-I
N	II-E-N (other education)	XV	II-E-I
O	II-E-N	XVI	II-E-I
P	II-E-N	XVII	II-E-I
Q	II-E-N	XVIII	II-E-I
R	II-E-N (education)	XIX	II-E-I
S	II-E-N (other education)	XX	II-E-I
T	II-E-N (education)	XXI	II-E-I
U	II-E-N (other education)	XXII	II-E-I
V	II-E-I	XXIII	II-E-I
W	II-E-I	XXIV	II-E-I
X	II-E-I (agriculture or detected nonagriculture)	XXV	II-E-I
Y	II-E-N (agriculture or detected nonagriculture)	XXVI	II-E-I

^a Not applicable.

- b. Type I characteristics are family or one-person-per-household characteristics.
- b. Type II characteristics refer to some persons in a household (not one and not all) and consist of education (II-E), income (II-I), and characteristics other than education or income (II-E-N).
- c. Type III characteristics relate to most or all of the persons in a household.

^d Standard errors for these estimates are given in table A-2.

Standard error of estimated numbers. The approximate standard error of the estimated numbers may be obtained by dividing the estimated standard error by the estimated standard error of the estimated number. This may also be obtained by dividing the estimated standard error of the estimated number by the estimated standard error of the estimated total. Alternatively, the approximate standard error may be obtained from the following formula:¹ From the data in tables A-1 and A-2, were assumed that all the data in the tables provide same σ_{est} and σ_{est}^2 for each type of estimate.

$$\sqrt{\frac{\sigma_{\text{est}}^2}{\sigma_{\text{est}}^2 + \sigma_{\text{est}}^2}} = \frac{\sigma_{\text{est}}}{\sqrt{2\sigma_{\text{est}}^2}} = \frac{\sigma_{\text{est}}}{\sqrt{2}} \quad (1)$$

This is the approximate standard error of the estimated number. The estimated standard error of the estimated number is given in table A-2 according to the particular type of estimate.

Standard errors of estimated percentages. The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total upon which this percentage is based. Estimated percentages are relatively more reliable than the corresponding estimates of the numerators of the percentages, particularly if the percentages are 50 percent or more. When the numerator and denominator of the percentage are in different categories, use the factor or parameters indicated for the numerator. The approximate standard error, $\sigma_{(x,p)}$, of an estimated percentage can be obtained by use of the formula

$$\sigma_{(x,p)} = f\sigma \quad (2)$$

In this formula, f is the appropriate factor from table A-2, and σ is the standard error of the estimate from either table A-4 or A-6. Alternatively, standard errors may be approximated by the following formula (3), from which the standard errors in tables A-4 and A-6 were calculated; direct computation will give more accurate results than use of the standard error tables and the factors.

$$\sigma_{(x,p)} = \sqrt{\frac{b}{x}} p (100 - p) \quad (3)$$

Here x is the size of the subclass of persons or families and unrelated individuals which is the base of the percentage, p is the percentage ($0 \leq p \leq 100$), and b is the parameter in table A-2 associated with the particular type of characteristic in the numerator of the percentage.

Illustration of the use of standard error tables. Table 20 of this report shows that in 1977 there were 5,695,000 persons of Mexican origin in the five Southwestern States. This is a type III characteristic, and interpolation in column 4 of table A-3 shows the standard error of an estimate of this size to be approximately 222,622. Applying the factor of 1.25 for the Southwestern States gives a standard error of approximately $278,000 = 222,622 \times 1.25$.¹ The chances are 68 out of 100 that the estimate would have been a figure differing from a complete census figure by less than 278,000. The chances are 95 out of 100 that the estimate would have differed from a complete census figure by less than 556,000 (twice the standard error).

Of these 5,695,000 persons 1,504,000, or 26.4 percent, headed households in 1977. Table A-1 shows this to be an estimate of a type I characteristic, and the appropriate b parameter from table A-2 is $b = 1.56 \times 1422$. Using formula

¹ Formula (1) gives a standard error of 277,000.

Table A-2. Parameters and Factors to be Used for Each Characteristic Spanish Origin and Total U.S. Population

¹ Factors for Spanish origin characteristics should be applied only to table A-4; factors for total U.S. population characteristics should be applied only to table A-6.

²To obtain parameters for estimates for the five Southwestern States (tables 1, 4, 20, and 23) multiply the appropriate characteristic type parameters by the factor 1.56; to obtain parameters for residence estimates (tables H and 18) multiply the appropriate characteristic type parameters by the factor 2.0.

