 IDENTIFIERS *Educational Indicators

ABSTRACT

The 1997 "Condition of Education" is an indicator report, analyzing key data that measure the health of education, monitor important developments, and show trends in major aspects of education. The report first presents four "Issues in Focus": (1) "The Social Context of Education"; (2) "Women in Mathematics and Science"; (3) "Public and Private Schools: How Do They Differ?"; and (4) "Postsecondary Persistence and Attainment." Following the discussion of issues are 60 indicators of the current status of education, 18 of which are new. The indicators are divided into six areas: (1) access, participation, and progress; (2) achievement, attainment, and curriculum; (3) economic and other outcomes of education; (4) organization and management of educational institutions; (5) climate and diversity of educational institutions; and (6) human and financial resources of educational institutions. The report includes the text, tables, and charts for each indicator plus the technical supporting data, supplemental information, and data sources. Information on issues in elementary and secondary education are integrated with those on issues in postsecondary education to reflect the continuity of educational experiences. Appendices comprise over half of the publication and contain supplemental tables and notes, a list of data sources, a glossary, an index, and a list of selected publications of the National Center for Education Statistics.

Commissioner

The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to:

Commissioner's Statement

The National Center for Education Statistics (NCES) gathers and publishes information on the status and progress of education in the United States. The congressional authorization for these activities (with antecedents to 1867) states that the purpose of the Center is to collect and report “. . . statistics and information showing the condition and progress of education in the United States and other nations in order to promote and accelerate the improvement of American education”—Section 402(b) of the National Education Statistics Act of 1994 (20 U.S.C. 9001). This law also mandates an annual statistical report on the subject from the Commissioner of Education Statistics. This 1997 edition of *The Condition of Education* responds to the requirements of that law.

Interest in education data and indicators: Federal, state, and local policymakers require a variety of information to develop, implement, and monitor policies designed to improve education. Education and business organizations, as well as community groups and citizens, generally want to know how to make and support efforts designed to bring about that improvement. Informed decisions cannot be made without valid information, however. As various groups voice their desires and concerns about our schools, NCES continually seeks to define efficient and effective measures that can meet the demands for timely, useful information, while maintaining high statistical standards. At the same time, the interest in data about new topics has not lessened the need for basic statistical information about educational institutions and trends.

Developing education indicators is one way the Center has participated in a widening national discussion about the types of measures needed to serve these diverse purposes. *The Condition of Education* is an indicator report, analyzing key data that measure the health of education, monitor important developments, and show trends in major aspects of education. Unlike most other statistics, an indicator is policy relevant and problem oriented; it usually incorporates a standard against which to judge progress or regression. Indicators cannot, however, identify causes or solutions and should not be used to draw conclusions without other evidence.

Organization of this report: The format of *The Condition of Education* is designed to present statistical information in a manner accessible to a general audience. The *Condition* first presents four Issues in Focus: The Social Context of Education; Women

in Mathematics and Science; Public and Private Schools: How Do They Differ?; and Postsecondary Persistence and Attainment. These topics were chosen because they are important to the national education policy debate. The data summarized in these essays are drawn from this report, as well as other sources, in order to construct a comprehensive statistical picture on these issues. Following the Issues in Focus are the indicators, with each one appearing on two facing pages. The first page presents statistical results and one or two tables with supporting data, while the second page presents one or more figures that illustrate the major findings of the indicator.

The indicators are organized into six sections: (1) Access, Participation, and Progress; (2) Achievement, Attainment, and Curriculum; (3) Economic and Other Outcomes of Education; (4) Organization and Management of Educational Institutions; (5) Climate and Diversity of Educational Institutions; and (6) Financial and Human Resources of Educational Institutions. Within each section, indicators on issues in elementary and secondary education are integrated with those on issues in postsecondary education to reflect the continuity of educational experiences. In addition, a discussion preceding each of the six sections provides a brief overview of the indicators in that section. Additional tables and supplemental notes that support both the Issues in Focus and the indicators follow the six indicator sections. For those interested in delving deeper into the supporting data, a companion volume is available, entitled *The Condition of Education 1997 Supplemental and Standard Error Tables*. (See the reply card at the end of this volume for ordering information.)

Indicator selection: Each year, indicators are carefully selected, and no more than 60 indicators are presented in each year's report. The indicators represent a consensus of professional judgment on the most significant national measures of the condition and progress of education at this time, but are tempered necessarily by the availability of current and valid information. The indicators presented here reflect a basic core that can be repeated with updated information on a yearly or other cyclical basis, supplemented by a more limited set of indicators based on infrequent or special studies.

The indicators presented in this report were developed using data from 29 different studies carried out by NCES, as well as from surveys conducted elsewhere, both within and outside of the federal

government. Although indicators may be simple statistics, more often they are analyses—examining relationships; showing changes over time; comparing or contrasting subpopulations, regions, or states; or studying characteristics of students from different backgrounds. Data used for these indicators are the most valid and representative education statistics available in the United States today for the subjects and issues at hand.

The utility of *The Condition of Education* should increase as more diverse, high quality data become available, especially as new time series data can be constructed. For example, in 1996, data on the mathematics and science performance of 8th-grade students in 41 countries were released in the Third International Mathematics and Science Study (TIMSS). Data on 4th- and 12th-grade students will be available in mid-1997 and early 1998, respectively. In this study, NCES combined multiple methodologies to create an information base that goes beyond simple student test score comparisons and questionnaires to examine the fundamental elements of schooling. A number of innovative research techniques were used in TIMSS, including analyses of textbooks and curricula, videotapes, and ethnographic studies. NCES is currently exploring the utility of expanding some of its other surveys to use similar kinds of techniques.

This year's edition contains 18 new indicators, either based on recently released data or exploring new issues with previously existing data. These new indicators are integrated throughout the report:

- Early literacy experiences in the home;
- Early signs of school problems;
- Grade retention, by English language usage and proficiency, and disability status;
- School library media center resources;
- Postsecondary enrollment rates among the high school classes of 1972, 1980, and 1992;
- Employment and postsecondary persistence and attainment;
- Reading and writing habits of students;
- International comparisons of mathematics and science performance of eighth-grade students;
- Labor market outcomes for non-college-bound high school graduates;
- Community service activities following high school;
- Homework assigned by elementary teachers;
- Teachers' use of various instructional methods;

- Use of student portfolios by elementary teachers;
- Public schools with bilingual or ESL programs;
- Students who have been suspended from school;
- Teacher satisfaction;
- Research output of postsecondary faculty; and
- Nontenure-track faculty.

Data on early childhood education will greatly expand with the start of the Early Childhood Longitudinal Study, which will follow a sample of children from kindergarten through fifth grade, beginning in 1998. Plans are also under way for the next wave of the Schools and Staffing Survey (SASS), National Study of Postsecondary Faculty (NSOPF), and National Adult Literacy Survey (NALS). In addition, the next round of secondary and postsecondary longitudinal studies will enable us to update what we have learned from the National Longitudinal Study of the High School Class of 1972 (NLS-72), the High School and Beyond (HS&B) Study, the National Education Longitudinal Study of 1988 (NELS:88), the Beginning Postsecondary Students Longitudinal Study (BPS), and the Baccalaureate and Beyond Longitudinal Study (B&B). New data from each of these studies will help us better understand the educational experience in our nation's schools and colleges.

Availability of NCES data and information: We strive to make our products available in a variety of formats and in language that is appropriate to diverse audiences. Currently, most NCES publications and data sets are available on-line through the NCES Internet site at <http://www.ed.gov/NCES>. I hope that you find this medium a useful way to access our data. In addition, the National Education Data Resource Center (NEDRC) performs special statistical analyses and tabulations of NCES data sets. NEDRC services are free of charge for state education personnel, education researchers, and others requesting special tabulations. NEDRC also distributes NCES publications and CD-ROMs containing NCES data. (See the description of NEDRC in the back for more information.)

I hope that you find the material in this document useful and invite you to send us comments on how we can improve future editions of this report.

Pascal D. Forgione, Jr., Ph.D.
Commissioner of Education Statistics

Acknowledgments

The Condition of Education 1997 was authored by a joint NCES/Pinkerton Computer Consultants, Inc./MPR Associates, Inc./American Institutes for Research team under the general direction of Thomas M. Smith, Director of *The Condition of Education* Project in the Data Development and Longitudinal Studies Group. Overall direction was provided by Thomas D. Snyder, Director of the Annual Reports Program. Rebecca Pratt of Pinkerton Computer Consultants, Inc. was the managing editor for the publication. Ginger G. Rittenhouse of Pinkerton Computer Consultants, Inc. carefully edited the manuscript and coordinated the production of the volume.

The authors would like to thank all those who contributed to this report. From Pinkerton Computer Consultants, Inc., Kathryn Tingos authored several indicators using the NSOPF and IPEDS data sets, and Vaishali Joshi authored several indicators using the March CPS data set. Brenda Broussard designed and edited all of the graphics for the indicators and essays in the report and prepared them for printing.

Huong Huyen produced tabulations from the Schools and Staffing Survey and the Teacher Follow-up Survey. Sharon Xu, Gung-mei Chao, and Steve Agbayani produced tabulations from the October and March CPS. Alan Boyington assisted with formatting and typesetting the manuscript, and Michelle Brown assisted with the preparation of the final graphs.

Authors of indicators at MPR Associates, Inc. included Martha Naomi Alt, Laura J. Horn, Philip Kaufman, and Robert Fitzgerald. Barbara Kridl supervised production; Andrea M. Livingston and Karyn Madden edited the text and tables; Francesca Tussing proofread the manuscript; Mary Sukkestad and Don Eike provided word processing support; and Leslie Retallick contributed to the design.

Richard Phelps of the American Institutes for Research helped to develop and review the indicator on international public expenditure for education, and Joel Sherman of the American Institutes for Research reviewed several of the indicators and notes.

The authors would like to thank Katherine Chandler, Mary Rollefson, and Edith McArthur of NCES for their close coordination efforts on data and substantive issues.

Producing *The Condition of Education* requires a 12 month cycle. The *Condition* team formally asks for advice twice during this cycle, once when devel-

oping the proposed table of contents and again when the draft report has been prepared. Reviewers of the plan for the 1997 edition of *The Condition of Education* included Rolf Blank and Barb Clements, Council of Chief State School Officers; Jewell Gould, American Federation of Teachers; Jack Jennings and Diane Stark, Center on National Education Policy; Jacqueline King, American Council on Education; Leslie Lawrence, National Education Goals Panel; and Audrey Pendleton and Daniel Goldenberg of the Planning and Evaluation Service, Office of the Undersecretary.

This volume has been reviewed by many people, often within tight time constraints and at the expense of the reviewers' many other responsibilities. Their high professional standards, discerning eyes, and commitment to quality are crucial to the quality, utility, and relevance of this volume. Mary Frase of NCES and Ellen Bradburn of the Education Statistics Services Institute (ESSI) painstakingly reviewed the entire manuscript through several drafts and made many important suggestions that improved the technical accuracy and clarity of the final volume. Susan Ahmed, Sam Barbett, Steve Broughman, Bob Burton, Dennis Carroll, Kathryn Chandler, Mike Cohen, Bill Fowler, Claire Geddes, Bernard Greene, Kerry Gruber, Frank Johnson, Laura Lippman, Edith McArthur, Marilyn McMillen, Frank Morgan, Laurence Ogle, Peter Stowe, Jeff Williams, and Linda Zimmler of NCES all provided detailed and helpful reviews. Valerie Conley of Synectics reviewed the NSOPF indicators and Laurence Peters reviewed the document for the Office of the Assistant Secretary in OERI. Other offices within the Department of Education that provided comments were the Planning and Evaluation Service and the Budget Service of the Office of the Undersecretary; and the Office of Bilingual Education and Minority Language Affairs.

Several individuals served as invited external peer reviewers of the draft manuscript and made valuable contributions: David Boesel, National Library of Education; Rolf Blank, Council of Chief State School Officers; Chris Cross, Council for Basic Education and the Maryland State Board of Education; Sandra Hanson, Catholic University of America; Martha Galindo, National Association of Independent Schools; Irene Harwarth and Barbara Hume, National Institute on Postsecondary Education, Libraries, and Lifelong Learning; Jacqueline King, American Council on Education; and Jennifer Manlove, Child Trends, Inc.

Issues in Focus

The Social Context of Education

by Beth Aronstamm Young, Pinkerton Computer Consultants, Inc. and Thomas M. Smith, NCES

Children in the United States come from a variety of family situations, income strata, and cultural backgrounds. As a result, our Nation's schools are faced with unique challenges as they strive to provide equal educational opportunities to all students.¹ Factors such as family income, family structure, and parents' education have been shown to influence a child's educational opportunities. Today, of the 4 million babies born each year, nearly one out of eight is born to a teenage mother, one out of four to a mother with less than a high school education, almost one out of three to a mother who lives in poverty, and one out of four to an unmarried mother.² These conditions have been shown to be associated with children who experience problems such as repeating a grade, requiring special education services, and being suspended and dropping out of school.³

Students from racial/ethnic minority backgrounds and low income families are more at risk for poor school outcomes and are becoming an increasing share of the student population.⁴ Since the mid-1960s, studies have linked the educational disadvantage of minority students to a combination of out-of-school factors, many of which center on family characteristics, such as poverty and parents' education.⁵ The data contained in this report highlight similar findings.

Changes over time in the composition of students in terms of factors such as student English language proficiency, family income, parents' education, and family structure affect the social context of education. In the essay that follows, associations between these student-level social factors and different indicators of educational access and progress are reviewed. For each student background factor, the essay will point out how these factors have changed for families and children over time, as well as how they affect various racial/ethnic groups.

The social context of schooling is also a function of how students with various characteristics are distributed across schools. The last half of this essay examines differences in school climate and human and financial resources in high and low poverty schools. The data on these factors reflect changing conditions that schools must confront in order to be effective. In order to provide equal educational opportunity, policymakers must be aware of differences in the background of students, as well as differences in the climate and resources of schools.

Student Background

Social background factors such as race/ethnicity, limited English proficiency, family income, parental education, and family structure are associated with various levels of educational access and different educational outcomes. For example, differences in preprimary enrollment, incidence of early childhood academic and behavioral problems, level of student achievement, and the likelihood of dropping out of school or going on to college after graduation are each associated with various social background factors. Such factors are interrelated, however, and must be examined jointly when trying to understand the effect of any single factor on education. For example, a recent study showed that variation in student performance associated with family structure disappeared when other factors, such as family income, family size, and parents' education level, are taken into account.⁶ Several examples of the association between social and educational access and outcomes contained in this report are summarized below.

- *Poverty is negatively associated with enrollment rates in early childhood education programs.*

Differences in enrollment rates in early childhood education across levels of poverty may indicate differential access to this level of education. For example, in 1995, 3- and 4-year-olds from families who were classified as poor (a measure of a family's composition and income) were less likely to be enrolled in preprimary education than 3- and 4-year-olds from families who were classified as non-poor (24 and 52 percent compared to 42 and 64 percent, respectively) (table 1-1).

- *Children in single parent families are more likely to experience early school problems and are less likely to participate in early literacy activities than children in two parent families.*

Family structure is associated with children's early literacy activities and early school problems. In 1995, 3- to 5-year-olds living with two biological or adoptive parents were more likely to have been read to three or more times a week, to have been told a story once a week, or to have visited the library in the previous month than 3- to 5-year-olds living

with one biological or adoptive parent (table 2-1). Moreover, first- and second-graders aged 6–8 living with one biological or adoptive parent were more likely to experience academic problems and to have their parents report that they were academically below the middle of their class than those students living with two biological or adoptive parents (table 3-1).

- *Parents' education level is strongly associated with student achievement.*

In general, children of parents with higher levels of education perform better, on average, on assessments of student achievement. For example, in 1994, 13- and 17-year-olds whose parents had at least some college had higher mathematics and science proficiency scores than those whose parents did not finish high school. Parents' educational attainment was positively related to reading and writing scores as well (tables 15-4 and 16-4).

- *Difficulty speaking English is associated with dropping out of school.*

In 1995, of those 16- to 24-year-olds who spoke a language other than English at home, the dropout rate of those who had difficulty speaking English (44 percent) was substantially more than that of those who did not have difficulty speaking English (12 percent) (table 4-1).

- *High school graduates from high income families are more likely than high school graduates from low income families to go directly to college.*

High school graduates from low income families were more likely to go directly to college in 1995 than in 1972.⁷ Still, in 1995, 34 percent of high school graduates from low income families went directly to college, compared to 83 percent of those from high income families (*Indicator 8*).

Changes in the social background of children

The learning environment of schools can be enhanced by what students with a variety of backgrounds and interests bring with them; however, heterogeneity of student ability levels and preparation for school may create increased challenges for schools to meet the needs of students from different social backgrounds. This section describes changes in the social background charac-

teristics of children in general, as well as of children from various racial/ethnic groups.

Racial/ethnic makeup of students

A greater racial/ethnic diversity of students is related to more heterogeneity of language and culture in our Nation's schools. Many minority students come from poverty or non-English language backgrounds and may be at greater risk of not succeeding in school than other children.

- *Minority students are projected to make up an increasing share of the school age population during the coming decades.*

Racial and ethnic diversity has increased substantially in the United States in the last two decades, and is projected to increase even more in the decades to come. In 1995, 67 percent of U.S. children aged 5–17 were white, 15 percent were black, 13 percent were Hispanic, and 5 percent were Asian/Pacific Islander, American Indian, and Alaskan Native.⁸ Between 2000 and 2020, the number of minority children aged 5–17 is projected to grow much faster than the number of white children. Between 2000 and 2020, it is projected that there will be 61 percent more Hispanic children aged 14–17 and 47 percent more Hispanic children aged 5–13. The numbers of Asian/Pacific Islander, American Indian, and Alaskan Native children aged 14–17 is projected to increase by 73 percent, while the number of those children aged 5–13 is projected to grow by 67 percent. In contrast, between 2000 and 2020, the number of white children aged 5–13 is projected to decrease by 11 percent, and the number of white children aged 14–17 is projected to decrease by 10 percent.

Table 1. Percentage change in the population of children aged 5–17, by race/ethnicity

Race/ethnicity	Percentage change	
	1993 to 2000	2000 to 2020
White		
Aged 5–13	2.9	-11.2
Aged 14–17	10.1	-10.3
Black		
Aged 5–13	12.9	15.4
Aged 14–17	11.5	20.0
Hispanic		
Aged 5–13	29.8	47.0
Aged 14–17	23.6	60.6
Other		
Aged 5–13	32.5	67.2
Aged 14–17	45.1	73.3

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Youth Indicators 1996*, Indicator 2.

Difficulty speaking English

Children who speak languages other than English at home and who have difficulty speaking English face great challenges progressing through school. By law, school systems across the United States must provide services for children who have difficulty speaking English. Difficulty speaking English is most common among immigrant children and the U.S.-born children of immigrants.

- *The percentage of children having difficulty speaking English increased in recent years.*

Between 1979 and 1989, the percentage of children aged 5–17 in the United States who spoke a non-English language at home and who had difficulty speaking English increased from 3 to 5 percent and remained at 5 percent between 1989 and 1995. Hispanic children were more likely to have difficulty speaking English than their white or black peers. In 1995, 31 percent of Hispanic children spoke a non-English language at home and had difficulty speaking English, compared to 1 percent each of black and white children. The percentage of Hispanic children who spoke a non-English language at home and who had difficulty speaking English increased slightly between 1979 and 1995.⁹

Table 2. Percentage of children aged 5–17 who spoke a language other than English at home and who spoke English with difficulty,* by race/ethnicity: 1979, 1989, 1992, and 1995

Race/ethnicity	1979	1989	1992	1995
Total	3	5	5	5
White	1	1	1	1
Black	—	1	2	1
Hispanic	29	28	30	31

— Too few sample observations for a reliable estimate.

* Respondents were asked to rate the child's ability to speak English using the following scale: "not at all," "not well," "well," or "very well." All those who reported less than "very well" were categorized as having difficulty speaking English.

Socioeconomic status

Many studies have found that students' socioeconomic status (SES) is associated with their likelihood of success in school. Whether measured by parents' income, occupational prestige, or level of education, students from low SES families are more likely to experience school failure than those from higher SES families.¹⁰ Differences in the educational success of minority groups are also confounded by differences in the average SES level of minority and white families.¹¹ The rest of this section summarizes the changes in SES factors,

which include family income, poverty rates, and parents' education level.

- *Although median family income has increased substantially since 1950, there has been little gain since 1970. Median family income in black and Hispanic households remains at about 60 percent of income in white households.*

Median family income, in constant dollars, increased substantially between 1950 and 1970; however, median family income showed no real gains in the 1970s, a modest increase during the 1980s, and a decline between 1989 and 1993.¹² Income in black and Hispanic households remains much less than that in white households. In 1993, the median family income for whites was \$39,300, compared to \$24,542 for blacks and \$23,654 for Hispanics. These income differences by race/ethnicity are also evident in poverty rates.

- *In 1995, both black and Hispanic children were more than twice as likely as white children to live in poverty.*

Figure 1. Percentage of children less than 18 years old who lived in families with incomes below the poverty level: Selected years 1960–95

SOURCE: Indicator 44, *Condition 1996*, and U.S. Bureau of the Census, Current Population Reports P60-194, *Poverty in the United States: 1995, 1996*.

The proportion of children under 18 who lived in families with incomes below the poverty level decreased substantially during the 1960s and then rose from 1970 to 1983. Between 1983 and 1995, the poverty rate for children fluctuated between 19 and 22 percent. Throughout the period, minority children were more likely to live in poverty than white children. In 1995, both black and Hispanic children (42 and 39 percent, respectively) were more than twice as likely as white children (16 percent) to live in poverty. Children living with two married par-

ents were also much less likely to live below the poverty level than children living only with their mother (6 percent of children compared to 32 percent).¹³

- *Poverty rates are much higher in the United States than in many other industrialized countries.*

The percentage of children living below the poverty line, adjusted for the impact of taxes and governmental transfers on income, suggests how effective government fiscal policies are at reducing income inequalities and poverty in a society. Among countries with data available, the United States was the only wealthy industrialized country to have double-digit child poverty rates (20.4 percent in 1986) after adjusting for taxes and governmental transfers.¹⁴ The post-transfer poverty rates for children in the United States were between two and seven times higher than comparable rates in Canada, France, former West Germany, and the United Kingdom.

Table 3. Percentage of children (aged 17 or younger) whose family income is below 40 percent of adjusted median family income, by tax and transfer status and country

G-7 Country	Year	Before transfer	After transfer
Canada	1987	15.7	9.3
France	1984	21.1	4.6
West Germany (former)	1984	8.4	2.8
United Kingdom	1986	27.9	7.4
United States	1986	22.3	20.4

NOTE: No data were available for Italy and Japan.

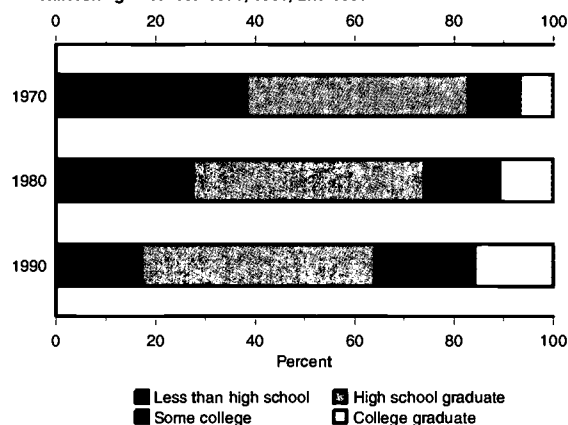

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Educational Indicators: An International Perspective*, 1996, Indicator 35.

Parents' education levels are strongly associated with family income levels. Disentangling the separate effects of parents' education and family income on children's education is extremely difficult. Both are, in fact, often used as proxies for SES. Independent of income, however, parents' level of education may influence the value that parents place on education, which in turn can influence their children's educational attainment.¹⁵ While median family income has been relatively stagnant (in constant dollars) since 1970, the average education level of parents has been increasing. Changes in parents' education levels may be an indicator of changes in families' ability to support and promote education for their children.

- *Parents' education levels have increased dramatically since 1970.*

The average education level of parents has continued to increase. For example, the percentage of fathers with less than a high school education declined from 43 percent in 1970 to 19 percent in 1990. Over the same 20-year period, the percentage of fathers with a bachelor's degree or higher increased from 13 to 23 percent. The percentage of mothers with less than a high school diploma declined from 38 to 17 percent between 1970 and 1990, while the percentage with a bachelor's degree or higher doubled.¹⁶ There is some evidence that this increase has had an impact on student performance. A recent study on family characteristics and test scores found that parents' education was the family characteristic most strongly related to student achievement.¹⁷

Figure 2. Percentage distribution of the highest education level of mothers with children aged 15-18: 1970, 1980, and 1990

SOURCE: RAND, *Student Achievement and the Changing American Family*, 1994.

- *Parents' level of education remains higher for white children than for black or Hispanic children.*

Figure 3. Percentage distribution of the highest education level of parents with children aged 3-5, by race/ethnicity: 1995

SOURCE: U.S. Department of Education, National Center for Education Statistics, *National Household Education Survey*, 1995.

Although the average highest education level of parents has increased considerably, black and Hispanic children remain more likely than white children to have parents who did not graduate from high school and are less likely than white children to have parents who graduated from college. For example, in 1995, 16 percent of black and 27 percent of Hispanic children aged 3–5 had parents who had not completed high school, compared to 4 percent of their white counterparts.

Family structure

The definition of a “family” has changed greatly in the past three decades. Today children may live in a variety of family structures. For example, in 1995, 25 percent of children aged 6–8 lived with a single parent, 3 percent lived with other relatives, and 64 percent lived with two biological or adoptive parents.

Table 4. Percentage distribution of children from birth to age 8, by family structure: 1995

Family structure	Birth to age 2	Aged 3–5	Aged 6–8
Total	100.0	100.0	100.0
Two biological or adoptive parents	72.4	67.0	64.0
One biological or adoptive parent	24.2	25.7	25.3
One biological and one stepparent	1.3	4.7	7.8
Other relatives	2.0	2.7	2.9

NOTE: Details may not add to totals due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey, 1995.

Different family structures are associated with different educational outcomes, even though the effects of family structure are likely to be confounded by family income, parents’ education level, race/ethnicity, and the amount of time that parents participate in their children’s education.¹⁸ Because different family structures are associated with different educational outcomes, it is important to examine how the structure of families has changed over time.

- *The proportion of children living in single parent families has more than doubled since 1970. In 1994, black children were three times more likely than white children to live in a single parent family.*

The proportion of children living in single parent families increased sharply during the 1970s and continued to rise slowly through the early 1990s. In 1994, 25 percent of children under age 18 lived in single parent families, while 11 percent did so in 1970. Between 1970 and 1994, the percentage of black children living in a single parent family nearly

doubled. In 1994, 60 percent of black children lived in single parent families compared to 19 percent of white children and 29 percent of Hispanic children.¹⁹

Figure 4. Percentage of children under age 18 living in single parent families, by race/ethnicity of family householder: Selected years 1965–94

Social context of public schools

An analysis of the social context of education cannot be complete unless it also examines differences in the schooling environment across low and high poverty schools.²⁰ Research has shown that student performance is strongly related to the educational backgrounds and aspirations of other students in the school.²¹ This context or composition effect has been found to be particularly strong for low income students. For example, low income students in schools with small concentrations of such students have higher achievement and graduation rates than their counterparts in schools with high concentrations of low income students.²²

The percentage of students receiving free or reduced-price lunches in school is the most widely available and comparable measure of school poverty concentration.²³ For the purpose of this essay, “low poverty” is a term used to describe public schools in which 5 percent or fewer of the students receive free or reduced-price lunches, and “high poverty” is used to describe public schools in which more than 40 percent of students receive free or reduced-price lunches.

- *Minority students are more likely than white students to attend high poverty schools.*

Differences in climate or in the distribution of resources between high and low poverty schools have

a disproportionate impact on minorities, as racial/ethnic minorities are far more likely to attend high poverty schools. In the 1993–94 school year, 27 percent of white students were in schools with a high poverty rate compared to 65 percent of black and Hispanic students, 37 percent of Asian/Pacific Islander students, and 57 percent of American Indian/Alaskan Native students.

Figure 5. Percentage distribution of students, by percentage of students eligible for free or reduced-price lunch in public schools: School year 1993–94

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993–94.

Systematic differences in the learning environment and the level of financial and human resources between high and low poverty schools can adversely affect the equality of educational opportunities, especially for many minority children. The remainder of this essay will examine differences in these educational opportunities between high and low poverty public schools.

Learning environment in high and low poverty schools

Differences in how teachers in high and low poverty schools perceive conditions in their schools may reflect differences in the learning environment in which education takes place in those schools.

- Public school teachers in high poverty schools are more likely to report that student misbehavior interfered with their teaching than were teachers in low poverty schools.

In the 1993–94 school year, public school teachers from high poverty schools were less likely to be satisfied with their school conditions than were

teachers from low poverty schools (*Indicator 49*). For example, teachers in high poverty schools were more likely than their counterparts in low poverty schools to report that student misbehavior (e.g., noise, horseplay, or fighting in the halls, cafeteria, or student lounge) in their school interfered with their teaching (18 and 8 percent, respectively). Teachers in high and low poverty schools were about equally likely, however, to agree strongly that their principal enforced school rules for student conduct and backed them up when they needed it and that there was a great deal of cooperative effort among the staff members in their school.

Table 5. Public school teachers' perceptions and attitudes toward teaching, by percentage of students eligible for free or reduced-price lunch: School year 1993–94

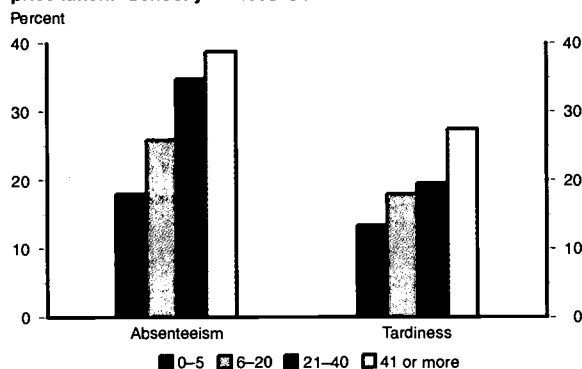

Perceptions and attitudes	Percentage of students eligible for free or reduced-price lunch			
	0–5	6–20	21–40	41 or more
Percentage of teachers who strongly agree with the following:				
My principal enforces school rules for student conduct and backs me up when I need it	43.0	44.3	48.8	46.4
There is a great deal of cooperative effort among the staff members	32.7	33.5	34.8	34.3
Necessary materials are available as needed by the staff	38.8	34.4	33.6	29.6
The level of student misbehavior in this school interferes with my teaching	8.2	10.3	13.1	18.3

SOURCE: Indicator 49, *Condition 1997*.

- Public secondary teachers in high poverty schools are more likely to report that student absenteeism and tardiness were serious problems in their schools than public secondary teachers in low poverty schools.

An important aspect of student access to education is the amount of time students actually spend in the classroom. When students are absent from school, arrive late, or cut class, they forgo their opportunities to learn. Furthermore, when students disrupt classes by being late or absent, they interfere with lessons in progress and with other students' opportunity to learn. In the 1990–91 school year, the reported percentage of secondary students absent on a typical day was higher in high poverty public schools (10 percent) than in low poverty public schools (7 percent). Secondary teachers in high poverty schools were more than twice as likely as secondary teachers in low poverty public schools to report that student absenteeism and tardiness were serious problems in their schools (*Indicator 45, Condition 1995*).

Figure 6. Percentage of public high school teachers who reported that absenteeism or tardiness was a serious problem in their school, by percentage of students eligible for free or reduced-price lunch: School year 1993–94

SOURCE: Indicator 42, *Condition 1996*.

- Teachers in high poverty public schools are more likely than their counterparts in low poverty public schools to report that lack of parental involvement was a serious problem in their school.

When school personnel and parents communicate, they can mutually establish a stronger learning environment for the student both at home and at school. In the 1993–94 school year, public school teachers from high poverty schools were three times more likely than their counterparts in low poverty schools to report that lack of parental involvement was a serious problem in their schools (38 compared to 12 percent).

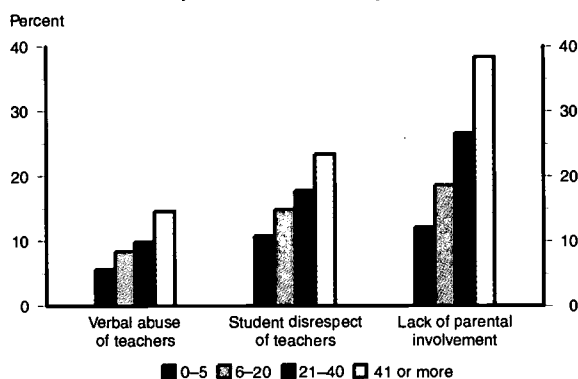

Teachers in high poverty schools may be making less of an effort to reach out to parents, however. In 1992, parents of seniors in high poverty schools were less likely than their counterparts in low poverty schools to be contacted regarding their child's academic performance, academic program, or post-high school plans. They were also less likely to be asked to volunteer time at the school. There was no measurable difference in school-teacher contacts with parents regarding the student's attendance or behavior, however (Indicator 44, *Condition 1995*).

- Teachers in high poverty public schools are more likely than teachers in low poverty public schools to report that verbal abuse of teachers and student disrespect of teachers were serious problems in their schools.

Frequent negative interactions between students and teachers are an indicator of a school environment that is less conducive to learning. In the 1993–94 school year, public school teachers in high

poverty schools were more than twice as likely to report that verbal abuse and student disrespect for teachers were serious problems at their school than their counterparts in low poverty schools.

Figure 7. Percentage of public school teachers who reported selected problems were serious, by percentage of students eligible for free or reduced-priced lunch: School year 1993–94

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993–94.

- An increasing percentage of public school teachers report that physical conflicts and weapons possession are moderate or serious problems in their schools.

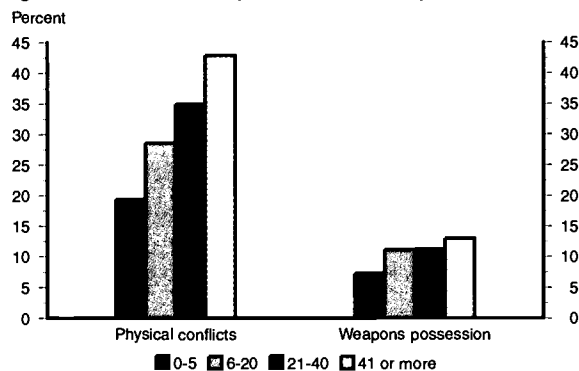

There has been an increase in the percentage of public school teachers who, between the 1987–88 and 1993–94 school years, felt that physical conflicts and weapons possession were moderate or serious problems in their schools.²⁴ This concern is reflected in the views of students as well as teachers. In 1993, 50 percent of students reported using some sort of strategy to avoid harm at schools. Black and Hispanic students were more likely to have reported using such a strategy than were white students.²⁵

- Public school teachers in high poverty schools are more likely than teachers in low poverty schools to report that physical conflicts and weapons possession were moderate or serious problems in their schools.

In the 1993–94 school year, 43 percent of public school teachers in high poverty schools reported that physical conflicts among students were a moderate or serious problem in their schools; this was more than twice the percentage of their counterparts in low poverty schools who reported that physical conflicts were a moderate or serious problem (19 percent). Thirteen percent of public school teachers in high poverty schools reported that weapons

possession was a moderate or serious problem in their school, compared to 7 percent of teachers in low poverty schools.

Figure 8. Percentage of public school teachers reporting physical conflicts among students and weapons possession as a moderate or serious problem in their schools, by percentage of students eligible for free or reduced-price lunch: School year 1993-94

SOURCE: U.S. Department of Education, National Center for Education Statistics, Schools and Staffing Survey, 1993-94.

Resource equity across high and low poverty schools

Equity concerns typically focus on the fairness of how financial and human resources are allocated across schools. Equity can be measured across several types of resources, including differences in programs and services offered, levels of teacher qualifications and experience, teacher salaries, average class size, and expenditures per student. Equity in financial and human resources between schools with high and low poverty levels is one aspect of providing equal educational opportunities to all students.

- *Fourth-graders in high poverty public schools are less likely to be in schools with gifted and talented programs or extended day programs than fourth-graders in low poverty schools.*

The programs and services that a particular school offers are a function not only of the needs of the students, but also of the resources available to that school. Differences in offerings across school poverty levels provide information as to how educational resources are being deployed.

In the 1993-94 school year, fourth-graders enrolled in low poverty public schools were more likely to have programs for the gifted and talented, diagnostic and prescriptive services, and extended day programs in their schools than fourth-graders in

high poverty public schools. Fourth-graders in high poverty public schools were more likely, however, to have bilingual education programs offered in their schools than fourth-graders in low poverty schools (Indicator 41, *Condition 1995*).

Table 6. Percentage of fourth-grade students in public schools offering various programs and services, by percentage of students receiving free or reduced-price lunch: School year 1993-94

School poverty level	Bilingual education	English as a second language	Programs for the gifted and talented	Diagnostic and prescriptive services	Extended day
Total fourth-graders	23.2	51.9	77.9	82.7	40.8
Percentage of students receiving free or reduced-price lunch					
0-5	14.0	59.6	83.3	87.6	58.5
6-20	7.5	51.1	82.2	83.7	42.6
21-40	18.6	47.7	79.9	83.9	39.3
41 or more	36.6	53.8	74.8	80.9	38.7

SOURCE: Indicator 41, *Condition 1995*.

- *Students in mathematics classes in low poverty public secondary schools are more likely to be taught by teachers who majored or minored in mathematics than were students in high poverty public secondary schools.*

Concern about the quality of education in the United States has focused interest on teacher qualifications and student exposure to well-qualified teachers, especially in mathematics and science. Educational background is one measure of teacher qualifications. One indicator of teachers' substantive and academic qualifications is whether or not they majored or minored in the fields they teach.

The differences in teacher qualifications shown by school poverty levels are not uniform across subjects. For example, there is a 9 percentage point difference in the percentage of students taught mathematics by a teacher with a major or minor in mathematics between high and low poverty schools. There is no measurable difference in the percentage of students taught science by a teacher who majored or minored in a science subject between high and low poverty schools. Differences exist, however, within specific science subjects; students in high poverty schools were less likely than students in low poverty schools to be taught chemistry by a teacher who majored or minored in chemistry (63 and 77 percent, respectively) or to be taught physics by a teacher who majored or minored in physics (29 and 43 percent, respectively) (table 57-1).

Table 7. Percentage of public secondary mathematics and science students taught by teachers with a major or minor in the class subject, by percentage of students eligible for free or reduced-price lunch: School year 1993–94

Subject	Percentage of students eligible for free or reduced-price lunch			
	0–5	6–20	21–40	41 or more
Mathematics	83.3	79.7	76.1	74.1
Total science*	92.0	90.1	91.5	86.5
Biology	80.9	73.5	75.7	72.7
Chemistry	77.2	64.8	72.1	62.9
Physics	42.8	50.5	39.3	29.3

* It is easier to have majored, minored, or to have become certified in "science" than in a specific discipline, such as biology, because a teacher from any scientific field may qualify in "science," whereas qualifying in a specific discipline requires a match in class subject matter.

SOURCE: Indicator 57, *Condition 1997*.

- Public schools with high levels of students in poverty are less likely to be connected to the Internet than schools with lower levels of student poverty.

Access to the Internet is one indicator of a school's connection to the "Information Superhighway." In 1996, Internet access was available in about half (53 percent) of the schools in which 71 percent or more students were eligible for free or reduced-price lunch programs and in 58 percent of schools in which 31 to 70 percent of students were eligible. In comparison, 72 percent of schools with 11 to 30 percent of students who were eligible for the lunch program had Internet access, and 78 percent of those with less than 11 percent of students with free or reduced-price lunch eligibility were connected to the Internet.²⁶

- Teacher salaries are higher in low poverty public schools than they are in high poverty public schools.

Teacher salaries are an important way for schools to attract and retain high quality teachers. In the 1993–94 school year, public school teachers in low poverty schools earned 28 percent more in total school earnings than did public school teachers in high poverty schools (\$45,547 versus \$35,496, respectively) (table 56-2). Teachers in high poverty schools were also less likely to be satisfied with their salaries than teachers in low poverty schools (table 49-4).

- The average class size of public school teachers is similar across all levels of school poverty.

Class size is a measure of the average number of students a teacher sees during a class period or

school day. Smaller class sizes are valued because they may allow students to receive more individual attention from their teachers and may reduce the teacher's burden of managing large numbers of students and their work. In the 1993–94 school year, the average class size was similar in high and low poverty public schools (*Indicator 39*).

- Relatively low wealth public school districts spend less per pupil in general and more on capital investment than do school districts with more wealth.

Public elementary and secondary spending can be divided into three main functional areas: instruction, support services, and capital outlay. Many factors influence how school districts spend the funds that they receive, including the overall level of funding, the organizational structure of the district; district- and state-level goals; differences in student needs (e.g., demand for special education services and programs for limited-English-proficient students); and the relative cost of educational resources (e.g., teacher salaries, building maintenance, or construction cost for new schools). The distribution of expenditures across functional areas is an indication of how different public school systems allocate funds to meet their specific needs.

In the 1992–93 school year, relatively low wealth school districts (those with a median household income of less than \$20,000) spent less per student than districts with more wealth (those with a median household income of \$35,000 or more). Relatively low wealth districts also spent 31 percent less per student on capital investment (\$434 per student) than relatively high wealth districts (\$630 per student) (*Indicator 52*).

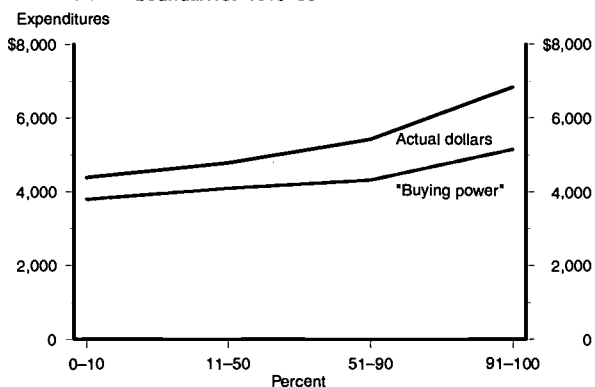

- Adjusting education expenditures to reflect differences in the relative cost of providing education services reduces the spending gap between districts with high and low income households.

