ABSTRACT

As part of the needs assessment phase of the Graduate Education for Librarianship in Ohio Project, a content analysis of classified advertisements for professional vacancies in Ohio libraries was conducted to determine past employment trends and develop a profile of library job requirements. Employment announcements in Library Journal, American Libraries, College and Research Library News, and Ohio Library Opportunities were examined, and for each Ohio position advertised the following information was recorded: (1) the name of the employing institution, (2) the type of institution, (3) the educational requirements, (4) the type and number of years of experience required, (5) the language requirements, (6) the service area, (7) the level of the available position, and (8) the minimum salary offered. Tallies of the data by Ohio region and by library type were made. The findings of the analysis include a conservative estimate of 100 to 110 professional openings annually in Ohio libraries, and a clear indication that the majority of Ohio library positions require prior experience in addition to an MLS. The data are summarized in 18 tables. (JL)

Foreword

Ohio residents interested in pursuing a graduate degree in library and/or information science offered by a program accredited by the American Library Association may choose to attend one of the following: 1) the Kent State University program, 2) the Case Western Reserve University program, or 3) an out-of-state program. Both Ohio, ALA accredited programs are currently located in the northeastern part of the state. Residents in northwestern, central, and southern portions of Ohio are therefore confronted with problems of long commuting distances, high costs of out-of-state tuition at out-of-state programs, separation from families, or indefinite postponement of graduate degrees.

In an attempt to reduce some of these problems, the Kent State University School of Library Science, with the support of the Public Library of Columbus and Franklin County, initiated an extension program in 1975 to serve the Columbus and central Ohio region. In 1978 facilities at The Ohio State University were made available to the Columbus program, through an expanded cooperative agreement. In 1980 a part-time coordinator was hired on a trial basis for the Columbus program, with office space in the main library at The Ohio State University.

The continuation of the off-campus program, in part, depends on the continued demand for graduate library science training in the Columbus and central Ohio area. Rather than limiting a needs assessment to the Columbus area, the School of Library Science at Kent State University sought and received LSCA Title III funding from The State Library of Ohio to conduct a state-wide

needs assessment and to evaluate alternative programming to meet identified needs throughout the state.

The needs assessment phase of the project consisted of the following parts:

1. A survey of previous and predicted personnel needs in Ohio academic, public, special and school libraries,
2. A survey of library associates employed in Ohio academic, public and special libraries to determine their interest in graduate programs in librarianship,
3. A survey of certified librarians in Ohio public schools to determine their interest in graduate programs,
4. A survey of undergraduates enrolled in educational media and library science courses in Ohio to determine their interest in graduate programs,
5. A survey of student assistants employed at Ohio academic libraries to determine their interest in graduate programs,
6. A study of advertisements for professional vacancies at Ohio academic, public, special libraries and other agencies posted between 1976 and October 1980, and
7. A review of previous studies on national and state employment trends, placement patterns, enrollment forecasts, etc.

The report which follows is a result of one of these studies.

The Job Market in Ohio, 1976-1980:
An Analysis of Position Advertisements
for Public, Academic, Special
and Other Library Vacancies in Ohio

Introduction

Purpose of the study

An analysis of classified advertisements for professional library vacancies in Ohio was conducted as part of the needs assessment phase of the Graduate Education for Librarianship in Ohio Project, School of Library Science, Kent State University. The study was designed to supplement a concurrent survey of personnel directors at major academic, special, public and school libraries in Ohio. The two main objectives for this study were as follows:

1. To determine past trends in professional library vacancies in Ohio, e.g., annual number of vacancies, geographical location, type of employing library, minimum salaries, etc.
2. To develop a profile of minimum job requirements, e.g., experience, education, language, etc.

Methodology

A content analysis of advertisements for professional vacancies at Ohio libraries was performed in November, 1980. Four periodicals were selected: 1) Library Journal, 2) ^{American} Academic Libraries,

3) College and Research Libraries News, and 4) Ohio Library Opportunities. It was assumed that these periodicals would give fairly comprehensive coverage for those Ohio positions advertised both nationally and locally. The intent was not to determine exact number of vacancies but to estimate trends, regional needs, etc.