(3), the standard error on 26.4 percent with a base of 5,695,000 is approximately:

$$0.9 = \sqrt{\frac{(1.56)(1422)}{5,695,000}} (26.4)(73.6)$$

Consequently, chances are 68 out of 100 that the estimated 26.4 percent would be within 0.9 percentage points of a complete census figure. Chances are 95 out of 100 that the estimate would be within 1.8 percentage points of a complete census figure, i.e., the 95-percent confidence interval would be from 24.6 to 28.2 percent.

Standard error of a difference. For a difference between two sample estimates, the standard error is approximately equal to

$$\sigma_{(x-y)} = \sqrt{\sigma_x^2 + \sigma_y^2} \quad (4)$$

where σ_x and σ_y are the standard errors of the estimates x and y; the estimates can be of numbers, percents, ratios, etc. This will represent the actual standard error quite accurately for the difference between two estimates of the same characteristic in two different areas, or for the difference between separate and uncorrelated characteristics in the same

3,000.....	0.2	0.2	0.4	0.5	0.7	0.8
7,500.....	0.14	0.2	0.3	0.4	0.6	0.7

¹To obtain standard errors for estimates for the five Southwestern States, multiply the above figures by 1.25; to obtain standard errors for residence estimates multiply the above figures by 1.4.

ERIC See table A-2 for factors to apply to obtain standard errors for the characteristic of interest.

area. If, however, there is a high positive correlation between the two characteristics, the formula will overestimate the true standard error.

For percents, formula (4) can be written as

$$\sigma(p_1 - p_2) = \sqrt{\frac{\sigma^2}{p_1} + \frac{\sigma^2}{p_2}}$$

$$= \sqrt{\frac{b_1}{x_1} p_1 (100 - p_1) + \frac{b_2}{x_2} p_2 (100 - p_2)} \quad (5)$$

In this situation the bases of the two percentages, x_1 and x_2 , are not the same. When the base, x , of the two percentages is the same, use the following formula (6).

$$\sigma(p_1 - p_2) = \sqrt{\frac{b}{x} [100(p_1 + p_2) - (p_1 - p_2)^2]} \quad (6)$$

In formula (5), b_1 and b_2 are the parameters for the characteristics and population in question, and p_1 and p_2 are the percentages being compared, with $(0 \leq p_1 \leq 100)$ and $(0 \leq p_2 \leq 100)$. In formula (6), b is the b -parameter for the characteristic in question.

Formula (5) is to be used when the bases do not overlap; for example, males of Mexican origin and males of Puerto Rican origin. It can also be used when one base is a subset of the other; for example, males of Mexican origin and all Spanish origin males, but in this case (5) will overestimate the standard error of the difference.

Formula (6) is to be used when the base of the two percents is the same, the percents do not overlap and the characteristics in the numerators of p_1 and p_2 are of the same type, i.e., they have the same b parameter. For example, if the base is all families with head of Spanish origin, and one is comparing the percent of these families living in central cities with the percent in the suburbs (table 18), one may use formula (6) to calculate the standard error of the difference.

Illustration of computation of the standard error of a difference. Table 20 shows that in 1977 26.4 percent of the 5,695,000 persons of Mexican origin in the five Southwestern States headed households, while 36.1 percent of all 39,941,000 persons living in these States headed households. The apparent difference is 9.7 percent. As shown above the standard error on 26.4 percent is approximately 0.9. Using $b = 1389$ from table A-2 and formula (3), the standard error on 36.1 percent with a base of 39,941,000 is found to be about

0.3 percent. Therefore, using formula (4), the standard error of the estimated difference of 9.7 percent is approximately

$$0.9 = \sqrt{(0.3)^2 + (0.9)^2}$$

This means the chances are 68 out of 100 that the estimated difference based on the sample estimates would vary from the difference derived using complete census figures by less than 0.9 percent. The 68 percent confidence interval about the 9.7 percent difference is from 8.8 to 10.6, i.e., 9.7 ± 0.9 . A conclusion that the average estimate of the difference derived from all possible samples of the same size and design lies within a range computed in this way would be correct for roughly 68 percent of all possible samples. The 95 percent confidence interval is 7.9 to 11.5. Thus, we can conclude with 95 percent confidence that there is a difference between the 1977 percentage of heads of households of Mexican origin in the five Southwestern States and the percentage for all persons living in these States, i.e., the confidence interval does not include zero.

Standard error of a ratio. Certain mean values for persons in families shown in the tables of this report were calculated as the ratio of two numbers. For example, the mean number of persons per family is calculated as

$$\bar{x} = \frac{\text{total number of persons in families}}{\text{total number of families}}$$

Standard errors for these means may be approximated as shown below. There are two cases to consider. In either case, the denominator y represents a count of families of a certain class, and the numerator x represents a count of persons with the characteristic under consideration who are members of these families.