"Buying power" is a concept used as an alternative measure of expenditures. Actual dollars spent per student can be adjusted to reflect differences in the cost of living and differences in the educational needs of students. The cost of living adjustment reflects the fact that a dollar spent in New York City buys substantially less in actual education resources than a dollar spent in Des Moines, Iowa. The needs adjustment takes into account expenditure differences that result from the additional resources required to provide an education to students who

need special education, bilingual, and compensatory education services.²⁷

Disparities in public education spending are most pronounced at the extremes of district wealth (measured by median household incomes). For example, in 1989–90, the Nation's richest school districts spent 56 percent more per student than the Nation's poorest districts. These differences in expenditures per student are reduced to 36 percent, however, when "buying power" is taken into account.²⁸

Figure 9. Public education expenditures per student, by percentage distribution of median household income of households located within district boundaries: 1989–90

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Do Rich and Poor Districts Spend Alike?*, 1996.

Summary

The social context of education has changed over the past few decades. The structure of families is shifting away from two biological parent families. The percentage of children from minority backgrounds is increasing, as is the percentage of children who have difficulty speaking English. Over the past 25 years, median family income has been relatively stagnant, and the poverty rate has changed very little. Black and Hispanic children remain much more likely than white children to be living in poverty, a factor associated with poor school outcomes. On the positive side, today children live in households with more educated parents than they did a few decades ago and parents' education level is a strong predictor of student achievement.

Minority students are more likely to attend schools with a high level of poverty. This is significant since in many ways the climate in high poverty schools appears to be less conducive to learning than that in low poverty schools. Similarly, high poverty schools are, on average, worse off than low pov-

erty schools with regard to human and financial resources.

The social context in which schools operate can influence their effectiveness. Changes in social context present challenges that schools must address to enhance their effectiveness and ensure that education progress can occur.

Women in Mathematics and Science

by Yupin Bae, Pinkerton Computer Consultants, Inc. and Thomas M. Smith, NCES

In the past two decades, women have made tremendous progress in education, putting them on par with men in many respects. The large gaps in the education levels between women and men that were evident in the early 1970s have essentially disappeared for the younger generation. For example, in 1995, women were as likely as men to attend college immediately following high school graduation (table 8-2) and in 1996, young women aged 25–29 were more likely to have completed at least some college than young men of the same age. Young women were also just as likely as young men to have completed at least a bachelor's degree.

Figure 1. Percentage of 25- to 29-year-olds who have completed selected levels of education, by sex: March 1971 and 1996

SOURCE: Indicator 22, *Condition 1997*.

These trends indicate that women have made important strides toward closing the educational gap between men and women. It is also important, however, to examine how women have progressed in specific areas that are important to domestic and international competitiveness. Goal Five of the National Education Goals states that "by the year 2000, U.S. students will be first in the world in mathematics and science achievement."¹ Specifically, the objectives of this goal emphasize that the number of women studying mathematics, science, and engineering should increase significantly. Including achievement in mathematics and science as one of the National Education Goals exemplifies how important these fields are to the United States and to our global competitiveness. Therefore, closing the gender gap in overall educational attainment is not considered enough; significant progress must also be made in the crucial fields of mathematics and science.

Research studies suggest that many factors contribute to the attitudes, access, and achievement of young women in mathematics and science: encouragement from parents, preparation of mathematics and science teachers, interactions between teachers and students, curriculum content, hands-on laboratory experiences, self-concept, attitudes toward mathematics, high school achievement in mathematics and science, availability of mentors, and resources available at home.² This essay reviews the most current data on women's progress in mathematics and science achievement, attitudes, course-taking patterns, and college majors. The final section summarizes earnings differences between women and men who majored in mathematics and science in college.

Mathematics and science achievement of male and female students

Proficiency in mathematics and science is an important outcome of education. In an increasingly technological society, the ability of workers to solve complex scientific problems and to use advanced mathematical skills are crucial components of the Nation's ability to compete in the global marketplace. Early success in mathematics and science is important, both because a firm foundation in basic principles is necessary before more complex material can be mastered and because early success can keep young people interested in these fields. The National Assessment of Educational Progress (NAEP) has assessed the knowledge of 9-, 13-, and 17-year-olds in reading, mathematics, science, and other fields for more than 20 years. Differences in the performance of both younger and older female and male students can be examined over time with these data.

- *Boys and girls have similar mathematics and science proficiency scores at age 9.*

As the mathematics proficiency of both female and male 9-year-olds has increased since the early 1970s, the gap in scores that previously favored girls has disappeared. Between 1973 and 1994, the average mathematics proficiency of both 9-year-old girls and boys increased (10 and 14 points, respectively). In 1994, there was no measurable difference in the mathematics proficiency of female and male 9-year-olds (*Indicator 18*).

Science scores of 9-year-olds declined in the 1970s, but have since improved. In 1994, 9-year-old girls scored 7 points higher on the NAEP science assessment than did their counterparts in 1970. Science proficiency was similar for 9-year-old boys and girls in 1994 (*Indicator 19*).

- *A gender gap in science proficiency scores begins to appear at age 13.*

Average scale scores on the NAEP mathematics assessment increased between 1973 and 1994 for both girls and boys at age 13 (6 and 11 points, respectively). In 1994, there was no measurable difference in the mathematics proficiency of male and female 13-year-olds.

Since 1970, 13-year-old boys have outperformed girls in science. In 1994, 13-year-old boys scored 5 scale points higher than girls of the same age. For both male and female 13-year-olds, science scores in 1994 were not different from scores in 1970 within each gender group (*Indicator 19*).

- *In general, the international pattern of gender differences in mathematics scores is less pronounced than that in science for many countries. Eighth-grade boys in most countries have higher average science scores than girls.*

The Third International Mathematics and Science Study (TIMSS) is one of the largest international comparative studies conducted by the International Association for the Evaluation of Educational Achievement (IEA). More than half a million students at five grade levels in 15,000 schools and from more than 40 countries around the world participated in this study. International comparisons from this study allow us to see whether or not differences observed across groups in the United States are unique or if they mirror differences observed in other countries. According to TIMSS, among most participating countries, the pattern of differences indicates that girls and boys either had similar average mathematics achievement scores, as was the case for the United States (*Indicator 20*). In science, for many countries, eighth-grade boys had higher average science achievement scores than did girls.

In both mathematics and science, 17-year-old females have consistently scored lower, on average, than 17-year-old males. In 1994, females scored 5 scale points lower than males on the NAEP mathematics assessment (roughly equivalent to almost

one-half year of schooling), and 11 scale points lower on the science assessment (about 1 year's worth of science).

Figure 2. Trends in differences in average scales scores (scores of male minus female), by age: Selected years 1970–94

SOURCE: U.S. Department of Education, National Center for Education Statistics, *NAEP 1994 Trends in Academic Progress*, 1996.

Average mathematics proficiency scores among 17-year-old female students declined between 1973 and 1982, increased since 1982, and in 1994, the average mathematics proficiency scores of 17-year-old females were similar to their female counterparts in 1973. In 1994, the gap was not statistically different from that in 1973.

- *The gender gap in the science proficiencies of male and female 17-year-olds has narrowed over time.*

Among 17-year-old females, the 1994 average science proficiency score was lower than the 1969 score, despite improvement in average proficiency scores between 1986 and 1994. At age 17, the gap between the average science proficiency scores of males and females was generally smaller between 1986 and 1994 when compared to the gap observed before 1986. The reduction in the gap resulted from

gains for female students in 1986 (7 points) and in 1990 (3 points) compared to male students (3 points in 1986 and 1 point in 1990).³

Recent research analyzing patterns across three nationally representative longitudinal data sets finds that young women fall behind in science before they fall behind in mathematics: Women score lower on standardized science exams by 7th grade and on mathematics exams by 10th grade.⁴

- *Men score higher than women on the SAT mathematics and science Achievement Tests, as well as on the mathematics and science Advanced Placement (AP) examinations.*

The Achievement Tests, which students can elect to take when they register for the Scholastic Assessment Test (SAT), measure knowledge in specific subject areas. The tests are designed to be independent of particular textbooks or instructional methods. Among students taking the 1991 Achievement Tests in mathematics and science, scores varied substantially by gender. On a scale of 200–800, males consistently scored higher than females in the subject areas, with differences ranging from 33 points on the biology test to 59 points on the physics test.⁵

AP examinations are administered by the College Board for high school students who are enrolled in AP courses. Approximately 15 percent of college-bound seniors elect to take at least one AP examination.⁶ These examinations are graded on a scale from 1 (no recommendation for college credit) to 5 (extremely well qualified in the subject area). Test-takers scoring 3 or above on an AP examination may receive college credit or appropriate placement in that subject area. Males were more likely than females to take AP examinations in calculus, computer science, and specific science subjects, and were also more likely to score 3 or higher in these areas (*Indicator 25*).

Table 1. Number of AP examinations taken and the number of examinations with scores of 3 or higher (per 1,000 11th- and 12th-grade students), by sex: 1995

	Male	Female
Examinations taken		
Calculus	18	16
Science	19	17
Scored 3 or higher		
Calculus	12	9
Science	13	9

Attitudes toward mathematics and science

Students' perceptions about the value of learning mathematics and science may be considered as both inputs to and outcomes of the educational process, since their attitudes toward these subjects can be related to educational achievement in ways that reinforce higher or lower performance.⁷ In other words, students who do well in mathematics and science generally have more positive attitudes toward those subjects, and those who have more positive attitudes tend to be more likely to take courses in those subjects and to perform better.

In the United States, research findings are mixed concerning the grade in which boys' and girls' attitudes about mathematics and science diverge. Analyzing several nationally representative longitudinal studies, one researcher found few differences between girls and boys in their attitudes about science in the early secondary school years.⁸ For example, in seventh and eighth grades, girls were no more anxious than boys about mathematics or science and were just as likely to believe that mathematics knowledge is necessary for obtaining a good job. These findings contrast with those who have found that girls' attitudes are more negative even in the early years.⁹

- *Data from the late 1980s and early 1990s indicate that 7th- and 10th-grade boys and girls are equally likely to say that they enjoy mathematics and science. Among 12th-graders, however, a gender gap emerges in science.*

Data from the Longitudinal Study of American Youth indicate that 7th- and 10th-grade boys and girls have a similar liking for mathematics and science. Among both 7th-graders in 1987–88 and 10th-graders in 1990–91, boys and girls had similar responses to questions regarding how much they liked mathematics and science in general and how much they liked the subject matter of their mathematics and science classes in particular. Among 12th-grade students in 1989–90, males were about as likely as females to agree or strongly agree that they enjoyed mathematics (57 and 52 percent, respectively), while males were more likely to agree or strongly agree that they enjoyed science (60 and 48 percent, respectively).¹⁰

- *While attitudes toward mathematics and science were similar between boys and girls in the United States in eighth grade, boys typically had more positive attitudes about mathematics than did girls in France, Germany, and Japan.*

Gender differences in eighth-grade students' perceptions toward mathematics and science mirrored achievement differences in TIMSS.¹¹ In general, eighth-grade students had positive attitudes toward mathematics, and those with more positive attitudes had higher average mathematics achievement. In many countries, including the United States, girls and boys reported similar overall attitudes about mathematics. A gender gap in attitudes about mathematics appeared in several large industrialized countries, however. For example, boys' attitudes were more positive than those of girls in France, Germany, and Japan.

Data from TIMSS also indicate that across countries, eighth-grade girls generally had lower perceptions than boys about how well they usually did in mathematics. Boys were more likely than girls to report that they usually did well in mathematics in England, France, Germany, and Japan. Self-perceptions about mathematics performance were similar between eighth-grade boys and girls in the United States, however.¹²

In TIMSS, eighth-grade students were also asked how much they liked or disliked science. In England and Japan, boys reported liking science more than girls did. The percentages of female and male eighth-graders who reported that they liked science were similar in the United States and Canada.¹³

While positive attitudes toward mathematics and science can be related to better performance and higher educational achievement, participation in activities related to these fields may also help to keep students interested in the fields of mathematics and science. There is some evidence that boys are more likely than girls to participate in mathematics- and science-related activities. For example, one researcher who used longitudinal data sets to follow students over time found that in the middle school years boys were more likely than girls to have talked to a scientist or attended a computer club, or to have used a computer for a significant amount of time during the week, or to have a computer or microscope at home. By 10th grade, boys were more likely than girls to have conducted their own science experiments, to have a computer or calculator at home, or to have used a computer more often during the week. In contrast, girls were spending more time on mathematics or science homework. Nonetheless, in the years after high school, girls were more likely than boys to have used a pocket calculator and to have used a computer terminal. This research shows that girls start out with a deficit in activities related to mathematics and science and gain some ground over time.¹⁴

Career expectations in science, mathematics, and engineering

Students' aspirations toward careers in mathematics and science are likely to influence both their course taking in those areas and the level of effort put forth in their coursework.

- *A gap in the career aspirations of boys and girls in science or engineering exists as early as eighth grade.*

As early as eighth grade, students have some idea about the type of work that they would like to do as adults. Among the eighth-grade class of 1988, boys were more than twice as likely as girls to aspire to be scientists or engineers (9 and 3 percent, respectively), although girls were more likely than boys to aspire to professional, business, or managerial occupations (38 and 20 percent, respectively).¹⁵

- *While male and female high school seniors are equally likely to expect a career in science or mathematics, male seniors are much more likely than their female counterparts to expect a career in engineering.*

Overall, few high school seniors expect to have a career in science/mathematics or engineering: About 5 percent plan to have a career in engineering, while about 1 percent plan a career in science or mathematics. Males and females are about equally likely to expect to pursue a career in science or mathematics; however, males are considerably more likely (9 percent) than their female classmates (2 percent) to anticipate a career in engineering.¹⁶

Mathematics and science course-taking patterns in high school

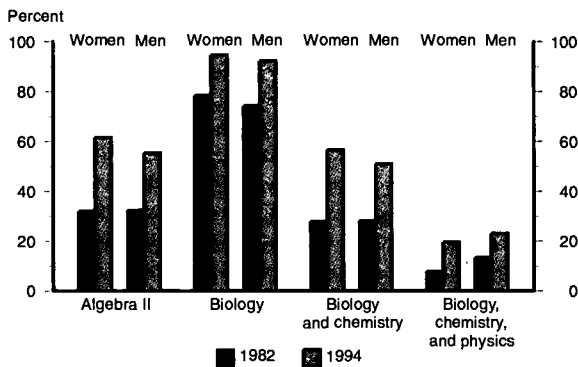

According to many researchers, the pool of talent from which the Nation's future scientists and engineers come is largely formed in high school. In order to adequately prepare themselves for careers in mathematics and science, students must take and excel in advanced mathematics and science courses in high school.

- *In general, female students are just as likely as male students to take advanced mathematics and science courses in high school; physics is the exception.*

For many mathematics and science subjects, gender parity had been attained by 1982, between 1982

and 1994, the percentage of both female and male graduates who took advanced mathematics and science courses in high school increased. In the class of 1994, females were more likely than males to take algebra II in high school, and were just as likely to take calculus. With respect to science, females were just as likely as males to take biology, and were more likely to take chemistry. Females have continued, however, to be less likely than males to take physics (*Indicator 24*).

Figure 3. Percentage of high school graduates who took selected mathematics and science courses, by sex: 1982 and 1994

SOURCE: Indicator 24, *Condition 1997*.

Other research has shown that women taking mathematics courses are taught similar amounts of mathematics and receive grades that are similar to (or better than) those of their male counterparts.¹⁷

■ *Female seniors were more likely than male seniors to say that they did not take additional mathematics because of poor performance in the subject matter.*

Almost one-third of the 1989–90 seniors who did not take mathematics or science in their last year of high school reported being advised by others that they did not need additional coursework in these subjects. Females were more likely than males to say that they had been advised against taking these courses (32 and 26 percent, respectively). Dislike of the subject matter was given as the reason for not enrolling by about 35 percent of the seniors who were not taking mathematics, while about 30 percent cited this reason for not enrolling in science. Female seniors were more likely than their male peers to say they did not take mathematics and science courses because they disliked the subject matter (35 and 22 percent, respectively). Males were slightly more likely than females to report that they did not need advanced science or mathematics courses for what they planned to do in the future.

While similar proportions of males and females said they did not enroll in science because they did not do well in these courses, females were more likely than their male peers to say poor performance in the subject kept them from taking additional mathematics classes.¹⁸

Women in mathematics and science at the postsecondary level

Although male students' achievement in mathematics and science is higher than that of female students at the end of high school, similar high school course-taking patterns in these fields may indicate similar preparation for study in mathematics and science in college. The intended majors of first-time college freshmen provide an indication of the relative interest men and women have in mathematics and science at the postsecondary level.

■ *Male first-time college freshmen were more likely to choose engineering as an intended field of study, while female first-time freshmen were more likely to choose professional fields, education, and social sciences.*

Table 2. Percentage distribution of probable fields of study among first-time college freshmen, by sex: Fall 1996

Probable major field of study	Men	Women
Arts and humanities	9.4	10.5
Biology	6.5	7.4
Business	18.1	13.8
Education	6.3	14.2
Engineering	15.2	2.6
Physical sciences ¹	2.7	2.0
Professional ²	9.8	20.2
Social sciences	6.1	11.7
Technical	3.7	1.4
Computer sciences	4.3	1.2
Other	10.5	6.5
Undecided	7.4	8.8

¹ Includes fields such as astronomy, chemistry, earth science, mathematics, and physics.

² Includes fields such as architecture and health technologies.

SOURCE: Higher Education Research Institute, Graduate School of Education and Information Studies, *The American Freshman: National Norms for Fall 1996*. University of California, Los Angeles, 1996.

A 1996 study of college freshmen by the Higher Education Research Institute shows that men and women differ greatly in their intended fields of study. Of first-time freshmen in 1996, 20 percent of men and 4 percent of women planned to major in computer sciences or engineering, while similar percentages of male and female freshmen planned to major in biology or physical sciences. Female freshmen were more likely to plan to major in pro-

professional fields, education, social sciences, or humanities than their male counterparts.

The differences in the intended majors of male and female first-time freshmen directly relate to the differences in the fields in which men and women earn their degrees. The differences in degrees conferred to women and men are best illustrated by a female field concentration ratio. This ratio is calculated as the percentage of females earning degrees who majored in a specific field divided by the percentage of males earning degrees who majored in the same field. A ratio above 1.0 indicates that females are more likely than males to major in a field, and a ratio below 1.0 indicates the opposite is true.

- *At the postsecondary level, women are less likely than men to earn a degree in mathematics, physical sciences, and computer sciences and engineering. The exception is in life sciences degrees.*

Table 3. Female field concentration ratio of bachelor's degrees conferred: Academic years ending 1971, 1982 and 1994

Field of study	1971	1982	1994
Humanities	1.84	1.41	1.32
Social sciences and history	0.76	0.80	0.72
Psychology	1.04	1.99	2.27

Education	3.82	3.10	2.84
Business management	0.13	0.64	0.76
Health professions	4.39	5.23	3.93

*Includes fields such as physics, chemistry, astronomy, and geology.

SOURCE: U.S. Department of Education, National Center for Education Statistics, IPEDS/HEGIS surveys of degrees conferred, various years.

While earning a bachelor's degree is associated with long-term economic advantages (*Indicator 33*), the fields in which college students choose to earn a degree also affect the career potential after graduation. More than 20 years ago, women were less likely to earn a bachelor's degree in life sciences, mathematics, physical sciences, computer sciences and engineering fields than their male counterparts. Instead, women were about four times as likely as men to earn a degree in education and the health professions. This tendency of women and men to choose different fields of study has shifted somewhat over the past 20 years. For example, differences in the proportion of women and men earning a degree in life sciences and mathematics have narrowed substantially over time. While the gap between women and men who earned a de-

gree in computer sciences and engineering narrowed, the gap between women and men who earned a degree in physical sciences, such as physics and chemistry, increased. In 1994, women were more likely to earn a bachelor's degree in psychology, education, health sciences, and the humanities.

- *Even though men were more likely than women to earn master's degrees in science, gaps in the proportion of life sciences, physical sciences, and computer sciences and engineering degrees earned by women and men decreased somewhat in the past 20 years.*

At the master's degree level, in the past 20 years, the differences between the proportions of women and men who earned master's degrees in life sciences, physical sciences, and computer sciences and engineering have narrowed. Between 1971 and 1986, the difference in the proportions of men and women who earned master's degrees in computer sciences and engineering narrowed each year; since 1986, this difference has remained stable with men being five times more likely than women to earn a master's degree in computer sciences and engineering (*Indicator 28*). However, the gap in the proportion of mathematics graduate degrees conferred to women and men has increased somewhat in the past 20 years. In 1994, men were twice as likely to earn a master's degree in mathematics than women.

At the doctor's degree level, women were more likely than men to earn a degree in life sciences; however, they were less likely than men to earn a degree in physical sciences, mathematics, and computer sciences and engineering, although the differences in the proportions of women and men who earned degrees in most of these fields have narrowed over time.

Table 4. Female field concentration ratio of graduate degrees conferred: Academic years ending 1971, 1982 and 1994

Field of study	1971	1982	1994
Master's degrees			
Life sciences	0.76	0.69	0.92
Physical sciences*	0.23	0.27	0.35
Mathematics	0.56	0.43	0.51
Computer sciences and engineering	0.03	0.14	0.19

Computer sciences and engineering	0.04	0.13	0.21
Computer sciences	0.14	0.19	0.29
Engineering	0.04	0.12	0.20

*Includes fields such as physics, chemistry, astronomy, and geology.

SOURCE: Tables 28-1 and 28-4, *Condition 1997*.

Gender differences in employment and earnings in mathematics and sciences

Although female college graduates shared in the earnings growth of all college graduates in the 1980s, they earned less on average than male college graduates. Some of the differences in salary may be related to the occupations women and men entered. Among employed recent science and engineering bachelor's degree recipients, women were less likely than men to be employed in science and engineering occupations.¹⁹ For example, 18 percent of employed recent female science and engineering graduates were employed in science and engineering occupations in 1993, compared to 35 percent of their male counterparts.

- *The salary differential between women and men in comparable scientific jobs is still evident.*

There remains an earnings gap between men and women in comparable scientific positions. Among more experienced bachelor's and master's scientists and engineers, the gap between men's and women's salaries is larger than for recent graduates.²⁰ Some of the difference in salary is due to differences in the field in which they are employed. Salaries are highest in mathematics/computer science and engineering, fields in which women are not highly represented. Such factors as the number of years in the labor force, primary work activity, supervisory status, and number of people supervised also influence salaries and may account for some of the gap.

- *Among recent college graduates who majored in the natural sciences, women earned less than men did. There was no measurable difference between the starting salaries of men and women who majored in computer sciences and engineering, however.*

College graduates who majored in computer sciences and engineering had much higher starting salaries than did all college graduates. On the other hand, graduates who majored in the natural sciences or mathematics earned less than the typical graduate did. Although median starting salaries for 1993 female recent graduates were substantially lower than those of male graduates, there was no measurable difference between the starting salaries of men and women who majored in computer science and engineering. Women who majored in the natural sciences earned 15 percent less than men who majored in the same field, however (*Indicator 34*).

Table 5. Annual median starting salaries (in 1996 constant dollars) of 1993 college graduates, by major field of study

Major field of study	All graduates	Men	Women	Women's salary as a percentage of men's
Total	\$23,600	\$26,122	\$21,990	*84.2
Natural sciences/ mathematics	21,833	24,226	20,508	*84.7
Computer sciences and engineering	32,046	32,385	30,155	93.1

*Male salaries significantly greater than female salaries ($p < 0.05$).

SOURCE: Indicator 34, *Condition 1997*.

Summary

Women have made important advances in education over the last few decades, closing the gender gap in the level of educational attainment among younger women that existed 20 years ago. In fact, for several years, women have been awarded the majority of associate's, bachelor's, and master's degrees. However, a gender gap still exists with respect to mathematics and science, and it widens as students climb the education ladder. Although boys and girls have similar mathematics and science proficiencies at age 9, a gap begins to appear at age 13. At age 17, there is some evidence that the gender gap in mathematics and science has narrowed over time, although a substantial gap remains. Internationally, a gender gap in science is common across countries at grade 8, while it is less evident in mathematics.

Even though girls are less likely than boys to aspire to careers in science or engineering as early as grade eight, boys' and girls' attitudes toward mathematics and science appear to be similar up to grade 10 (a time when the attitudes of boys and girls have already diverged in other large industrialized countries). Among U.S. 12th-graders, however, a gender gap in attitudes is apparent in science.

The mathematics and science courses that women and men take in high school are similar, with the exception that women remain less likely than men to study physics but are more likely to take chemistry. Among students who do not take mathematics or science in their senior year, women are more likely than men to say that they did so either because others advised them that they did not need those courses or because they disliked the subject matter.

While women are just as likely as men to go to college immediately after high school, from the start they are less interested in majoring in mathematics and science. Although women tend to major in different subjects than men in college, some of these

differences have narrowed over time. The mathematics and science fields continue to be areas where the gender gap remains large. Women are far less likely than men to earn bachelor's degrees in computer science, engineering, physical sciences, or mathematics.

Even though women make up about half of the labor market, they are both underrepresented in jobs in scientific fields and are paid less than men. Some of these differences can be explained by differences in the field chosen, level of experience, and level of education. Overall, there are still substantial differences between women and men in mathematics and science fields, and these differences appear as early as middle school.

¹¹ In TIMSS, students were asked to state their level of agreement with the following four statements: 1) I would like a job that involved using mathematics; 2) Mathematics is important to everyone's life; 3) Mathematics is boring; and 4) I enjoy learning mathematics. TIMSS researchers averaged the results across these questions with students' responses to questions about liking mathematics in general in order to form an index of their overall attitudes toward mathematics.

Public and Private Schools: How Do They Differ?

by Susan P. Choy, MPR Associates, Inc.

About 46 million students are currently enrolled in the Nation's public schools in kindergarten through grade 12, and another 6 million are enrolled in private schools (*Indicator 44*). Because private schools are often perceived to be more successful in teaching students, with at least some empirical basis,¹ many reform proposals for public schools have looked to the private sector for models to emulate. School choice, small schools, and decentralized decision making, for example, are among the features commonly associated with private education that many have suggested might benefit public schools.

Exactly how do public and private schools differ? To address this question, at least in the aggregate, national data are assembled here to compare public and private schools along a number of important dimensions. The discussion begins with an examination of two fundamental differences between public and private schools: their sources of support and the role of choice in determining where students go to school. Next is a description of the characteristics of the key participants in the education process—students and teachers—and how they differ in the public and private sectors. Following that is a comparison of selected aspects of the organization and management of public and private schools, including school and class size and who makes policy decisions for the school and classroom. Next, the varying circumstances under which teaching and learning take place in public and private schools (the school climate) are examined. The final sections describe differences in academic programs and support services.

The data show many systematic differences between public and private schools, and provide a context in which to consider the debates about the relative merits of various aspects of public and private schooling. However, as public and private schools are compared, it is important to keep in mind the enormous variation that exists within each sector and the overlap between the two. As Baker, Han, and Keil point out in their examination of organizational differences between public and private secondary schools, "School sector is not a *simple organizational fault line* running through the Nation's schools."² More detail on the nature of the diversity that exists within each sector can be found in other NCES publications.³

Sources of support

The defining distinction between public and pri-

vate schools is their different sources of support. Public schools depend primarily on local, state, and federal government funds, while private schools are usually supported by tuition payments and sometimes by funds from other nonpublic sources such as religious organizations, endowments, grants, and charitable donations. In some states, private schools receive public funds for certain services (e.g., transportation).

Tuition at private schools varies considerably by grade level and whether or not the school has a religious affiliation. In 1993–94, the average tuition paid by private school students was about \$3,100, but ranged from a low of about \$1,600 in Catholic elementary schools to a high of about \$9,500 in nonsectarian secondary schools. Total public school expenditures were about \$6,500 per pupil (computed using average daily attendance) in 1993–94,⁴ but it is impossible to compare public and private school expenditures because tuition often covers only part of the total spent.

Table 1. Average private school tuition:* 1993–94

School level	Total	Catholic	Other religious	Nonsectarian
Total	\$3,116	\$2,178	\$2,915	\$6,631
Elementary	2,138	1,628	2,606	4,693
Secondary	4,578	3,643	5,261	9,525
Combined	4,266	4,153	2,831	7,056

* Tuition weighted by the number of students enrolled in schools.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Education Statistics 1996*, table 60.

School choice

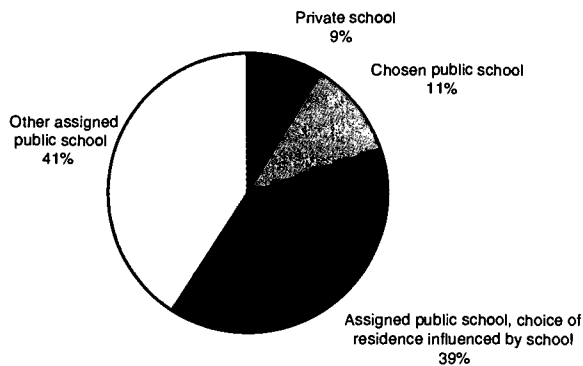

The idea of school choice has traditionally been associated with private schools, but many advocate offering at least some choice within the public sector. Having public schools compete for students, the thinking goes, will provide them with a strong incentive to improve and be more responsive to the needs and concerns of students and their parents.

- *Private schools are attended by choice, but choice is not limited to the private sector.*

Private schools provide an alternative for parents who are dissatisfied with public schools or have other reasons for wanting their children to attend a private school. Within the private sector, parents can choose among a range of religiously affiliated and nonsectarian schools (as long as they can af-

ford the tuition charged or receive financial aid). Some private schools are very selective in their admissions, while others are not. In 1993, 9 percent of all students in grades 3–12 attended a private school.

Figure 1. Percentage distribution of students in grades 3–12, by parental choice of school attended: 1993

SOURCE: Indicator 4, *Condition 1996*.

Parents of students in public schools can sometimes choose or exert influence over which schools their children attend. In 1993, 11 percent of students in grades 3–12 attended a public school chosen by their parents. In addition, parents can indirectly choose among public schools for their children to the extent that they can choose where to live. While 80 percent of public school students in grades 3–12 attended an assigned public school in 1993, the parents of 39 percent of the students in these grades indicated that their child attended an assigned school but that their choice of residence was influenced by where their children would go to school. Thus, less than half (41 percent) of the students in grades 3–12 attended assigned public schools over which their parents had exercised no direct or indirect choice.

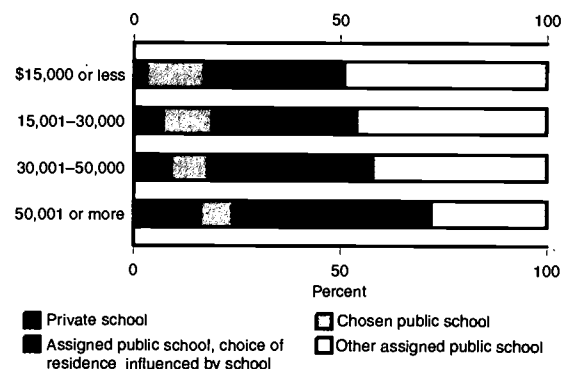

- Families with annual incomes over \$50,000 have the most choice.

Higher family income facilitates both public and private school choice. Because most private schools charge tuition, only parents with the personal financial resources or financial aid to afford the tuition truly have the option of selecting a private school. Thus, the rate of private school attendance in 1993 increased with family income. Similarly, because the housing options that realistically can be considered are related to a family's income, the

percentage of parents who reported that their choice of residence was influenced by where their children would go to school also generally increased with family income.

Children from the lowest income families (less than \$15,000) were more likely than those from families with incomes over \$30,000 to attend a chosen public school. However, the net result of the various types of choice was that children from families with incomes over \$50,000 were much less likely than children from families in lower income categories to attend an assigned public school over which they had not exercised any choice.

Figure 2. Percentage distribution of students in grades 3–12, by parental choice of school attended and income: 1993

SOURCE: Indicator 4, *Condition 1996*.

- Parents who exercise some choice over where their children go to school tend to be more satisfied than those who have not.

Parents of students in grades 3–12 who attended private schools were more likely than their public school counterparts to be very satisfied with their children's school overall and with its specific aspects, such as the teachers, academic standards, and discipline. Within the public sector, parents whose children attended a chosen public school were generally more satisfied than those whose children were in an assigned school. Furthermore, among those whose children attended assigned public schools, parents whose choice of residence was school related were more satisfied than those who did not choose their residence for this reason. Parents whose children attended chosen public schools and those whose choice of residence was school related were about equally likely to be very satisfied with their children's schools.

Table 2. Percentage of parents of students in grades 3–12 who were very satisfied with aspects of their child’s school: 1993

School attended	School	Teachers	Academic	Discipline
			standards	policy
Chosen school	70.7	67.6	72.1	72.6
Public	61.2	61.5	63.0	63.0
Private	82.5	75.2	83.4	84.4
Assigned public school	52.3	56.0	55.0	55.1
Influenced choice of residence	56.0	58.9	59.3	58.2
Other	48.7	53.1	51.0	52.2

SOURCE: Table 4-4, *Condition 1996*.

Students

Many of the ways in which public and private schools differ reflect differences in their student populations. Students bring with them to school certain background characteristics such as their racial/ethnic and linguistic backgrounds and sometimes, personal or family problems that affect their ability to learn. Teachers and administrators take these characteristics into account as they organize and manage their schools and plan and implement curriculum and support services. Thus, to the extent that public and private school students differ, one can expect public and private schools to differ as well. Other student characteristics, such as attitudes toward learning and behavior toward teachers, are also taken into account; however, because these are determined by the school environment as well as students’ backgrounds, they are discussed below in the section on school climate.

- *Public schools tend to have more racially and ethnically diverse student populations.*

Table 3. Percentage of students in grades 1–12 who were black or Hispanic: 1985, 1990, and 1993

Year	Total	Public			Private
		Central	Other		
		cities	metropolitan	Nonmetropolitan	
1985	26.8	56.7	18.1	16.8	11.5
1990	27.8	52.1	19.5	16.4	14.3
1993	28.4	53.8	20.2	16.0	16.7

SOURCE: Table 40-1, *Condition 1995*.

Racial and ethnic diversity can enrich the school experiences of students and teachers in many ways. However, a heterogeneous school population creates additional challenges for school teachers and administrators, who must be sensitive to different cultural backgrounds and the interactions among individuals (students and teachers) from different backgrounds. In 1993, 28 percent of public school students in grades 1–12 were black or Hispanic, compared to 17 percent of those in private schools.

Private schools are changing, however, as evidenced by the increase in the percentage of black and Hispanic students between 1985 and 1993.

- *Public schools have more students with limited English proficiency.*

Students with limited English proficiency create demands on school resources and needs for teacher training that are absent in schools without such students. In 1993–94, 5 percent of all public school students (and 9 percent in central cities) had limited English proficiency, compared to 1 percent of private school students.⁵

- *Personal problems that interfere with learning are more of a problem in public schools.*

When students bring to school personal problems such as those associated with alcohol use, drug abuse, and poverty, both teaching and learning can be seriously compromised. In all types of communities, public school teachers were much more likely than private school teachers to believe that each of these problems was serious in their schools.

Table 4. Percentage of secondary school teachers who reported that various problems were serious in their schools: 1993–94

Student problems	Public			Private		
	Central city	Urban fringe	Rural	Central city	Urban fringe	Rural
Use of alcohol	19.6	21.7	26.3	12.4	9.4	10.5
Drug abuse	17.1	14.8	12.1	5.1	2.8	3.7
Poverty	24.8	9.6	15.3	3.6	2.5	3.7

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, pp. 112–113.

Teachers

Because of the central role teachers play in the educational process, differences between public and private school teachers are an important dimension in which to compare public and private schools. In the aggregate, public and private school teachers come from different racial/ethnic backgrounds, have different qualifications to teach, and are compensated differently.

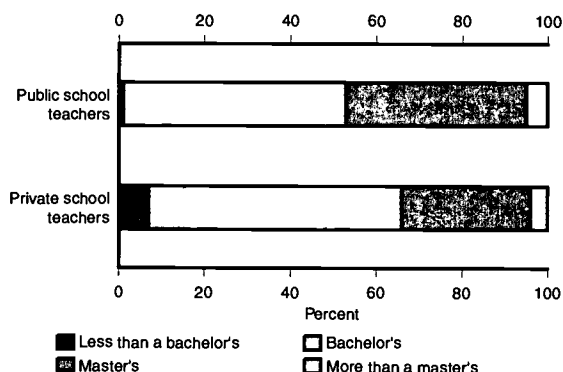

- *Private schools have fewer minority teachers and principals.*

In public schools, an average of 12 percent of the teachers and 16 percent of the principals were mi-

norities. The percentages were lower in private schools (9 percent minority teachers and 8 percent minority principals). The benefits of having minority teachers as role models have been widely discussed.⁶ Nevertheless, 42 percent of public schools and 66 percent of private schools had no minority teachers in 1993–94.⁷

- *On certain measures, public school teachers appear to be more qualified than their private school counterparts.*

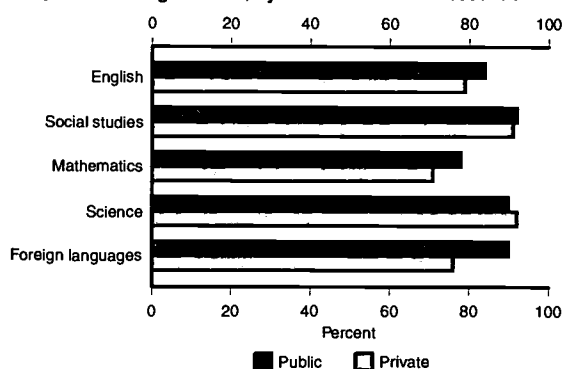

Figure 3. Percentage distribution of public and private school teachers according to highest degree earned: 1993–94

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, p.40.

Although many aspects of teacher qualifications are difficult to measure, public school teachers appear to be more qualified than private school teachers in terms of their education and years of teaching experience. In the 1993–94 school year, public school teachers were more likely than private school teachers to have earned a master's degree (42 versus 30 percent).

Figure 4. Percentage of secondary students in selected subjects taught by teachers who majored or minored in the subject as undergraduates, by control of school: 1993–94

SOURCE: Indicator 57, *Condition 1996*.

In addition, at the secondary level, students in public schools were more likely than those in private schools to be taught English, mathematics, or a foreign language by teachers who majored or minored in the subject as undergraduates. Public school teachers in 1993–94 had more teaching experience, on average, than private school teachers (15 versus 12 years).⁸

Public school teachers were also more likely to participate in professional development activities, which many believe teachers should do throughout their careers to update and improve their teaching skills. Beginning teachers in public schools (those in their first 3 years of teaching) were much more likely than their private school counterparts to participate in a formal teacher induction program (56 versus 29 percent).⁹ However, induction may be done informally in some schools. Full-time public school teachers were more likely than their private school counterparts to participate in in-service education or professional development on the uses of educational technology for instruction, methods of teaching in a specific subject field, in-depth study in a specific field, student assessment, and cooperative learning in the classroom.

Table 5. Percentage of full-time public and private school teachers who participated in certain professional development activities during the 1993–94 school year

Professional development topic	Public	Private
Uses of educational technology for instruction	50.1	34.3
Methods of teaching in specific subject field	64.4	59.8
In-depth study in specific field	30.1	25.9
Student assessment	52.0	40.4
Cooperative learning in the classroom	51.5	43.6

SOURCE: Indicator 40, *Condition 1997*.

- *On average, public school teachers receive higher salaries and more benefits.*

In 1993–94, the average base salary was \$34,200 for public school teachers, and \$22,000 for private school teachers. Among public districts and private schools with salary schedules, the averages for the highest steps on the schedules were \$40,500 and \$27,300, respectively.¹⁰ The difference between principals' salaries was also large, with public school principals earning an average of \$54,900 compared to an average of \$32,000 for private school principals. Public school teachers were more likely than private school teachers to be provided with medical insurance (87 versus 60 percent), dental insurance (66 versus 36 percent), group life insurance (61 versus 36 percent), and pension contributions (63 versus 47 percent). One substan-

tial benefit that private school teachers sometimes received (15 percent) was tuition for their children.¹¹

- *Teacher attrition is higher in private schools, but private school teachers are more satisfied with their working conditions.*

Teacher attrition tends to be higher in private than public schools: Between the 1993–94 and 1994–95 school years, 10 percent of full-time private school teachers left teaching, compared to 6 percent of their public school counterparts (*Indicator 58*). Nevertheless, private school teachers were more likely than public school teachers to be highly satisfied with their working conditions (36 versus 11 percent).¹²

School organization and management

Many school reform efforts have focused on the organization and management of schools in the search for ways to increase school effectiveness. Public and private schools, in the aggregate, are organized differently in terms of school and class size and the locus of responsibility for decision making in a number of important policy areas.

School size

The relative merits of various school sizes have been studied extensively as researchers have searched for the ideal school size.¹³ Smaller schools are generally thought to be easier to manage and to promote a greater sense of community among both students and teachers; however, larger schools (within limits) are often more equipped to offer a wider range of academic programs and support services. The advantages of larger schools are more relevant to secondary than elementary schools.

- *Public schools tend to have larger enrollments.*

Table 6. Average school size: 1993–94

Level and urbanicity	Public	Private
Total	516	191
Elementary		
Central city	547	210
Urban fringe/large town	524	201
Rural/small town	378	112
Secondary		
Central city	1,083	398
Urban fringe/large town	973	308
Rural/small town	468	183

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, p. 23.

In the 1993–94 school year, public schools were at least twice the size of private schools, on average. This relationship held across schools in different types of communities at both the elementary and secondary levels.

Class size

Small classes allow teachers to give students more individual attention and lighten the teacher’s workload and therefore are generally considered desirable,¹⁴ although research on the relationship between outcomes and class size has not been conclusive. Despite the advantages they may have, small class sizes are also expensive, and invoke trade-offs between small class size and other uses of school resources.

- *Average class size is larger in public schools.*

At both the elementary and secondary levels, private schools, on average, have smaller classes. In the 1993–94 school year, the average class size was 24 in both elementary and secondary public schools, compared to 22 in private elementary schools and 19 in private secondary schools (*Indicator 39*).