Issues published between January 1, 1976 and October 31, 1980 were examined. For each Ohio position advertised, the following information was recorded: 1) name of employing institution, 2) type of institution, 3) educational requirements, 4) experience required, both type and number of years, 5) language requirements, 6) service area of position, 7) level of position, 8) and minimum salary offered. All responses were examined and mutually exclusive categories were developed for all information points. These categories are listed in the tables below.

It should be noted that public school districts do not typically advertise in these periodicals. Consequently this study has restricted its analysis and conclusions primarily to job trends in public, academic, and special libraries and secondarily to trends in library-related agencies; e.g., library networks, library science schools, etc.

Findings

Number of annual vacancies: by region and type of library

During the five year period examined, 544 professional positions were advertised. As Table 1 shows, public libraries had the highest number of vacancies (47%) followed by academic (34%) and then special (10%). This was as expected, the number of vacancies being

TABLE 1

1. 1980 figures reflect advertisements for the 9 month period, January through October, 1980.

proportional to number of librarians employed at each library type. Except for academic libraries, no particular pattern of annual fluctuations appeared. Academic libraries experienced a decrease in vacancies between 1976 and 1979, with 1980 perhaps beginning a period of renewed demand.

Table 2 presents a regional breakdown of annual vacancies. Figure 1 identifies these regions. During the five year period over one-fourth of the vacancies occurred in the CALICO region (27%), with the INFO/CAMLS region (16%) and the NORWELD region (12%) having the next highest occurrence. It should be noted that some of these regions do not correspond exactly to the multi-county consortia of the same names.

As Table 3 indicates, Ohio Library Opportunities published at The State Library of Ohio in Columbus, gave the most comprehensive coverage to Ohio listings. The high occurrence of CALICO listings may therefore be due to the proximity of the State Library. Table 4 demonstrates, however, that a high percentage of Ohio librarians are employed in the CALICO region, so a high number of vacancies would be expected.

Because regional needs were important for the project, they were examined more closely. Table 5 suggests that during the five years studied special library opportunities were most available in the CALICO region (64%) followed by the INFO/CAMLS region (16%). Academic library opportunities were available in CALICO (30%), in INFO/CAMLS and SWORL/GCLC regional (both 15%), and in NORWELD (11%) and MILO (10%) regions. The pattern was similar for public library opportunities, with CALICO, INFO/CAMLS and NORWELD having over 50%

1. Overall percentages include 41 positions available on teaching faculties, in consortia, networks, and other information agencies.

of the vacancies. Again this follows the regional breakdown of total professional positions, previously reported in Table 4.

Table 6 indicates that certain regions had a wider range of opportunities than others. CALICO had the most even breakdown of opportunities for the five year period with 37% of its vacancies being "academic", 32%, "public", and 24%, "special." INFO/CAMLS was the only other region with a similar range. Public library vacancies dominated almost all other regions, with the exception of SWORL/GCLC with its 62% academic openings.

Job Requirements

Table 7 reports the general job requirements for the 544 positions advertised. The MLS degree was required or desirable for 75% of the positions; 12% required or preferred an additional graduate degree. Over 70% of the positions required or desired applicants with experience. In looking at specific types of experience it was found that only 25% of the advertisements specified administrative experience. Less than 50% mentioned specific types of experience, e.g., a children's librarian with experience in children's services. Finally less than 10% of the advertisements included foreign language abilities as a job qualification.

1. Education and Language

Table 8 contains a breakdown of educational requirements by type of library. Academic, public and institution libraries required the MLS degree for the majority of their vacancies. Academic libraries actually had the highest educational requirements since a second master's degree was preferred or required for

approximately 32% of its vacancies. Special libraries gave the lowest emphasis to the MLS degree. In fact 36% of the vacancies stressed non-library degrees corresponding to the institution's collection emphasis. As expected faculty positions required advanced degrees and vacancies at multi-type consortia required the MLS degree.