Case 1: There is at least one person having the characteristic in every family of the class: as for example, the mean number of persons per family or the mean number of persons per family with a male head. For ratios of this kind, the standard error is approximated by the following formula:

$$\sigma\left(\frac{x}{y}\right) = \sqrt{\left(\frac{x}{y}\right)^2 \left[\left(\frac{\sigma_y}{y}\right)^2 + \left(\frac{\sigma_x}{x}\right)^2 - 2\rho \left(\frac{\sigma_x}{x}\right) \left(\frac{\sigma_y}{y}\right) \right]} \quad (7)$$

The standard error of the estimated number of families, σ_y , and the standard error of the

estimated number of persons with the characteristic in those families, σ_x , may be calculated by the methods described above. In formula (7), ρ represents the correlation coefficient between the numerator and the denominator of the estimate. In the above examples, and for other ratios of this kind, use 0.7 as an estimate of ρ .

Case 2: The number of persons having the characteristic in a given family may be 0, 1, or more; for

example, the mean number of persons under 18 years of age. For ratios of this kind the standard error is approximated by formula (7), but ρ is assumed to be zero. If ρ is actually positive, then this procedure will provide an overestimate of the standard error of the ratio.

Estimating the standard error of an arithmetic mean. The standard error of an arithmetic mean can be approximated by formula (8) below. Because of the approximations used in

Table A-5. Standard Errors of Estimated Numbers of Persons and Families, Total U.S. Population

Table A-8. Standard Errors of 1970 Census Data

(5-percent sample)

Description of base of percentage	Base (000)	Description of numerator	Percent	Standard error (percent)
Spanish origin males 14 years and over	2,838	single men	32.2	.16

developing formula (8), an estimate of the standard error of the mean obtained from that formula will generally underestimate the true standard error. The formula used to estimate the standard error of a mean is

$$\frac{s}{x} = \sqrt{\frac{b}{y} s^2} \quad (8)$$

where y is the size of the base and b is the parameter from table A-2 corresponding to the characteristic of interest. The variance, s^2 , is given by formula (9)

$$s^2 = \frac{c}{\sum_{i=1}^c p_i} \bar{x}_i^2 - \bar{x}^2 \quad (9)$$

where \bar{x} is the mean of the distribution; c is the number of groups; i indicates a specific group, thus taking on values 1 through c ; p_i is the estimated proportion with the characteristic in group i ; Z_{i-1} and Z_i are the lower and upper interval boundaries respectively, for group i ; and $\bar{x}_i = \frac{Z_{i-1} + Z_i}{2}$,

which is assumed to be the most representative value for the characteristic for persons or families and unrelated individuals in group i . Group c is open-ended, i.e., no upper interval boundary exists. For this group an approximate average value is

$$\bar{x}_c = \frac{3}{2} Z_{c-1}$$

Standard error of a median. The sampling variability of an estimated median depends upon the form of the distribution as well as the size of its base. An approximate method for measuring the reliability of a median is to determine an interval about the estimated median, such that there is a stated degree of confidence that the median based on a complete census lies within the interval. Standard errors for the medians presented in table 11 are provided in table A-7. For other medians shown in the report, the following

procedure may be used to estimate the 68-percent confidence limits on sample data.

1. Determine, using the standard error tables and factors or formula (3); the standard error of the estimate of 50 percent from the distribution.
2. Add to and subtract from 50 percent the standard error determined in step 1.
3. Using the distribution of the characteristic, calculate the confidence interval corresponding to the two points established in step 2.

Illustration of the computation of a confidence interval for a median. Table 3 of this report shows that the median age in March 1977 of persons of Puerto Rican origin living in the United States was 20.4 years. Table 3 also shows that the base of the distribution from which this median was determined is 1,742,000 persons.

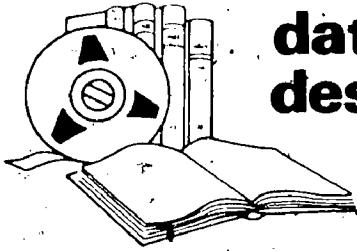

1. Using formula (3) the standard error of 50 percent on a base of 1,742,000 is about 2.5 percent.
2. To obtain a 95-percent confidence interval on an estimated median add to and subtract from 50 percent twice the standard error found in step 1. This yields percent limits 45.0 and 55.0.
3. From table 3 the age of 57.7 percent of the persons was greater than 15, and the age of 42.1 percent of the persons was greater than 24. Thus, the lower limit on the estimate is found to be about

$$\frac{57.7 - 55.0}{57.7 - 54.3} (2) + 16 = 17.5.$$

Similarly, the upper limit may be found by linear interpolation to be about

$$\frac{47.0 - 45.0}{47.0 - 42.1} (3) + 22 = 23.2.$$

Thus the 95-percent confidence interval on the estimated median is from 17.5 to 23.2.