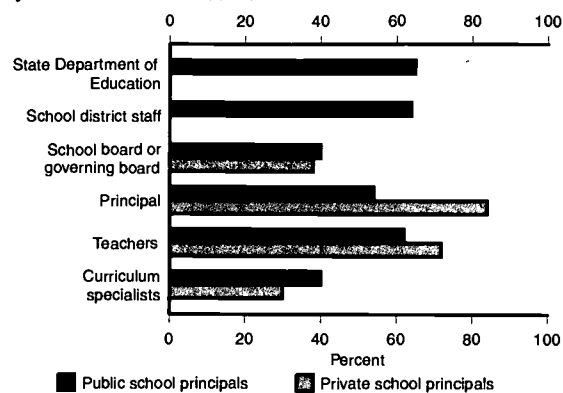

Decision making for the school and classroom

A key aspect of school management is where important decisions are made concerning curriculum, school policies, and classroom practices. While public schools necessarily must take some direction from State Departments of Education, local school boards, and district staff, more site-based management and local decision making are frequently advocated as a means of improving school effectiveness.¹⁵

- *Private school principals (or heads) report having more influence over curriculum than their public school counterparts.*

When principals were asked to rate the influence of various groups on establishing curriculum in 1993–94, private school principals were more likely to report that they, rather than any other group, had a great deal of influence. Public school principals, on the other hand, attributed more influence to the State Department of Education, school district staff (which private schools do not have), and even to teachers than to themselves.

Figure 5. Percentage of principals who thought that various groups had a great deal of influence over curriculum decisions, by control of school: 1993–94

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, pp. 116–117.

■ *In a number of school policy areas, private school teachers and principals are more likely than their public school counterparts to believe that they have a great deal of influence.*

In the areas of setting discipline policy and establishing curriculum, in particular, private school teachers in the 1993–94 school year were considerably more likely than public school teachers to think that they had a great deal of influence. Only a relatively small percentage of teachers in either sector were likely to think that they had a great deal of influence over certain other important policy areas, such as making budget decisions, hiring, and evaluating teachers.

Table 7. Percentage of teachers and principals who thought that they had a great deal of influence* over certain school policies: 1993–94

Policy area	Teachers		Principals	
	Public	Private	Public	Private
Setting discipline policy	34.9	59.2	86.9	95.0
Establishing curriculum	34.3	55.7	53.9	84.1
In-service training content	30.6	35.3	72.4	88.4
School budget decisions	10.1	6.2	63.5	84.3
Hiring full-time teachers	8.1	8.4	84.6	90.9
Teacher evaluation	2.7	8.5	94.5	94.6

* Responded 4 or 5 on a scale of 0–5.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, pp. 118–119 and 120–121.

In the area of teacher evaluation, almost all principals, public or private, thought that they had a great deal of influence. However, in a number of other policy areas—discipline, curriculum, in-service

training, budgeting, and hiring—private school principals were more likely than public school principals to think that they had a great deal of influence. Public school principals share authority for many policy decisions with school boards, district personnel, and State Departments of Education.

■ *Private school teachers reported having more autonomy in the classroom.*

Table 8. Percentage of teachers who thought that they had a good deal of control* over classroom practices: 1993–94

Classroom practice	Public	Private
Evaluating and grading students	86.9	91.6
Determining amount of homework	86.7	87.4
Selecting teaching techniques	86.4	91.6
Disciplining students	69.0	84.3
Selecting content, topics, skills to be taught	60.5	74.6
Selecting textbooks and other materials	55.5	67.9

* Responded 4 or 5 on a scale of 0–5.

SOURCE: Indicator 41, *Condition 1997*.

In both public and private schools, the vast majority of teachers thought that they had a good deal of control over certain classroom practices: evaluating and grading students, determining the amount of homework, and selecting teaching techniques. Relatively fewer in each sector thought that they had a good deal of control over disciplining students; selecting the content, topics, and skills to be taught; or selecting textbooks and other instructional materials. Except in the area of determining the amount of homework, private school teachers were more likely than public school teachers to think that they had a good deal of control.

School climate

School climate can significantly affect the quality of the educational experience for students, teachers, and other staff as well as parents' satisfaction with their child's school. Neither teachers nor students can perform at their best if their school is unsafe or disrupted by misbehaving students or if there is a lack of cooperation among teachers or between the school and parents. The National Education Goals for the year 2000 call for schools that "will be free of drugs, violence, and unauthorized presence of firearms and alcohol and will offer a disciplined environment conducive to learning." The Goals also call for increased "parental involvement and participation in promoting the social, emotional, and academic growth of children."¹⁶

- *Exposure to crime or threats is far more common in public schools.*

Table 9. Percentage of students in grades 6–12 who reported knowing about, witnessing, worrying about, or being victimized by robbery, bullying, or physical attack at school: 1993

Robbery, bullying, or physical attack	Public		Private
	Assigned	Chosen	
Knowledge of occurrence	73.0	71.0	45.0
Witnessed	58.0	54.0	32.0
Worried about	26.0	27.0	13.0
Victimized	12.0	10.0	7.0

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Student Victimization at School*, NCES 95-204, 1995.

To learn effectively, students must feel safe at school. The learning environment in schools where students have to worry about being threatened or becoming victims of crime may be seriously compromised. Crime occurs in and around both public and private schools, but public school students have a much greater exposure to crime. The percentages of students in grades 6–12 who knew about, witnessed, or worried about being a victim of bullying, physical attack, or robbery were much greater in both assigned and chosen public schools than in private schools. In addition, students in assigned public schools were more likely than private school students to report being victimized personally.

- *Public school teachers are far more likely to believe that certain negative student attitudes and behavior are serious problems in their schools.*

Table 10. Percentage of teachers who perceived various problems as serious in their schools: 1993–94

Problems	Public		Private	
	All	Central city secondary schools	All	Central city secondary schools
Attitudes toward learning				
Come unprepared to learn	28.8	46.6	4.1	7.3
Apathy	23.6	46.4	4.5	10.7
Absenteeism	14.4	41.9	2.2	4.4
Tardiness	10.5	30.1	2.6	3.7
Interactions with teachers				
Verbal abuse of teachers	11.1	22.6	2.3	2.9
Disrespect for teachers	18.5	32.5	3.4	5.4

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, pp. 112–113.

In the 1993–94 school year, teachers were asked to report their perceptions of the seriousness of various problems in their schools, and their responses suggest that there are different climates in public

and private schools. Teachers in public schools were far more likely to report that poor attitudes toward learning and negative interactions with teachers were serious problems in their schools. The contrast between the perceptions of public and private school teachers was particularly striking in central city secondary schools.

- *Public school teachers are more likely to believe that a lack of parent involvement is a serious problem in their school.*

Communication between parents and school personnel promotes a spirit of home-school cooperation, which is important to student success. Public school teachers were much more likely than private school teachers to believe that a lack of parental involvement was a serious problem in their school (28 versus 4 percent).¹⁷

The nature of the contact between schools and parents tends to differ in public and private schools. For example, high school seniors in private schools were more likely than their public school peers to have their parents contacted about volunteering their time at school or about the student’s post-high school plans, while seniors in public schools were more likely to have their parents contacted about their school attendance.

Table 11. Percentage of seniors whose parents reported that school personnel had contacted them at least once during the current school year: 1992

Reason for contact	Public	Catholic	Other private
Discussion of student’s:			
Academic performance	52.5	48.5	60.8
Academic program	42.9	46.1	59.0
Post-high school plans	34.9	50.0	69.1
Attendance	38.7	17.5	25.7
Behavior	20.5	14.6	18.5
Request parent to volunteer			
time at school	51.9	82.9	86.2
Inform parent how to help			
student with school work	21.5	29.3	31.8

SOURCE: Indicator 44, *Condition 1995*.

- *Private school teachers share a greater sense of community within their schools.*

When teachers in a school share a strong sense of community, they are likely to be more effective instructors and more satisfied with their working conditions.¹⁸ In the 1993–94 school year, private school teachers in both large and small schools were

more likely than public school teachers to report that they and their colleagues shared goals, beliefs, and expectations (and that the goals and priorities for the school were clear); that they were recognized for good work; that teachers participated in most of the important decisions in their schools; that the staff cooperated; and that the administration was supportive and encouraging.

Table 12. Percentages of teachers who strongly agreed with items related to their sense of community at work: 1993–94

Sense of community	Public		Private	
	Less than 150 students	750 or more students	Less than 150 students	750 or more students
Goals, beliefs, and expectations				
Colleagues share beliefs and values about central mission of school	40.8	26.2	71.4	49.4
Goals and priorities for school are clear	36.0	33.1	61.7	56.3
Governance procedures				
Staff members are recognized for good work	23.5	22.1	48.1	34.7
Teachers participate in most of the important educational decisions	23.7	10.1	38.0	22.6
Collegiality and cooperation				
Great deal of cooperative effort among staff	41.5	25.9	65.3	46.4
Administration's behavior is supportive and encouraging	42.0	38.5	65.1	57.0

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Teachers' Sense of Community: How Do Public and Private Schools Compare?*, IB-10-96, 1996.

Academic programs

A major thrust of school reform efforts begun in the 1980s has been setting higher academic standards for elementary and secondary school students. One of the National Education Goals for the year 2000 is to have all students be able to demonstrate in grades 4, 8, and 12 "competency over challenging subject matter" in a range of subjects, including reading, mathematics, science, and social studies.

Elementary schools

Key aspects of the instructional program at the elementary level are the amount of time spent on core subjects, the teaching methods used in the classroom, and how homework is handled. Public and private schools exhibit both similarities and differences in these areas.

- *Elementary public school teachers spend more time than private school teachers on core subjects.*

In the 1993–94 school year, public elementary teachers in self-contained classrooms spent more time than their private school counterparts teaching each of the four core subjects—English, mathematics, social studies, and science—and more time on all four together. Public elementary teachers spent an average of about 22 hours per week teaching the four core subjects, and private school teachers spent about 3 hours less. Teachers in both sectors divided their time among these subjects in approximately the same way. That is, they spent about half of the time teaching English, the next most time on mathematics, then social studies, and science.

Table 13. Average hours per week elementary school teachers spent teaching core subjects: 1993–94

Subject	Public	Private
Total	21.5	18.1
English	10.3	8.5
Mathematics	5.2	4.5
Social studies	3.1	2.7
Science	3.0	2.4

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993–94*, pp. 76–77.

Elementary school students in public and private schools spent virtually identical amounts of time in school (6.4 hours per day and 179 hours per year), which implies that private school elementary teachers allocate more time than public school teachers to non-core subjects such as music, art, physical education, and, sometimes, religion (Indicator 49, *Condition 1993*).

- *Elementary teachers in public and private schools use similar teaching methods.*

When asked if they used certain instructional strategies at least once a week during the 1993–94 school year, 90 percent or more of the elementary teachers in both sectors said that they provided instruction to the class as a whole, demonstrated concepts using the board or an overhead projector, worked with individual students, and worked with small groups of students (*Indicator 37*). Among less commonly used practices, public school teachers were more likely than private school teachers to demonstrate a concept using a computer, videotape, or other electronic medium (75 versus 57 percent), while private school teachers were more likely than public school teachers to lecture (78 versus 69 percent).

- *Private elementary teachers handle homework differently than public elementary teachers.*

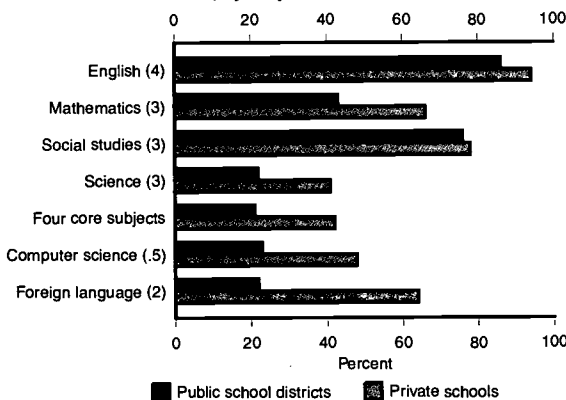

Almost all elementary school teachers (94 percent of public school teachers and 98 percent of private school teachers) reported that their students did some homework during an average week in 1993–94 (*Indicator 36*). Forty-six percent of public school teachers and 40 percent of private school teachers assigned 1 hour or less per week. Although the focus is often on how much homework is assigned, how teachers use homework assignments may be more important than quantity. For example, some argue that homework is most useful to students if teachers collect, correct, and return their assignments. At the elementary level, private school teachers were more likely than their public school counterparts to do this (82 versus 72 percent).

High school academic programs

In 1983, the National Commission on Education and the Economy (NCEE) proposed in *A Nation at Risk* that all high school graduates be required to complete at least 4 years of English; 3 years each of social studies, science, and mathematics; and .5 years of computer science. This has become a standard against which high school programs are evaluated.

- *Private high schools appear to have more rigorous academic programs.*

Figure 6. Percentage of high school students in public districts or private schools with course graduation requirements at/above the NCEE recommendations, by subject and control of school: 1990–91

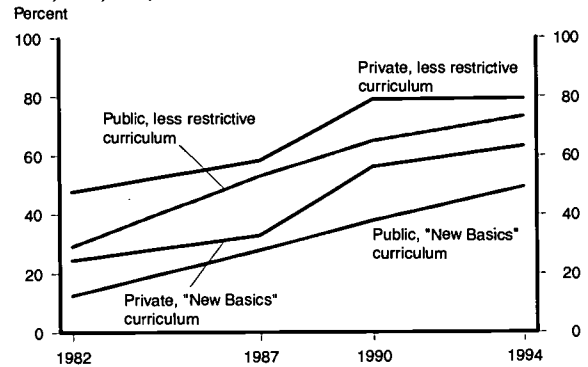

SOURCE: Tables 24-5 and 24-6, *Condition 1995*.

Except in social studies, greater percentages of private than public high school students attended schools with graduation requirements at or above the NCEE recommendations in 1990–91. In addition, private school students were much more likely than their public school peers to be required to take 2 years of a foreign language.

In both sectors, a greater percentage of high school graduates earned the minimum number of units specified in the “New Basics” curriculum (4 years of English, and 3 years each of social studies, science, and mathematics) in 1994 than in 1982. Although the percentage meeting this standard is still higher for private school graduates, the two sectors are now similar when a less restrictive curriculum (one less year each of science and mathematics) is used as the standard (*Indicator 28* and table 28-1, *Condition 1996*).

Figure 7. Percentage of high school graduates earning a minimum number of units in core courses, by curriculum type and sector: 1982, 1987, 1990, and 1994

SOURCE: Table 28-1, *Condition 1996*.

- *Graduates of private high schools are much more likely to have taken advanced mathematics and science courses.*

In both 1982 and 1994, virtually all graduates of either public or private high schools earned some credits in mathematics and science. However, in both years, graduates of private high schools were more likely than their public school counterparts to take advanced mathematics courses such as algebra II, trigonometry, analysis/pre-calculus, and calculus; courses in biology, chemistry, and physics; and courses in all three of the major sciences (biology, chemistry, and physics). The percentages of students taking these courses increased between 1982 and 1994 for public high school graduates in all of these subjects and for private high school graduates in most of them.

Table 14. Percentage of high school graduates taking selected mathematics and science courses in high school: 1982 and 1994

Courses (credits)	1982		1994	
	Public	Private	Public	Private
Any mathematics	98.4	99.8	99.5	99.9
Algebra II (0.5)	29.7	52.8	56.4	81.8
Trigonometry (0.5)	11.0	21.4	16.2	29.5
Analysis/pre-calculus (0.5)	5.0	12.8	16.2	29.6
Calculus (1.0)	3.7	12.0	8.8	14.4
Any science	96.2	99.0	99.5	100.0
Biology (1.0)	74.5	91.9	93.5	97.4
Chemistry (1.0)	28.7	49.2	54.4	74.8
Physics (1.0)	13.3	22.0	23.7	32.1
Biology, chemistry, physics (3.0)	9.7	17.5	20.5	30.1

SOURCE: Table 24-3, *Condition 1997*.

Support services

In addition to their curricular offerings, schools provide various other services to support the academic and health-related needs of their students. The particular services a school provides reflect the needs of the students and the availability of resources as well as the importance that the school places on such services. Federal and state laws require public schools to provide some services that are not required of private schools.

- Public schools provide a wide array of academic support and health-related services.

Table 15. Percentage of schools in which various services were available to students: 1993-94

Service	Public	Private
Academic support		
Remedial	83.2	54.5
Gifted and talented	70.7	24.9
Bilingual	17.8	4.2
ESL	42.7	11.3
Chapter I	61.6	22.7
Disability	89.2	24.8
Diagnostic services	82.6	43.5
Library	95.6	80.3
Health-related		
Medical services	58.7	31.0
Drug and alcohol prevention	93.6	70.6
Substance abuse counseling	36.2	14.4
Free or reduced-price lunches	94.3	22.4

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Schools and Staffing in the United States: A Statistical Profile, 1993-94*, pp. 26-29.

Most support services are found more often in public than private schools. This may occur because private schools do not believe their students need these services or because they do not believe they

can afford to provide them. In addition, private schools may meet the special needs of students without formal programs.

- Increasing numbers of schools in both sectors are providing extended-day programs, but public schools still lag behind private schools in this area.

Because of the importance of high-quality child care to working parents, extended-day programs have become increasingly common in elementary and combined schools. However, considerably more private than public elementary and combined schools provided this service in the 1993-94 school year (48 versus 30 percent).

Figure 8. Percentage of elementary and combined schools that offered extended-day programs, by control of school: 1987-88, 1990-91, and 1993-94

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Extended-Day Programs in Elementary and Combined Schools* Issue Brief, 1996 and *Schools and Staffing in the United States: A Statistical Profile, 1993-94*, pp. 30-31.

- Private schools tend to have larger library collections (on a per pupil basis), but public school library/media centers tend to be more technologically advanced.

Library/media center resources provide students with access to materials and equipment that facilitate and promote learning. Public schools were more likely than private schools to have libraries in 1993-94, but among schools with libraries, private schools had larger collections, on average, on a per student basis (37 versus 26 volumes) (*Indicator 6*). Expenditures (excluding federal gifts and grants) were similar in both sectors in 1993-94, however (about \$8 per student annually among schools with libraries).

The library/media centers in public schools were more technologically advanced than those in pri-

vate schools in 1993–94. For example, they were more likely to have an automated catalog and circulation system; computers with modems and connection to the Internet; and broadcast, cable, and closed circuit television facilities.

Table 16. Percentage of library media centers with various types of equipment: 1993–94

Equipment	Public	Private
Automated circulation system	37.9	9.5
Automated catalog	24.0	9.7
Computer with modem	34.3	19.5
Connection to Internet	12.0	5.3
Cable television	76.2	39.9
Broadcast television	48.6	39.9
Closed circuit television	25.5	8.8

SOURCE: Table 6-1, *Condition 1997*.

Summary

Although there is much variation within each sector, in the aggregate, public school students present their schools with greater challenges than do their private school counterparts. Not only do they come from more diverse racial/ethnic and linguistic backgrounds but also public school teachers are more likely than private school teachers to perceive their students and their families as having problems that can interfere with learning.

Overall, teachers in public schools are more likely than their private school counterparts to have certain attributes that are thought to contribute to effective teaching. These include more schooling, more teaching experience, and greater participation in professional development activities. However, public and private school teachers use similar teaching strategies. On average, public school teachers earn more and receive more benefits, which provides public schools with one advantage when trying to attract and retain the best teachers.

Despite poorer pay, private school teachers as a group are more satisfied than public school teachers with their jobs. In the aggregate, private schools seem to offer a greater sense of community, greater teacher autonomy in the classroom, and more local influence over curriculum and important school policies. In addition, on average, private schools have a climate that would appear to be more conducive to learning, including greater safety and fewer problems caused by students having poor attitudes toward learning or negative interactions with teachers.

Finally, private school students take more advanced courses than do public high school students. They also appear to follow a more rigorous academic program overall, but the differences may be narrowing.

While some systematic differences between public and private education have been outlined here, enormous variation exists within each sector. How successful students are in school does not depend on whether they attend public or private schools, but is related in complex ways to the abilities, attitudes, and problems they bring to school; the skills and expertise of their teachers; and the quality of the learning environment, which is the joint responsibility of students, teachers, school administrators, parents, the larger communities in which the schools are located, and policymaking at the local, state, and federal levels.

Postsecondary Persistence and Attainment

by Stephanie Cuccaro-Alamin, MPR Associates, Inc.

Postsecondary degree attainment is associated with better access to employment and higher earnings, especially for bachelor's degree seekers.¹ In 1995, on average, male bachelor's degree recipients aged 25–34 earned 52 percent more, and female bachelor's degree recipients 91 percent more than their counterparts with a high school diploma (*Indicator 33*). As students' awareness of the economic and social benefits of degree attainment has increased, so have their postsecondary enrollments. The percentage of high school graduates who enrolled in 2- or 4-year colleges and universities in the October following graduation increased from 49 percent to 62 percent between 1972 and 1995 (*Indicator 8*). During this same period, the percentage of 25- to 29-year-old high school graduates who had completed 4 or more years of college rose from 24 to 28 percent (*Indicator 22*).

To help ensure successful outcomes for the increasing number of students seeking postsecondary credentials, it is crucial to understand the factors associated with degree completion. Today, students can choose from a range of institution types and enrollment options to find the best fit between their degree objectives, abilities, and social and economic circumstances. Many students are attending part time, working while enrolled, attending sporadically, and attending more than one institution before graduating.² While these strategies may help students strike a balance between their economic and social considerations and their degree objectives, they may also negatively affect students' persistence and attainment.

The following discussion addresses how students' enrollment choices are related to their postsecondary persistence and attainment. Specifically, it takes into account such factors as degree objective, type of institution attended, timing of enrollment, enrollment intensity and continuity, transfer, financial aid receipt, and student employment. Examining persistence and attainment outcomes and the enrollment factors related to them can provide the critical information necessary to help teachers, counselors, parents, and students make informed enrollment decisions to help maximize their success.

Most of the data describe the persistence and attainment through 1994 of students (regardless of age) who began their postsecondary education in the 1989–90 academic year. Additional data describe the postsecondary experiences of 1980 high

school sophomores 10 years after their expected graduation. Some data on the college experiences of 16- to 24-year-olds from the 1970s to the 1990s are also included.

Postsecondary access

- *Increasing proportions of high school graduates are enrolling in 2- or 4-year colleges and universities.*

The percentage of high school graduates who enrolled in 2- or 4-year colleges and universities in the October following high school graduation increased from 49 percent in 1972 to 62 percent in 1995. The difference in the immediate enrollment rates of male and female high school graduates disappeared during this period.

Table 1. Percentage of high school graduates aged 16–24 enrolled in college the October following graduation, by selected characteristics: 1972 and 1995

Selected characteristics	1972	1995
Total	49.2	61.9
Sex		
Male	52.7	62.6
Female	46.0	61.3
Family income		
Low income	26.1	34.2
Middle income	45.2	56.1
High income	63.8	83.4
Race/ethnicity		
White	49.7	64.3
Black	44.6	51.2
Hispanic	45.0	53.7

SOURCE: Indicator 8, *Condition 1997*.

Despite overall rising enrollment rates, participation in higher education is still lower for many minority and low income students. The percentage of high school graduates aged 16–24 who enrolled in college immediately after high school grew for whites and blacks between 1972 and 1995, and fluctuated, but overall, remained relatively stable for Hispanics. In addition, in 1972, high school graduates from low income families were less likely than those from middle or high income families to go directly to college; these income differences still existed in 1995.

Immediate enrollment in postsecondary education following high school graduation is not a complete measure of enrollment trends, however, as many students may delay their entry into postsecondary education to work and save money for school. Examining the postsecondary enrollment rates of 1980 high school sophomores within 10 years of their expected high school graduation (1992) produces a more accurate picture of enrollment. For example, among the 1980 high school sophomore cohort, by 1992 female students were more likely to have enrolled in postsecondary education than were males.

Table 2. Percentage of 1980 high school sophomores who were enrolled in postsecondary education by 1992, by 1982 selected characteristics

Selected characteristics	Enrolled by 1992
Total	66.4
Sex	
Male	61.9
Female	70.7
Socioeconomic status	
Lowest quartile	48.0
Middle quartiles	69.0
Highest quartile	88.3
Race/ethnicity	
White	68.8
Black	61.3
Hispanic	53.1

SOURCE: Table 26-1, *Condition 1996*.

Nevertheless, the disparities found in the immediate enrollment rates of low income and some minority high school graduates aged 16–24 are still evident when we examine the postsecondary enrollment rates of 1980 high school sophomores after 10 years. For example, white students from this cohort were more likely than black or Hispanic students to have enrolled in postsecondary education within 10 years (69 versus 61 and 53 percent, respectively) (table 26-1, *Condition 1996*). In addition, black students were more likely than their Hispanic counterparts to enroll by 1992 (61 percent versus 53 percent), and students with high socioeconomic status (SES) were nearly twice as likely as their low SES counterparts to do so (88 versus 48 percent).

Even among students in the highest achievement test quartiles, enrollment rates were considerably lower for low SES students than for high SES students. For example, 1992 seniors in the highest achievement test quartile and highest SES were much more likely to enroll within 2 years of scheduled graduation than those in the highest

achievement test quartile and lowest SES (97 compared to 78 percent, respectively) (*Indicator 9*). Although enrolling in postsecondary education is the first step toward degree completion, ultimate attainment of a postsecondary credential depends upon students' ability to persist in their enrollment.

Postsecondary outcomes

Approximately half of those students of all ages who began their postsecondary education in 1989–90 attained some postsecondary credential within 5 years of their initial enrollment: 26 percent obtained a bachelor's degree, 11 percent an associate's degree, and 13 percent a certificate. Another 13 percent of students were also still working toward a degree in 1994, and the remaining 37 percent were no longer enrolled and left without a degree or certificate by that year.³

Figure 1. Percentage of 1989–90 beginning postsecondary students according to persistence and attainment outcomes as of spring 1994

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

- *Disparities found in postsecondary enrollment rates related to low income and minority status are also evident in attainment outcomes.*

Generally, regardless of the type of degree pursued, 1980 high school sophomores with low SES backgrounds and those from some minority groups were less likely than others to obtain a postsecondary credential. For instance, Asian/Pacific Islander and white high school sophomores were more likely than their black, Hispanic, or American Indian/Alaskan Native counterparts to have earned a bachelor's degree by 1992. In addition, high school sophomores with high SES backgrounds were much more likely than their low or middle SES counterparts to have earned at least a bachelor's degree. About 75 percent

of low SES high school sophomores had obtained no postsecondary credential by 1992.⁴

Table 3. Percentage distribution of 1980 high school sophomores according to highest degree earned through 1992, by selected characteristics

Selected characteristics	Less than high school	High school	Certificate	Associate's	Bachelor's or higher
Total	5.8	51.5	11.0	7.9	23.8
Sex					
Male	6.5	53.5	9.7	6.7	23.6
Female	5.0	49.5	12.4	9.1	23.9
Socioeconomic status					
Lowest quartile	9.0	64.6	12.3	6.9	7.2
Middle two quartiles	3.9	53.8	11.5	9.1	21.6
Highest quartile	1.4	32.7	7.0	7.6	51.3
Race/ethnicity					
White	4.9	49.1	10.1	8.4	27.5
Black	6.9	59.6	16.3	5.2	12.2
Hispanic	11.9	59.6	11.2	7.3	9.9
Asian/Pacific Islander	0.6	40.9	6.9	6.2	45.6
American Indian/ Alaskan Native	17.8	58.2	11.8	5.0	7.2

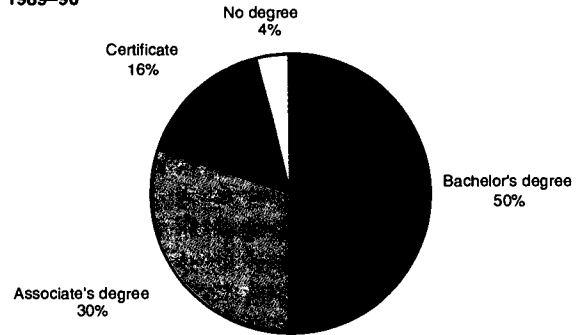

SOURCE: Table 26-2, *Condition 1996*.

Students who choose to enroll in postsecondary education face a range of enrollment choices. Such choices include their degree objective, the type of institution to attend, the timing of enrollment, enrollment intensity and continuity, and financing their enrollment. These decisions, in turn, can affect students' persistence and attainment outcomes.

Degree objective

Of students beginning their postsecondary education for the first time in the 1989–90 academic year, half were working toward a bachelor's degree, 30 percent toward an associate's degree, and 16 percent toward a certificate. Approximately 4 percent of first-time beginners were not working toward any degree.⁵ An examination of student outcomes 5 years later shows differential results depending on degree objective.

Figure 2. Percentage distribution of 1989–90 beginning postsecondary students according to degree objective in 1989–90

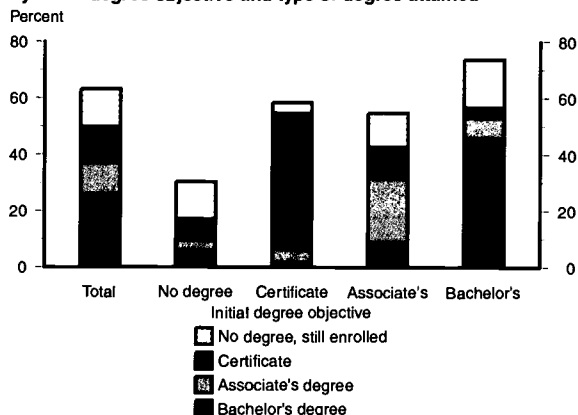

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

- *Students seeking bachelor's degrees are more likely than students seeking other degrees to attain a degree or be still enrolled 5 years after their initial enrollment.*

Irrespective of the institution where they first enrolled, first-time beginning students seeking bachelor's degrees in 1989–90 were more likely than those seeking associate's degrees to attain their degree objective within 5 years of initial enrollment (46 versus 23 percent); however, they were no more likely than students seeking certificates to do so (48 percent). Given the relative durations of the typical programs, data on differences in degree completion after 5 years may be more meaningful for students seeking associate's degrees and certificates than for bachelor's degree seekers.

In measuring persistence and attainment rates for bachelor's degree seekers, it is appropriate to include those still enrolled in postsecondary education who have not yet reached their goal, as well as those who have attained a degree other than the one they initially sought. By this measure, bachelor's degree seekers were more likely to persist overall than their counterparts seeking any other degree. For example, nearly three-quarters of all bachelor's degree seekers who began in 1989–90 either attained some degree or were still enrolled in postsecondary education in 1994, compared to 59 percent of those seeking a certificate and 55 percent of those seeking an associate's degree.

Figure 3. Percentage of 1989–90 beginning postsecondary students who attained a degree or who were still enrolled as of spring 1994, by initial degree objective and type of degree attained

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

Although many first-time 1989–90 beginning students seeking associate's degrees and certificates had not completed the degree they sought after 5 years, many were enrolled for a significant period of time. For instance, among associate's degree seekers at 2-year institutions who had not completed degrees, the average student was enrolled for 19 months. Certificate seekers at less-than-4-year institutions (includes 2-year and less-than-2-year institutions) who did not complete their credential were enrolled for an average of 11 months (*Indicator 11*).

Type of institution

Community colleges are an important cost-saving vehicle for students seeking bachelor's degrees. Because their tuition and fees are often lower, they can be an inexpensive way for students to meet lower-division requirements. In 1989–90, nearly one-quarter (23 percent) of bachelor's degree seekers began their studies at 2-year institutions.⁶ Although attending a community college may make good financial sense, it may not be conducive to completing a bachelor's degree.

- *Bachelor's degree seekers who enroll initially at 2-year institutions are far less likely than those who start at 4-year institutions to attain a bachelor's degree within 5 years.*

Fifty-seven percent of first-time beginning students seeking a bachelor's degree who began at a 4-year institution in 1989–90 had completed the degree 5 years later, compared to 8 percent of those who began at a 2-year institution. Taking into account

continued enrollment toward a bachelor's degree and attainment of other degrees, three-quarters of bachelor's degree seekers who began at 4-year institutions had completed some degree or were still enrolled toward a bachelor's degree after 5 years, compared to 54 percent of those who began at 2-year institutions.

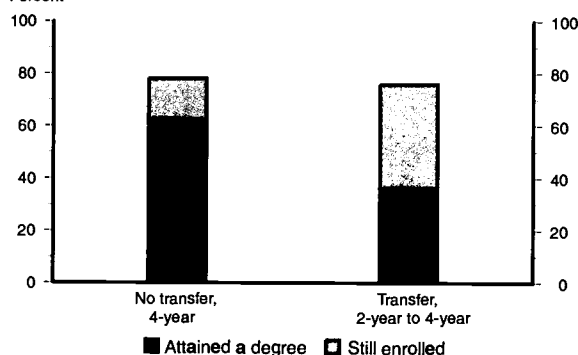

Table 4. Percentage distribution of 1989–90 beginning postsecondary students seeking bachelor's degrees, by highest degree attained as of spring 1994 and level of first institution attended

Level of first institution	Highest degree completed			Total, any degree	Still enrolled for bachelor's	No degree, not enrolled
	Bachelor's	Associate's	Certificate			
Total	45.8	5.1	3.3	54.3	17.5	28.3
4-year	57.1	2.5	2.1	61.7	15.3	23.1
2-year	7.9	13.9	7.2	29.0	25.3	45.8

SOURCE: Table 10-1, *Condition 1996*.

Bachelor's degree seekers who begin their postsecondary education at a 2-year institution must transfer to a 4-year institution in order to complete a bachelor's degree; however, many students fail to do so. For students who do transfer to a 4-year institution, having attended a 2-year institution is not related to their overall rates of persistence, but is associated with time-to-degree. Five years after initial entry, 40 percent of bachelor's degree seekers at 2-year institutions who transferred to 4-year institutions were still enrolled, and 36 percent had completed a postsecondary credential.

Figure 4. Percentage of 1989–90 beginning postsecondary students seeking bachelor's degrees who attained a degree or were still enrolled as of spring 1994, by type of first institution attended and transfer status

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

Thus, although bachelor's degree seekers who started at 2-year institutions were less likely than those who started at 4-year institutions to attain a bachelor's degree within 5 years (57 versus 8 percent), if students who began at 2-year institutions

did transfer, they were equally as likely as those who began at 4-year institutions to persist overall (76 versus 78 percent).

- *Bachelor's degree recipients who start at 2-year institutions are more than twice as likely as those who start at 4-year institutions to take more than 6 years to complete their degree.*

Many students who enroll at community colleges attend part time. For instance, in 1989–90, 48 percent of students enrolled at 2-year institutions were enrolled on a less than full-time basis.⁷ Therefore, bachelor's degree seekers who first enroll in these institutions may be likely to take longer to complete their degree. Among 1992–93 bachelor's degree recipients, those who started at 2-year institutions were more than twice as likely as those who started at 4-year institutions to take more than 6 years to complete their degree (44 versus 18 percent) (Indicator 11, *Condition 1996*).

- *Graduates of public 4-year institutions take longer to complete their bachelor's degree than graduates of private, not-for-profit institutions.*

Among bachelor's degree seekers who start at 4-year institutions, time-to-degree is also related to the control of the 4-year institution. Those who received their bachelor's degree from private, not-for-profit 4-year institutions were much more likely than graduates of public 4-year institutions to have completed the degree within 4 years (53 versus 28 percent) (Indicator 11, *Condition 1996*).

Timing of enrollment

- *Delaying enrollment into postsecondary education by as little as 1 year after high school is associated with poorer persistence and attainment outcomes.*

Many students delay enrolling in postsecondary education; in fact, almost one-third of beginning postsecondary students in 1989–90 did so.⁸ Delayed entry is more common among lower SES students than high SES students (57 versus 10 percent), and among students whose parents had not completed any education beyond high school than among students whose parents have had some postsecondary education (from 33 to 50 percent and 9 to 20 percent, respectively).⁹ These differences in the timing of enrollment are important because students who delay their enrollment are less likely to

attain a degree or persist than those who enter postsecondary education immediately.

Figure 5. Percentage of 1989–90 beginning postsecondary students who attained their initial degree objective or a higher degree as of spring 1994, by delayed entry status

SOURCE: Table 10-1, *Condition 1996* and tables 11-1 and 11-2, *Condition 1997*.

Among first-time beginning students in 1989–90, bachelor's degree seekers who delayed their entry into postsecondary education by as little as 1 year after receiving their high school diploma were less likely to attain the degree they sought within 5 years than those who enrolled immediately. They were also twice as likely as those who did not delay to attain no degree and to no longer be working toward a bachelor's degree (48 versus 25 percent) (table 10-1, *Condition 1996*). Similarly, associate's degree seekers at 2-year institutions who delayed their enrollment were less likely to attain the degree they sought or a higher degree than students who did not delay. Delayed entry was not associated with the likelihood of attaining a certificate or a higher degree among certificate seekers at less-than-4-year institutions, however.

The experience of students who received their bachelor's degrees in 1993 provides further evidence of the effect of delayed enrollment. Among 1993 bachelor's degree recipients, those who delayed entry by 1 or more years were less likely to complete their degree within 4 years (11 versus 38 percent) and were more likely to take 6 or more years to do so (22 versus 59 percent) (Indicator 11, *Condition 1996*).

Enrollment intensity and continuity

Enrollment has two dimensions: intensity and continuity. The intensity of enrollment refers to whether a student attends part time or full time, and the continuity of enrollment refers to whether

or not a student is continuously enrolled over a period of time. Both part-time and noncontinuous enrollment have been shown to be related to lower rates of student persistence.¹⁰

- *Full-time enrollment is associated with higher rates of persistence and attainment.*

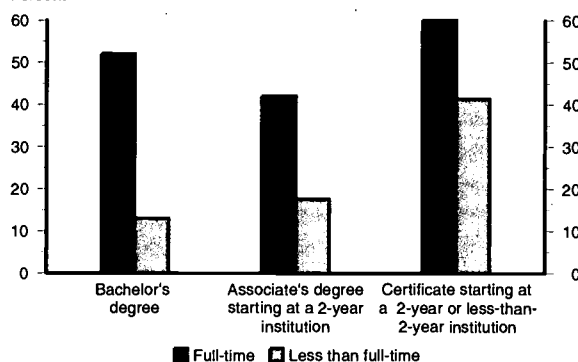

Exclusively part-time enrollment is most common among first-time beginning students attending public less-than-4-year institutions and those seeking subbaccalaureate degrees and certificates.¹¹ In total, 42 percent of associate's degree seekers at 2-year institutions and 36 percent of certificate seekers at less-than-4-year institutions enrolled on a less than full-time basis during their first term in 1989–90, compared to 15 percent of bachelor's degree seekers.¹² Exclusively part-time attendance is more common among students who are older (45 percent for those aged 20 years or older versus 7 percent for those aged 18), financially independent (46 percent for independent students versus 10 percent for dependent students), and who work full time while enrolled (52 percent for those who worked 34 or more hours per week versus 4 percent for those who worked less than 15 hours per week) (table 13-1).

The intensity of students' enrollment is related to their postsecondary persistence and attainment regardless of their degree objective. As expected, bachelor's degree seekers who first enrolled on a full-time basis were more likely to complete a bachelor's degree within 5 years than those who enrolled less than full time (52 compared to 13 percent). Illustrating that part-time attendance may prolong students' time-to-degree, bachelor's degree seekers who attended less than half time were more likely than their full-time counterparts to still be enrolled 5 years after initially entering postsecondary education. Despite the high number of part-time students who were still enrolled, overall the 1989–90 beginning bachelor's degree seekers who initially attended less than full time were more likely than students who attended exclusively full time to have no degree and to no longer be working toward a bachelor's degree 5 years after initially entering postsecondary education (25 versus 44 percent).

Less than full-time attendance is also negatively associated with the persistence and attainment outcomes of students seeking subbaccalaureate degrees. For example, 62 percent of certificate seekers at less-than-4-year institutions and 42 percent of associate's degree seekers at 2-year institutions who attended full time had attained the degree they

sought or a higher degree after 5 years, compared to 41 and 18 percent, respectively, of those who attended less than half time (*Indicator 11*).

Figure 6. Percentage of 1989–90 beginning postsecondary students who attained their degree objective or a higher degree as of spring 1994, by enrollment status during first term
Percent

SOURCE: Table 10-1, *Condition 1996* and tables 11-1 and 11-2, *Condition 1997*.

- *Breaking the continuity of enrollment is related to lower overall persistence and prolonged time-to-degree.*

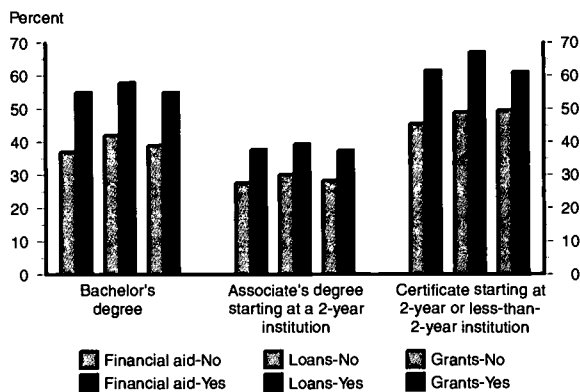

As with part-time attendance, noncontinuous enrollment may be associated with factors such as students' lack of funds or their need to work full time, which might interfere with their persistence. On average, 35 percent of 1989–90 first-time beginners who interrupted their enrollment for a period of more than 4 months had completed a degree 5 years after their initial enrollment, compared to 56 percent of those who had no break in continuity.¹³ Students who interrupted their enrollment were more likely to be still enrolled 5 years after initially entering postsecondary education (25 versus 8 percent).

Financial aid

Financial aid provides access to postsecondary education for students without the financial resources to attend on their own. Because aid may substitute for work as a financial resource, it may facilitate persistence and attainment by enabling a student to attend full time rather than working to finance their education and enrolling part time.

- *Aided bachelor's degree seekers graduate at the same rate as bachelor's degree seekers who do not receive aid.*

Figure 7. Percentage of 1989–90 beginning postsecondary students who attained their initial degree objective or a higher degree as of spring 1994, by receipt of financial aid, loans, and grants

SOURCE: Table 10-1, *Condition 1996* and tables 11-1 and 11-2, *Condition 1997*.