Of the few positions citing foreign language criteria, most were advertised by academic libraries or by schools of library science or educational media. Exact percentages are reported in Table 9.

2. Experience

As Table 10 reveals, library consortia and other "non-traditional" agencies had the highest percentage of positions which required experience. Applicants for more traditional positions found that academic libraries placed highest emphasis on experience (82%) followed by public libraries (69%). In fact only institutional and teaching faculty positions had fewer than 50% of their advertisements citing experience as a job qualification.

Administrative experience was specified for only 25% of the 544 vacancies. Again consortia positions had the highest percentage (43%). During the five year period, it would seem that public libraries were seeking a slightly higher percentage of administrators than academic libraries (29% vs 22%).

In regards to specific experience, academic libraries again ranked highest (63%), followed by consortia and other agencies (50%). Again institutional and teaching faculty positions ranked lowest in citing specific experience requirements.

Table 11 reports the median years of general experience, administrative experience, and specific experience required by each

Specific experience	-	-	-	-	3

type of employing institution. Not all positions requiring experience specified a given number of years. It can be seen that few, if any, of the institutional faculty or "other" agency positions required a minimum number of years of general experience. Three years was the median for academic, public, and consortium positions; two, for special. Public libraries generally specified four years minimum administrative experience for those positions requiring it; consortia, three to four years; and academic, two years. Finally academic and public libraries generally required three years of specific experience; library consortia and special libraries, two.

It has been stated that not all jobs requiring experience of one form or another specified a minimum number of years as a screening criterion. Table 12 reports the percentage of positions specifying minimum years for each of the seven employer categories. If the data in Table 12 and Table 10 are compared, it is found that, in most cases, there is a difference of 10% to 20% between the percentage of positions requiring experience and the percentage of positions specifying minimum years required. For example 68% of the academic positions required general experience, but only 50% specified a minimum number of years. It appears, therefore, that there may have been some flexibility in qualifications.

Vacancies by Service Area

Yearly postings were broken down by service area to determine which skills were most marketable during the five year period and to determine if any trends emerged. From Table 13 it would appear that individuals with administrative skills were most in demand, even though only 25% of all positions specified administrative

11. Subject specialists: Sciences	1.0	6.0	2.0	1.0	0.0
12. Archives, rare books	0.0	0.0	0.0	1.0	3.0
13. Computer and System analysts	3.0	3.0	1.0	4.5	3.5
14. User education	5.5	3.0	7.0	2.0	4.5
	100.0%	100.0%	100.0%	100.0%	100.0%

1. Sixty-eight positions advertised between 1976 and 1980 could not be classified into these fourteen categories and therefore are not included in this breakdown.

2. 1980 figures cover a nine month period, January through October, 1980.

experience. Reference, circulation, and other public service positions continued to be available. Technical service positions seemed to decrease between 1976 and 1979, with 1980 showing a change upward. Other positions generally demonstrating an upward trend in demand were children and young adult services' librarians, outreach librarians, and computer and system analysts. The demand for A-V librarians also increased slightly.

Table 14 reports service vacancies by the three principal library types. The most obvious trends are summarized here. Public libraries emphasized administrative positions in the five year period. Technical services, and surprisingly public services, were emphasized more by academic and special libraries. Public libraries had a high percentage of their openings in children's and young adult's services. Media personnel were needed by all three library types. In general the three library types had more social science openings than science openings, contrary to national trends.

Finally Table 15 examines relative experience and language requirements by service area. Administrative and technical service positions had the highest percentage of vacancies requiring relevant experience, 54% and 56% respectively. The only area reporting a higher percentage was the archival/rare book specialty (75%). User education and computer and system analysts ranked next with percentage rates in the forties. Science and media specialists followed (38% and 35% respectively). Government documents, humanities, and outreach librarians had the lowest relevant experience requirements.