Beginning bachelor's degree seekers who received financial aid in 1989–90 (both grants and loans) were more likely to attain a bachelor's degree within 5 years than those who did not receive such aid. Those who did not receive aid were more likely to still be working toward their degree. Students who did not receive aid were also more likely to have no degree and to no longer be enrolled in postsecondary education.

Table 5. Percentage of 1989–90 beginning postsecondary students seeking bachelor's degrees who attained any degree or were still enrolled as of spring 1994, by control of first institution and aid receipt in 1989–90

Aid received	Control of first institution	
	Public	Private, not-for-profit
Total	71.2	81.0
Received aid in 1989–90		
No	71.0	80.8
Yes	71.5	81.1
Received grant in 1989–90		
No	71.6	80.6

Received loan in 1989–90		
No	70.9	81.8
Yes	72.6	79.9

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

The differences in the attainment rates among 1989–90 beginning postsecondary students seeking bachelor's degrees according to financial aid receipt are largely an artifact of the control of the institutions students attend. Specifically, overall rates of

persistence and attainment are higher among bachelor's degree seekers in private, not-for-profit institutions, where financial aid receipt is more common than in public institutions.¹⁴ When the control of the institution is held constant, persistence and attainment rates among bachelor's degree seekers who received any aid, and grants and loans in particular, are similar. Thus it appears that financial aid helps aided students graduate at the same rate as nonaided students.

■ *Financial aid is positively related to attainment among students seeking subbaccalaureate degrees.*

For students seeking subbaccalaureate degrees and certificates, the effects of financial aid receipt differ according to degree objective. For example, certificate seekers at less-than-4-year institutions who received financial aid in general, and specifically grants or loans, were more likely to obtain a certificate or a higher degree by 1994 than those who did not receive such aid.

Compared to students attending other levels of institutions, relatively few 1989–90 beginning postsecondary students seeking associate's degrees at 2-year institutions received financial aid. In total, 35 percent received some sort of aid; 11 percent received loans and 31 percent received grants (table 11-3). Among associate's degree seekers at 2-year institutions, both overall receipt of financial aid and receipt of grants were associated with completing associate's and higher degrees.

Working while enrolled

Many students work in order to help finance their postsecondary enrollment, which students may do instead of or in addition to receiving financial aid. Although working full time while enrolled may help free students from future debt, evidence suggests that this choice is negatively related to persistence and attainment outcomes.

■ *Student employment is on the rise.*

The percentage of full-time students at 2- and 4-year colleges and universities who work while enrolled rose from 34 percent in 1970 to 47 percent in the late 1980s and has stabilized at this rate since then (47 percent in 1995). During this same period, the percentage of students working 20 or more hours per week almost doubled (from 14 to 27 percent) (*Indicator 50*). Data on 1989–90 first-time

beginning students indicate that the majority of students worked at some time while enrolled in postsecondary education (89 percent) (*Indicator 13*).

Figure 8. Percentage of 16- to 24-year-old full-time college students who were employed in October, by hours employed per week: 1970-95

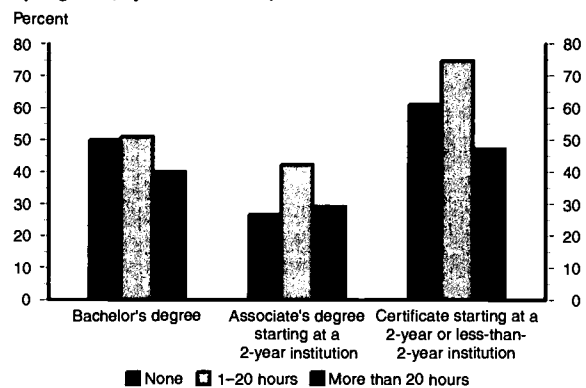

- *Students who work full time have lower rates of postsecondary persistence and attainment.*

The relationship of student employment to persistence and attainment varies with the intensity of the employment. Research suggests that full-time, off-campus work may negatively affect students' persistence and attainment.¹⁵ Students who work full time are more likely to attend exclusively part time (*Indicator 13*). As indicated above, part-time students have lower rates of persistence and attainment.

Students who work appear to be disadvantaged in programs where full-time attendance is highly correlated with completing postsecondary education. For instance, bachelor's degree seekers and certificate seekers at less-than-4-year institutions who worked 20 or more hours per week during their first year of enrollment were much less likely than students who did not work or who worked 1-20 hours per week to earn the degree they sought within 5 years (or a higher degree in the case of certificate seekers). However, the attainment rates of associate's degree seekers at 2-year institutions did not vary according to the number of hours they worked while enrolled.

Figure 9. Percentage of 1980-90 beginning postsecondary students who attained their initial degree objective or a higher degree as of spring 1994, by hours worked per week while enrolled

SOURCE: Table 10-1, *Condition 1996* and tables 11-1 and 11-2, *Condition 1997*.

Summary

The data presented here illustrate that along with students' background characteristics, their enrollment choices are related to their likelihood of completing postsecondary education. Students choose when to enroll, the type of institution in which to enroll, the intensity of their enrollment, and how to finance their enrollment. In doing so, they must balance their degree aspirations with the economic and social realities of their lives.

Generally, the evidence suggests that students who attend part time and work full time are less likely to complete their degree in a timely fashion than students who attend full time and work part time. Part-time attendance can also signify the existence of other factors besides work that might interfere with persistence, such as limited financial resources or family responsibilities.

For students seeking bachelor's degrees, the surest path to attainment appears to be entering a 4-year institution immediately following high school. Although delaying entry in order to work and save money or starting out at a lower cost community college may make good financial sense, evidence suggests these choices are less likely to lead to attaining a bachelor's degree within 5 years.

Bachelor's degree seekers who received financial aid and those who did not receive aid persisted and attained at similar rates. For students seeking subbaccalaureate credentials, in the aggregate, financial aid significantly improved their chances of success. Among certificate seekers at 2-year and less-than-2-year institutions and associate's degree seekers at 2-year institutions, students who received

any financial aid, and grants in particular, were more likely to have completed the degree they sought or a higher degree within 5 years. Although receipt of loans had a similar effect for certificate seekers, attainment rates of associate's degree seekers at 2-year institutions did not differ according to loan receipt.

Even though certain enrollment choices may be associated with higher rates of success, no particular enrollment pattern is feasible or appropriate for every student. Rather, the postsecondary sector offers a range of enrollment choices in order to meet the needs of students with different degree objectives and social and economic circumstances. With the earnings gap between a high school degree and a postsecondary credential widening and the economy demanding increasingly skilled workers, greater numbers of students who are unable to attend full time or who cannot afford to enroll in 4-year institutions may be entering the postsecondary sector. Many of these students have full-time jobs, child care needs, and other family obligations. Understanding the factors associated with postsecondary success can help these students in making appropriate enrollment choices. Moreover, this information can assist postsecondary institutions in designing programs for students who are at risk of attrition.

⁴ Although family income and socioeconomic status (SES) are highly correlated, they are constructed differently. Family income is usually shown in percentiles that are calculated separately for dependent and independent students. The percentile rank is based on family income for dependent students, and the student's own income for independent students. SES is a composite variable that combines parents' occupation, dependent student's family income, and the family's possession of a series of material goods.

Access, Participation, and Progress

A wide variety of educational opportunities are available to both children and adults in the United States. Preprimary education prepares young children socially and academically for first grade; elementary and secondary education provide a foundation of basic skills that prepare young people to become productive members of society; and postsecondary education provides a wide range of options for individuals to gain advanced knowledge and skills either immediately after high school or later in life. In addition, many employers help workers upgrade their skills or reorient them to meet the demands of changing technologies.

The benefits one obtains from formal education are closely related to the degree of participation. Thus, the extent to which individuals and groups have access to educational opportunities and how they progress through various levels is important to monitor. While the data show increased access to and participation in many types of educational activities, there continue to be discrepancies in access, participation, and progress according to family income, parents' education, and race/ethnicity.

Access and participation

Because of mandatory attendance laws, enrollment rates for children aged 6–15 have been close to 100 percent for many years (*Indicator 1, Condition 1996*). However, increasing emphasis on the importance of education in recent years has brought greater participation by age groups for whom attendance is not compulsory.

In 1995, 37 percent of 3-year-olds, 61 percent of 4-year-olds, and 90 percent of 5-year-olds were enrolled in a center-based program or kindergarten (*Indicator 1*). For each age group, the 1995 enrollment rate was greater than the 1991 rate. Preprimary programs are not equally accessible to all children, however. In both 1991 and 1995, enrollment rates for 3- and 4-year-olds were closely related to family income, with children from families with incomes greater than \$50,000 being much more likely than those from families with lower incomes to be enrolled. Enrollment rates for 3- and 4-year-olds also rise with parents' education level.

Parents can help prepare their children for school by reading to them, telling them stories, and taking them to the library. Between 1991 and 1995,

the percentage of children aged 3–5 who participated in each of these activities increased (*Indicator 2*). Participation rates for these activities increased with parents' education level, and were higher for white children than for black or Hispanic children.

Participation in postsecondary education is increasing, although enrollment varies by income, race/ethnicity, and socioeconomic status (SES). For example, in 1972, 49 percent of high school graduates went directly to college, compared to 62 percent in 1995 (*Indicator 8*). Eighty-three percent of high school graduates from families with incomes in the top 20 percent, compared to 34 percent of those from families with incomes in the bottom 20 percent, went directly to college in 1995. In addition, college enrollment rates for whites aged 18–24 grew substantially between 1982 and 1995 (11 percentage points), but grew more moderately for blacks (8 percentage points) (*Indicator 10*). Finally, even among students in the highest test quartile in high school, enrollment within 2 years of graduating from high school was much greater for students in the highest SES quartile (97 percent) than for those in the lowest SES quartile (78 percent) (*Indicator 9*).

The cost of postsecondary education to students and their families affects access, and costs have been rising faster than income. In 1980, the average undergraduate tuition, room, and board at 2- and 4-year public institutions amounted to 11 percent of the median family income, compared to 15 percent in 1995 (*Indicator 12*). Lower income families have been hit particularly hard: At the 20th percentile of family income, college costs increased from 22 to 32 percent of family income between 1980 and 1995, while costs rose from 7 to 9 percent for higher income families.

On-the-job training represents a firm's investment in the continuing education of its work force. The percentage of workers who participated in skill improvement training for their current job increased slightly from 30 to 32 percent between 1991 and 1995 (*Indicator 14*).

The availability of technology in schools is another aspect of access to educational opportunity. Computers have become an essential tool in today's society; in fact, the dramatic increase in the use of computers at school over the past decade reflects this trend. For example, 39 percent of 4th-graders used computers at school in 1984, compared to 86

percent who did so in 1994 (*Indicator 5*). While older students were less likely to report using computers than younger students, older students were more likely to use a computer every day. The percentage of schools with access to the Internet has increased rapidly in the last few years as well, rising from 35 percent in fall 1994 to 65 percent in fall 1996.*

Library media center resources provide another indication of student accessibility of computer technology. In the 1993–94 school year, 34 percent of public school library media centers had computers equipped with modems (*Indicator 6*). The extent that such resources are more available to some students than to others raises equity issues. Schools with relatively few low income students were much more likely than those with relatively high proportions of such students to have library media centers equipped with this technology.

Progress

To benefit fully from educational opportunities, individuals must show evidence of their development through and completion of various levels of education. Thus, it is just as important to monitor students' progress as it is to monitor their access and participation.

Children who experience problems in school during their early years may be at a higher risk for experiencing similar problems later on. Twenty percent of first- and second-graders aged 6–8 had parents who reported that they had academic problems with school work in 1995 (down from 24 percent in 1991) (*Indicator 3*). Black first- and second-graders were more likely than their white or Hispanic peers to have academic problems. In addition, the education level of parents was related to their children's behavioral problems and problems with school work: The lower the parents' education level, the more likely they were to report that their children had behavioral problems and problems with school work.

Students who repeat one or more grades are at greater risk of dropping out of school. In 1992 and 1995, about 10 percent of all children aged 5–17 had repeated at least one grade (*Indicator 4*). Children who had a disabling condition were more likely

than children who did not have a disabling condition to repeat a grade in 1995 (25 versus 9 percent); however, unlike other children, the percentage of children who had a disabling condition and who repeated a grade declined between 1992 and 1995 (from 29 to 25 percent).

Because dropping out of school has negative economic and social consequences, it is important to monitor dropout rates. In October 1995, 6 percent of the students who had been in grades 10–12 a year earlier left without graduating (*Indicator 7*). Black and Hispanic students were more likely than white students to drop out, as were students from low income families compared to students from middle or high income families.

Subbaccalaureate programs offer occupationally specific training or may serve as the first step toward attaining a bachelor's degree. Many of those who enroll in these programs do not complete them, at least within 5 years. Of students who enrolled in postsecondary education for the first time in the 1989–90 academic year, 57 percent of those working toward an associate's degree and 46 percent of those seeking a certificate had not attained any degree by spring 1994 (*Indicator 11*). Attending part time and (for associate's degree seekers) delaying enrollment for at least 1 year after high school graduation were associated with lower completion rates.

Working while enrolled helps students better afford postsecondary education, but working a substantial amount may have negative consequences for persistence and attainment. Five years after their initial enrollment, students who began postsecondary education in the 1989–90 academic year and who worked full time (34 or more hours per week) were less likely than those who worked part time to have earned a degree or to be still enrolled (*Indicator 13*).

Preprimary education enrollment

Participating in early childhood programs such as nursery school, prekindergarten, Head Start, and kindergarten can better prepare a child to enter first grade. Many policymakers and educators believe that it is important to help children from disadvantaged backgrounds start elementary school on an equal footing with other children. Involving these students and their parents in preprimary programs beginning at earlier ages may provide them with valuable experiences that will help them start elementary school better prepared to learn.

- Preprimary education enrollment rates for 3-, 4-, and 5-year-olds were higher in 1995 than in 1991. In 1995, 37 percent of 3-year-olds, 61 percent of 4-year-olds, and 90 percent of 5-year-olds were enrolled in preprimary education.
- In 1995, similar percentages of white and black 3- and 4-year-olds were enrolled in center-based programs and kindergarten, while their Hispanic peers were less likely to be enrolled. In both 1993 and 1995, blacks and Hispanics were more likely than whites to be enrolled in kindergarten at age 5 (see supplemental tables 1-1 and 1-2).
- In 1991, 1993, and 1995, 3- and 4-year-olds from families with incomes of more than \$50,000 were more likely to be enrolled than 3- and 4-year-olds from families with incomes of \$50,000 or less.
- There was a positive relationship between parents' educational attainment and preprimary education enrollment rates of 3- and 4-year-olds: As parents' educational attainment increased, so did the preprimary enrollment rates of their children.
- In both 1993 and 1995, preprimary education enrollment rates for children aged 3 and 4 who lived with one biological or adoptive parent were similar to those of children who lived with two biological or adoptive parents.

Early literacy activities in the home

Participating in literacy activities with family members provides valuable developmental experiences for young children. In addition to developing an interest in reading, children who are read to or told stories and who visit the library may start school better prepared to learn. Engaging young children in literacy activities at home also provides parents and family members with the opportunity to become actively involved in their children's education at an early age.

- In 1995, more than 80 percent of children aged 3–5 were read to or told a story in the past week by a parent or family member, while 41 percent had visited a library in the past month. The percentage of children who participated in these literacy activities increased between 1991 and 1995.
- In 1995, children aged 3–5 who were not enrolled in preprimary education were as likely to have been told a story at home at least once in the past week as those 3- to 5-year-olds who were enrolled in center-based programs or kindergarten. However, children aged 3–5 who were not enrolled in preprimary education were less likely to have visited a library in the past month than children who were enrolled in center-based programs or kindergarten.
- White children aged 3–5 were more likely to have been read to or told a story in the past week than their black and Hispanic counterparts. In addition, white children were more likely to have visited a library in the past month than their black and Hispanic peers.
- There was a positive relationship between the education level of parents and their children's participation in early literacy activities: As parents' education level increased, so did their children's participation rates in early literacy activities.

Percentage of children aged 3–5 who participated in various literacy activities with a parent or family member, by selected characteristics: 1991 and 1995

Early signs of school problems

Children who experience behavioral or academic problems early in school may be more likely to experience similar problems later on. Children with poor academic performance often require more individual time from teachers, and children who misbehave in school can disrupt the classroom environment for other students. Data on the extent of early behavioral and academic problems in school may help heighten school administrators' awareness of these problems among students with different background characteristics.

- Between 1991 and 1995, the percentage of first- and second-graders aged 6–8 whose parents reported that they had behavioral problems and problems with school work decreased (from 23 to 19 percent and 24 to 20 percent, respectively).
- Black first- and second-graders were more likely than their white and Hispanic peers to have their parents report that they had behavioral problems or problems with school work in 1995.
- The education level of parents was also related to their children's behavioral problems and problems with school work: Parents with a high school diploma or less were generally more likely to report that their children had these problems than parents with a bachelor's degree or higher.

Percentage of first- and second-graders aged 6–8 whose parents reported they had behavioral and/or academic problems in school, by selected characteristics: 1991 and 1995

Selected characteristics	Behavioral problems ¹		Problems with school work ¹		Academically below the middle of the class ²

Grade retention, by English language usage and proficiency, and disability status

Studies have shown that students who repeat at least one grade are more likely to drop out of school. Students who have difficulty speaking English or who have disabling conditions already start school at a disadvantage, and although retaining these students may be a way to allow them to "catch up" to their grade level peers, it may also further stigmatize them. Knowledge of the differences in relationships between grade retention and English language proficiency and/or disability status can help school administrators develop effective grade retention policies and services for these students.

- In 1995, 13 percent of students aged 5–17 spoke a language other than English at home; 5 percent had difficulty speaking English; and 8 percent had a disabling condition.
- The retention rate of children aged 5–17 who spoke Spanish at home in 1995 was similar to the retention rate of children aged 5–17 who spoke English at home (10 percent). However, retention rates varied by language spoken: The retention rate for children aged 5–17 who spoke only English at home was higher than that of children who spoke an Asian or other European language at home.
- Children aged 5–17 who had a disabling condition were more likely to repeat at least one grade in 1995 than were children aged 5–17 who did not have a disabling condition (25 versus 9 percent). The percentage of children aged 5–17 who had a disabling condition and who repeated at least one grade decreased between 1992 and 1995, declining from 29 to 25 percent, while the percentage of children who did not have a disabling condition and who repeated at least one grade remained similar.

Percentage of all children aged 5–17 and those who repeated at least one grade, by English language usage and proficiency, and disability status: October 1992 and 1995

English language usage and proficiency, and disability status	All children		Repeated at least one grade

Student computer use

In our increasingly technological society, computers are an essential tool. Through computers, students can access information, manipulate data, and produce results in ways that were unimaginable just a short time ago. Early exposure to computers in school can help young people gain the technological literacy that will be crucial for success in tomorrow's schools, as well as tomorrow's jobs. Changes in the frequency of student computer use and the ways in which students are using computers are indicators of the degree to which they are taking advantage of the full power of these tools.

- Between 1984 and 1994, there was a large increase in the percentage of 4th-, 8th-, and 11th-grade students who reported using a computer at school at least once a week. This increase was paralleled by a similar decrease in the percentage of students who reported never using a computer at school.
- Younger students reported using computers more frequently than did older students. In 1994, 70 percent of 4th-graders reported using a computer at school at least once a week, compared with 46 percent of 8th-graders and 43 percent of 11th-graders. Older students were more likely to use computers every day, however.
- In 1994, more than two-thirds of 4th-graders and at least 80 percent of 8th- and 11th-graders reported using a computer to write stories or papers, a substantial increase from 1984. The percentage of students who reported using a computer to learn things also increased between 1984 and 1994 for all three grades, while the percentage of students who reported using a computer to play games remained relatively constant for 8th- and 11th-graders.
- Students from high income families have continued to be more likely to report using a computer than students from low income families. While the percentage of students who reported using a computer at school increased by similar amounts across family income levels, between 1984 and 1993, the increase in the percentage of students who reported using a computer at home was higher for students from families with higher incomes (see supplemental table 5-1).

School library media center resources

Historically, libraries have been an important component of the educational process, contributing to the success of the educational mission of schools. Education reform has prompted increased attention to the role school library media centers might play in the expanding role of computer- and technology-based education. However, policymakers have expressed concern that school library media centers have suffered from inadequate resources and support. Differences in library resources between schools can indicate how technology-based equipment and services are distributed as well as student accessibility to these resources.

- In school year 1993–94, about one-third of public school library media centers had computers with modems, automated circulation systems, and database searching capability with CD-ROM; 9 percent had on-line database searching capability; and 47 percent had the capability to use compact-disc-based periodical indices.
- Library media centers in public schools with less than 20 percent minority enrollment were more likely to have computers with modems, database searching capability with CD-ROM, and on-line database searching capability than library media centers in schools with 20 percent or more minority enrollment.
- In school year 1993–94, the availability of resources and services provided by library media centers was directly related to the poverty level of the school. For example, schools with low poverty levels (5 percent or less of students eligible for free or reduced-price lunch) were more likely than schools with high poverty levels (41 percent or more of students eligible for free or reduced-price lunch) to have library media centers equipped with computers with modems, an automated circulation system, database searching capability with CD-ROM, on-line database searching capability, and connection to the Internet.
- Public school library media centers were far more likely to have computers with modems, automated circulation systems, database searching capability with CD-ROM, and a connection to the Internet than were private school library media centers (see supplemental table 6-1).

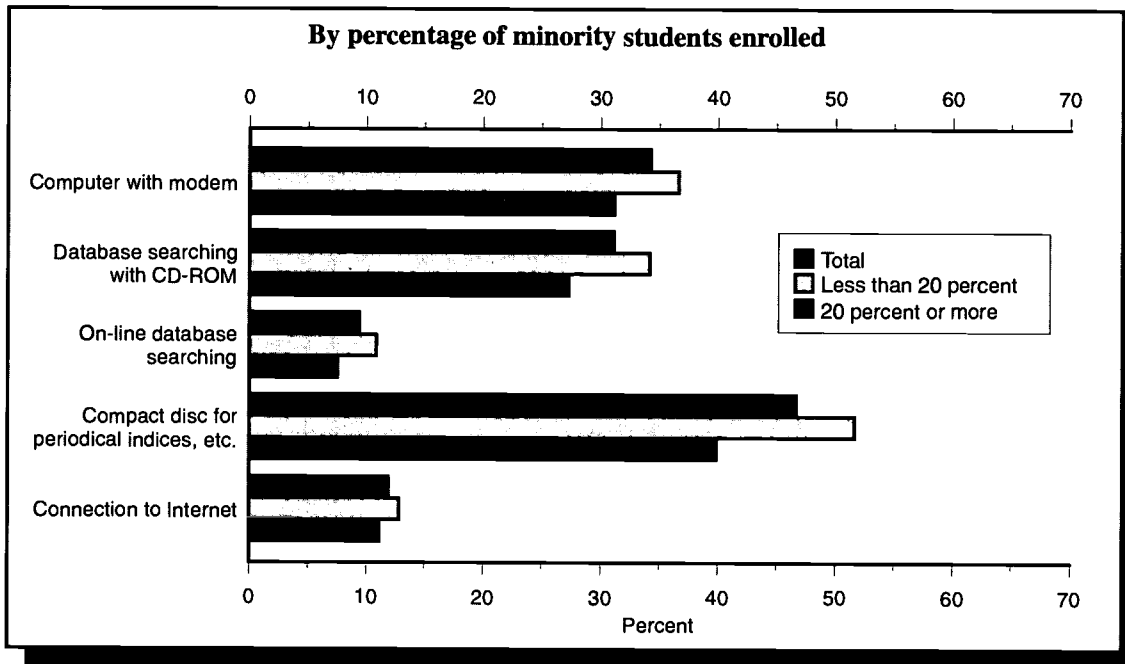

Percentage of public school library media centers that offered selected services and equipment, by selected school characteristics: School year 1993–94

Recent school dropouts

Students who drop out of school have fewer opportunities to succeed in the work force or to assume a fully functional place in society at large than those students who complete high school. The event dropout rate, a measure of the proportion of students who drop out in a single year without completing high school, is one of several ways to define dropout rates.

- In October 1995, 6 percent of students who were in grades 10–12 the previous October were not enrolled again and had not graduated from high school—that is, they dropped out of high school sometime during the year.
- In 1995, Hispanic students were more likely than white students to drop out (12 compared to 5 percent, respectively). Although the dropout rate for black students fell between the rates for Hispanic and white students, there were no measurable differences in the dropout rates of black and white students or in the rates of black and Hispanic students.
- Between 1990 and 1995, high school students whose parents did not finish high school were, on average, three times more likely to drop out than those students whose parents had at least some college education (see supplemental table 7-1).

Event dropout rates¹ for those in grades 10–12, aged 15–24, by sex, race/ethnicity, and family income: Selected Octobers 1972–95

October	Total	Sex		Race/ethnicity ²			Family income ³		
		Male	Female	White	Black	Hispanic	Low	Middle	High
1972	6.1	5.9	6.3	5.3	9.5	11.2	14.1	6.7	2.5
1974	6.7	7.4	6.0	5.8	11.6	9.9	—	—	—

— Not available.

¹ The event dropout rate is the percentage of those in grades 10–12, aged 15–24, who were enrolled the previous October, but who were not enrolled and had not graduated the following October.

² Included in the total but not shown separately are dropouts from other racial/ethnic groups.

³ Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent in-between.

⁴ In 1994, new survey collection techniques and population weighting were used. See the supplemental note to this indicator for further discussion.

NOTE: Beginning in 1992, the Current Population Survey (CPS) changed the questions used to obtain the educational attainment of respondents. See the supplemental note to this indicator for further discussion.

Immediate transition from high school to college

Since most college students enroll in college immediately after completing high school, the percentage of high school graduates enrolled in college the October following graduation is an indicator of the total proportion of that year's high school graduates who will ever enroll in college. The percentage enrolling not only reflects the accessibility of higher education to high school graduates but also shows their assessment of the value of attending college as compared to working, entering the military, traveling, or other possible pursuits.

- Between 1972 and 1995, the proportion of high school graduates going directly to college increased from 49 to 62 percent.
- Between 1972 and 1995, high school graduates from high income families were more likely than high school graduates from low income families to go directly to college.
- Between 1990 and 1995, the higher the education level of a student's parents, the more likely the student was to enroll in college the year after high school graduation (see supplemental table 8-1).
- In 1995, black high school graduates were less likely than their white counterparts to go directly to college (51 compared to 64 percent, respectively).

Percentage of high school graduates aged 16–24 who were enrolled in college the October following graduation, by type of institution, family income, and race/ethnicity: Selected Octobers 1972–95

Postsecondary enrollment rates among the high school classes of 1972, 1980, and 1992

As the earnings gap between high school and college graduates widens, postsecondary education becomes more attractive to graduating high school seniors. The proportion of seniors enrolling in postsecondary programs after graduation is a measure of access to postsecondary education, as well as its perceived value among students. Comparing these enrollment rates across several years may indicate changes in access to and the perceived value of postsecondary education.

- The percentage of high school seniors enrolling in any postsecondary institution within 2 years of their scheduled graduation increased from 61 percent of the class of 1972 to 72 percent of the class of 1992.
- Between 1974 and 1994, enrollment rates in 2-year institutions increased 8 percentage points, and enrollment rates in 4-year institutions increased 7 percentage points. During the same period, enrollment rates in vocational, technical, and trade schools declined (see supplemental table 9-1).
- Between 1974 and 1994, postsecondary enrollment rates of low and high socioeconomic status (SES) students increased similar amounts (7 and 6 percentage points), but in different types of institutions. Postsecondary enrollment rates of low SES students increased at 2-year institutions only, while postsecondary enrollment rates of high SES students increased at 4-year institutions.
- In 1994, within achievement test quartiles, low SES students were less likely than high SES students to enroll in 4-year institutions, except low SES students in the top two achievement test quartiles were more likely to enroll in 2-year institutions than their high SES counterparts.

Percentage of students who attended a postsecondary institution within 2 years following scheduled high school graduation, by socioeconomic status, achievement test quartile in high school, and highest level of institution attended: 1974, 1982, and 1994

Racial and ethnic differences in participation in higher education

Racial and ethnic differences in college enrollment rates may reflect differences in access to and persistence in higher education for groups with varying social and economic backgrounds. Differing enrollment rates are also a leading indicator of future differences in the earnings and productivity associated with postsecondary education. The college enrollment rate for 18- to 24-year-olds is influenced by the number who enroll immediately after graduating from high school, the number who delay entry, and the number of years individuals in both of these groups stay in higher education.

- Between 1993 and 1995, white high school graduates aged 18–24 were more likely to be enrolled in college than were their black and Hispanic counterparts. For these years, the average enrollment rate for whites was 9 percentage points higher than that of both blacks and Hispanics.
- The percentage of high school graduates aged 18–24 enrolled in college was higher in 1995 than in 1972 for whites and blacks. During this period, the college enrollment rates for whites grew substantially (11 percentage points), with most of the growth occurring after 1981. College enrollment rates for blacks of the same age group grew moderately over the period (8 percentage points).
- Between 1993 and 1995, enrollment rates in 2-year institutions were similar for white and black high school graduates aged 18–24, while Hispanics were more likely than whites or blacks to be enrolled in 2-year institutions. However, both black and Hispanic high school graduates aged 18–24 were substantially less likely to be enrolled in 4-year institutions than were their white counterparts (see supplemental table 10-1).
- Enrollment rates for older adults, high school graduates aged 25 or older, were much lower than those for their younger counterparts aged 18–24 regardless of racial and ethnic group. Between 1993 and 1995, college enrollment rates were similar for white, black, and Hispanic high school graduates aged 25–34.

Percentage of high school graduates enrolled in college, by age and race/ethnicity: Selected Octobers 1972–95

Subbaccalaureate persistence and attainment

About half of first-time beginning students report working toward either an associate's degree or a certificate. These subbaccalaureate programs can offer occupationally specific training for immediate transition into the labor market or serve as a stepping stone to bachelor's degree programs. To help ensure successful outcomes for the increasing number of students seeking these credentials, it is crucial to understand the particular enrollment patterns associated with their completion.

- Forty-three percent of 1989–90 beginning postsecondary students seeking an associate's degree had attained some degree or certificate 5 years after initial enrollment: 8 percent earned a bachelor's degree; slightly less than a quarter (23.7 percent) earned an associate's degree; and 11 percent earned a certificate. Students who did not earn a degree were enrolled for an average of 19 months.
- Certificate seekers were more likely than associate's degree seekers to attain a postsecondary credential (55 versus 43 percent, respectively). Within 5 years of initial enrollment in postsecondary education, half (50 percent) had earned a certificate, and 4 percent had earned an associate's degree. Students who had not earned a credential were enrolled an average of 11 months.
- Regardless of initial degree objective, students who enrolled full time were more likely to attain either the degree they sought or a bachelor's degree than those who were enrolled less than full time.
- Associate's degree seekers who delayed entry into postsecondary education by at least 1 year were much less likely to complete an associate's or bachelor's degree within 5 years than their counterparts who did not delay.

Percentage distribution of 1989–90 beginning postsecondary students seeking an associate's degree or certificate, by persistence and attainment as of spring 1994 and selected enrollment characteristics

College costs and family income

Families' ability to afford college for their children depends on many factors, including tuition levels, availability of financial aid, family income and assets, and family size. Tuition, room, and board are a measure of the gross price of college. The average cost for tuition, room, and board as a percentage of family income is an indicator of the affordability of a college education.

- Between 1980 and 1995, college costs (tuition, room, and board) rose in both public and private institutions, but increased more at private colleges (from \$9,908 to \$17,474, in 1996 constant dollars) than at public colleges (from \$4,298 to \$6,349 in 1996 constant dollars).
- After a period of decline in the 1960s and 1970s, average tuition, room, and board at public institutions rose to 15 percent of median family income in 1993 and has remained stable since. At private institutions, the pattern was similar, but average tuition, room, and board as a percentage of median family income increased to 42 percent of median family income in 1995.
- Between 1980 and 1995, tuition, room, and board at public institutions increased from 11 to 15 percent of median family income. This increase was larger for lower income families than for higher income families: It increased from 22 to 32 percent for families at the 20th percentile of family income, compared to an increase from 7 to 9 percent for families at the 80th percentile.

Average undergraduate tuition, room, and board (in 1996 constant dollars) as a percentage of selected percentiles of income of all families, by control of institution: Selected years 1964-95

Year	Public Institutions				Private Institutions			
	Tuition, room, and board	Family income percentile			Tuition, room, and board	Family income percentile		
		20th	50th	80th		20th	50th	80th

Employment and postsecondary persistence and attainment

Faced with the rising costs of higher education, students are increasingly opting to work in order to help finance their postsecondary education. Although the experience gained from working while enrolled may ease students' transition to full-time employment after completing a degree, students who work full time have less time available to commit to studies.

- Five years after their initial enrollment in 1989–90, 89 percent of beginning postsecondary students had worked at some time while enrolled. The majority of students (75 percent) worked part time (less than 34 hours per week), but 15 percent worked full time (34 or more hours per week).
- Students who first enrolled in 4-year institutions were more likely than those who started at public 2-year or private, for-profit institutions to work 1–15 hours per week, while students in public 2-year or private, for-profit institutions were more likely than those in 4-year institutions to have worked 34 or more hours per week. Students who first enrolled in private, for-profit institutions were less likely than students who started in other types of institutions to report working while enrolled.
- Regardless of the type of institution first attended, students who worked full time were less likely than students who worked part time (1–33 hours) to have attained a degree or to still be enrolled 5 years after their initial entry into postsecondary education. Overall, 31 percent of students who worked full time while enrolled attained a degree or were still enrolled compared to 79 percent of students who worked 1–15 hours per week and 65 percent of those who worked 15–33 hours per week.
- Students who work full time may need to adjust the intensity of their enrollment. Students who worked full time (34 or more hours per week) were more likely than students who worked part time to attend exclusively part time (see supplemental table 13-1). At each type of institution, those who attended exclusively part time were less likely to persist and attain 5 years after their initial entry into postsecondary education than their counterparts who attended sometimes or always full time (see supplemental table 13-2).

Percentage of 1989–90 beginning postsecondary students, by average hours worked per week while enrolled and control and type of first institution: 1994

Control and type of first institution	Did not work	Average hours worked per week while enrolled*		
		Less than 15 hours	15–33 hours	34 or more hours
Total	10.9	31.2	43.4	14.5

Skill improvement training among currently employed workers

In the face of changing technologies, work methodologies, and markets, firms and workers benefit from education or training that upgrades or reorients workers' skills. The proportion of workers participating in skill improvement training for their current job is one indicator of the extent to which firms invest in the re-education of the employed work force. Differences in the proportions of workers who receive training provide an indication of which professions view training as a valuable investment.

- Between 1991 and 1995, the percentage of employed workers who participated in skill improvement training for their current job rose from 30 to 32 percent, increasing for both full- and part-time workers.
- In 1995, females were more likely than males to participate in skill improvement training for their current job.
- Individuals aged 35–54 years old were more likely to participate in skill improvement training for their current job than workers in other age groups in 1995.
- The percentage of workers who participate in skill improvement training is related to their education, occupation, and work status. In both 1991 and 1995, college graduates, workers in executive, professional, and technical occupations, and those employed full time were more likely than other workers to participate in training to improve their current job skills.

Percentage of employed individuals who took one or more courses during the previous 12 months to improve their current job skills, by work status and worker characteristics: 1991 and 1995

Worker characteristics	All workers		Full-time		Part-time

Achievement, Attainment, and Curriculum

Indicators of what students have learned in school are perhaps the most important measures of the outcomes of education. Although performance on examinations is one measure of what students have learned in school, examinations do not measure the wide array of skills and experiences that formal education provides. Educational attainment (e.g., finishing high school or college) is not only an indirect measure of how much subject matter students may have learned but also of how much knowledge students potentially have gained in learning civic responsibilities, social skills, work ethics, and life skills. Furthermore, information about courses taken in high school and fields of study in college is an additional indirect indicator of the content of students' knowledge.

Achievement

The National Assessment of Educational Progress (NAEP) has assessed students' knowledge in reading, writing, science, mathematics, and other subjects for more than 20 years. Average reading proficiency among 9-year-olds increased slightly between 1971 and 1994, while among 13-year-olds it remained about the same; for 17-year-olds, reading scores increased between 1971 and 1988, and then remained stable between 1988 and 1994 (*Indicator 15*). Across all grade levels, average writing proficiency either remained the same or decreased between 1984 and 1994 (*Indicator 16*). Overall, the reading and writing habits of students did not change much over the past 10 years, with a few exceptions. For example, in 1994, more 9-year-olds reported reading for fun every day than in 1984: More 8th-graders reported writing stories outside of school, and more 11th-graders reported keeping a diary or journal. Also, more 9- and 13-year-olds reported that they were required to do more reading in 1994 than in 1984 (*Indicator 17*).

Mathematics achievement is assessed through NAEP for 9-, 13-, and 17-year-olds and through the Graduate Record Examination (GRE) for college graduates intending to continue their education. NAEP shows that average mathematics proficiency among 9- and 13-year-olds was slightly higher in 1994 than in 1973, and among 17-year-olds, it was about the same in 1994 as in 1973 after declining in the late 1970s (*Indicator 18*).

According to NAEP, average science proficiency among 9-year-olds was higher in 1994 than in 1970;

among 13-year-olds, it was about the same in 1994 as in 1970; and among 17-year-olds, it was lower (*Indicator 19*).

NAEP further shows that although overall scores have changed little over the last two decades, the large gaps in achievement between whites and minorities have narrowed somewhat. In particular, blacks have improved relative to whites in mathematics and science. For example, in 1973, average mathematics proficiency scores for 17-year-old blacks and Hispanics were well below those of 17-year-old whites (40 and 33 scale points, respectively). Although the gap was still large in 1994, the mathematics proficiency scores for 17-year-old white students increased only 2 scale points between 1973 and 1994, and the scores for 17-year-old blacks and Hispanics increased 16 and 14 scale points, respectively (*Indicator 18*).

In 1994, history and geography achievement were also assessed through NAEP (*Indicators 18 and 19, Condition 1996*). U.S. history scores of whites and Asians were higher than those of blacks and Hispanics across all three grade levels; however, the differences between the scores of blacks and whites and of Hispanics and whites were smaller in 8th and 12th grades than in 4th grade. In geography, at all three grade levels, males outperformed females; white and Asian students outperformed black and Hispanic students; and Hispanic students outperformed black students.

Students participating in the Advanced Placement (AP) program may acquire college credit for their knowledge of college-level subjects. Measuring the number of students who participated in AP examinations each year shows the level of importance students, schools, and colleges place on the AP program. Between 1984 and 1995, the number of students taking AP examinations increased dramatically, rising from 24 students per 1,000 11th- and 12th-grade students to 66 per 1,000. Overall, more females than males took AP examinations in 1995; however, males were more likely to take examinations in calculus and science and to score at or above level 3 in those subjects (*Indicator 25*).

International comparisons

International comparisons of student achievement are available in basic reading literacy, mathematics, and science. Generally, U.S. students compare favorably to their counterparts in other large in-

dustrialized countries in reading, and less favorably in mathematics and science; nevertheless, in 1994, eighth-graders from the United States scored higher in science than eighth-graders in France, about the same as their counterparts in Canada and Germany, and lower than their counterparts in Japan and England (Indicator 20, *Condition 1996* and *Indicator 20*).

Adult literacy

In 1992, the literacy of adults aged 16 and older was assessed in three areas: prose, document, and quantitative. Approximately 20 percent of the adults in the United States performed at a low proficiency level. In each of the three areas, scores of whites averaged 67 to 75 points higher than those of Hispanics, and 50 to 63 points higher than those of blacks. In addition, older Americans had lower literacy scores than younger Americans, and adults with more education had higher literacy scores than adults with less education (*Indicator 21* and tables 20-1 and 20-3, *Condition 1994*).

Adult literacy was assessed across seven countries in 1994. Relative to most other countries assessed, the United States had a large concentration of adults score at the highest literacy levels across the prose, document, and quantitative literacy domains. However, the United States also had a greater concentration of adults score at the lowest levels of literacy (*Indicator 21*).

Attainment

High school completion

In 1996, 87 percent of all 25- to 29-year-olds had a high school diploma or an equivalency certificate, up from 78 percent in 1971. However, the completion rate varied among racial/ethnic groups. For example, in 1996, 93 percent of whites had a high school diploma or the equivalent, compared to 86 percent of blacks and 61 percent of Hispanics. Blacks showed the most improvement: the percentage of blacks earning a high school diploma or equivalency certificate rose 27 percentage points between 1971 and 1996, compared to 11 and 13 percentage points for whites and Hispanics, respectively (*Indicator 22*). In terms of high school attainment, the United States compares favorably to other large industrialized countries. For instance, the United States has a similar or higher percent-

age of 25- to 64-year-olds who have completed high school than many other countries. However, with respect to young adults aged 25–34, several other nations approach or surpass U.S. secondary education completion rates (*Indicator 23*).

College attainment

In 1996, among 25- to 29-year-olds who had completed high school, 65 percent had completed at least some college, and 31 percent had earned a bachelor's degree or higher (*Indicator 22*). In the United States, a larger proportion of adults had earned college degrees compared to their counterparts in most other industrialized countries (*Indicator 23*).

Curriculum

The courses students take in high school and college are an indirect indication of the content of students' knowledge. A greater percentage of 1994 than 1982 high school graduates earned the number of units in the core courses—4 units in English, and 3 each in science, social studies, and mathematics—recommended in *A Nation at Risk* (Indicator 28, *Condition 1996*). In 1994, 51 percent of high school graduates earned at least this number of credits in the core subjects, compared to 14 percent in 1982. The class of 1994 took more mathematics and science courses in high school than did 1982 graduates, particularly geometry, algebra II, biology, and chemistry (*Indicator 24*).

Remedial courses are often needed in higher education to bridge the gap between high school and college curricula. In 1995, 78 percent of higher education institutions offered remedial courses, up slightly from 1989. One out of three college freshmen enrolled in a remedial course in either year. More students took remedial mathematics in 1995 than either remedial reading or remedial writing (*Indicator 26*).

The fields of study students choose to pursue at the postsecondary level affect both the demand for courses and faculty and the supply of new graduates in different fields. Business management is the most popular major in college: 21 percent of all bachelor's degree recipients in 1994 majored in this subject area (*Indicator 27*). At the graduate level, males were still twice as likely as females to earn degrees in business, although the gap has narrowed significantly since the early 1970s (*Indicator 28*).