Table 15 also demonstrates that those positions requiring a language occurred primarily in technical services, serials, and humanities areas, as would be expected. In fact technical services

12. Archives and rare books	4	75%	0%
13. Computer and System Analysts	14	43%	7%
14. User Education	22	41%	0%

had higher percentages of both relevant experience and language requirements than any other area. The number of positions available may have declined, but the qualifications remained high.

Position level and salary information

Although job titles do not always accurately reflect the amount of authority or supervisory responsibility associated with a position, they do differentiate between entry-level and other positions. Table 16 indicates that of the 544 positions advertised, only 43% could be considered entry level positions.

Data given in Table 17 confirm earlier statements on the prevalence of administrative positions in public libraries. Only 36% of the public library positions could be considered entry level positions, while academic and special libraries had 53% and 51% respectively. Institutional libraries afforded the most opportunity for beginning librarians.

Table 18 reports minimum salary levels for the 544 positions, broken down by year and type of employing institution. Among traditional libraries, academic libraries generally offered the highest salaries, followed by special, and then public libraries. This follows since academic libraries were also the employers specifying the most education, experience, and language requirements.

Summary

A conservative estimate of the annual professional vacancies in Ohio would range from 100 to 110 openings. This would not include school library positions or positions existing in small, rural libraries which fail to advertise at the national or state level.

Annual vacancies would occur primarily in the INFO/CAMLS, CALICO, NORWELD, and SWORL/GCLC regions. The INFO/CAMLS region currently is served by two ALA accredited library schools; the CALICO region, by the off-campus program of Kent State University. Graduates from these two regions have the widest variety of positions to choose from, openings having been advertised for all three principal library types.

Graduates having worked prior to or during their master degree programs would have an advantage in securing an Ohio position. Seventy-five percent of all advertisements specified the MLS degree as a required or desirable qualification, with 76% citing some experience as desirable or required. Two to three years was generally the minimum amount of experience desired. Of the three traditional library types covered, academic libraries had the highest percentage of job requirements; they also paid the highest salaries. The data reported in Table 3 also suggested that competition for academic positions might be higher, these positions being advertised more frequently in national periodicals than public library openings.

These findings can be compared with those of similar studies. For example, Creth and Harders found that applicants for 89% of the entry-level positions advertised by thirty academic research libraries would need previous academic library experience to be competitive.

They also reported that the second master's was being used to screen applicants for interviews.¹

Genaway, in a study of the job market in the Southeast, compared characteristic of new job incumbents to the qualifications cited in position postings. He found that 69% of the positions requiring an MLS degree had been filled by an MLS applicant. In cases where "no experience" was listed, only 4% of the individuals hired lacked experience. Genaway reported that the incumbents typically had more previous experience and educational background than required in the job advertisements.²

A Bureau of Labor Statistics study, conducted in the early 1970's, forecasted that the main source of employment opportunities in the period 1970-85 would result from library replacement needs and not expansion. The study projected that 80% of these positions would be filled by new graduates from MLS/M.Ed degree programs.³ If this prediction holds true, then new graduates will need to acquire pre-degree experience to be competitive in the Ohio library job market.

This present study also indicated specific skills valued in today's job market. These include administrative skills, children and young adult services experience, outreach programming capabilities, media skills, and computer programming background. These skills are similar to those needs projected by the Bureau of Library Statistics⁴ and identified by Creth and Harders.⁵

What then are the implications of this study for graduate education in librarianship in Ohio? It would appear that the INFO/CAMLS and CALICO regions are the areas most likely to provide employment opportunities for library school graduates. The NORWELD areas could also provide employment, although to a lesser degree.

These would be areas to consider when deciding on the continuation or development of library education opportunities. It would also appear that the programs which cater to the needs of the working paraprofessional and professional librarian will have a higher success rate in graduate placements, the demand for experience being what it is. Also those programs with field practicums may provide some of the requisite experience during the training program. Finally, it would seem that students must have a wide spectrum of courses to choose from, i.e., those for specific library types and those on specific content areas such as management, computer programming, media, etc. Non-experienced students taking just traditional core offerings may be less competitive in today's job market.