Trends in the reading proficiency of 9-, 13-, and 17-year-olds

A student's ability to read is essential to the educational process. If students fall behind in reading proficiency, they may find it difficult to benefit from other aspects of the curriculum. In the future, poor readers may also find it difficult to participate effectively in an economy requiring increasingly sophisticated job skills.

- Overall, reading proficiency for 9-year-olds improved between 1971 and 1980, declined slightly between 1980 and 1990, and remained stable between 1990 and 1994. Little change occurred from 1971 to 1994 at ages 13 and 17, although scores for 17-year-olds increased slightly between 1971 and 1988.
- Females continued to outscore males in reading proficiency at all age groups.
- Although black students have made no progress in reading since 1988, the average reading proficiency of black students was higher in 1994 than in 1971. Consequently, the gap between white students and their black counterparts decreased at ages 9 and 17 during this time period.
- There is evidence that reading proficiency increases more between ages 9 and 13 than between ages 13 and 17. For example, in 1994, there was an average proficiency difference of 47 scale points between 9- and 13-year-olds, and 30 scale points between 13- and 17-year-olds. This pattern holds for both genders and all racial/ethnic groups.

Trends in writing proficiency in grades 4, 8, and 11

Effective writing skills are important in all stages of life from early education to future employment. In school, as well as in the business world, students often must convey complex ideas and information in a clear, succinct manner. Inadequate writing skills, therefore, could inhibit achievement across curriculum and in future careers, while proficient writing skills help students convey ideas, deliver instructions, analyze information, and motivate others.

- Despite some fluctuations throughout the years, the average writing proficiency for fourth-grade students was about the same in 1994 as in 1984. Eighth-grade writing scale scores declined between 1984 and 1990, increased in 1992, and then dropped back down to their original level in 1994. Eleventh-grade scores were slightly lower in 1994 than in 1984.
- Females have outscored males in writing proficiency at all levels since 1984.
- Scores for black and Hispanic students have remained relatively unchanged since 1984 at all grade levels. Although scores have dropped slightly for white 11th-graders between 1984 and 1994, white students continue to outscore black and Hispanic students at all grade levels.
- In 1994, 85 percent of 11th-graders could write focused, clear responses (level 250); 33 percent were generally able to write complete, sufficient responses (level 300); and 3 percent provided effective, coherent responses (level 350) (see supplemental table 16-2).
- In 1994, fourth-grade scores ranged from 140 at the 5th percentile to 266 at the 95th percentile. At the eighth-grade level, the median score (50th percentile) was 266, indicating that the highest scoring fourth-graders achieved the same proficiency as the average scoring eighth-graders (see supplemental table 16-3).

Reading and writing habits of students

Research has shown that reading ability is positively correlated with the extent to which students read recreationally. Educators are increasingly encouraging their students to read and write on their own, outside of school. Changes in the frequency with which students read and write independently, as well as in the types of materials students read and write, indicate the degree to which recreation activities related to education are supported outside of the classroom.

- Independent reading and writing habits of students have remained relatively stable across all age groups since 1984, with a few exceptions. For example, although the percentage of students writing letters, notes, or messages has remained nearly constant over the years, more 8th-graders in 1994 reported writing stories outside of school at least once a week than in 1984. Also, between 1984 and 1994, the percentage of 8th- and 11th-grade students who reported keeping a diary or journal increased.
- Between 1984 and 1994, a greater percentage of 9-year-olds than 13- and 17-year-olds reported reading for fun almost every day. In addition, 4th-grade students were more likely than 8th- or 11th-grade students to report that they wrote stories outside of class at least once a week.
- In 1994, 9-, 13-, and 17-year-old students who reported reading for fun at least once a week had higher average reading proficiency scores than students who reported never or hardly ever reading for fun (see supplemental table 17-1).
- In 1994, the types of materials students read both at home and at school varied. For all ages, students reported having most recently read a science, social studies, or mathematics book in school than at home, while they reported most recently reading magazines more at home than in school. Nine-year-olds and 13-year-olds reported having most recently read stories more at home, while 17-year-olds reported reading stories more at school (see supplemental tables 17-2 and 17-3).

Percentage of students who read for fun, by frequency and age: Selected years 1984-94

Frequency	Age 9					Age 13					Age 17

Trends in the mathematics proficiency of 9-, 13-, and 17-year-olds

Proficiency in mathematics is an important outcome of education. In addition, knowledge of mathematics is critical for success in science, computing, and a number of other related fields of study. In an increasingly technological world, the mathematics skills of the Nation's workers may be a crucial component of economic competitiveness.

- Average mathematics proficiency improved between 1978 and 1994 for all age groups, with the largest improvements occurring among 9- and 13-year-olds. Furthermore, on another mathematics assessment that reflects recent curricular emphasis and mathematics standards developed by the National Council for Teachers of Mathematics, scores increased for 4th-, 8th-, and 12th-graders between 1990 and 1996 (see supplemental table 18-2).
- Several states had significant increases in average mathematics scores between the early 1990s and 1996. Of the 38 jurisdictions in which 4th-graders participated in the assessment in both 1992 and 1996, 16 states had significant improvements in 1996, and of the 36 jurisdictions in which 8th-graders participated, 13 states showed significant improvements in 1996 (see supplemental table 18-3).
- Although whites continue to outscore blacks and Hispanics at all ages, white scores increased at a slower rate than black and Hispanic scores at ages 13 and 17, causing this gap to decrease for these age groups over the last 20 years.
- Between 1978 and 1994, the percentage of 17-year-olds scoring at or above level 250 increased from 92 to 97 percent; those scoring at or above level 300 increased from 52 to 59 percent, but those scoring at or above level 350 stayed at 7 percent (see supplemental table 18-4).

Trends in the science proficiency of 9-, 13-, and 17-year-olds

Competence in science is an important outcome of education. The ability to apply scientific information, interpret data, and make inferences about scientific findings is required in a world that relies heavily on technological and scientific advances.

- In 1994, average science achievement was higher at all three age levels than in 1982. Following a period of decline in the 1970s, scores were higher at age 9 in 1994 than 1970, about the same at age 13, and lower at age 17.
- In 1994, the average science proficiency of blacks and Hispanics remained well below that of whites. However, between 1977 and 1994, the proficiency gap decreased between whites and blacks at age 9 and between whites and Hispanics at age 13.
- A higher percentage of 9-, 13-, and 17-year-olds demonstrated general science skills by reaching level 250 in 1994 than in 1982. In addition, more 17-year-olds reached levels 300 and 350 in 1994, exhibiting detailed knowledge and analytical understanding of scientific principles and the ability to integrate specialized scientific information (see supplemental table 19-2).
- There is a great deal of variation in science proficiency scores within an age group. For example, in 1994, the proficiency of white 9-year-olds varied by 123 scale points from the 5th percentile to the 95th percentile. By comparison, the difference in the proficiency of median white 9-year-olds and white 17-year-olds was 66 scale points (see supplemental table 19-3).

International comparisons of mathematics and science performance of eighth-grade students

The technical and scientific skills of a nation's workers are a crucial component of its economic competitiveness. The recently completed Third International Mathematics and Science Study (TIMSS) assessed the mathematics and science performance of students around the world. By comparing the mathematics and science proficiency of eighth-graders in six wealthy industrialized countries, one can monitor our progress toward meeting the National Education Goal of being first in the world in mathematics and science achievement.

- In 1995, eighth-grade students from the United States scored lower, on average, in mathematics than students in Japan, France, and Canada, and scored about the same as students in Germany and England.
- In science, eighth-grade students from the United States scored higher, on average, than students in France, about the same as students in Canada and Germany, and lower than students in Japan and England.
- Eighth-grade boys and girls in the United States had similar average scores in both mathematics and science. Boys scored higher than girls in mathematics in Japan, and in science in Japan, England, Canada, Germany, and France.
- Mathematics and science proficiency varied widely among students within each country. Moreover, this degree of variation also differed across countries. For example, the difference between the 5th and 95th percentiles for mathematics scores in the United States was less than in Japan, but more than the difference in France. In science, the variation of scores in the United States was greater than in Canada, Japan, and France.

Average mathematics proficiency scores of eighth-grade students, by country and sex: 1995

International comparisons of adult literacy

In recent years, literacy has been viewed as one of the fundamental tools necessary for successful economic performance in industrialized societies. Literacy is no longer defined merely as a basic threshold of reading ability, but rather as the ability to understand and use printed information in daily activities, at home, at work, and in the community. As society becomes more complex and low skill jobs continue to disappear, concern about adults' ability to use written information to function in society continues to increase. Within countries, literacy levels are affected by both the quality and quantity of the population's formal education, as well as participation in informal learning activities.

- Compared to most of the other countries assessed in 1994, the United States had a greater concentration of adults who scored at the lowest literacy levels across the prose, document, and quantitative literacy domains. However, the United States had one of the higher concentrations of adults who scored at or above level 4 on the prose scale.
- In 1994, the proportion of adults who scored at each literacy level was similar across the three scales in Canada and the United States. In Germany, the Netherlands, and Switzerland, on the other hand, the proportion of adults who scored at the highest literacy level (level 4/5) was greater on the quantitative scale than on the prose scale.
- The distribution of literacy proficiency across different age groups was fairly uniform in the United States, with the exception of the oldest age group, while in several other countries, young adults had higher literacy levels than older adults. For example, the percentage of U.S. adults aged 26–35 who scored at or above level 4 on the prose scale was similar to the percentage of U.S. adults aged 46–55 scoring at that level (22 and 24 percent, respectively). Within Germany, the younger group was almost twice as likely to score at or above level 4 on the prose scale as the older group (20 and 11 percent, respectively). Differences in literacy proficiency by age in Switzerland, Sweden, and the Netherlands were similar to those in Germany (see supplemental table 21-1).
- Within particular occupations, the proportion of workers scoring at each literacy level varied across the assessed countries. For example, the proportion of skilled craft workers scoring at level 3 or above was lower in the United States than in other countries, particularly Germany (see supplemental table 21-2).

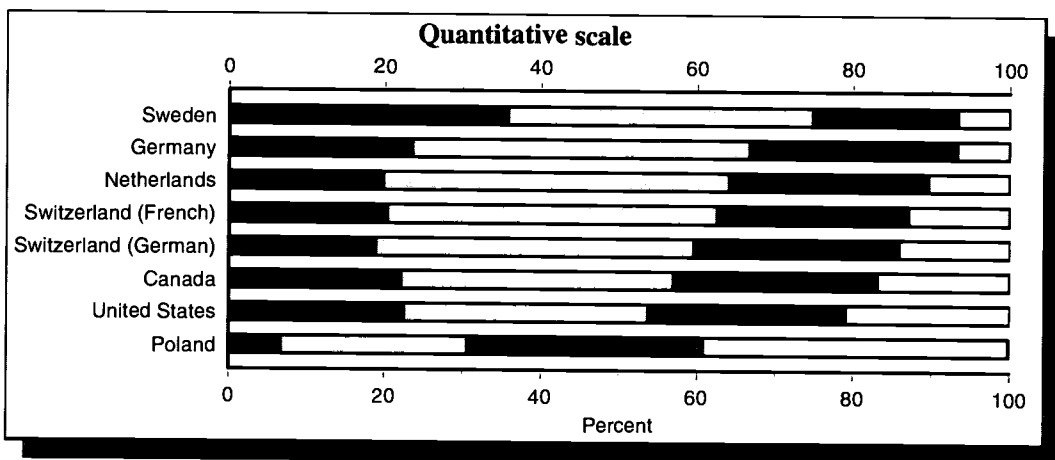

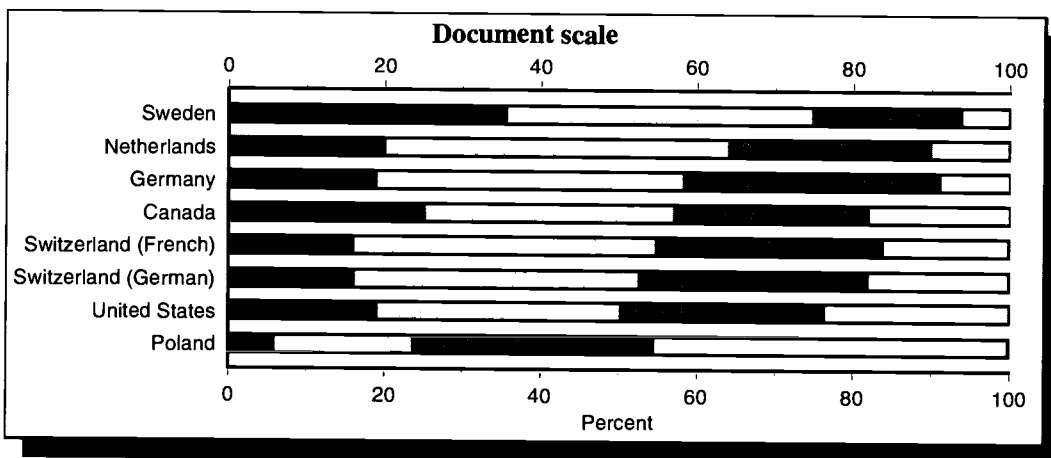

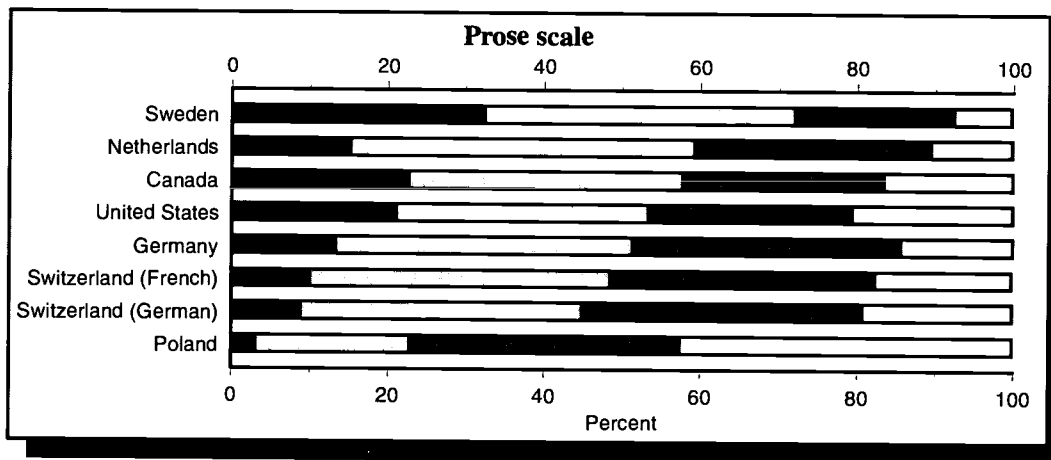

Percentage distribution of the population in selected countries scoring at each of the five literacy levels, by literacy scale: 1994

Country	Prose scale				Document scale				Quantitative scale			
	Level 1	Level 2	Level 3	Level 4/5	Level 1	Level 2	Level 3	Level 4/5	Level 1	Level 2	Level 3	Level 4/5
Canada	16.6	25.6	35.1	22.7	18.2	24.7	32.1	25.1	16.9	26.1	34.8	22.2
Germany	14.4	34.2	38.0	13.4	9.0	32.7	39.5	18.9	6.7	26.6	43.2	23.5
Netherlands	10.5	30.1	44.1	15.3	10.1	25.7	44.2	20.0	10.3	25.5	44.3	19.9
Poland	42.6	34.5	19.8	3.1	45.4	30.7	18.0	5.8	39.1	30.1	23.9	6.8
Sweden	7.5	20.3	39.7	32.4	6.2	18.9	39.4	35.5	6.6	18.6	39.0	35.8
Switzerland (French)	17.6	33.7	38.6	10.0	16.2	28.8	38.9	16.0	12.9	24.5	42.2	20.4
Switzerland (German)	19.3	35.7	36.1	8.9	18.1	29.1	36.6	16.1	14.2	26.2	40.7	19.0
United States	20.7	25.9	32.4	21.1	23.7	25.9	31.4	19.0	21.0	25.3	31.3	22.5

NOTE: The individuals who performed at level 1 demonstrated the lowest literacy proficiency, while those at level 5 displayed the highest literacy proficiency. See the supplemental note to this indicator for a description of the literacy scales and levels.

Educational attainment

Changes in educational attainment over time indicate changes in the demand for skills and knowledge in the work force. Also, changes in educational attainment can reflect the increasing emphasis society places on graduating from high school and college: Completing high school and college is an important educational accomplishment that yields many benefits to those who achieve it. Better job opportunities and higher earnings are examples of those benefits.

- The educational attainment of 25- to 29-year-olds increased between 1971 and 1996. The percentage of students completing high school rose from 78 to 87 percent; the percentage of high school graduates completing at least some college rose from 44 to 65 percent; and the percentage of high school graduates completing 4 or more years of college rose from 22 to 31 percent.
- While the educational attainment of blacks aged 25 to 29 in 1996 is below that of their white counterparts, it did increase between 1971 and 1996. However, the gap between black and white attainment decreased only for high school graduates. The percentage of blacks completing high school rose from 59 to 86 percent during this period.
- In 1996, fewer Hispanic 25- to 29-year-olds had completed high school than their black counterparts. The percentages of Hispanic and black high school graduates with some college or a bachelor's degree or more were similar.

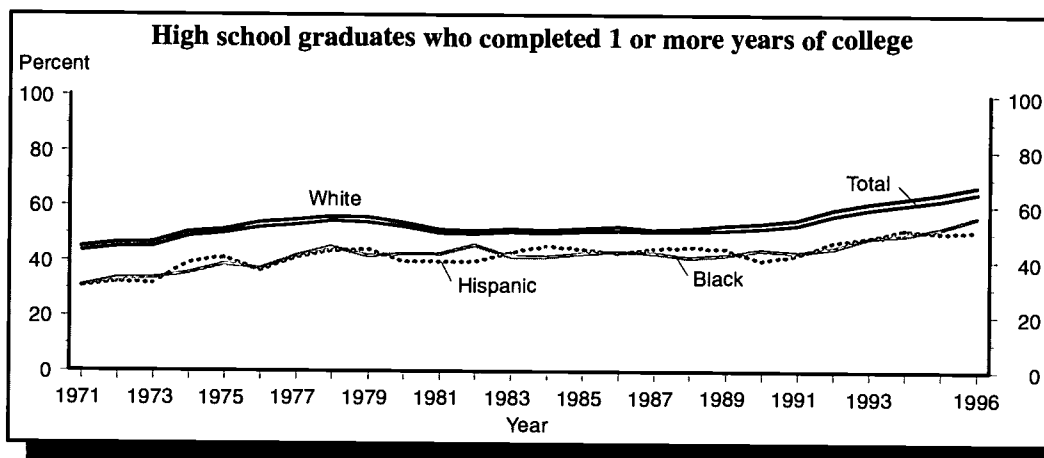

Percentage of 25- to 29-year-olds who have completed high school, and percentage of high school graduates who have completed 1 or more and 4 or more years of college, by race/ethnicity: Selected years March 1971-96

March	High school graduates				High school graduates completing:							
	Total	White	Black	Hispanic	1 or more years of college				4 or more years of college			
					Total	White	Black	Hispanic	Total	White	Black	Hispanic
1971	77.7	81.7	58.8	48.3	43.6	44.9	30.9	30.6	22.0	23.1	11.5	10.5
1973	80.2	84.0	64.1	52.3	45.3	46.6	33.5	31.6	23.6	24.8	12.7	10.8

International comparisons of educational attainment, by age

The percentage of the population completing secondary and higher education in the United States and other highly industrialized countries indicates the skill level of the U.S. work force as compared to the work force of our nation's economic competitors. In addition, contrasting the educational attainment of the general population to the attainment of younger aged cohorts provides a means of comparing past and recent progress in rates of completion of high school or college.

- The educational attainment of the U.S. population in 1994 was high compared to that of other large industrialized countries. A similar or higher percentage of 25- to 64-year-olds in the United States had completed secondary and higher education compared to their counterparts in Japan, Germany, the United Kingdom, France, Italy, or Canada.
- In 1994, 25- to 34-year-olds in Japan, Germany, the United Kingdom, France, and Canada had completed secondary education at rates similar to their counterparts in the United States.
- Females aged 25–34 in the United States were much more likely to complete higher education than females and males in the same age group in other large industrialized countries (with the exception of males aged 25–34 in Japan).
- Males aged 25–34 in Japan were much more likely to complete higher education than males of the same age group in the other large industrialized countries. Males aged 25–34 in the United States ranked second.

Percentage of the population in large industrialized countries who had completed secondary and higher education, by age, sex, and country: 1994

Country	25–64 years old		25–34 years old					
	Total		Total		Male		Female	
	Secondary education ¹	Higher education	Secondary education ¹	Higher education	Secondary education ¹	Higher education	Secondary education ¹	Higher education
Canada	74.1	16.9	82.3	18.4	80.6	18.0	84.0	18.9
France ²	67.1	9.2	84.4	11.6	86.4	11.9	82.3	11.3
Germany	84.0	12.6	89.6	11.9	91.6	12.7	87.5	11.0
Italy	33.2	7.5	47.3	7.9	45.6	7.7	49.0	8.1
Japan ³	69.7	13.3	90.6	22.9	89.3	34.2	91.8	11.5
United Kingdom	74.5	11.7	86.1	13.7	87.3	15.7	84.9	11.7
United States	85.1	24.4	86.4	23.4	85.2	23.4	87.5	23.5

¹ Includes individuals who have at least completed secondary education.

² France's definitions of ISCED levels were changed so that they are more similar to EUROSTAT definitions and are easier to compare to the definitions of other countries. As a result, data for 1994 are not directly comparable with data for other years.

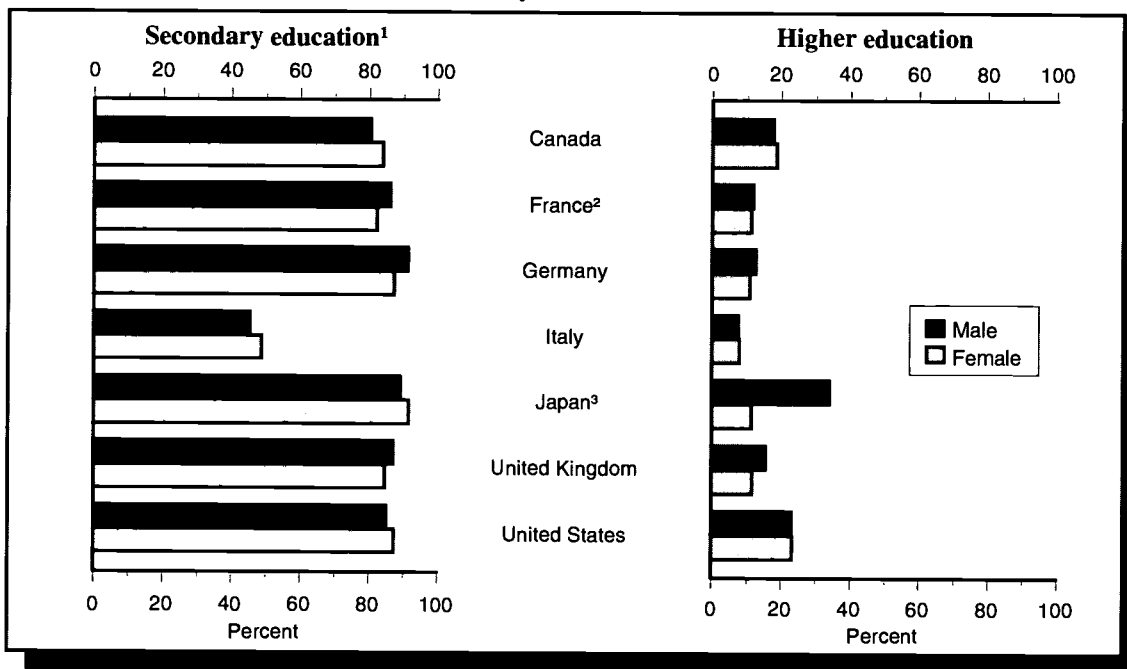

³ Data are for 1989.

NOTE: In the United States, completing secondary education is defined as graduating from high school or earning a GED; completing higher education is defined as earning a bachelor's degree or higher.

High school mathematics and science course-taking patterns

Courses in mathematics and science can teach students to use higher level thinking skills to solve complex problems. These skills are considered valuable both in educational and marketplace settings. Analysis of course-taking patterns of high school graduates can indicate levels of exposure in these fields for individuals who are about to advance to higher education or to enter the work force.

- High school graduates in 1994 were more likely to take mathematics courses at the level of algebra I or higher and science courses at the level of biology or higher than their counterparts in 1982.
- The proportion of high school graduates who took algebra II and the proportion who took chemistry increased 7 percentage points between 1990 and 1994 and increased over 25 percentage points between 1982 and 1994 (to 59 and 56 percent, respectively).
- A larger percentage of 1994 graduates, both male and female, earned credit in biology, chemistry, and physics than their 1982 counterparts. Similar percentages of males and females earned credit in biology in both years. Females were more likely to earn credit in chemistry in 1994, while males were consistently more likely to earn credit in physics.
- The percentage of Hispanics and American Indians/Alaskan Natives taking algebra II more than doubled between 1982 and 1994, rising from 18 percent for Hispanics and from 11 percent for American Indians in 1982 to 51 percent for Hispanics and 39 percent for American Indians/Alaskan Natives in 1994 (see supplemental table 24-1).

Percentage of high school graduates taking selected mathematics and science courses in high school, by sex: 1982, 1987, 1990, and 1994

Mathematics and science courses ¹	Total				Male				Female			
	1982	1987	1990	1994	1982	1987	1990	1994	1982	1987	1990	1994
Mathematics²												
Algebra I	53.9	64.0	64.2	66.4	52.2	62.3	61.7	64.7	55.4	65.7	66.5	68.1
Geometry	45.5	59.7	63.4	70.4	45.0	58.8	62.4	68.3	45.9	60.4	64.4	72.4
Algebra II	32.2	48.1	51.7	58.6	32.4	47.3	50.0	55.4	32.0	48.9	53.3	61.6
Trigonometry	12.1	18.6	18.2	17.2	13.2	19.5	18.1	16.6	11.1	17.6	18.2	17.8
Analysis/pre-calculus	5.9	12.6	13.4	17.3	6.2	13.5	14.0	16.3	5.6	11.6	12.8	18.2
Calculus	4.6	6.0	6.5	9.2	5.1	7.4	7.5	9.4	4.1	4.6	5.6	9.1
Science												
Biology	76.4	87.8	91.3	93.5	74.2	86.3	90.0	92.3	78.4	89.4	92.5	94.7
Chemistry	30.9	43.7	49.0	56.0	31.9	44.3	47.9	53.2	30.0	43.2	50.0	58.7
Physics	14.2	19.2	21.5	24.4	18.8	24.0	25.4	26.9	10.0	14.6	18.0	22.0
Biology and chemistry	28.1	42.1	47.6	53.8	28.2	42.2	46.4	50.9	28.0	42.0	48.8	56.6
Biology, chemistry, and physics	10.6	16.4	18.8	21.3	13.4	20.1	21.8	23.1	7.9	12.8	16.1	19.6

¹ The minimum number of units used for inclusion in this indicator was 1.0 for individual courses except for algebra II, trigonometry, and analysis/pre-calculus where 0.5 was set as the minimum number of credits.

² These data only report the percentage of students who earned credit in mathematics courses while in high school and do not count those students who took these courses prior to entering high school. In 1992, for example, approximately 93 percent of students had taken algebra I at any time prior to graduating from high school, and about 70 percent had taken geometry.

NOTE: See the supplemental note to this indicator for further explanation of courses and definitions.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The 1994 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1994, 1990, 1987, and 1982 High School Graduates*, 1996.

Students taking Advanced Placement (AP) examinations

Participation in the Advanced Placement (AP) program is associated with a demanding academic curriculum and illustrates the desire of schools, colleges, and universities to offer college-level courses in high school. By participating in the AP program, high school students may acquire college credit for their knowledge of college-level subjects. Measuring the number of students who participated in AP examinations per 1,000 11th- and 12th-grade students each year suggests the level of importance students, schools, and colleges place on the AP program and how that importance has changed over time.

- Between 1984 and 1995, the number of students taking AP examinations increased dramatically, rising from 24 students per 1,000 11th- and 12th-grade students to 66 students per 1,000. The number of examinees increased for both sexes and all racial/ethnic groups during this period.
- In 1984, similar numbers of males and females (per 1,000 11th- and 12th-grade students) took AP examinations. Between 1984 and 1995, the number of females who took the exams (per 1,000 11th- and 12th-grade students) rose at a faster rate than did the number of males who took AP examinations. In 1995, 74 females per 1,000 11th- and 12th-grade female students took the exams, compared to 58 males per 1,000 11th- and 12th-grade male students.
- In 1995, females were more likely to take AP examinations in social studies subjects, English, and foreign language than were their male counterparts, who were slightly more likely to take examinations in calculus and science subjects.
- Whites were both more likely to take exams and to score 3 or higher on a social studies subject, English, calculus, and science subject AP examinations than were blacks or Hispanics.

Number of students who took AP examinations (per 1,000 11th- and 12th-grade students), by sex and race/ethnicity: 1984-95

Sex and race/ethnicity	1984	1985	1986	1987	1988	1989	1990	1991	1992	1993	1994	1995

Remedial education in higher education institutions

The role of remedial courses in higher education institutions has been the subject of ongoing debate among policymakers and educators. Some view remedial courses as a way to expand educational opportunities for unprepared students, while others feel that remedial courses should be discouraged because precollege-level courses have no place in the college curriculum. The percentage of institutions offering remedial courses and the percentage of freshmen who enroll in these courses provide a snapshot of the current availability and the demand for these courses at higher education institutions.

- The percentage of freshmen enrolled in remedial courses and the percentage of institutions offering remedial courses was similar in 1989 and 1995.
- In 1995, freshmen were more likely to enroll in a remedial mathematics course than in a remedial reading or writing course. In fact, from 1989 to 1995, the percentage of freshmen who enrolled in a remedial mathematics course increased, while the percentage who enrolled in a remedial reading or writing course was similar.
- In 1995, freshmen in public 2-year colleges were far more likely to enroll in remedial courses than freshmen in public 4-year institutions (41 compared to 22 percent, respectively).
- Almost all public 2-year institutions offered remedial writing and mathematics courses, while about three-quarters of public 4-year institutions offered remedial courses in these subjects. Half of private 4-year institutions offered remedial writing and mathematics courses.
- A larger percentage of institutions with high minority enrollment offered remedial reading, writing, and mathematics courses than institutions with low minority enrollment.

Percentage of freshmen enrolled in remedial courses, by subject, control and type of institution, and minority enrollment: Fall 1989 and 1995

Subject	Fall 1989	Total	1995					
			Public		Private		Minority enrollment*	
			2-year	4-year	2-year	4-year	High	Low

Bachelor's degrees conferred, by field of study

Changing opportunities within the job market affect the fields in which students choose to major. In turn, the majors that students choose affect the demand for courses and faculty, as well as the supply of new graduates in different fields. Trends in the number and proportion of bachelor's degrees conferred in different fields help to identify these changing conditions.

- After declining for several years, the number of degrees conferred in the humanities and the social and behavioral sciences has grown since the mid-1980s. Combined with business management degrees, these three types of degrees have constituted half or more of all degrees conferred since 1971.
- After a sharp decline between 1986 and 1991, the number of degrees conferred in computer sciences and engineering leveled off between 1991 and 1994 (see supplemental table 27-1).
- Degrees in the natural sciences as a percentage of all degrees conferred dropped from 10 percent in 1971 to 7 percent in 1994; a major factor in this decrease was the sharp decline in the percentage of degrees conferred in mathematics between 1971 and 1981 (see supplemental table 27-2).
- The percentage of degrees awarded in education dropped by more than one-half between 1971 and 1994, declining from 21 percent to 9 percent.

Index of the number of bachelor's degrees conferred, and the percentage of total bachelor's degrees conferred, by field of study: Selected academic years ending 1971-94

Field of study	1971	1976	1981	1986	1991	1992	1993	1994

Graduate field of study, by sex

Changing opportunities within the job market affect the fields in which males and females choose to earn a graduate degree. The female field concentration ratio shows how much the fields studied by females differ from those studied by males. A ratio above 1.0 indicates that females are more likely than males to major in a field, and a ratio below 1.0 indicates the opposite pattern. Changes in the ratio show whether differences in the field preferences of males and females are narrowing or widening, and also may indicate changes in females' occupations and earning potential compared to those of males.

- Overall, in 1994, substantially more females than males earned graduate degrees in education and health professions. A higher proportion of males than females earned graduate degrees in natural sciences, computer sciences and engineering, and business management.
- Between 1970 and 1986, the difference in the proportion of men and women earning master's degrees in computer sciences and engineering narrowed each year. Since 1986, it has remained stable with males being five times more likely than females to earn a master's degree in computer sciences and engineering.
- Although differences in the proportions of males and females earning master's degrees in business management narrowed between 1971 and the mid-1980s when the trend leveled off, males were still twice as likely as females to earn a master's degree in business management in 1994.
- From 1971 to 1983, a higher percentage of males than females earned master's degrees in the social and behavioral sciences. From 1984 to 1994, a higher percentage of females than males earned master's degrees in this field. At the doctorate level, females have been consistently more likely to earn a degree in the social and behavioral sciences since 1971 (see supplemental table 28-1).

Female field concentration ratio¹ of graduate degrees conferred, by field of study and degree level: Selected academic years ending 1971-94

34.	Starting salaries of college graduates.....	122
35.	Community service activities following high school	124

Economic and Other Outcomes of Education

Education is an investment in human skills, and like all investments, it involves both costs and returns. The cost of finishing high school to the student is quite low: it consists of the relatively low wages earned by a 16- to 19-year-old dropout. However, the cost to the student of attending college is higher because it includes tuition, books, fees, and the earnings a student gives up either by not working at all during college or by working part time. The returns of a high school and college degree come in many forms; for example, money, personal satisfaction, social position, and economic growth. While some returns accrue for the individual, others benefit society and the Nation in general. Returns related to the economy, specifically the labor market, include better job opportunities and jobs that are less sensitive to general economic conditions. Returns for the individual include opportunities to participate in employer-provided training and higher earnings. Other societal returns that are often attributed to education include a greater interest and participation in civic affairs.

Since the costs and returns of investing in education change over time, the incentive for individuals to participate changes as well. This section presents measures that illustrate the rewards of finishing high school (or conversely, the penalties of not finishing) and the rewards of investing in postsecondary education.

Penalties of not graduating from high school

The data in the indicators that follow suggest some general conclusions regarding the labor market penalties of not finishing high school. The difficulty of making the immediate transition from attending school full time to working full time appears much greater for those who leave high school before graduating. Without prior job experience or specialized training, school leavers may have difficulty finding jobs that they are willing to take. In October 1995, 63 percent of recent high school graduates who were not enrolled in college were employed, compared to 48 percent of recent school dropouts. The employment rates of high school graduates vary by race/ethnicity, however. For example, white recent high school graduates who were not enrolled in college were more likely to be employed than their black or Hispanic counterparts in October 1995 (*Indicator 29*).

As individuals enter their 20s and early 30s, some of the problems they face during the transition from school to the work force are solved, but the disadvantage of not having a high school diploma persists. For example, in March 1996, 75 percent of males aged 25–34 who completed 9–11 years of school were employed, compared to 86 percent of males in this age group who graduated from high school. Among females aged 25–34, less than half (46 percent) of high school dropouts were employed, compared to 66 percent of their female peers with a high school diploma (*Indicator 32*).

Of those who were employed, the earnings disadvantage of not finishing high school is apparent. Among workers aged 25–34, those who completed 9–11 years of school earned substantially less than those who completed high school. In 1995, for example, the median annual salary of males with 9–11 years of school was only 74 percent of the median salary of high school graduates. The median annual salary of female high school dropouts was only 62 percent of that of female high school graduates (*Indicator 33*).

Transition to work for non-college-bound high school graduates

As with high school dropouts, the main concern of individuals who graduate from high school but do not attend college is how to make a successful transition to full-time employment. Many are concerned that non-college-bound high school graduates are ill prepared to enter the work force and that their opportunities for employment and earnings have decreased over time. Compared to 1982 high school graduates, 1992 high school graduates earned less (in constant 1996 dollars) and held more jobs during their first full year after graduation. Working while in high school and the number of hours students were employed were associated with continuous employment and earnings for 1982 graduates but not for 1992 graduates (*Indicator 30*).

Rewards of college attendance and graduation

The decision to attend college is often influenced by the hope for better employment opportunities and greater earnings potential. Generally, between 1971 and 1996, the percentage of 25- to 34-year-olds who were employed was greater among those in-

dividuals with a higher level of education. In 1996, male and female college graduates aged 25–34 were more likely to be employed than male and female high school graduates of the same age (92 and 84 percent versus 86 and 66 percent, respectively) (*Indicator 32*).

The financial returns of attending and graduating from college become evident when comparing the ratio of the median annual earnings of those who attended and graduated from college to the median annual earnings of high school graduates. In 1995, males aged 25–34 who had completed a bachelor's degree earned 52 percent more than their male peers who had only a high school diploma. For females in the same age group, the earnings premium was even higher. That is, females who completed a bachelor's degree earned 91 percent more than females with only a high school diploma. Since 1970, the earnings advantage for those who attended some college or earned a bachelor's degree or higher was generally greater for female than for male 25- to 34-year-olds (*Indicator 33*).

While both males and females who persist in their education have substantial earnings advantages compared to high school dropouts, there is an enduring difference between the earnings of males and females with the same educational attainment. Among full-time, year-round workers, males earned more than females across all levels of education. In 1995, for instance, the median income for male college graduates (in 1996 constant dollars) was \$38,033 compared to \$30,750 for female college graduates (table 33-1).

When students decide what to study in college, they often think about the possibilities of obtaining a job related to their major, and the earnings potential associated with these jobs. In April 1994, about three-fourths (78 percent) of 1992–93 graduates who were working and not enrolled reported having a job related to their major. A similar proportion (76 percent) reported that their jobs had career potential (*Indicator 31*). The median starting salary (in 1996 constant dollars) for 1992–93 graduates who worked full time and were not enrolled in school was \$23,600. Graduates who

majored in computer sciences and engineering had higher starting salaries than average, while students who majored in the humanities, social and behavioral sciences, natural sciences, and education had the lowest starting salaries (*Indicator 34*).

The majors that both sexes choose may account for some of the salary differences between male and female college graduates. In 1993, females were more likely than males to major in education, and males were more likely to major in computer sciences and engineering. Nevertheless, among college graduates who were working full time and not enrolled in school whose majors were business and management, social and behavioral sciences, and natural sciences, females earned less than males (*Indicator 34*).

Performance of community service

Education plays a vital role in preparing individuals to actively participate in the political, economic, and social lives of their communities. One aspect associated with education is performing community service. Since community service is viewed as a benefit to the community and the individual, many have expressed interest in involving a greater number of high school students in community service activities.

Performing community service in high school is positively associated with performing community service after graduation. For example, high school seniors from 1992 who performed community service in high school were more likely to have performed community service 2 years later than those seniors who had not performed community service in high school (61 versus 30 percent, respectively) (*Indicator 35*).

Whether individuals attend a postsecondary institution is also positively associated with performing community service. Among the 1992 high school seniors who had attended some college by 1994, 50 percent reported performing community service during the previous year, compared to 24 percent of the 1992 high school seniors who had not attended college (*Indicator 35*).

Transition from high school to work

The transition from high school to work can be difficult. Without prior job experience or specialized training, school leavers may find it difficult to find jobs they are willing to take. The employment rate among school leavers, both those who have not finished high school and those who have finished but have not gone on to college, indicates the difficulty of making this transition.

- In 1995, 63 percent of recent high school graduates not enrolled in college were employed, compared to 48 percent of recent school dropouts.
- During the period of economic recession between 1989 and 1992, the employment rates in both groups fell about 10 percentage points. However, in 1993, the employment rate for recent school dropouts increased markedly, rising more than 10 percentage points.
- In 1995, white recent high school graduates not enrolled in college were more likely to be employed than their black or Hispanic counterparts.
- Between 1960 and 1995, male recent high school graduates not enrolled in college and recent school dropouts were more likely than their female counterparts to be employed (see supplemental table 29-1).

Employment rates for recent high school graduates not enrolled in college and for recent school dropouts, by race/ethnicity: Selected Octobers 1972-95

October	Recent high school graduates not enrolled in college				Recent school dropouts			
	Total*	White	Black	Hispanic	Total*	White	Black	Hispanic

Labor market outcomes for non-college-bound high school graduates

Labor market outcomes for non-college-bound high school graduates are influenced by student characteristics, such as motivation and work commitment, skills and knowledge acquired during high school, and previous work experience. Many are concerned that the non-college-bound are ill prepared to enter the work force and that their employment rates and earnings—both of which are important indicators of how well they are faring—have deteriorated over time.

- Non-college-bound 1992 high school graduates worked more months and spent less time out of the labor force in the first year after graduation than did 1982 graduates.
- Two-thirds of non-college-bound 1992 graduates worked continuously in the first year after high school, compared to about half (48 percent) of non-college-bound 1982 graduates.
- The 87 percent of non-college-bound 1992 graduates who worked earned less and had more jobs in the first full year after leaving high school, compared to the 81 percent of non-college-bound 1982 graduates who worked.
- Working while in high school and the number of hours students were employed were associated with earnings and continuous employment for 1982 graduates but not for their 1992 counterparts.

Average number of months non-college-bound high school graduates were employed, unemployed, or not in the labor force, and their average earnings, hours worked per week, number of jobs, and the percentage who worked continuously in the first year after high school: 1983 and 1993

Transition from college to work

The attainment of a bachelor's degree is one measure of the skills learned through college attendance. In recent years, concern about the difficulties recent graduates encounter in making the transition from college to work has grown. Students, their families, and educational policymakers are interested in graduates' employment prospects and how they relate to their fields of study.

- In April 1994, two-thirds (67 percent) of recent college graduates were employed full time and were not enrolled in postsecondary education; 9 percent were employed part time and were not enrolled. About three-fourths (76 percent) of those who worked full time and who were not enrolled had jobs with career potential.
- Although about three-fourths (78 percent) of recent graduates who worked full time and who were not enrolled reported that their jobs were related to their field of study, only 60 percent reported that a college degree was required to get their job.
- There were no measurable differences among the percentages of recent graduates who were unemployed by field of study (see supplemental table 31-1).
- Females who majored in seven fields of study (business and management, public affairs/social services, biological sciences, mathematics and science, social sciences, humanities, and "other" majors) were more likely than males to work in the traditionally female occupations of administrative and clerical support (see supplemental table 31-1).

Percentage of 1992-93 college graduates, by employment and enrollment status, relatedness of jobs to education, and selected characteristics: April 1994

Selected characteristics	Employment and enrollment status					Relatedness of job to education ¹

Employment of young adults

The percentage of a population group with jobs is influenced by a variety of factors. Some factors influence the willingness of employers to offer jobs to individuals with different levels of education at the going wage rate, while others influence the willingness of these individuals to take jobs at the going wage rate. The higher the proportion of young adults who are employed, the better their labor market opportunities are relative to other things they could do and vice versa.

- Generally, between 1971 and 1996, the percentage of 25- to 34-year-olds who were employed was higher among those individuals with a higher level of education. In 1996, male and female college graduates aged 25–34 were much more likely to be employed than their counterparts who did not finish high school.
- The gap between the percentage of males and females aged 25–34 who were employed narrowed between 1971 and 1996 within each education group. The change was particularly noteworthy for college graduates, decreasing from 36 percentage points in 1971 to 8 percentage points in 1996, 45 to 11 percentage points for those with some college, 51 to 20 percentage points for those with a high school diploma, and 53 to 29 percentage points for those who did not finish high school.
- In 1996, the percentage of females aged 25–34 who were employed was higher than that in 1971, regardless of their education level. However, the percentage of females with a high school diploma or higher who were employed increased at a faster rate than did the percentage of females with less than a high school diploma.

Percentage of 25- to 34-year-olds who were employed, by sex and years of school completed: Selected years March 1971–96

March	Male				Female			
	Grades 9–11	High school diploma	Some college	Bachelor's degree or higher	Grades 9–11	High school diploma	Some college	Bachelor's degree or higher

Annual earnings of young adults, by educational attainment

Wages and salaries are influenced by many factors, including the employer's perception of the productivity and availability of workers with different levels of education and the economic conditions in the industries that typically employ workers with different levels of education. Annual earnings are influenced by the number of weeks worked in a year and the usual number of hours worked each week. The ratio of annual earnings of high school dropouts or college graduates to those of high school graduates is affected by all of these factors: It is a measure of the earnings disadvantage of not finishing high school and the earnings advantage of completing college.

- In 1995, the median annual earnings of young adults aged 25–34 who had not completed high school were substantially lower than those of their counterparts who had completed high school (26 and 38 percent lower for males and females, respectively). Young adults who had completed a bachelor's degree or higher earned substantially more than those who had only completed high school (52 and 91 percent more for males and females, respectively).
- Between 1974 and 1995, the earnings advantage of obtaining a bachelor's degree or higher increased dramatically for males, rising from 14 to 52 percent.
- Since 1970, the earnings advantage of 25- to 34-year-olds with some college or a bachelor's degree or higher (relative to their counterparts who had completed high school) was generally greater for females than for males.

Ratio* of median annual earnings of wage and salary workers aged 25–34 whose highest education level was grades 9–11, some college, and a bachelor's degree or higher to those with a high school diploma, by sex: Selected years 1970–95

Year	Grades 9–11		Some college		Bachelor's degree or higher	
	Male	Female	Male	Female	Male	Female
1970	0.84	0.69	1.10	1.19	1.24	1.68
1972	0.80	0.70	1.04	1.16	1.19	1.63
1974	0.81	0.62	1.02	1.19	1.14	1.74
1976	0.78	0.61	1.03	1.14	1.19	1.58
1978	0.77	0.54	1.05	1.17	1.18	1.55
1980	0.73	0.65	1.04	1.24	1.19	1.52
1982	0.71	0.66	1.12	1.21	1.34	1.63
1984	0.63	0.56	1.15	1.21	1.36	1.61
1986	0.69	0.65	1.18	1.21	1.50	1.78
1988	0.68	0.56	1.10	1.31	1.42	1.81
1990	0.71	0.58	1.14	1.34	1.48	1.92
1991	0.64	0.64	1.14	1.32	1.53	1.90
1992	0.68	0.76	1.13	1.34	1.60	2.00
1993	0.67	0.59	1.12	1.31	1.57	1.99
1994	0.68	0.58	1.14	1.20	1.52	1.86
1995	0.74	0.62	1.11	1.28	1.52	1.91

* This ratio is most useful when compared to 1.0. For example, the ratio of 1.52 in 1995 for males whose highest education level was a bachelor's degree or higher means that they earned 52 percent more than males who had a high school diploma. The ratio of 0.74 in 1995 for males whose highest education level was grades 9–11 means that they earned 26 percent less than males who had a high school diploma.

NOTE: In 1992, the Current Population Survey (CPS) changed the questions used to obtain the educational attainment of respondents. See the supplemental note to *Indicator 22* for further discussion.

Starting salaries of college graduates

One of the values that students place on the field of study they choose for their bachelor's degree is the earning potential associated with occupations in that field. Starting salaries offered by employers are related not only to the value of the skills learned by college graduates but also to the supply of qualified individuals. Thus, differences in starting salaries shed light on the changing demands of the labor market and the response of students and the education system to those changes.

- Between 1977 and 1993, college graduates who majored in computer sciences and engineering had much higher starting salaries than did graduates in all other fields of study; while the salary benefit of majoring in such fields was high, it declined between 1980 and 1993.
- Starting salaries among graduates who majored in the humanities or education have fluctuated over time, but in general, they were considerably lower than the starting salaries for all graduates. Salaries in both fields, however, rose relative to those of all graduates between 1984 and 1993.
- Among 1993 graduates, females were much more likely than males to major in education, and males were more likely than females to major in computer sciences and engineering; The most common field of study for both males and females was business, with the starting salary benefits for those who majored in this field increasing between 1986 and 1993.
- Median starting salaries for 1993 male graduates were substantially higher than those for female graduates, both overall and within certain fields of study including business, social and behavioral sciences, and natural sciences.

Percentage difference between median starting salaries for all college graduates and college graduates in major fields of study: Selected years of graduation 1977-93

Major field of study	Year of graduation					
	1977	1980	1984	1986	1990	1993
	Percent above or (below) median for all college graduates					
Humanities	(20.3)	(15.4)	(18.6)	(17.1)	(13.6)	(11.1)

Community service activities following high school

There is considerable interest in involving a greater number of high school students in community service because having students perform community service is viewed as beneficial for both society and the individual. Data on community service performed by high school seniors and their participation in community service after leaving high school may help school administrators assess their current community service programs.

- In 1994, 43 percent of 1992 high school seniors reported performing community service in the previous year. Those who performed community service during the last 2 years of high school were more likely to report performing community service 2 years later than those who did not (61 compared to 30 percent, respectively).
- In 1994, high school seniors who were required to perform community service during the last 2 years of high school were more likely to perform community service than all 1992 high school seniors (58 compared to 43 percent, respectively).
- Those 1992 high school seniors who had attended some college by 1994 were more likely to have reported performing community service in the previous year than those who had not attended some postsecondary education. Of those 1992 seniors who had attended some postsecondary education, those who performed community service in high school were more likely to have performed community service in the previous year than those who had not performed community service in high school.
- A lower percentage of 1992 high school seniors from public schools reported performing community service 2 years later than did seniors from Catholic schools or other private schools.

Percentage of 1992 high school seniors who in 1994 reported performing community service during the previous year, by community service in high school and selected characteristics

Selected characteristics	Total	No community service in high school ¹	Reported performing community service in high school ¹		
			Total ²	Strictly voluntary ²	Required ²

Organization and Management of Educational Institutions

The effective organization and management of educational institutions is important to any nation's education system: It provides the framework upon which policymakers and educators build school standards and policies. School standards, such as the number of pupils in a classroom, and school practices, such as the role teachers play in school decision making, can have a large impact on how teachers organize instruction—teachers' class size, instructional methods, workload, professional development, and influence over school and classroom policies are all affected by the types of decisions that policymakers make about organization and management.

Average class size

The organization and management of schools influences class size. Although the size of classes in public elementary and secondary classrooms did not change between the 1987–88 and 1993–94 school years, class size did vary across school characteristics. For example, in the 1993–94 school year, public school teachers' average class size was slightly larger than that of their private school counterparts at both the elementary and secondary levels (24 versus 22 students and 24 versus 19 students, respectively). Public school teachers from large schools (those with 750 or more students) had larger average class sizes than public school teachers from small schools (those with less than 150 students) at both the elementary and secondary levels (26 versus 18 students and 25 versus 15 students, respectively).

In school year 1993–94, public school teachers' average class sizes were similar across all levels of school poverty. However, at the secondary level, teachers from public schools with a high minority enrollment (20 percent or more) had slightly larger average class sizes than teachers from schools with a low minority enrollment (less than 20 percent) (*Indicator 39*).

Instructional methods

As a result of the 1980s reform movement, instructional methods have become the focus of many education debates. Recently, many teachers have introduced new instructional methods that use exercises to help build student knowledge rather than to require students to memorize facts. In the

1994–95 school year, 97 percent of public school teachers worked with individual students at least once a week, and 87 percent worked with small groups of students that often. To demonstrate a concept to their classes, 57 percent of public school teachers used a computer, videotape, or other electronic medium.

In the 1994–95 school year, public school teachers were more likely than private school teachers to work with small groups of students; private school teachers were more likely than public school teachers to lecture to their students. Elementary teachers were more likely to work with small groups of students and to demonstrate concepts using a computer, videotape, or other electronic medium than were secondary teachers (*Indicator 37*).

One instructional method that some may argue has been practiced for years, but has just recently been recognized as an "official" teaching technique, is the use of student portfolios. Student portfolios are collections of student-generated works that can indicate the range and extent of a student's performance and growth. In the 1994–95 school year, 72 percent of public elementary teachers used student portfolios. New public elementary teachers (those with less than 4 years of teaching experience) were more likely to use student portfolios than elementary teachers with 4 or more years of teaching experience (79 versus 72 percent).

Advocates of the use of student portfolios argue that this teaching technique can be used to engage students, and to support effective curricula and student teaming. Of those teachers who used student portfolios, private elementary teachers were more likely to use them at least once a week to communicate student progress to parents and to determine student grades than were public elementary teachers (*Indicator 38*).

Homework is an important tool that teachers use to help students review and practice what they have learned. In the 1994–95 school year, 49 percent of public elementary teachers reported that their students spent more than 1 hour on homework during an average week, while 58 percent of private elementary teachers reported that their students did so. Six percent of public and 2 percent of private elementary teachers reported that their students spent no time on homework during an average week.

While there is much debate on how effective homework assignments are, some argue that the most effective homework assignments are those that are meaningful to the student, those that the student completes successfully, and those that the teachers read, comment on, and return to the student. Forty-eight percent of public elementary teachers reported that they often used written homework to record whether students had completed their assignments. In the 1994–95 school year, 4 out of 10 public elementary teachers often used written homework assignments to determine student grades (*Indicator 36*).

School decision making

Teachers have differing perceptions of the amount of control they have over school policies and classroom decisions. In the 1993–94 school year, a higher percentage of teachers perceived having a good deal of control over their classroom decisions than perceived teachers having a good deal of influence over their school's policies (ranging from 57 to 88 percent and 31 to 38 percent, respectively). Private school teachers were more likely than public school teachers to perceive having influence over their school's policies and control over most of their classroom decisions.

With regard to specific school and classroom policies, one-third of public school teachers perceived having a good deal of influence over setting school discipline policies and establishing curriculum. More than 85 percent of public school teachers perceived having a good deal of influence over teaching techniques, evaluating and grading students, and determining the amount of homework to be assigned (*Indicator 41*).

Professional development

While teachers' initial education and training are essential, ongoing professional development throughout their careers also contributes significantly to their teaching qualifications. In the

1993–94 school year, a majority of public school teachers received in-service education or professional development on topics such as the use of educational technology, methods of teaching, student assessment, and cooperative learning. Teachers received support for professional development in the form of time away from teaching, travel expenses, tuition and fees, and professional growth credits. However, 22 percent of public school teachers received none of these types of support for professional development (*Indicator 40*).

Teaching workload

The management and organization of schools and postsecondary institutions affect teachers' salaries, instructional time, and other professional duties, and spark interest in how teachers are spending their time. In the 1993–94 school year, at the elementary/secondary level, full-time public school teachers reported working 45 hours per week, even though they were required to be at school 33 hours a week. Full-time public school teachers reported spending 12 extra hours before and after school and on weekends. Of these extra hours, one-fourth were spent in activities involving students. Teachers with less experience (those with less than 4 years of teaching experience) worked more total hours than did more experienced teachers (those with 4 or more years of teaching experience) (*Indicator 42*).

At the postsecondary level, faculty have many professional duties and responsibilities that elementary and secondary teachers do not have. Along with spending time on instruction, postsecondary faculty must spend time on activities such as research, freelance work, administrative tasks, and professional development. In 1992, faculty spent 54 percent of their work hours teaching, 18 percent conducting research, and 13 percent performing administrative tasks. Between 1987 and 1992, the percentage of time that full-time postsecondary faculty spent teaching decreased, while the percentage of time they spent on service and other duties increased (*Indicator 43*).

Homework assigned by elementary teachers

Homework is an important tool that teachers use to help students review and practice what they have learned, to teach children to work independently, and to encourage children to develop good habits and attitudes, such as self-discipline and responsibility. Some argue that the most effective homework assignments are those that are meaningful, those that the student completes successfully, and those that the teachers read, comment on, and return to the student.

- In 1994–95, 49 percent of public school elementary teachers reported that their students spent more than one hour on homework during an average week, compared to 58 percent of private school elementary teachers. Only 6 percent of public and 2 percent of private school elementary teachers reported that their students spent no time on homework during an average week.
- Forty-eight percent of public school elementary teachers reported that they often used written homework to record only whether students had completed their assignment.
- In 1994–95, 4 out of 10 public elementary school teachers often used written homework assignments as a basis for determining student grades. Private elementary teachers were more likely to collect, correct, and return written homework assignments to students and to use homework assignments for grading students than were public elementary teachers.
- In 1994–95, public and private elementary teachers were more likely to give their students homework assignments that involved reading textbooks and completing routine exercises at least once a week than they were to assign students written or oral reports and problems for which there was no obvious method of solution (see supplemental table 36-1).

Average amount of time elementary¹ teachers reported that their students spent on homework during an average week and teachers' use of homework, by control of school and years of teaching experience: School year 1994–95

Time spent on homework and teachers' use of homework	Public			Private		
	Total	Years of teaching experience		Total	Years of teaching experience	
		Less than 4 years	4 years or more		Less than 4 years	4 years or more
Average time spent on homework during an average week						
None	5.5	1.7	6.1	1.9	4.4	1.4
One hour or less	45.5	42.9	45.9	39.7	32.2	41.2
Between one and two hours	26.0	37.1	24.5	29.8	31.0	29.6
More than two hours	23.0	18.3	23.6	28.5	32.4	27.8
Percentage of teachers who often ² used written homework in the following ways:						
Record only whether assignments were completed	47.7	48.9	47.5	54.4	53.4	54.6
Collect, correct, and keep assignments	41.2	46.7	40.5	52.6	39.5	55.1
Keep items in a student portfolio	35.1	44.3	33.8	37.0	26.6	39.1
Collect, correct, and return assignments to students	72.3	78.3	71.5	81.8	81.4	81.8
Use assignments as a basis for grading students	41.4	41.9	41.3	51.3	40.2	53.5

Teachers' use of various instructional methods

Determining which teaching methods are most effective for educating students has historically been a topic of debate in the education community. As a result of the education reform movement, many teachers are introducing new teaching methods, such as using exercises to build student knowledge rather than those requiring students to memorize facts. A snapshot of the various instructional methods currently being used in the classroom can help us better understand how teachers are communicating with students, as well as serve as a baseline for monitoring the acceptance of these methods over time.

- In the 1994–95 school year, 97 percent of public school teachers worked with individual students at least once a week; 87 percent worked with small groups of students; and 62 percent lectured to their students. To demonstrate a concept to their class, 87 percent of public school teachers used the board or overhead projector, while 57 percent used a computer, videotape, or other electronic medium.
- Ninety percent of public school teachers asked students to respond orally to questions testing recall and 85 percent asked students to respond orally to open-ended questions at least once a week. Seventy-two percent of public school teachers had students use textbooks, while 29 percent required students to use school computers for writing.
- Public school teachers were more likely than private school teachers to work with small groups of students and to demonstrate concepts using a computer, videotape, or other electronic medium, while private school teachers were more likely than public school teachers to lecture to their students.
- Elementary teachers were more likely to work with small groups of students and to demonstrate concepts using a computer, videotape, or other electronic medium than were secondary teachers.

Percentage of teachers¹ who used selected teaching methods, by control and level of school: School year 1994–95

Use of student portfolios by elementary teachers

Portfolios are a collection of student-generated works that can indicate the range and extent of a student's performance and growth. Advocates of portfolios argue that they can be fully integrated into the curriculum, that they are a good device for engaging students and supporting effective curricula, instruction, and student teaming, and can be used to compare student achievement across classrooms or schools.

- In the 1994–95 school year, 72 percent of public elementary teachers used student portfolios compared to 63 percent of private elementary teachers. Of those elementary teachers who used student portfolios, about 80 percent reported using them for more than one subject.
- Less experienced public elementary teachers (those with less than 4 years of teaching experience) were more likely to use student portfolios than elementary teachers with 4 or more years of teaching experience (79 versus 72 percent, respectively).
- Of those who used student portfolios, private elementary teachers were more likely to use them at least once a week to communicate student progress to parents and to determine student grades than were public elementary teachers.
- Of those who used student portfolios, public elementary teachers with 4 or more years of teaching experience were more likely to use student portfolios at least once a week to diagnose student learning problems and to make decisions about student placement than were less experienced public elementary teachers (those with less than 4 years of teaching experience).

Percentage of elementary teachers¹ who used student portfolios and how portfolios were used, by control of school and years of teaching experience: School year 1994–95

Portfolio uses	Public			Private		
	Total	Less than 4 years	4 or more years	Total	Less than 4 years	4 or more years
Total teachers who used student portfolios	72.4	79.0	71.6	63.0	55.4	64.5
Of those teachers who used student portfolios, those who used them for more than one subject	79.0	89.6	77.4	80.0	83.7	79.4

Class size

Class size is a measure of the average number of students a teacher sees during a class period or school day. Smaller class sizes are valued because they may allow students to receive more individual attention from their teachers and may reduce teachers' burden of managing large numbers of students and their work. However, smaller class sizes are more expensive. Also, large classes may not necessarily hinder instruction, depending on teaching style, student behavior, and frequency of outside class meetings.

- In the 1993–94 school year, public school teachers' average class size was larger than that of their private school counterparts at both the elementary and secondary levels (24 versus 22 students and 24 versus 19 students, respectively).
- The average class size of public elementary and secondary teachers was similar in the 1987–88 and 1993–94 school years.
- The average class size of public school teachers was similar across all levels of school poverty. However, at the secondary level, teachers from public schools with a high minority enrollment (20 percent or more) had slightly larger average class sizes than public teachers from schools with a low minority enrollment (less than 20 percent) (24 versus 23 students, respectively).
- Public school teachers from large schools (750 or more students) had larger average class sizes than those teachers from small schools (less than 150 students) at both the elementary and secondary levels (26 versus 18 students and 25 versus 15 students, respectively).

Teachers' average class size, by control of school and teacher level: School years 1987–88, 1990–91, and 1993–94

Control of school and teacher level	1987–88	1990–91	1993–94

Teachers' participation in professional development

Professional development for current teachers includes both seminars offered by schools or school districts and courses affiliated with institutions of higher education. The extent to which teachers pursue professional development while continuing to teach may indicate either the commitment of the teaching profession to improve teaching practice or salary structures that reward participation in professional development.

- In school year 1993–94, 50 percent or more of full-time public school teachers participated in professional development on topics including uses of educational technology for instruction, methods of teaching in their subject field, student assessment, and cooperative learning in the classroom.
- Full-time public school teachers were more likely to participate in activities on all types of professional development topics than were full-time private school teachers. Full-time public elementary school teachers were more likely to participate in activities on four of the five types of professional development topics than were their secondary school counterparts.
- In school year 1993–94, 48 percent of full-time public school teachers received released time from teaching, and 41 percent received scheduled time for professional development. Twenty-two percent received none of the types of support listed.
- Full-time public school teachers were more likely to receive professional growth credits and released and scheduled time from teaching than were their private school counterparts. However, private school teachers were more likely to receive tuition and/or fees than were public school teachers.
- In recent years, teacher induction programs appeared to be more prevalent. For example, public elementary and secondary teachers with less than 4 years of teaching experience were more likely to have participated in a formal teacher induction program in their first year of teaching than were teachers with 4 or more years of experience (see supplemental table 40-1).

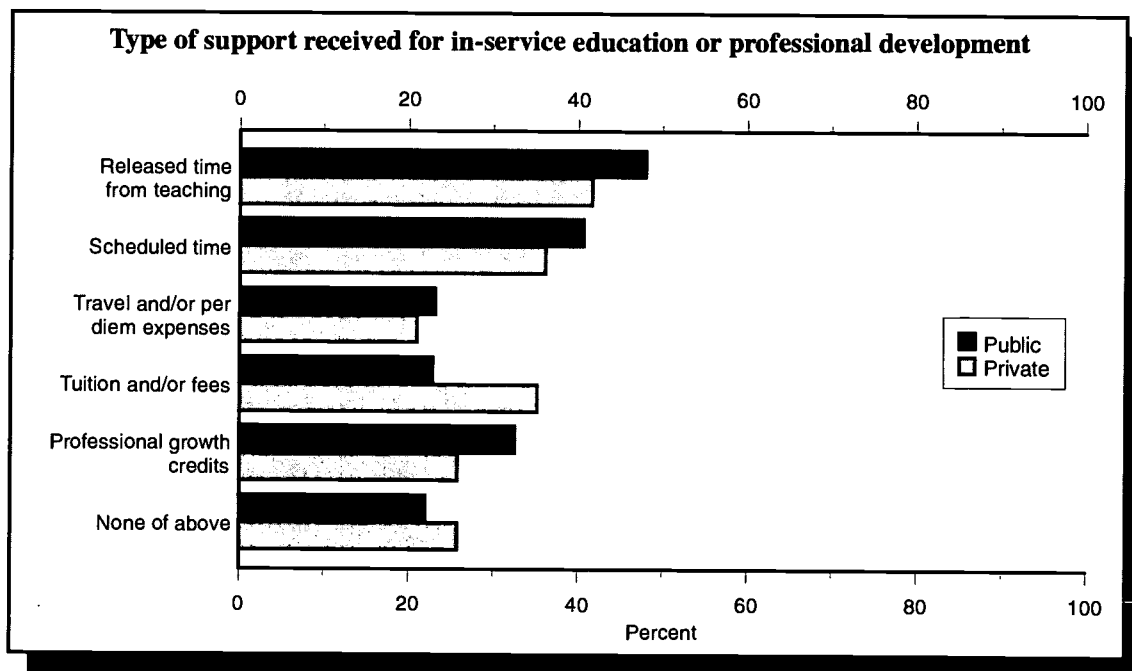

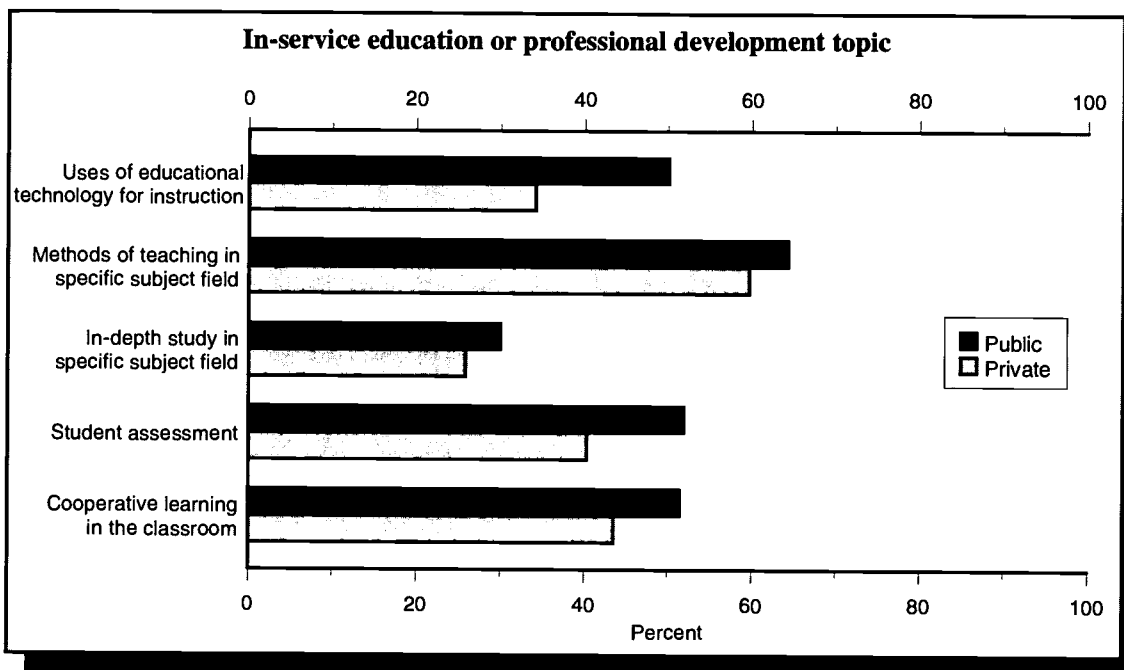

Percentage of full-time teachers who participated in professional development during the 1993–94 school year, by topic, type of support received, and control and level of school

Professional development topic and type of support received	Public			Private		
	Total	Elementary	Secondary	Total	Elementary	Secondary
In-service education or professional development topic						
Uses of educational technology for instruction	50.1	49.7	50.7	34.3	32.8	38.5

Teachers' participation in school decision making

Two aspects that can affect school climate and responsiveness are the extent to which teachers participate in making decisions about important school policies and issues and the autonomy teachers have in the classroom. Data on teachers' opinions about their influence over school policies and the control that they have over their classrooms can contribute to current debates on teacher professionalism.

- Teachers perceived that they had more control over classroom policies than they had over school policies. For example, in the 1993–94 school year, a higher percentage of teachers perceived that they had a good deal* of control over their classroom decisions than they perceived teachers having a good deal of influence over their school's policies (ranging from 57 to 88 percent and 31 to 38 percent, respectively).
- Private school teachers were more likely than public school teachers to perceive having influence over their school policies and control over most of their classroom decisions in the 1993–94 school year.
- Public and private secondary teachers were more likely than elementary teachers to perceive having a good deal* of control over classroom decisions, except for the decision to discipline students over which elementary teachers perceived having more control.
- Private school principals were more likely than public school principals to attribute a good deal of influence to teachers on setting discipline policy and establishing curriculum.

Teachers' and principals' perceptions of the amount of influence or control teachers had over selected school and classroom decisions in their schools, by control and level of school: School year 1993–94

School and classroom decisions	All schools	Public			Private		
		Total	Elementary	Secondary	Total	Elementary	Secondary
Percentage of teachers who reported that teachers had a good deal* of influence in their school over							
Setting discipline policy	37.9	34.9	41.8	27.5	58.9	64.6	50.9
Determining the content of in-service programs	31.2	30.6	32.6	28.5	35.1	36.1	33.7
Establishing curriculum	37.2	34.6	32.2	37.2	55.4	54.5	56.6

Teaching workload of full-time teachers

Ongoing debates about teachers' salaries, professional status, and instructional time spark interest in the amount of time teachers spend working, the number of classes they teach per day, and the number of students in each class. A teacher's work day does not end when classes are over. They are likely to spend additional time outside of school hours on work-related activities.

- While full-time public school teachers were required to be at school 33 hours per week on average in the 1993–94 school year, they reported working 45 hours per week. Private school teachers were required to be at school an average of 34 hours per week, but reported working 47 hours per week.
- Public and private full-time teachers reported spending extra hours (12 and 13 hours, respectively) before and after school and on weekends; of these extra hours, about one-fourth were spent in activities involving students.
- In the 1993–94 school year, public school teachers' classes were larger than those of their private school counterparts (23 students compared to 20 students per class).
- In the 1993–94 school year, less experienced teachers (those with less than 4 years of teaching experience) worked more total hours per week than did more experienced teachers (those with 4 or more years of teaching experience).

Average hours full-time teachers spent per week at school and in school-related activities, class size, and classes taught per day, by control and level of school and years of teaching experience: School year 1993–94

Control and level of school and teacher characteristics	Average hours worked per week	Average hours required at school	Average hours spent before and after school and on weekends			Average class size	Average number of classes taught per day ²

Teaching workload of full-time postsecondary faculty

Teaching students is only one aspect of a postsecondary faculty member's job. Faculty members also spend time on other activities such as research, freelance work, administrative tasks, and professional growth activities. Debates about tenure, instructional time, and the overall quality of a college education raise questions about the actual time postsecondary faculty spend teaching relative to the time they spend doing these other activities.

- In 1992, faculty members spent 54 percent of their work hours teaching, 18 percent conducting research, and 13 percent performing administrative tasks.
- Between 1987 and 1992, the percentage of time full-time postsecondary faculty members spent teaching decreased (from 57 to 54 percent); however, the number of classroom and student contact hours per week increased (see supplemental table 43-1).
- Generally, full professors tended to spend a higher percentage of their time conducting research than other professors in 1992. Assistant professors, instructors, and lecturers spent a higher proportion of time teaching than full or associate professors.
- Full-time postsecondary faculty members at 2-year institutions had more student contact hours per week in 1992 than did faculty at other institutions (over 87 percent more than those at liberal arts institutions and 67 percent more than those at research institutions) (see supplemental table 43-1).

Percentage of time full-time postsecondary faculty spent on various activities, by academic rank and type of institution: Fall 1987 and fall 1992

Climate and Diversity of Educational Institutions

The quality of education is reflected not only in the class subjects taught and in student achievement levels but also in the learning environment schools provide. A school's learning environment is enhanced by a diverse student population, the safety of school classrooms and facilities, and the behaviors, enrollment, and attendance patterns of the students themselves. Schools, in turn, affect their own climate by the programs and services they offer to students who have special needs.

Diversity of students

The characteristics and needs children bring to school based on their race/ethnicity, family backgrounds, economic well being, and disabilities influence the environment in which learning occurs.

Race/ethnicity

The racial/ethnic composition of the student population contributes to the increasing linguistic and cultural diversity of the Nation's elementary and secondary schools. With the rich opportunities for learning that diversity brings come challenges and risks associated with poverty, which is more concentrated among minority than nonminority students. Growth in the Hispanic population over the past decades has increased Hispanic representation in schools of all types. Like black students, Hispanic students are more concentrated in central city public schools than in other areas. In 1993, black and Hispanic students together made up more than 50 percent of students in central city public schools (Indicator 40, *Condition 1995*).

Bilingual and ESL programs

As the number of limited-English-proficient children increased from 1.25 million in 1979 to 2.44 million in 1995, the burden on school systems to provide services for those children also increased. Some schools provide bilingual education, which teaches students core curriculum content in their native language while they learn English; other schools provide intensive instruction in English as a Second Language (ESL) courses; and some schools provide both types of programs. Between the 1987–88 and 1993–94 school years, the percentage of schools that provided bilingual programs declined slightly (from 20 to 18 percent), while the percentage that provided ESL programs increased from 34 to 43 percent. In the 1993–94 school year, 27 percent of all schools with bilingual or ESL teach-

ing vacancies found them very difficult or impossible to fill; however, schools had less difficulty filling these vacancies in the 1993–94 school year than in the 1990–91 school year (*Indicator 45*).

Students with disabilities

Programs and services offered to special populations are a function not only of the needs of the students but also of the resources available to the school. The number of students who participated in federal programs for children with disabilities has been increasing at a faster rate than total public school enrollment. Between 1977 and 1995, the number of students who participated in federal programs for children with disabilities increased by 47 percent, while total public school enrollment decreased by 2 percent (table 46-1). In 1995, children with disabilities who received services in federally supported programs comprised 12 percent of all students enrolled in public grades K–12, up from 8 percent in 1977 (*Indicator 46*). In 1994, three out of four public school children with disabilities who were served by federally supported programs were taught in regular or resource-room combined classrooms, and one out of four were served in separate classes in regular schools (table 46-4).

Higher education

There is less student racial/ethnic diversity at the postsecondary level than at the elementary/secondary level. In 1993, more than one out of five postsecondary students were members of minority groups (*Indicator 45, Condition 1996*), compared to one out of three public elementary/secondary students. Colleges and universities have sought to increase the racial/ethnic diversity of their student bodies, and minority enrollment increased from 15 percent in 1976 to 23 percent in 1993. This increase was due primarily to the increased enrollment of Hispanic and Asian/Pacific Islander students, whereas the enrollment of black students remained fairly steady at 9 to 10 percent of all students.

Climate

A school's learning environment can both reflect and influence the behavior of students. At the same time, the learning environment is affected by events both in and outside of the school. For example, suspensions can detract from learning since students generally must be physically present at school in order to learn. Individual exposure to

drugs and alcohol can negatively affect student learning as well as the overall learning environment. Additionally, working while in high school and college can take students away from their studies and can affect student success in school.

Student alcohol and drug use

Alcohol and drug use can interfere with a student's thinking, can reduce a student's academic achievement and often is associated with violent crime. Educators need to determine the scope of student alcohol and drug problems and identify how these problems affect the school's goal of providing a safe and effective learning environment. After falling dramatically throughout the 1980s and early 1990s, drug use by high school seniors is on the rise again. For example, cocaine use by high school seniors decreased from 12 percent in 1981 to 3 percent in 1992; however, it increased to 5 percent in 1996. Marijuana use dropped from 51 percent in 1979 to 22 percent in 1992; however, it climbed to 36 percent in 1996. While the percentage of high school seniors who reported consuming alcohol any time during the previous year decreased between 1979 and 1992, it still remains high (table 47-1). In 1996, 73 percent of high school seniors reported using alcohol during the previous year. In 1995, 45 percent of eighth-graders reported using alcohol in the previous year, and in 1996, 26 percent reported using alcohol in the previous 30 days (table 47-2). Also in 1995, 16 percent of eighth-graders reported using marijuana and 3 percent reported using cocaine in the previous year (*Indicator 47*).

Suspensions

Prior research has confirmed the common perception that students who have been suspended from school are at a higher risk for other poor school outcomes such as dropping out of school. Students who are being disruptive in school may not be fully engaged in active learning and students who are not in school typically cannot be expected to be learning. Eleven percent of eighth-graders in 1988 had been suspended at least once by 1992. Black students were more likely to have been suspended from school than Asian, white, or Hispanic students, and males were more likely than females to have been suspended (*Indicator 48*).

Teacher satisfaction

Teachers' attitudes and perceptions about their work environment reflect current school and classroom conditions. A combination of the degree of

respect teachers received from administrators, the support they received from parents, and the amount of resources available for their use may indicate teachers' level of job satisfaction. The percentage of public school teachers who reported that they were given the necessary materials, that they received a great deal of support from parents, and that their principal enforced school rules decreased between the 1987–88 and 1993–94 school years (*Indicator 49*). In 1993–94, public school teachers were more likely than private school teachers to report that student misbehavior and routine duties interfered with teaching. Private school teachers were more likely to report that teachers participated in making important educational decisions in their schools, that teachers received a great deal of support from parents, and that there was a great deal of cooperation among staff members (table 49-1).

Working while in school

Students spend more time outside of school than in school, so their use of time outside school has important consequences for their learning. In 1995, about 33 percent of high school students were employed, and 14 percent reported working 20 or more hours per week (table 50-2). An even greater percentage of students held a job while in college. In 1995, almost half of all full-time college students and 83 percent of part-time students were employed (table 50-1). Employment among full-time college students increased from 34 percent in 1970 to 47 percent in 1988, and has remained fairly stable since then. While a job can take time away from a student's studies, it may also provide the student with an education that he or she cannot obtain inside the classroom (*Indicator 50*).

Part-time enrollment

Enrolling in college part time is an option for high school graduates who want to continue their education but who choose not to attend full time. Part-time enrollment is also an option for older or returning students, especially those aged 25 or older who are more likely to have a full-time job and family responsibilities. In 1995, almost 1 in 3 undergraduates attended college part time. In general, between 1976 and 1995, the percentage of undergraduates who enrolled part time was fairly stable. Undergraduates aged 25 or older were far more likely to attend college part time; Hispanics were more likely than whites or blacks to attend part time; and females were more likely than males to do so (*Indicator 51*).

Elementary and secondary school enrollment

School enrollment is one measure of the size of the educational system and of the demand for teachers, buildings, and education resources. Past trends and projected future changes in the composition of enrollment across levels of education and regions of the country, as well as between public and private schools, indicate the types of teachers and other resources the Nation requires. Demographics, such as birth rates and immigration, are a primary factor in determining elementary and secondary school enrollment.

- From 1984 to 1996, total public school enrollment rose 17 percent, after falling 15 percent between 1970 and 1984; public schools continue to enroll almost 9 out of 10 children (see supplemental tables 44-1 and 44-2).
 - Total private school enrollment increased 2 percent between 1970 and 1986, but rose 6 percent between 1986 and 1996.
 - Total public school enrollment is projected to rise from 46.4 million in 1997 to 48.3 million by 2007,
- an increase of 4 percent. During this same period, total private school enrollment is expected to increase 3 percent, rising from 5.9 million to 6.1 million.
- Between 1970 and 1995, the share of total public school enrollment increased in the South and West, while it declined in the Northeast and the Midwest.

Public schools with bilingual or ESL programs

If students are to have a full range of educational and job opportunities open to them, they must develop competence in speaking, reading, and writing English. Public schools are required to provide programs to help children with limited English proficiency develop competence in the language. Some schools provide bilingual education, which teaches students using their native language while they learn English; others provide intensive instruction in English as a second language (ESL); and some provide both. As the number of children with difficulty speaking English has increased (from 1.25 million in 1979 to 2.44 million in 1995), so has the burden on school systems to recruit teachers with the skills necessary to teach these classes. The difficulty schools have in filling such positions is one indication of whether the supply of bilingual and ESL teachers is adequate to meet the demand.

- In school year 1993–94, 46 percent of all public schools had limited-English-proficient (LEP) students. In central cities and urban fringe/large towns, about 60 percent of the schools had such students. In five states, 75 percent or more of the schools had LEP students (see supplemental table 45-1).
- Between school years 1987–88 and 1993–94, the percentage of schools that provided bilingual programs declined slightly (from 20 to 18 percent), while the percentage providing ESL programs increased from 34 to 43 percent. In rural areas, the percentage of schools that provided ESL programs increased by about 50 percent.
- In school year 1993–94, 27 percent of all schools with bilingual/ESL teaching vacancies found them very difficult or impossible to fill, more than for many other teaching fields. However, schools generally had less difficulty filling these vacancies in school year 1993–94 than in 1990–91.

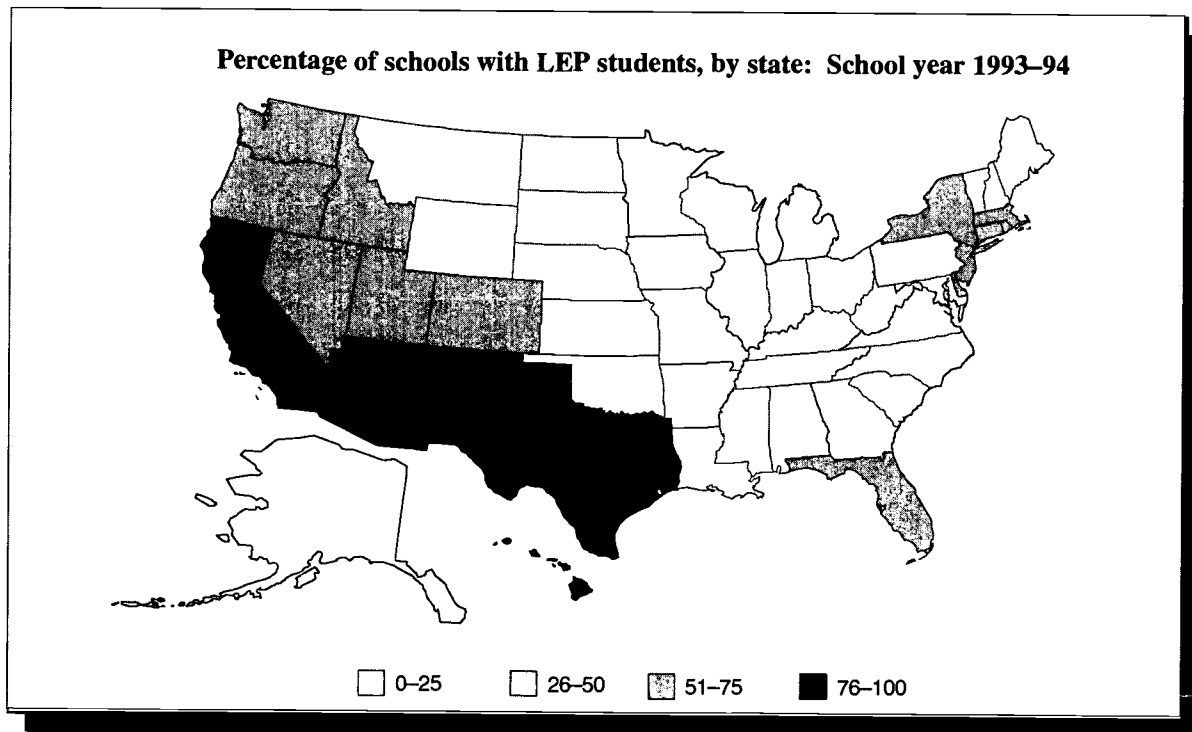

Percentage of public schools that enrolled students with limited English proficiency, that provided bilingual or ESL programs, and that found it difficult or impossible to fill teacher vacancies in this field, by level of school, urbanicity, and school size: School years 1987–88, 1990–91, and 1993–94

Education of students with disabilities

The Individuals with Disabilities Education Act (IDEA) mandates that all children have available to them a free and appropriate education designed to meet their unique needs. Changes in the percentage of total public elementary and secondary enrollment and the distribution of students with disabilities affect the level of effort required of educators and policymakers to comply with the current law and help them to forecast the need for future resources.

- The number of students participating in federal programs for children with disabilities has increased at a faster rate than total public school enrollment. Between 1977 and 1995, the number of students who participated in federal programs for children with disabilities increased 47 percent, while total public school enrollment decreased by 2 percent (see supplemental table 46-1).
- In 1995, children with disabilities receiving services in federally supported programs comprised 12 percent of all students enrolled in public schools (grades K-12), up from 8 percent in 1977.
- Between 1977 and 1995, the percentage of children with specific learning disabilities as a percentage of total public K-12 enrollment rose from 2 to 6 percent, while those with speech or language impairments or mental retardation decreased slightly.
- In 1992, males with specific learning disabilities represented 7 percent of total public school enrollment, while females with this type of disability accounted for 3 percent (see supplemental table 46-2).

Children from birth to age 21 who were served by federally supported programs for students with disabilities, by type of disability: Selected school years ending 1977-95

Student alcohol and drug use

Alcohol and drug use can interfere with a student's thinking and reduce a student's academic achievement, and it is associated with violent crime. Therefore, it is important for educators and administrators to determine the scope of student drug and alcohol problems both in and outside of schools and how these problems affect the schools' goal of providing a safe and effective learning environment. The percentage of students who report alcohol and drug use is an indicator of how prevalent these problems are.

- After falling dramatically throughout the 1980s and early 1990s, drug use by high school seniors has begun to rise again. The percentage of seniors who reported having used cocaine in the previous year decreased from 12 percent in 1981 to 3 percent in 1992; however, it increased to 5 percent in 1996. The percentage of seniors who reported having used marijuana dropped from 51 percent in 1979 to 22 percent in 1992; however, it climbed to 36 percent in 1996 (see supplemental table 47-1).
- While the percentage of high school seniors who reported consuming alcohol any time during the previous year decreased between 1979 and 1992, it still remains high (see supplemental table 47-1). In 1996, 73 percent of high school seniors reported using alcohol during the previous year and 51 percent reported using alcohol in the previous 30 days (see supplemental table 47-2).
- In 1995, 45 percent of 8th-graders reported using alcohol in the previous year and 26 percent reported using alcohol in the previous 30 days in 1996 (see supplemental table 47-2). Also, in 1995, 16 percent of 8th-graders reported using marijuana and 3 percent reported using cocaine in the previous year.
- In 1995, 8th-, 10th-, and 12th-graders who planned to complete 4 or more years of college were less likely to report alcohol, marijuana, or cocaine use in the previous year than those who did not plan to complete 4 or more years of college.

Percentage of high school seniors who reported using alcohol or drugs any time during the previous year, by type of drug: Selected school years 1975-96

Type of drug	1975	1978	1981	1984	1987	1990	1993	1994	1995	1996

Students who have been suspended from school

Prior research has confirmed the common perception that students who have been suspended from school are at higher risk for other poor school outcomes—including dropping out of school. Students who are being disruptive in school may not be fully engaged in active learning. Also, students who are not in school typically cannot be expected to be learning. Moreover, black and Hispanic students are suspended at rates higher than those for other groups, and males are suspended at greater rates than females.¹ In many urban schools, up to one-third of students may be suspended during the school year. In one urban school more than half of all black students were suspended during the school year.²

- Black students in the eighth-grade class of 1988 were more likely to have ever been suspended from school than were Asian, white, or Hispanic students.
- Overall, males were more likely than females to have ever been suspended, with males having been suspended at twice the rate of females (15 and 7 percent, respectively).
- Students from lower socioeconomic (SES) backgrounds were more likely to have ever been suspended from school at least once, compared with students from higher SES backgrounds: 17 percent of students from the lowest SES quartile were suspended, compared to 7 percent of those from the highest SES quartile.
- Within each SES quartile, black students were still suspended at higher rates than their white and Hispanic peers.

Percentage of 1988 eighth-graders who had ever been suspended, by race/ethnicity, sex, and socioeconomic status: 1992

Sex and Socioeconomic status	Total	Race/ethnicity				
		White	Black	Hispanic	Asian/Pacific Islander	American Indian/ Alaskan Native

Teacher satisfaction

Teachers' attitudes and perceptions about their work environment reflect current school conditions. Measures such as the degree of respect teachers receive from administrators, the support they receive from parents, and the amount of resources available may indicate the level of teachers' job satisfaction as well as their attitudes toward the teaching profession in general.

- Between the 1987–88 and 1993–94 school years, public school teacher satisfaction decreased in the areas of support from parents, having the necessary materials, and enforcement of school rules by principals.
- In 1993–94 school year, public school teachers from high poverty schools (more than 40 percent of students eligible for free or reduced-price lunch) were more likely to report that student misbehavior and routine duties interfered with their work and less likely to report that they received a great deal of support from parents than those teachers from low poverty schools (5 percent or less of students eligible for free or reduced-price lunch).
- In the 1993–94 school year, public school teachers were more likely than private school teachers to report that student misbehavior and routine duties interfered with teaching. Private school teachers were more likely to report that teachers participated in important educational decisions in their schools, received a great deal of support from parents, and had a great deal of cooperation among staff members (see supplemental table 49-1).
- Public elementary teachers were more likely than public secondary teachers to report that teachers participated in making important educational decisions in their school, they received a great deal of support from parents, their principal enforced school rules, and that there was a great deal of cooperation among staff members in the 1993–94 school year (see supplemental table 49-2).

Working while in college

Working while enrolled in college can be both beneficial and detrimental to a student's academic and labor market success. Although working during the school year leaves less time for students to concentrate on their studies or to participate in extracurricular activities, students who work may gain valuable knowledge and skills that are not taught in the classroom. While some studies show that working long hours while in college may reduce a student's likelihood of completing college or lengthen the time it takes to complete a degree, some employment experience may increase a student's employment prospects and expected post-graduation wages.

- The percentage of full-time college students aged 16–24 who were employed rose from 34 percent in 1970 to 47 percent in 1988, and has remained fairly stable since then.
- In general, between 1970 and 1995, white and Hispanic full-time college students aged 16–24 were more likely to be employed than their black peers.
- Almost half (47 percent) of full-time college students aged 16–24 were employed in October 1995, and more than one-fourth (27 percent) worked at least 20 hours per week. In addition, 83 percent of part-time college students in the same age group were employed, with 73 percent working at least 20 hours per week (see supplemental table 50-1).

Part-time enrollment in higher education

Enrolling in college part time is an option for high school graduates who want to continue their education but who choose not to attend full time. Part-time enrollment is also an option for older or returning students, especially those aged 25 or older who are more likely to have a full-time job and family responsibilities, as well as for those who are unable to attend full time due to financial, time, and other constraints. On the other hand, younger students who attend college part time may be less likely to complete and attain a degree.

- In 1995, about 3 in 10 undergraduates attended college part time. In general, between 1976 and 1995, the percentage of undergraduates who enrolled part time was similar.
- Between 1976 and 1995, undergraduates aged 25 or older were far more likely to be enrolled part time than undergraduates aged 18–24.
- In general, between 1976 and 1995, Hispanic undergraduates were more likely to be enrolled in college part time than were their white and black counterparts. In 1995, the percentage of Hispanic students enrolled part time was 10 and 7 percentage points higher than those of whites and blacks, respectively.
- Between 1978 and 1995, female undergraduates were more likely to be enrolled part time than their male counterparts.

Percentage of undergraduate students enrolled in college part time, by age, race/ethnicity, sex, and type of institution: Selected Octobers 1976–95

October	Total	Age			Race/ethnicity			Sex		Type of institution

Financial and Human Resources of Educational Institutions

During the 1980s and early 1990s, education officials at our Nation's schools, colleges, and universities faced challenges in providing students with a quality education, in light of constraints in the financial and human resources available to them. Nationwide, postsecondary institutions are confronting declining support from government appropriations and an increased reliance on other financial sources, such as tuition. At the elementary and secondary levels, the supply of teachers and teacher qualifications continue to be of concern. Furthermore, calls to raise the quality of education have grown as Americans feel increasing competitive pressure from the global marketplace.

Financial resources

The United States expends a substantial amount of its financial resources on education. It is important to have a full understanding of where and how our Nation expends its education resources. Measuring per pupil expenditures at the elementary/secondary and postsecondary level is one way to do this.

Elementary/secondary education

Expenditures in public elementary and secondary schools can be divided into three main functional areas: Instruction, support services, and capital outlay. The distribution of expenditures across functional areas may be a measure of how different public school systems allocate resources to meet their individual needs.

In the 1993–94 school year, public schools spent \$6,330 per pupil (in 1996 constant dollars). Of that amount, more than half (\$3,449) was spent on instruction, including teacher salaries and benefits, supplies, and purchased instructional services. Between the 1989–90 and 1993–94 school years, the percentage of total expenditures per pupil, adjusted for inflation, that public schools spent on instruction remained relatively stable, while the percentage of expenditures per pupil spent on support services decreased and the percentage spent on capital outlay increased. In the 1992–93 school year, relatively high wealth school districts (those with a median household income of \$35,000 or more) spent more per pupil than school districts with less wealth (*Indicator 52*).

Higher education

At all types of higher education institutions, overall spending per full-time-equivalent (FTE) student increased between 1984 and 1994. In 1996 constant dollars, these increases ranged from 15 percent at public 2-year colleges to 39 percent at private universities. Although instructional expenditures per FTE student increased between 1984 and 1994, instructional spending as a percentage of total expenditures fell by 3 percentage points at public universities and public 4-year colleges and by 4 percentage points at private 4-year colleges. Research expenditures increased by 38 percent in private universities and 43 percent in public universities during this period (table 54-1).

As expenditures increased at higher education institutions, tuition and fees per FTE student increased both in constant dollars and as a share of all revenue at all public institutions between 1984 and 1994, rising from \$3,028 to \$4,187 (in 1996 constant dollars). At private universities, average tuition and fees increased from \$11,338 to \$15,508 (in 1996 constant dollars). Between 1984 and 1994, government appropriations per FTE student fell both in constant dollars and as a share of all revenue at public institutions. For example, at public universities, government appropriations per FTE student fell from \$8,327 to \$7,393 in constant dollars and from 53 to 42 percent as a share of all revenue between 1984 and 1994 (table 53-1).

International comparisons

On the international level, the proportion of total resources that a country chooses to invest in education raises a number of issues, for example, whether and to what extent the public and private sectors should endure education costs. In 1993, total expenditures on education institutions in the United States were 4.2 percent of the Gross Domestic Product (GDP) for the primary/secondary grade levels, 2.5 percent for higher education, and 6.8 percent for all levels combined. While, of the G-7 countries, Canada and France spent a larger proportion of GDP on primary/secondary education, only Canada spent a larger portion of GDP on higher education than did the United States or for all levels combined (*Indicator 55*).

Human resources

Teachers are the most vital human resource for schools, and understanding the teacher work force is crucial to providing education to the Nation's students. Examining the career and salary trends of teachers as well as their educational backgrounds and qualifications can provide a glimpse into the nation's most important educational resource.

Teacher attrition

Teacher attrition is the largest single factor in determining the demand for additional teachers in the nation's schools. Six percent of full-time public school teachers and 10 percent of full-time private school teachers who taught during the 1993–94 school year left teaching before the 1994–95 school year. One-third of those public school teachers who left the teaching profession did so to retire (*Indicator 58*).

Teacher qualifications and training

Although it is difficult to assess the quality of education, many believe that the educational background of a teacher is an important measure of a teacher's qualifications. The qualifications of mathematics and science teachers especially have been called into question due to the importance placed on preparing U.S. students to compete in an increasingly technical workplace. In public schools, during the 1993–94 school year, 9 out of 10 secondary students in science classes were taught by a teacher who either majored or minored in science. However, fewer than 8 out of 10 students in mathematics classes were taught by a teacher who majored or minored in mathematics (*Indicator 57*).

Teacher salaries

Teacher salaries are a concern among policymakers, since attracting well-qualified teachers in schools involves an increase in teachers' base salaries. In 1996, the average annual salary (in 1996 constant dollars) of public elementary school teachers was \$37,916, while the average annual salary for public secondary school teachers was \$39,162. Between 1980 and 1996, the average salary (adjusted for inflation) of all public school teachers increased 19 percent, rising from \$32,332 to \$38,434 (table 56-1). Average beginning teacher salaries increased 24 percent over this period, rising from \$20,292 to \$25,167. However, even with this 24 percent increase, the average beginning teacher salary in 1996 was about the same as that in 1972 (*Indicator 56*).

Teacher salaries are relatively low when compared to salaries of other professions that college students could pursue, and this may discourage the "best and brightest" college students from choosing teaching as a profession. In 1995, the average annual salary of individuals aged 25 or older with a bachelor's degree was \$45,773 (in 1996 constant dollars), while the average annual salary of public school teachers was \$38,456 (*Indicator 56*).

Higher education faculty

At the postsecondary level, faculty are involved in different types of work-related issues, and institutions have different concerns when trying to attract and retain faculty members. While tenure inspires much debate among educators and policymakers, tenure-track positions are one way institutions attract the "best" faculty, since tenure denotes job security, salary, and benefits. However, institutions may rely on nontenure-track faculty to respond to fluctuating enrollment, to fill temporary vacancies, and to teach specialized courses. In fall 1992, higher education institutions employed nearly as many nontenure-track as tenure-track instructional staff members (45 and 48 percent, respectively). Among institutions with a tenure system, research universities had the lowest percentage of nontenure-track faculty (29 percent), while 2-year colleges had the highest (67 percent) (*Indicator 60*).

Among institutions with tenure-track systems, faculty may be pressured to conduct and publish research material, such as books, journal articles, and reports. This research responsibility is usually in addition to their teaching responsibilities and means that faculty members must strike a balance between research and teaching. On one hand, research activities can be an asset to both the institution and student, bringing together the creation and transmittal of knowledge. On the other hand, research activities may decrease the amount of time faculty have to prepare lectures and work individually with students. In fall 1987 and fall 1992, the average research output of full-time postsecondary faculty for the previous two years was similar. In fall 1992, faculty produced about three articles or creative works, and about four presentations or exhibits during the previous 2 years. At research institutions, postsecondary faculty produced on average more articles or creative works during the previous 2 years than faculty at other types of higher education institutions (*Indicator 59*).

Public elementary and secondary expenditures per student

Public elementary and secondary spending can be divided into three main functional areas: instruction, support services, and capital outlay. How school districts spend the funds they receive are influenced by many factors: The overall level of funding, the organizational structure of the district, district- and state-level goals, differences in student needs (e.g., demand for special education services and programs for limited-English-proficient students), and the relative cost of educational resources (e.g., teacher salaries, building maintenance, and construction costs for new schools). The distribution of expenditures across functional areas is an indication of how different public school systems allocate funds to meet their specific needs.

- In the 1993–94 school year, public schools spent \$6,330 per pupil (in 1996 constant dollars). Of that amount, more than half (\$3,449) was spent on instruction, which includes teacher salaries and benefits, supplies, and purchased instructional services.
- Between the 1989–90 and 1993–94 school years, the percentage of total expenditures per pupil that public schools spent on instruction remained relatively constant, while the percentage of expenditures per pupil spent on support services decreased and the percentage spent on capital outlay increased.
- In the 1992–93 school year, relatively high wealth school districts (those with a median household income of \$35,000 or more) spent more per pupil than school districts with less wealth. The distribution of expenditures across functional areas was fairly similar regardless of the wealth of the school district (see supplemental table 52-1).
- School districts with a low percentage of minority school-age children (less than 20 percent) spent slightly more per pupil on capital outlay than school districts with a high percentage of minority school-age children (20 percent or more), while those districts with a high percentage of minority school-age children spent slightly more on support services than those districts with a low percentage of minority school-age children.

Public school expenditures per pupil (in 1996 constant dollars) and percentage distribution, by function: School years 1989–90 to 1993–94

School year	Total	Instruc- tion	Support services	Capital outlay	Other	Percentage distribution				
						Total	Instruc- tion	Support services	Capital outlay	Other
1989–90	\$6,203	\$3,371	\$2,217	\$430	\$184	100.0	54.3	35.7	6.9	3.0
1990–91	6,527	3,546	2,315	471	195	100.0	54.3	35.5	7.2	3.0
1991–92	6,315	3,431	2,213	370	300	100.0	54.3	35.0	5.9	4.7
1992–93	6,202	3,374	1,996	566	267	100.0	54.4	32.2	9.1	4.3
1993–94	6,330	3,449	2,026	578	276	100.0	54.5	32.0	9.1	4.4

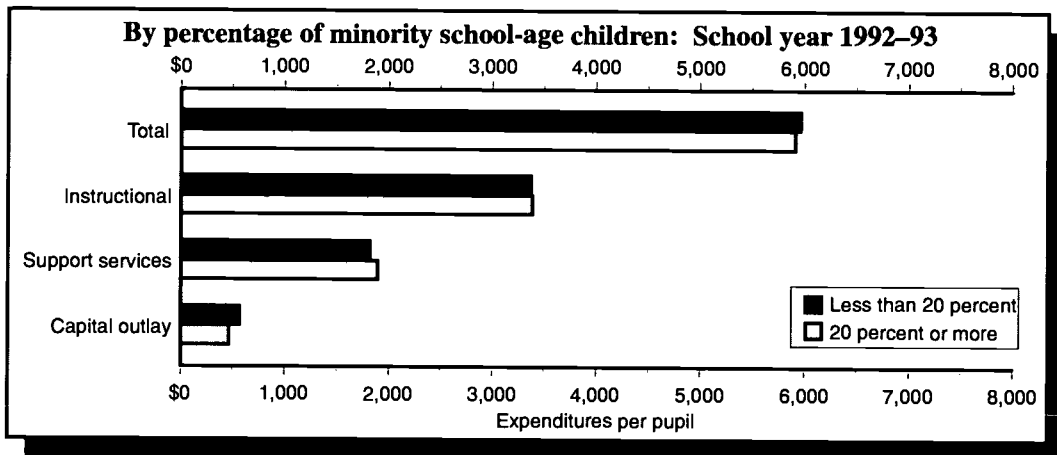

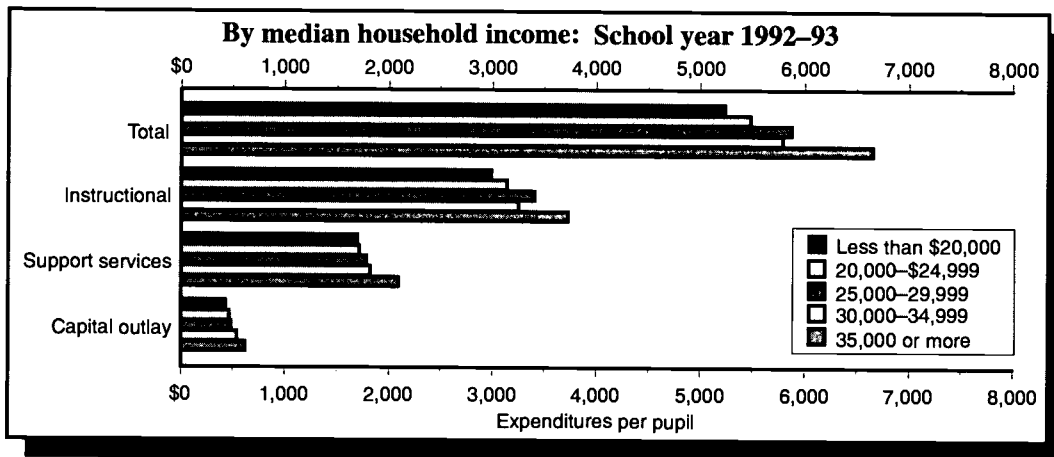

Public school expenditures per pupil (in 1996 constant dollars), by function and selected district characteristics: School year 1992–93

Selected district characteristics	Total	Instruction	Support services	Capital outlay	Other
Median household income					
Less than \$20,000	\$5,237	\$2,993	\$1,709	\$434	\$100
\$20,000–24,999	5,487	3,147	1,723	473	143
\$25,000–29,999	5,881	3,413	1,792	490	187
\$30,000–34,999	5,794	3,260	1,831	551	152
\$35,000 or more	6,661	3,737	2,102	630	192
Percentage of minority school-age children					
Less than 20 percent	5,972	3,384	1,828	580	180
20 percent or more	5,922	3,392	1,907	474	149

NOTE: Details may not add to totals due to rounding. Median household income categories are in 1992–93 dollars. See the glossary for definitions of specific functions. The number of pupils includes those who were enrolled on October 1. The Consumer Price Index (CPI) was used to adjust expenditures into constant 1996 dollars. See table 53-1 for resources on alternative adjustment approaches.

Higher education revenues per student

A substantial proportion of higher education revenues consists of student tuition and fees, government appropriations, and private gifts and endowments. Since access to higher education is partially determined by its cost to students, changes in the relative importance of these revenue sources can influence a student's decision to pursue a higher education degree.

- The primary source of revenue for public institutions is from federal, state, and local government appropriations. Between 1984 and 1994, government appropriations per full-time-equivalent (FTE) student fell both in constant dollars and as a share of all revenue at public universities, from \$8,327 to \$7,393 in constant dollars and from 53 to 42 percent as a share of all revenue (see supplemental table 53-1).
- Between 1984 and 1994, tuition and fees per FTE student increased both in constant dollars and as a share of all revenue at all public institutions. At public universities, for example, tuition and fees rose from \$3,028 to \$4,187 in constant dollars and from 19 to 24 percent as a share of all revenue during this period (see supplemental table 53-1).
- Between 1984 and 1994, average tuition and fee revenue per FTE student increased at private universities, rising from \$11,338 to \$15,508 in constant dollars. In addition, revenue from private gifts and endowment income per FTE student climbed by 36 percent (from \$5,591 to \$7,584), compared to less than 1 percent at private 4-year colleges (from \$2,657 to \$2,665).

Higher education expenditures per student

Faculty and staff salaries and institutionally supported research account for a large share of higher education expenditures. Since differences in institutional spending can affect the quality of instruction and learning experiences, understanding variations in expenditure categories can provide some insight into the organization and operation of higher education institutions.

- Overall spending per full-time-equivalent (FTE) student increased at all types of higher education institutions between 1984 and 1994. In 1996 constant dollars, increases ranged from 15 percent at public 2-year colleges (from \$5,636 to \$6,462 per FTE student) to 39 percent at private universities (from \$26,185 to \$36,280 per FTE student).
- Although instructional expenditures per FTE student increased between 1984 and 1994, instructional spending as a percentage of total expenditures fell at public universities, public 4-year colleges, and private 4-year colleges. At private universities and public 2-year colleges, the percentages of total expenditures in the 2 years were similar (see supplemental table 54-1).
- Between 1984 and 1994, research expenditures increased by 38 percent in private universities (from \$4,643 to \$6,405) and 43 percent in public universities (from \$2,996 to \$4,288). Over the decade, research spending accounted for roughly 18 percent of total institutional expenditures in private universities, and rose from 19 to 22 percent of total spending in public universities (see supplemental table 54-1).

International comparisons of expenditures for education

The portion of total financial resources that a country chooses to invest in education is a critical decision that raises many issues for debate, for example, whether and to what extent education costs should be borne by the public or private sector. International comparisons of expenditures for education show considerable variation across countries in the share of national resources devoted to education, the sources (public or private) of funds spent on education, and the levels of education to which funds are allocated.

- In 1993, total expenditures on education institutions in the United States were 4.2 percent of the Gross Domestic Product (GDP) for the primary-secondary grade level, 2.5 percent for higher education, and 6.8 percent for all levels combined. While Canada and France spent a larger fraction for primary-secondary education, of the G-7 countries, only Canada spent a larger fraction than the United States for higher education and for all levels combined.
- In most G-7 countries, expenditures on higher education that came from public sources were more than twice the amount of those that came from private sources. However, in both the United States and Japan, the percentage of GDP spent on higher education that came from private sources (1.2 and 0.6 percent, respectively) was similar in size to the percentage that came from public sources (1.3 and 0.4 percent, respectively). For primary/secondary education, the proportion of GDP that came from private sources was highest in Germany, at 0.9 percent.
- In all of the G-7 countries, expenditures per student were larger for higher education than for primary/secondary education. In the United States and the United Kingdom, the average amount spent per student in higher education was more than twice the amount spent per primary-secondary student, compared to less than 10 percent higher in Italy.

Public and private expenditures on education institutions,¹ by level of education and country: 1993

G-7 country	As a percentage of GDP					Per student ²			
	Primary/secondary		Higher education		All levels and sources combined ⁶	Constant 1993 U.S. dollars ³		As a percentage of GDP per capita

United States	3.8	0.4	1.3	1.2	6.8	5,987	14,607	24.4	60.2

— Not available.

¹ Includes all institutions (public and private) with the exception of Germany and Italy, which include only public institutions, and the United Kingdom, which includes public and government-dependent private institutions.

² Per-student expenditures were calculated based on full-time-equivalent (FTE) enrollment figures, and expenditures from both public and private sources, with the exception of the United Kingdom, for which private source data were unavailable.

³ Purchasing Power Parity (PPP) indices were used to convert other currencies to U.S. dollars. Because the fiscal year has a different starting date in different countries, within-country Consumer Price Indices (CPIs) were used to adjust the PPP indices to account for inflation. See the supplemental note to this indicator for further explanation.

⁴ Public expenditures are defined as direct public expenditures on education institutions plus public subsidies to households and other private entities for education institutions (e.g., tuition and fees), excluding other public aid to students and households (e.g., subsidies for student living costs).

⁵ Private expenditures are defined as private payments from households and other private entities to education institutions, minus any portion derived from public subsidies.

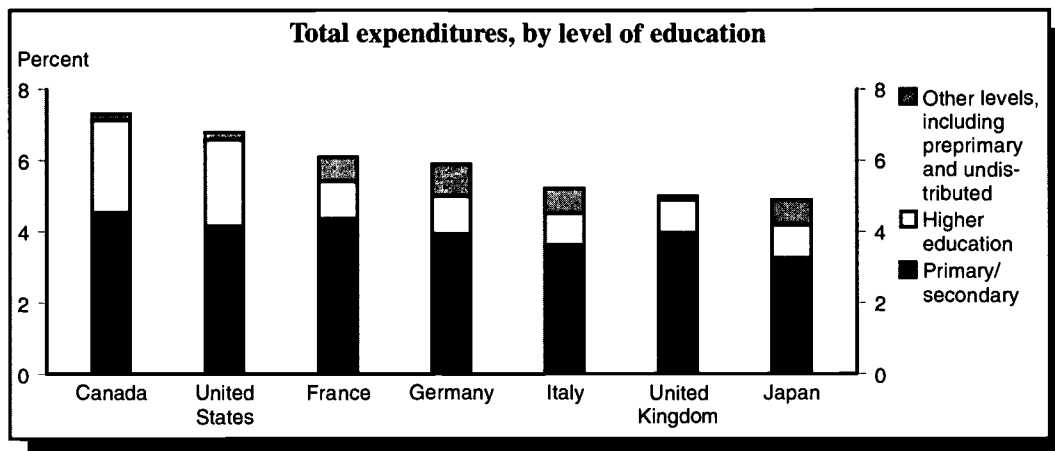

⁶ "All levels combined" includes expenditures on preprimary education and funds classified as "undistributed," a classification reserved for enrollments, expenditures, or programs that cannot be unambiguously assigned to International Standard Classification of Education (ISCED) defined levels. Examples of undistributed education can include nongraded special education or recreational nondegree adult education programs.

⁷ Primary/secondary per-student expenditures were calculated by adding primary and secondary FTE enrollments and by dividing the total FTE into the total expenditures. See the supplemental note to this indicator for further explanation.

⁸ Total expenditures in the United Kingdom do not include primary/secondary expenditures from private sources, for which data were unavailable.

Salaries of teachers

Methods of attracting and retaining quality teachers have long been discussed among education officials. Concerns about such issues have led to reforms designed to increase teacher benefits. These measures include creating new career steps or paths, establishing teaching positions with greater authority and responsibility, instituting merit pay schemes, and experimenting with teachers' salary structures.

- Between 1980 and 1996, the average salary (adjusted for inflation) of all public school teachers increased 19 percent, rising from \$32,332 to \$38,434 (see supplemental table 56-1). In 1995, the average salary of all bachelor's degree recipients who earned income was 19 percent higher than the average salary of public school teachers (\$45,773 compared to \$38,456).
- Following a period of decline in the 1970s, public school teachers' average salaries increased continuously throughout the 1980s and into the early 1990s, reaching a peak of \$38,830 in 1991. Since then, salaries have decreased slightly (see supplemental table 56-1).
- The average beginning salary (adjusted for inflation) of public school teachers increased 24 percent between 1980 and 1996, rising from \$20,292 to \$25,167 (see supplemental table 56-1).
- Public school teachers at central city schools with a high percentage of minority students (20 percent or more) had higher average salaries than those teachers at central city schools with a low percentage of minority students (less than 20 percent). Regardless of minority enrollment, public school teachers in urban fringe schools had higher average salaries than their counterparts in central city or rural/small town schools.

Average annual salaries (in 1996 constant dollars) of public elementary and secondary school teachers and individuals with a bachelor's degree or higher: Selected school years ending 1960-96

School year ending	All teachers	Elementary teachers	Secondary teachers	Beginning teachers ¹	Bachelor's degree or higher ^{1,2}
1960	\$26,718	\$25,755	\$28,222	—	—
1968	34,306	33,312	35,549	—	\$46,900
1976	35,708	34,801	36,664	\$23,745	44,803
1984	33,871	33,180	34,827	21,561	41,067
1992	38,737	38,072	39,602	25,397	43,816
1994	38,502	37,942	39,418	25,349	47,187
1995	38,456	37,906	39,312	25,185	45,773
1996	38,434	37,916	39,162	25,167	—

— Not available.

¹ Salaries of beginning teachers and persons with a bachelor's degree or higher are for the calendar year.

² Includes salaries of all individuals aged 25 or older who earned income and had a bachelor's degree or higher, including teachers.

Education and certification of full-time, secondary mathematics and science teachers

Concern about the quality of education in the United States has focused interest on teacher qualifications and student exposure to well-qualified teachers, especially in mathematics and science. Educational background is one measure of teachers' qualifications. Whether they had majored or minored or are certified in the fields they teach is an indication of their substantive and academic qualifications in those subjects.

- In school year 1993–94, about 90 percent of public and private secondary students in science classes were taught by teachers who had majored or minored in science at the undergraduate or graduate level. In mathematics classes, 70 to 80 percent of students were taught by teachers who had majored or minored in mathematics.
- Students in mathematics classes in public secondary schools with a high student poverty level (more than 40 percent of students eligible for free or reduced-price lunch) were less likely to be taught by teachers who had majored or minored in mathematics than were students in public schools with a low poverty level (5 percent or less of students eligible for free or reduced-price lunch) (see supplemental table 57-1).
- Secondary students in public schools with high minority enrollment (20 percent or more of students) were less likely to be taught mathematics or science by a teacher who had majored or minored in the class subject than were students at public schools with low minority enrollment (less than 20 percent of students).
- Students in mathematics classes at large public schools (750 or more students) were more likely to be taught by a teacher who had majored or minored in mathematics than students at small public schools (less than 150 students). Students in science classes at large and small public schools had similar chances of being taught by a teacher who had majored or minored in science (90 and 86 percent, respectively) (see supplemental table 57-2).

Percentage of secondary mathematics and science students taught by teachers with selected qualifications, by control of school, percentage of minority enrollment, and class subject: School year 1993–94

Attrition among full-time public and private school teachers

Teacher attrition is the largest single factor determining the demand for additional teachers in the Nation's schools. Patterns of attrition vary considerably by the age of teachers and the destination of those leaving. While the rate of teacher attrition is not as high today as it was in the 1960s and 1970s, it is still important to study attrition patterns and their implications for the Nation's future need for teachers as the current teacher work force ages.

- Six percent of full-time public school teachers and 10 percent of full-time private school teachers who taught during the 1993–94 school year left teaching before the 1994–95 school year. Attrition rates between the 1993–94 and 1994–95 school years for both full-time public and private school teachers were similar to those between the 1987–88 and 1988–89 school years.
- For public school teachers who left teaching between the 1993–94 and 1994–95 school years, the destination of leavers reported most was retirement. In fact, during that period, 3 out of 10 public school teachers who left teaching did so to retire.
- For private school teachers who left teaching between the 1993–94 and 1994–95 school years, the destination of leavers reported most was to pursue a career outside of education. For example, between the 1993–94 and 1994–95 school years, 33 percent of private school teachers left teaching to pursue a career outside of education.
- Attrition was highest among older teachers (those aged 60 and older) and among those aged 25–29. Among young teachers (those younger than 25) attrition was far higher in private than in public schools (see supplemental table 58-1).

Change in teaching status of full-time teachers between the 1987–88 and 1988–89, 1990–91 and 1991–92, and 1993–94 and 1994–95 school years, and destination of leavers, by control of school

Teaching status and destination of leavers	Public			Private

Research output of postsecondary faculty

In many postsecondary institutions, faculty members are expected to produce and publish original research such as journal articles, books, or reports. This research responsibility is usually in addition to their teaching responsibilities, meaning that faculty members must strike a balance between research and teaching. On the one hand, research activities can be an asset to both the institution and students, bringing together the creation and the transmittal of knowledge. On the other hand, research activities may decrease the amount of time faculty have to prepare lectures and work individually with students.

- In both the fall of 1987 and the fall of 1992, the average research output of full-time postsecondary faculty for the previous 2 years was similar, except for a slight decrease in the number of articles written. In the fall of 1992, faculty produced about three articles or creative works and about four presentations or exhibits during the previous 2 years.
- In the fall of 1992, postsecondary faculty at research institutions produced, on average, more articles or creative works during the previous 2 years than faculty at other types of higher education institutions. Faculty at doctoral institutions produced more articles than all other faculty at other types of higher education institutions except for research institutions.
- In general, in the fall of 1992, faculty in agriculture/home economics produced more articles or creative works (7.3), faculty in the social sciences produced more books (0.9), and faculty in the fine arts produced more presentations or exhibits (17.0) during the previous 2 years than faculty members in other fields.
- In the fall of 1992, tenured postsecondary faculty produced on average more articles or creative works, books or monographs, or other works during the previous 2 years than nontenured postsecondary faculty (see supplemental table 59-1).

Average research production of full-time postsecondary faculty during the previous 2 years, by academic discipline and type of institution: Fall 1987 and fall 1992

Academic discipline and type of institution	Fall 1987				Fall 1992

Nontenure-track faculty

Faculty in higher education are either tenured, on tenure track, or not on tenure track (those not eligible for tenure). Institutions rely on nontenure-track faculty to respond flexibly to fluctuating enrollments, to fill temporary vacancies, to teach specialized courses, and to reduce costs. While many are accomplished teachers, nontenure-track faculty may lack the training and record of scholarship required for the tenure track. Nontenure-track faculty face job uncertainty, often play no role in academic governance, and may lack job benefits provided to tenure-track faculty. Excessive dependence on nontenure-track faculty could undermine faculty morale and quality of teaching at a college or university.

- The Nation's higher education institutions employed nearly as many nontenure-track as tenure-track faculty in the fall of 1992 (45 and 48 percent, respectively). Another 7 percent of those teaching courses worked in institutions that lacked tenure systems.
- Among institutions with a tenure system, research universities had the lowest percentage of nontenure-track faculty (29 percent), while 2-year colleges had the highest (67 percent).
- Sixty percent of female faculty at institutions with tenure systems were in nontenure-track positions, while 42 percent of male faculty held such positions. This gender difference is only partly explained by females being younger: It also appeared in each age category (see supplemental table 60-1). Moreover, among full-time faculty, females were about twice as likely to be nontenure-track.
- At 4-year institutions, 34 percent of undergraduate courses and 26 percent of graduate courses were taught by nontenure-track faculty (see supplemental table 60-2). Four-year private institutions offered proportionally more courses (both undergraduate and graduate) taught by nontenure-track faculty than did 4-year public institutions.

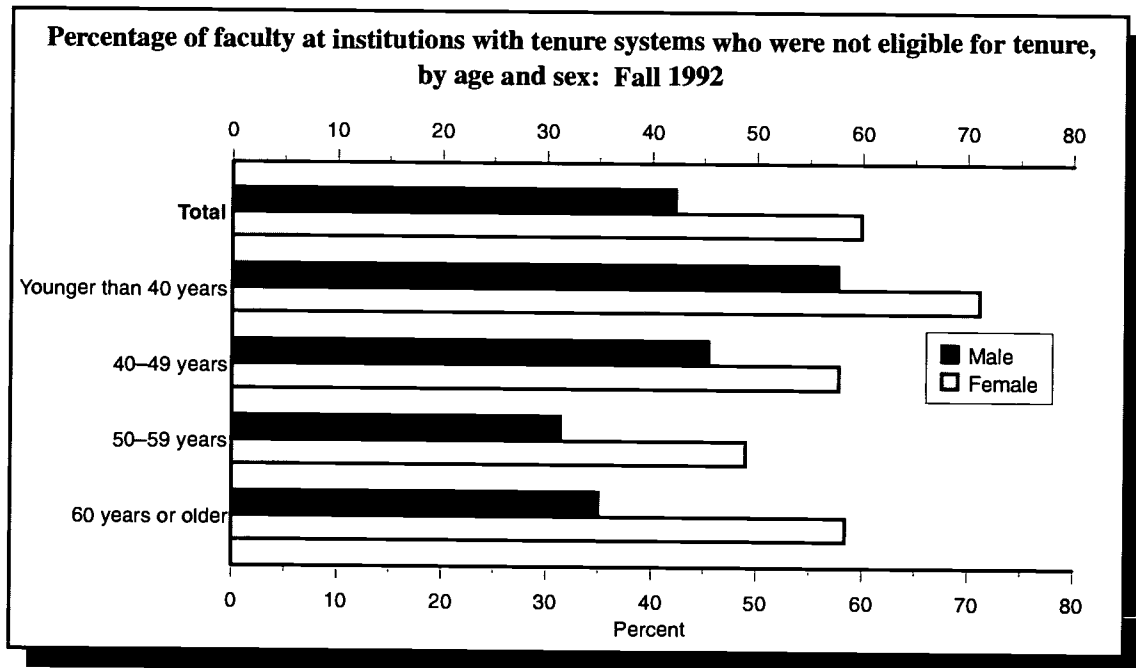

Percentage distribution of faculty's tenure status, by level, control, and type of institution, and faculty members' employment status: Fall 1992

Institutional characteristics and faculty employment status	All institutions			Institutions with tenure systems	
	Tenure-track	Nontenure-track	No tenure system at institution	Tenure-track	Nontenure-track
Total	47.6	45.3	7.1	51.3	48.7
4-year institutions	57.5	38.5	4.0	59.9	40.1

¹ Center-based programs include nursery, prekindergarten, and Head Start programs.

² The poverty measure presented in this analysis was developed by combining information about household composition and household income. See the supplemental note to this indicator for further discussion.

³ Percentages less than 0.05 are rounded to 0.0.

NOTE: Included in the total but not shown separately are children from other racial/ethnic groups and types of family structures. This analysis includes children aged 3-5 who were not enrolled in first grade. Age is as of December 31, 1992.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey (NHES), 1993 (School Readiness File).

Note to Indicator 1: Preprimary enrollment rates

Age of the child

For this analysis, the age of the child was calculated as of December 31, 1990 for 1991 data; as of December 31, 1992 for 1993 data; and as of December 31, 1994 for 1995 data.

Enrollment rates

The numerator used to calculate the enrollment rates for this analysis was the number of 3-, 4-, and 5-year-olds who were enrolled in center-based programs or kindergarten as of December 31, 1990, 1992, and 1994. The denominator used was the total number of children aged 3, 4, and 5 as of December 31, 1990, 1992, and 1994. Children who were enrolled in first grade or higher or who were in the "ungraded" category were excluded from this analysis.

Race/ethnicity

A child's race/ethnicity was determined by the composite of the National Household Education Survey (NHES) variables "race" and "Hispanic." If the child's ethnicity was Hispanic, he or she was classified as Hispanic, regardless of whether his or her race was classified as white, black, or other. Children of "other" race/ethnicities were included in the totals but were not shown separately in this analysis.

Parents' highest education level

"Parents' highest education level" is defined as the highest level of education of the child's parents or nonparent guardians who resided in the household. It was based on the highest education level of the mother or female guardian and the highest education level of the father or male guardian. If only one parent resided in the household, that parent's highest education level was used.

Poverty measure

The poverty measure used in this analysis was developed by combining information about household composition and household income. Household composition is the count of family members based on the relationship among the household members. The number of family members is the number of persons in the immediate family of the

child (e.g., parents, siblings, and the child him/herself). If the child had no parents in the household, the total number of household members was used.

Household income was also used as part of the poverty measure. NHES collects data on household income in increments. Information on the actual household income, which was available for about 7 percent of the population, was also used. Because exact household income was not available in most cases, the measure is an approximation. Households were categorized as "poor" if they met one of the following conditions:

- two family members and the household income was \$5,000 or less;
- two family members and the actual household income was less than \$10,000;
- three family members and the household income was \$10,000 or less;
- three family members and the actual household income was less than \$12,000;
- four or five family members and the household income was \$15,000 or less;
- five family members and the actual household income was less than \$18,000;
- six or seven family members and the household income was \$20,000 or less;
- seven family members and the actual household income was less than \$23,000;
- eight family members and the household income was \$25,000 or less; or
- nine or more family members and the household income was \$30,000 or less.

This information was available in 1993 and 1995 only.

¹ "Behavioral problems" and "problems with school work" represent students whose parents reported they had been contacted by the school about these types of problems.

² In 1995, parents were asked to rate how well their child was doing compared to other children in the class using the following scale: "near the top of the class," "above the middle of the class," "around the middle," "below the middle," or "near the bottom." Students whose parents answered "below the middle" or "near the bottom" were categorized as "academically below the middle of the class."

³ Age was as of December 31, 1990 for 1991 data, and as of December 31, 1994 for 1995 data.

⁴ Urbanicity, family income, and academic standing for 1991 were not comparable to data for 1995.

NOTE: Included in the total but not shown separately are children from other racial/ethnic groups.

Table 4-1 Percentage of all 16- to 24-year-olds and those who dropped out of school, by English language usage and proficiency, and disability status: October 1992 and 1995

English language usage and proficiency, and disability status	16- to 24-year-olds		16- to 24-year-old dropouts ¹	
	1992	1995	1992	1995
Total 16- to 24-year-olds	100.0	100.0	11.0	12.0
Spoke English at home	85.7	85.1	8.8	9.6
Spoke a language other than English at home	14.3	14.9	21.5	24.2
Spanish	9.4	10.9	29.0	29.6
Other European	1.6	1.4	8.8	8.0
Asian	2.0	1.2	6.5	4.2
Other	1.2	1.5	4.3	7.9
16- to 24-year-olds who spoke a language other than English at home and:				
Had difficulty speaking English ²	5.1	5.3	39.7	44.3
Did not have difficulty speaking English ²	9.2	9.6	11.2	12.0
Had taken an ESL course	—	3.8	—	22.6
Had not taken an ESL course	—	1.5	—	24.8
Disability status				
No disabling condition	91.9	93.1	10.2	11.8
Had a disabling condition ³	8.1	6.9	15.7	14.6
Blindness	0.7	0.1	16.2	16.9
Deafness	0.8	0.2	10.3	15.6
Other hearing impairment	1.1	0.5	13.5	(4)
Emotional disturbance	1.3	0.5	19.9	23.6
Learning disability	3.7	2.2	18.7	17.6
Orthopedic impairment	1.4	0.6	12.3	14.2
Mental retardation	1.2	0.5	22.4	31.1
Speech impediment	1.6	0.4	13.2	15.8

— Not available.

¹ Dropouts are those aged 16-24 who had not completed high school and who were not enrolled in school.

² Respondents were asked to rate the child's ability to speak English using the following scale: "not at all," "not well," "well," or "very well." If respondents answered "very well," children were categorized as not having difficulty speaking English; all others were categorized as having difficulty speaking English.

³ Included in the totals are other disabling conditions not presented in the table. Some 16- to 24-year-olds with a disabling condition may be included in more than one disability category.

⁴ Too few sample observations for a reliable estimate.

NOTE: For many key items in the October CPS, the Bureau of the Census imputes data for cases with missing data due to item non-response. However, for some of the items that were used in this

indicator and in *Dropout Rates in the United States, 1995* item non-response was not imputed by the Bureau of the Census. Using a sequential hot deck procedure, the authors of the *Dropout Rates* report produced special imputations for nine items from the October 1995 CPS used in their report. To avoid inconsistency between this indicator and the *Dropout Rates* report, six of these items were also used for the statistics in this table and in table 4-2. Special imputations were not available for the October 1992 CPS at the time this table was prepared. However, different treatment of missing data due to item non-response in the two years is likely to have only small effects on the calculated statistics. For example, the dropout rate in 1995 for 16- to 24-year-olds who had repeated a grade was 24.4 when missing data on grade repetition and completing high school with a GED was imputed and 24.1 when these items were imputed. Details may not add to totals due to rounding.

Note to Indicator 4: Estimates of non-English language usage and English language proficiency

Questions on language usage and proficiency were asked of the household respondent (usually the household head or the spouse of the household head) about all household members 5 years old and over. For each of these individuals the questions consisted of the following: "Does this person speak a language other than English at home?" If yes, then "What language does this person speak?" and "How well does this person speak English? Very well, Well, Not well, or Not at all." In 1995, the question "Has this person ever taken a course to learn how to read or write English as a second language?" was added.

Researchers and policymakers recognized that the question on English ability is an extremely subjective one: It is not possible to apply an objective standard to a person's report on his or her own English ability, or even worse, that person's report on the English language ability of other household members, to determine whether that person is really limited in his or her English ability. Thus, as a means of validating the English ability question, the English Language Proficiency Survey (ELPS) was sponsored by the Department of Education and carried out by the Census Bureau in 1982. The results

of that survey, which included a lengthier set of questions about language and tests of English ability geared to age, revealed a strong correlation between responses on the English ability question and the test scores.* Using a set pass/fail score, persons who had reported English speaking ability of "Very well" passed at a rate similar to English-only persons (who were used as a control group). Persons who reported less than "Very well," (e.g., "Well," "Not well," or "Not at all") had significantly higher rates of failure. These results indicated that, although it would not be advisable to use a person's response to the English language ability question as a diagnostic tool for determining that person's own need for language services, it was appropriate to use the results as an aggregate measure for the population as a whole. Thus the number of persons who reported speaking English less than "Very well" may be considered one measure of the number of limited-English-proficient persons in the country.

NOTE: Data in this table may appear inconsistent with data in table 5-1 due to a difference in respondents for the two sources. See the supplemental note to this indicator for further explanation.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, *Almanac: Writing, 1984 to 1994, 1996*.

Note to Indicator 5: Comparability of sources for student computer use

Two primary data sources were used for the analysis in *Indicator 5*. Each surveyed different populations for different reasons. The full citations for these data sources are as follows:

- U.S. Department of Education, National Center for Education Statistics, National Assessment of Educational Progress, *Almanac: Writing, 1984 to 1994, Mathematics, 1978 to 1994, Science, 1986 to 1994, 1996*.
- U.S. Department of Commerce, Bureau of the Census, *October Current Population Surveys, 1984, 1989, and 1993*.

The National Assessment of Educational Progress (NAEP) Almanac data come from a survey administered to 9-, 13-, and 17-year-olds every 2 years. The questions on computer use are background questions administered to the students along with an assessment of their skills in mathematics, science, reading, and writing. The background questionnaire asks, among other things, how much

time students spend on computers and for what activities they use a computer.

The October Current Population Surveys (CPS) are administered to households each year. The computer component of these surveys is included every few years, and has questions concerning the access students in the household have to computers at school and at home. These data can be broken out by race/ethnicity and family income level to provide descriptive information on who has access to computers and where they are using them.

Because one survey is directed toward students and the other toward the heads of households, the results from the two sources are not comparable. In fact, the difference in the respondents for these two surveys may account for the inconsistencies between supplemental tables 5-1 and 5-2, including the fact that household respondents reported students using computers at home less often than students themselves reported using computers at home.

Table 6-1 Percentage of school library media centers that offered selected services and equipment, and library media center expenditures, by control and level of school: School year 1993-94

Selected services and equipment	Public			Private		
	Total	Elementary	Secondary	Total	Elementary	Secondary

Table 7-1 Event dropout rates¹ for those in grades 10–12, aged 15–24, by parents' highest education level:² October 1990–95

Parents' highest education level	1990	1991	1992	1993	1994	1995
Total	4.0	4.0	4.4	4.5	5.3	5.7
Less than high school graduate	9.1	7.0	12.5	9.8	10.9	11.8
High school graduate	3.3	4.2	4.8	4.7	6.6	7.4
Some college	2.2	2.6	2.2	3.3	2.7	3.8
Bachelor's degree or higher	0.8	1.1	0.6	1.2	1.1	1.1
Not available ³	20.1	17.9	22.7	16.8	23.6	22.5

¹The event dropout rate is the percentage of those in grades 10–12, aged 15–24, who were enrolled the previous October, but who were not enrolled and had not graduated the following October.

²Parents' highest education level is defined as either 1) the highest educational attainment of the two parents who reside with the student, or if only one parent is in the residence, the highest educational attainment of that parent; or 2) when neither parent resides with the student (8 percent of 15–24 year olds in grades 10–12 in 1995), the highest educational attainment of the head of the household and his or her spouse.

³Parents' highest education level is not available 1) for those who do not live with their parents and who are classified as the head of the household (not including those who live in college dormitories); and 2) for those whose parents' educational attainment was not reported. In 1995, 15 percent of event dropouts aged 15–24 were in this category.

SOURCE: U.S. Department of Commerce, Bureau of the Census, October Current Population Surveys.

Note to Indicator 7: Recent school dropouts

In this indicator, recent school dropouts are measured by using the event dropout rate. The event dropout rate is the percentage of students enrolled in grades 10–12 in October of a given year who are not enrolled and have not graduated 1 year later.

Calculating the event dropout rate requires estimating 1) the number of students who left high school before graduating (recent dropouts), and 2) the number of students who were enrolled in grades 10, 11, and 12 the previous October. The event dropout rate for 1995 is calculated by using data from the October Current Population Survey (CPS). The numerator is estimated as the number of persons aged 15–24 who were enrolled in grades 10–12 in October 1994, were not enrolled in grades 10–12 in October 1995, and who had not completed 12 years of school. The denominator is estimated as the event dropouts and those aged 15–24 who attended grades 10, 11, and 12 in October 1994 who were still enrolled in October 1995, or who had completed 12 (or more) years of school and who indicated that they had graduated between October 1994 and 1995. Those enrolled in special schools are counted as “not enrolled in regular school” and may be classified as recent dropouts if they had been enrolled in a regular school the previous October.

Change in questions used to report educational attainment

From 1972 to 1991, the CPS defined educational attainment as “years of school completed.” Individuals who completed 12 years of school were regarded as high school graduates and those who completed 16 years of school as college graduates. The number of years of school completed was based on responses to two questions: 1) “What is the highest grade . . . ever attended?” and 2) “Did . . . complete it?” For example, an individual who responded that the highest grade he or she ever attended was the first year of college and that he or she did not complete it was regarded as having completed 12 years of school.

Beginning in 1992, these two questions were combined into a single question: “What is the highest level of school . . . has completed or the highest degree . . . has received?” Previously, the earlier high school levels were listed as single summary categories such as “9th grade, 10th grade, or 11th grade.” Then, several new categories were added, including “12th grade, no diploma;” “H.S. graduate—diploma or equivalent;” and “Some college—no degree.” Finally, college degrees were listed by type, allowing for a more exact understanding of educational attainment. See the supplemental note to *Indicator 22* for further discussion on the how this change affects the measurement of educational attainment.

Procedural changes

In 1994, the Bureau of the Census introduced several changes to the procedures used in the CPS. These changes may affect the comparability of current statistics to those derived from earlier surveys. In 1994, the sample weights were calculated using information from both the 1980 and the 1990 Decennial Censuses. In earlier surveys, 1990 population figures were based on the 1980 Decennial Census and information collected during the 1980s on births, deaths, and migration. For some groups, the latter produces different population estimates than the former, the sample weights would change, as would the statistics used to calculate them.

Also, the Bureau began using Computer-Aided Personal (and Telephone) Interviews (CAPI and CATI) to administer the survey in 1994. For earlier surveys, interviewers were given printed questionnaires to use. It is well known that the method in which a survey is administered can have effects on its responses. Although substantial testing was done to minimize or predict these effects, all questions were not tested. Therefore, some statistics, such as dropout rates, may be affected by the change in survey procedures.

NOTE: Details may not add to totals due to rounding.

Note to Indicator 8: Family income

The Current Population Survey (CPS) includes a family income variable that is used as a measure of a student's economic standing in many indicators in this publication. The three family income categories used in this publication are low, middle, and high income. Low income is the bottom 20 percent of all family incomes; high income is the top 20 percent of all family incomes; and middle income is the 60 percent in-between. The table that follows shows the real dollar amounts, rounded to the nearest \$100, of the breakpoints between low and middle income and between middle and high income. For example, in 1995, low income was defined as the range from \$0–\$11,700; middle income was defined as the range between \$11,701–\$56,200; and high income was defined as \$56,201 and over. Therefore, the breakpoints between low and middle income and between middle and high income are \$11,700 and \$56,200, respectively.

Dollar value (in current dollars) at the breakpoint between low and middle and between middle and high income categories of family income: October 1970–95

October	Breakpoints between:	
	Low and middle	Middle and high
1970	\$3,300	\$11,900
1971	—	—
1972	3,500	13,600
1973	3,900	14,800
1974	—	—
1975	4,300	17,000
1976	4,600	18,300
1977	4,900	20,000
1978	5,300	21,600
1979	5,800	23,700
1980	6,000	25,300
1981	6,500	27,100
1982	7,100	31,300
1983	7,300	32,400

* In 1980, the majority of the respondents missing the sex variable had less than a high school diploma; therefore, estimates of the percentage of male and female students who attended a postsecondary institution within 2 years following their scheduled 1980 high school graduation may be slightly inflated.

NOTE: Details may not add to totals due to rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Longitudinal Study of the High School Class of 1972 (NLS-72), First Follow-up (1974); High School and Beyond (HS&B) study, Senior Cohort, Third Follow-up Survey (1986); and National Education Longitudinal Study of 1988 (NELS:88), Second (1992) and Third Follow-up (1994).

Note to Indicator 9: Postsecondary enrollment rates**Definition of student percentages**

Indicator 9 reports the percentages of high school students from different cohorts who enroll in postsecondary institutions. The data used to calculate enrollment rates came from three different surveys: National Longitudinal Study of the High School Class of 1972 (NLS-72), High School and Beyond (HS&B), and National Education Longitudinal Study of 1988 (NELS:88). Therefore, the survey respondents' postsecondary institution data were combined to form the following set of postsecondary institution types:

- None (not enrolled in a postsecondary institution)
- 4-year colleges or universities
- 2-year colleges
- Vocational, technical, or trade schools

The lists below describe how the responses from each survey (left column) were translated to postsecondary institution types (right column).

National Longitudinal Study of the High School Class of 1972 (NLS-72)

<u>Survey response</u>	<u>Postsecondary institution</u>
Vocational or technical	Vocational, technical, or trade schools
2-year college	2-year college
4-year college	4-year colleges or universities
Other	None
Unclassified	None
Missing data	Missing

High School and Beyond (HS&B), Senior Cohort, Third Follow-up (1986)

<u>Survey response</u>	<u>Postsecondary institution</u>
Part time-other	Vocational, technical, or trade schools
Full time-other	Vocational, technical, or trade schools
Part time, public 2-year	2-year college
Full time, public 2-year	2-year college
Part time, private 4-year	4-year colleges or universities
Full time, private 4-year	4-year colleges or universities

Part time, public 4-year	4-year colleges or universities
Full time, public 4-year	4-year colleges or universities
Non-student	None
Missing	Missing

National Education Longitudinal Study of 1988, Third Follow-up (1994) (NELS:88)

<u>Survey response</u>	<u>Postsecondary institution</u>
Private for-profit	Vocational, technical, or trade schools
Private not-for-profit, less-than-4-year, not working toward an associate's degree	Vocational, technical, or trade schools
Public less-than-2-year, not working toward an associate's degree	Vocational, technical, or trade schools
Private not-for-profit, less-than-4-year, working toward an associate's degree	2-year college
Public less-than-2-year, working toward an associate's degree	2-year college
Public 2-year	2-year college
Private 4-year	4-year colleges or universities
Public 4-year	4-year colleges or universities
Legitimate skip	None
Missing	Missing

Enrollment in multiple postsecondary institutions

There are cases in which respondents reported having enrolled in more than one type of postsecondary institution (e.g., enrolled in a 2-year college and then transferred to a 4-year college). For this analysis, only the highest reported level of postsecondary institution was used to calculate survey respondents' enrollment rates. For example, if a respondent reported enrolling in more than one

type of postsecondary institution (2-year and 4-year colleges), the respondent was used in estimating the enrollment rate of the highest reported level of institution (4-year college) and not counted as enrolled in the lower level institution.

Enrollment rates were calculated for student enrollment in the fall following scheduled high school graduation and 2 years later. Since only the highest level of postsecondary institution was used in this analysis, respondents' earlier and later survey responses may differ because they reported enrolling in more than one type of institution within 2 years after their scheduled high school graduation. Therefore, the percentage of students whose highest level of postsecondary enrollment was a vocational, technical, or trade school or a 2-year college may have decreased between the fall following scheduled high school graduation and 2 years later if sufficient numbers of students enrolled in a second, higher level institution.

Definition of the fall and 2 years following scheduled high school graduation

Indicator 9 reports enrollment rates in postsecondary institutions the fall immediately following and 2 years following different cohorts' scheduled graduation from high school. Since graduation dates vary between schools and school years, standard dates following each cohort's scheduled high school graduation were selected to estimate enrollment rates rather than calculating the exact time period following graduation for each survey respondent.

Enrollment rates in the fall following scheduled high school graduation were calculated using the enrollment status of survey respondents in the October following their scheduled graduation. For example, a survey respondent in the NLS-72 was considered enrolled in a postsecondary institution in the fall following scheduled high school graduation if he or she reported being enrolled in October 1972. October was selected because enrollment data for October were available for each survey used in this analysis and because the academic year at postsecondary institutions would have begun by then.

Enrollment rates 2 years following scheduled high school graduation were calculated using the enrollment status of survey respondents in February of the second calendar year following scheduled graduation. The second February following scheduled graduation was selected because enrollment status for February was available in all three surveys. Assuming that scheduled high school graduations are in June, then the elapsed time between scheduled graduation and the second February following graduation is 20 months. The actual elapsed time varies among survey respondents, but February is directly comparable across surveys. Therefore, a survey respondent in the NELS:88 Second Follow-up (the class of 1992) was considered to be enrolled in a postsecondary institution 2 years following scheduled high school graduation if he or she reported being enrolled by February 1994.

Average or below	6.5	21.7	9.8	38.0	62.0	14.2	23.9	10.3	13.6	18.2

— Too few sample observations for a reliable estimate.

¹ Includes students who are still enrolled.

² Limited to students seeking an associate's degree at 2-year institutions.

³ Students were considered to have a diploma only if they had a regular high school diploma. Students with a GED or other high school credentials were considered to have no diploma.

⁴ Percentage of months enrolled in which the student was also employed in 1989–94.

⁵ Examines whether the student attended career-related lectures, participated in study groups with other students, talked about academic matters with faculty, or met with an advisor concerning academic plans.

⁶ Examines whether the students had contact with faculty outside of class, went places with friends from school, or participated in student assistance centers/programs or school clubs.

NOTE: The number of total cases in a row is used as the denominator in the calculation of the percentage distribution, whereas the number of cases within the cell is used as the denominator in the calculation of averages. If the number of cases in the cell is below 30, a low number will result, despite available estimates for the row as a whole.

— Too few sample observations for a reliable estimate.

¹ Includes students who are still enrolled.

² Limited to students seeking a certificate at 2-year and less-than-2-year institutions.

³ Students were considered to have a diploma only if they had a regular high school diploma. Students with a GED or other high school credentials were considered to have no diploma.

⁴ Percentage of months enrolled in which the student was also employed in 1989–94.

⁵ Examines whether the student attended career-related lectures, participated in study groups with other students, talked about academic matters with faculty, or met with an advisor concerning academic plans.

⁶ Examines whether the students had contact with faculty outside of class, went places with friends from school, or participated in student assistance centers/programs or school clubs.

NOTE: The number of total cases in a row is used as the denominator in the calculation of the percentage distribution, whereas the number of cases within the cell is used as the denominator in the calculation of averages. If the number of cases in the cell is below 30, a low number will result, despite available estimates for the row as a whole.

¹ Limited to students seeking an associate's degree at 2-year institutions or a certificate at 2-year and less-than-2-year institutions.

² Students were considered to have a diploma only if they had a regular high school diploma. Students with a GED or other high school credentials were considered to have no diploma.

³ Not applicable.

⁴ Percentage of months enrolled in which the student was also employed in 1989–94.

⁵ Examines whether the student attended career-related lectures, participated in study groups with other students, talked about academic matters with faculty, or met with an advisor concerning academic plans.

⁶ Examines whether the students had contact with faculty outside of class, went places with friends from school, or participated in student assistance centers/programs or school clubs.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

Note to Indicator 11: Postsecondary persistence and degree completion

This analysis was constructed using data from the 1990 Beginning Postsecondary Students Longitudinal Study (BPS:90/94). BPS is based on a subsample of the 1990 National Postsecondary Student Aid Study (NPSAS:90), which consists of students beginning their postsecondary education for the first time at community colleges, vocational schools, and institutions granting bachelor's degrees during the 1989–90 academic year. The BPS First Follow-up was conducted in the spring of 1992, 2 years following the students' entry into postsecondary education, and the Second Follow-up was conducted during the spring of 1994. BPS provides detailed information regarding individual students' attendance patterns for 5 years following their first enrollment in postsecondary education.

The analysis examines persistence toward and completion of postsecondary degrees for students whose initial postsecondary degree objective was an associate's degree and who were initially enrolled at a 2-year institution. It also examines the persistence of students seeking a postsecondary certificate who were initially enrolled at either a 2-year or less-than-2-year institution. Whether the stu-

dent was seeking an associate's degree or a certificate was determined by their response to the question "Toward which degree or other award are the courses you are taking leading?"

In constructing the analysis, students were first divided into two broad categories: those who completed a postsecondary degree and those who did not. Students who had completed a degree or certificate were categorized according to the highest degree attained. The remaining students who after 5 years had not completed a degree (bachelor's degree, associate's degree, or certificate), or who were still enrolled, were categorized according to the number of months they were (have been) enrolled in postsecondary education. It is important to note that the number of months enrolled is not necessarily continuous months; therefore, those months cannot be used as an indicator of when the student left postsecondary education. Rather, presenting the data in this manner was designed to give the reader a measure of the potential benefit derived from postsecondary attendance, even without having completed a degree.

— Too few cases for a reliable estimate.

¹ "Average hours worked per week while enrolled" was calculated relative to students' enrollment and included only hours for those months students were both working and enrolled up to first attainment (if any) or last enrollment.

² Students were considered to have a diploma only if they had a regular high school diploma. Students with a GED or other high school credentials were considered to have no diploma.

³ Does not include students enrolled in either public less-than-2-year or private, not-for-profit less-than-4-year institutions.

⁴ Includes whether the student attended career-related lectures, participated in study groups with other students, talked about academic matters with faculty, or met with an advisor concerning academic plans.

⁵ Includes whether the students had contact with faculty outside of class, went places with friends from school, or participated in student assistance centers/programs or school clubs.

NOTE: Due to rounding, details may not add to 100.0.

— Too few sample observations for a reliable estimate.

¹ "Average hours worked per week while enrolled" was calculated relative to students' enrollment and included only hours for those months students were both working and enrolled up to first attainment (if any) or last enrollment.

² Although not shown separately, totals include students enrolled in either public less-than-2-year or private, not-for-profit less-than-4-year institutions.

SOURCE: U.S. Department of Education, National Center for Education Statistics, 1990 Beginning Postsecondary Students Longitudinal Study, Second Follow-up (BPS:90/94).

Note to Indicator 13: Employment and postsecondary persistence and attainment

This analysis was constructed using data from the Beginning Postsecondary Student Longitudinal Study (BPS:90/94). BPS is based on a sub-sample of the 1990 National Postsecondary Student Aid Study (NPSAS:90) which consists of students beginning their postsecondary education for the first time at community colleges, vocational schools, and institutions granting bachelor's degrees during the 1989–90 academic year. The first BPS follow-up survey was conducted in the spring of 1992, two years following the student's entry into postsecondary education and the second follow-up was conducted during the spring of 1994. BPS provides detailed information regarding individual students' attendance patterns for five years following their first enrollment into postsecondary education.

The analysis examines the relationship between students' cumulative working status and their postsecondary outcomes according to the first type of institution in which they enrolled. Postsecondary outcomes were defined as whether the student had attained a degree or was still enrolled 5 years after initial entry into postsecondary education.

Average hours worked per week while enrolled

Students were divided into four categories based on the average number of hours they worked per week while enrolled up to their first attainment (if any) or last enrollment. These categories included no work, worked 1–15 hours per week, worked 15–33 hours per week, and worked 34 or more hours per week while enrolled. Average hours worked while enrolled was calculated relative to students' enrollment and included only hours for those months that students were both working and enrolled up to their first attainment (if any) or last enrollment. Students missing employment or enrollment information for any part of this period were excluded from the analysis.

Note to Indicator 14: Skill improvement training

Change between NHES 1991 and 1995

In 1995, the National Household Education Survey (NHES) questionnaire items on adult education and skill improvement training were constructed differently than those in the NHES 1991 questionnaire. In NHES 1991, different types of adult education courses and the main reasons for taking these courses could be obtained from the following item: "What was your main reason for taking (name 1 course)?" Response categories for this question included the following:

- A personal, family, or social reason;
- To improve, advance, or keep up-to-date on current job;
- To train for a new job or a new career;
- To improve your basic reading, writing, or math skills;
- To meet a requirement for a diploma, degree, or certificate of completion;
- Some other reason.

The participation rates for skill improvement training for 1991 were based on the number of respondents who chose the second response category, "to improve, advance, or keep up-to-date on current job."

In NHES 1995, respondents were asked about the different types of adult education courses they had taken in the last 12 months in each of five separate sections of the survey questionnaire: English as a Second Language; Basic Skills and GED preparation; Credential; Personal; and Career or Job related

activities. Within each section, the respondents were also asked to choose the main reason for participating in that type of course. Response categories for this question include the following:

- To improve, advance, or keep up-to-date on current job;
- To train for a new job or a new career;
- To improve your basic reading, writing, or math skills;
- To meet a requirement for a diploma, degree, or certificate of completion;
- A personal, family, or social reason;
- Some other reason.

The participation rates for skill improvement training for 1995 were based on the number of respondents who chose the first response category in each of the five sections "to improve, advance, or keep up to date on current job."

Currently employed workers

Currently employed workers were defined as individuals who were employed during the survey week and who were not full-time students. Individuals who were on vacation during the survey week were not included in this analysis.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Household Education Survey, 1991 and 1995 (Adult Education Component).

Table 15-1 Explanations of levels of reading proficiency**Level 350: Learns from specialized reading materials**

Readers at this level can extend and restructure the ideas presented in specialized and complex texts. Examples include scientific materials, literary essays, and historical documents. Readers also able to understand the links between ideas even when those links are not explicitly stated, and to make appropriate generalizations. Performance at this level suggests the ability to synthesize and learn from specialized reading materials.

Level 300: Understands complicated information

Readers at this level can understand complicated literary and informational passages, including material about topics they study at school. They can also analyze and integrate less familiar material and provide reactions to and explanations of the text as a whole. Performance at this level suggests the ability to find, understand, summarize, and explain relatively complicated information.

Level 250: Interrelates ideas and makes generalizations

Readers at this level use intermediate skills and strategies to search for, locate, and organize the information they find in relatively lengthy passages and can recognize paraphrases of what they have read. They can also make inferences and reach generalizations about main ideas and author's purpose from passages dealing with literature, science, and social studies. Performance at this level suggests the ability to understand specific or sequentially related information.

Level 200: Partial skills and understanding

Readers at this level can locate and identify facts from simple informational paragraphs, stories, and news articles. In addition, they can combine ideas and make inferences based on short, uncomplicated passages. Performance at this level suggests the ability to understand specific or sequentially related information.

Level 150: Simple, discrete reading tasks

Readers at this level can follow brief written directions. They can also select words, phrases, or sentences to describe a simple picture and can interpret simple written clues to identify a common object. Performance at this level suggests the simple, discrete reading tasks.

Note to Indicator 15: NAEP cohorts

Long-term trend

Three of the NAEP assessments, reading, mathematics, and science, report trends in the progress of students by age. Proficiencies are reported for those students aged 9, 13, and 17. The modal grades for students at these ages are 4th, 8th, and 11th grade. The fourth assessment, writing, is given to students in grades 4, 8, and 11, regardless of their age. In all four subjects, it would appear that the time span between the youngest and middle age/grade is greater than between the middle and oldest group. However, the way age is defined (on a calendar or fiscal year basis) and the time at which each age/grade is assessed (fall, winter, or spring) results in the same length of time (or years of schooling) between the three age/grade groups. A discussion of this methodology follows.

Age is determined on a calendar year basis for 9- and 13-year-olds, but on a fiscal year basis for 17-year-olds. In other words, the reading, mathematics, and science scores in 1994 represent students born in 1984 (9-year-olds), students born in 1980 (13-year-olds), and students born between October 1, 1976 and September 30, 1977 (17-year-olds). The writing scores represent students in grades 4, 8, or 11 at the time of the assessment regardless of age.

In addition to different age definitions, the time of the school year when the assessment is administered varies across age levels: 9-year-olds/4th-graders are tested in the winter; 13-year-olds/8th-graders are tested in the fall; and 17-year-olds/11th-graders are tested in the spring for all the assessments. Since 9-year-olds are tested between January and February of the year in which they turn 10, and 13-year-olds are tested between October and December of the year in which they turn 13, the 13-year-olds have had almost $3^{3/4}$ more years of schooling than the 9-year-olds. Likewise, since 17-year-olds are tested between March and May, they are between $16^{1/2}$ and $17^{1/2}$ at the time of the assess-

ment (the difference is due to age being determined on a fiscal year basis); thus, they have had about $3^{3/4}$ more years of exposure to school than 13-year-olds.

These different means of determining a student's age and the various testing times have been adopted in order to measure a uniform period of growth among the three age/grade groups. Comparing age/grade cohorts over time can be more problematic, however. Nine-year-olds in 1990 generally represent the same age cohort as 13-year-olds in 1994—two points in time not quite 4 years apart. However, the 17-year-olds tested in 1994 were generally younger than the 1990 13-year-old age cohort was in 1994. Therefore, care must be taken when examining student cohorts across assessments in different years.

Short-term trend

Although *Indicator 18* (Trends in the mathematics proficiency of 9-, 13-, and 17-year-olds) focused primarily on the trend data described above, supplemental data from the *NAEP 1996 Mathematics Report Card* were also included. These more recent data allow for trend comparisons just over the short term, as only the scores from the 1990, 1992, and 1996 surveys are comparable. These data were based on a separate survey instrument than those from the long-term trend data and were given to different students. The short-term trend assessment was designed using a framework influenced by the National Council for Teachers of Mathematics (NCTM) Curriculum and Evaluation Standards for School Mathematics. The long-term trend assessment has remained unchanged since its original design in 1973 and can be used to make comparisons in the performance of students over the past 21 years. One important difference of the short-term trend data is that 4th-, 8th-, and 12th-graders were assessed rather than 9-, 13-, and 17-year-olds, thus allowing for comparisons across cohorts.

Table 16-1 Explanations of levels of writing proficiency**Level 350: Effective, coherent writing**

The writing at this level provides clear complete responses to the assigned task. It tends to contain supportive details and discussion that contribute to the effectiveness of the response. This writing is also characterized by an overall unity and coherence not found at the lower levels.

Level 300: Complete, sufficient writing

Responses at this level tend to be complete and to contain sufficient information to accomplish the basic task.

Level 250: Beginning, focused, clear writing

Writing at this level tends to be more focused and clear, containing enough development and detail likely to accomplish the assigned task successfully.

Level 200: Incomplete, vague writing

The writing at this level, although clearer and more detailed than at the previous level, still tends to be vague and incomplete.

Level 150: Disjointed, unclear writing

Writing at this level tends to be too brief and disjointed to be considered a response to the task or, when longer, so vague and unclear that it is hard to understand.

Table 18-1 Explanations of levels of mathematics proficiency**Level 350: Multi-step problem solving and algebra**

Students at this level can apply a range of reasoning skills to solve multi-step problems. They can solve routine problems involving fractions and percents, recognize properties of basic geometric figures, and work with exponents and square roots. They can solve a variety of two-step problems using variables, identify equivalent algebraic expressions, and solve linear equations and inequalities. They are developing an understanding of functions and coordinate systems.

Level 300: Moderately complex procedures and reasoning

Students at this level are developing an understanding of number systems. They can compute with decimals, simple fractions, and commonly encountered percents. They can identify geometric figures, measure lengths and angles, and calculate areas of rectangles. These students are also able to interpret simple inequalities, evaluate formulas, and solve simple linear equations. They can find averages, make decisions on information drawn from graphs, and use logical reasoning to solve problems. They are developing the skills to operate with signed numbers, exponents, and square roots.

Level 250: Numerical operations and beginning problem solving

Students at this level have an initial understanding of the four basic operations. They are able to apply whole number addition and subtraction skills to one-step word problems and money situations. In multiplication, they can find the product of a two-digit and a one-digit number. They can also compare information from graphs and charts, and are developing an ability to analyze simple logical relations.

Level 200: Beginning skills and understandings

Students at this level have considerable understanding of two-digit numbers. They can add two-digit numbers, but are still developing an ability to regroup in subtraction. They know some basic multiplication and division facts, recognize relations among coins, can read information from charts and graphs, and use simple measurement instruments. They are developing some reasoning skills.

Level 150: Simple arithmetic facts

Students at this level know some basic addition and subtraction facts, and most can add two-digit numbers without regrouping. They recognize simple situations in which addition and subtraction apply. They also are developing rudimentary classification skills.

Table 19-1 Explanations of levels of science proficiency**Level 350: Integrates specialized scientific information**

Students at this level can infer relationships and draw conclusions using detailed scientific knowledge from the physical sciences, particularly chemistry. They also can apply basic principles of genetics and interpret the societal implications of research in this field.

Level 300: Analyzes scientific procedures and data

Students at this level can evaluate the appropriateness of the design of an experiment. They have more detailed scientific knowledge, and the skill to apply their knowledge in interpreting information from text and graphs. These students also exhibit a growing understanding of principles from the physical sciences.

Level 250: Applies general scientific information

Students at this level can interpret data from simple tables and make inferences about the outcomes of experimental procedures. They exhibit knowledge and understanding of the life sciences, including a familiarity with some aspects of animal behavior and of ecological relationships. These students also demonstrate some knowledge of basic information from the physical sciences.

Level 200: Understands simple scientific principles

Students at this level are developing some understanding of simple scientific principles, particularly in the life sciences. For example, they exhibit some rudimentary knowledge of the structure and function of plants and animals.

Level 150: Knows everyday science facts

Students at this level know some general scientific facts of the type that could be learned from everyday experiences. They can read simple graphs, match the distinguishing characteristics of animals, and predict the operation of familiar apparatus that work according to mechanical principles.

Note to Indicator 20: Data collection and sampling guidelines for TIMSS

All countries that participated in the Third International Mathematics and Science Study (TIMSS) were required to administer tests to students representing *Population 2*, defined as “students enrolled in the two adjacent grades that contained the largest proportion of 13-year-old students at the time of testing—seventh- and eighth-grade students in most countries.”

In some situations, where it was not possible to implement testing for the entire International Desired Population (*Population 2*), countries were permitted to define a National Desired Population, which excluded some portion of the International Desired Population. For example, Israel’s, Latvia’s, and Lithuania’s populations covered less than 100 percent of the International Desired Population because they needed to define their population according to the structure of school systems. In the case of Germany and Switzerland, however, some regions simply did not wish to participate in the study.

Country	International Desired Population	
	Coverage	Note on Coverage
Germany	88%	15 of 16 regions
Israel	74%	Hebrew Public Education System
Latvia	51%	Latvian-speaking schools
Lithuania	84%	Lithuanian-speaking schools
Switzerland	86%	22 of 26 cantons

Countries were also permitted to, within their desired population, define a population that excluded a small percentage (less than 10 percent) of schools or students that would be difficult to test (e.g., very small schools or schools located in a remote area). England was the only country that exceeded the 10 percent level, excluding 11.3 percent of schools from the desired population.

The TIMSS used a two-stage sample design, in which the first stage involved selecting 150 public and private schools within each country. Random sampling methods were then used to select one mathematics class and one science class from each school for each grade level (seventh and eighth). The required participation rates from the samples were at least 85 percent of both schools and students or a combined rate of 75 percent.

Compliance with Sampling Guidelines	Countries
Countries satisfying guidelines for sample participation rates, grade selection, and sampling procedures	Canada Cyprus Czech Republic France Hong Kong Hungary Iceland Iran, Islamic Rep. Ireland Japan Korea Latvia Lithuania New Zealand Norway Portugal Russian Federation Singapore Slovak Republic Spain Sweden
Countries satisfying guidelines for sample participation rates, with replacement schools	Belgium (Fl) England Germany United States
Countries not satisfying guidelines for sample participation rates	Australia Austria Belgium (Fr) Bulgaria Netherlands Scotland
Countries not meeting age/grade specifications	Colombia Germany Romania Slovenia
Countries with unapproved sampling procedures at the classroom level	Denmark Greece Israel Kuwait South Africa Thailand

Belgium (Fl), England, Germany, and the United States met sampling guidelines only after including replacement schools for those schools refusing or unable to participate. Australia, Austria, Belgium (Fr), Bulgaria, the Netherlands, and Scotland failed to meet sampling participation standards. These countries either did not reach a 50 percent participation rate without the inclusion of replacement schools, or failed to reach the required rate even with the inclusion of replacement schools.

Four countries (Colombia, Germany, Romania, and Slovenia) chose to test their seventh- and eighth-grade students even though these were not the two

adjacent grade levels with the highest proportion of 13-year-olds. Although this was done in order to increase the similarity of curricula, it resulted in their students being somewhat older than the students from other countries who participated in the study.

Denmark, Greece, Israel, Kuwait, South Africa, and Thailand, for various reasons, had difficulty complying with guidelines for sampling classrooms. Kuwait tested a single grade with relatively few 13-year-olds, and South Africa and Thailand had low sampling participation rates, contributing to additional difficulties.

Note to Indicator 21: Definitions of literacy scales and levels

This analysis reports the results of a wide-ranging test of literacy skills given to a large sample of adults (ranging from 1,500 to 1,800 per country) in Europe and North America in fall 1994. The International Adult Literacy Survey (IALS) was a collaborative effort among seven governments and three intergovernmental organizations. Each country was required to draw a probability sample that could be representative of the civilian, non-institutionalized population aged 16–65. In six countries, the survey was conducted in the national language; in Canada, respondents were given a choice of taking the survey in either English or French; in Switzerland, respondents in French-speaking and German-speaking cantons responded to survey questions in their respective languages.

As literacy cannot be narrowed down to a single skill suited for dealing with all types of text, nor defined as an infinite set of skills, the IALS defined literacy in terms of three scales, each encompassing a common set of skills relevant for diverse tasks:

Prose literacy: The knowledge and skills required to understand and use information from texts, including editorials, news stories, poems, and fiction;

Document literacy: The knowledge and skills required to locate and use information contained in various formats, including job applications, payroll forms, transportation schedules, maps, tables, and graphics; and

Quantitative literacy: The knowledge and skills required to apply arithmetic operations, either alone or sequentially, to numbers embedded in printed materials, such as balancing a checkbook, figuring a tip, completing an order form, or determining the amount of interest on a loan from an advertisement.

In each of these three scales, rather than expressing a threshold for achieving literacy, a scale from 0–500 was constructed, upon which tasks of varying difficulty were placed. These scales were developed through the item response theory (IRT) scaling procedures. First, the difficulty of tasks was ranked on a scale according to how well respondents actually performed. Then, each scale was divided into five levels, reflecting the empirically determined progression of information-processing skills and strategies. Next, individuals were assigned scores between 0 and 500 according to how well they performed on a variety of tasks at different levels. Finally, the percentage of readers falling into each skill level was calculated.

A person's ability in each literacy scale can be expressed by a score, defined as the point at which he or she has an 80 percent chance of successfully performing a given task. If a person scores at level 2, it means that this individual has an 80 percent chance of successfully performing level 2 tasks and a greater than 80 percent chance of performing level 1 tasks. It does not mean, however, that individuals with low proficiency cannot succeed at tasks that are rated at higher skill levels—only that the probability of their success is relatively low. Below is a description of the three literacy scales and the tasks required at each proficiency level:

Prose literacy includes text from newspapers, magazines, and brochures accompanied by one or more questions or directives asking the reader to perform specific tasks. These tasks represent three major aspects of information processing: locating, integrating, and generating. Locating tasks require the reader to find information in the text based on conditions or features specified in the question or directive. Integrating tasks ask the reader to pull together two or more pieces of information in the text. Generating tasks ask the reader to produce a written response by processing information from the text, making text-based references, and drawing on background knowledge.

Prose Level 1 (Difficulty values 0–225). Most of the tasks at this level require the reader to locate and match a single piece of information in the text that is identical to or synonymous with the information given in the directive. If a plausible incorrect answer is present in the text, it tends not to be near the correct information.

Prose Level 2 (Difficulty values 226–275). Tasks at this level tend to require the reader to locate one or more pieces of information in the text; however, several distracters may be present and the reader may need to make low-level inferences. Tasks at this level also begin to ask readers to integrate two or more pieces of information, or to compare and contrast information.

Prose Level 3 (Difficulty values 276–325). Tasks at this level tend to direct readers to search the text to match information, requiring the reader to make low-level inferences or to locate text that meets specified conditions. Sometimes the reader is required to identify several pieces of information that are located in different sentences or paragraphs rather than search for information located in a single sentence. Readers may also be asked to integrate

or to compare and contrast information across paragraphs or sections of text.

Prose Level 4 (Difficulty values 326–375). These tasks require readers to perform multiple-feature matching or to provide several responses where the requested information must be identified through text-based inferences. Tasks at this level may also require the reader to integrate or contrast pieces of information that are sometimes presented in relatively lengthy texts. Typically, these texts contain more distracting information, and the information that is requested is more abstract.

Prose Level 5 (Difficulty values 376–500). Some tasks at this level require the reader to search for information in dense text that contains a number of plausible distracters. Some tasks require readers to make high-level inferences or use specialized knowledge.

Document literacy involves using materials such as tables, schedules, charts, graphs, maps, and forms. Questions or directives associated with the various document tasks are categorized into four basic types: locating, cycling, integrating, and generating. Locating, integrating, and generating refer to the same skills as those in prose literacy. Cycling tasks require the reader to locate and match one or more features of information, but differ from locating tasks in that they require the reader to engage in a series of feature matches to satisfy conditions given in the question.

Document Level 1 (Difficulty values 0–225). Most of the tasks at this level require the reader to locate a piece of information based on a literal match. Distracting information, if present, is typically located away from the correct answer. Some tasks may direct the reader to enter personal information onto a form.

Document Level 2 (Difficulty values 226–275). Document tasks at this level are more varied. While some still require the reader to match a single feature, more distracting information may be present, and the match may require a low-level inference. Some tasks at this level may require the reader to enter information onto a form or to cycle through information in a document.

Document Level 3 (Difficulty values 276–325). Tasks at this level appear to be the most varied. Some require the reader to make identical or synonymous matches; however, these matches usually require the reader to take conditional information into account or to match multiple features of information.

Document Level 4 (Difficulty values 326–375). Tasks at this level, like those in the previous levels, ask the reader to match multiple features of information, to cycle through documents, and to integrate information; frequently, these tasks require the reader to make higher order inferences to arrive at the correct answer. Sometimes the reader must take conditional information into account.

Document Level 5 (Difficulty values 376–500). Tasks at this level require the reader to search through complex displays of information that contain multiple distracters, make high-level inferences, process conditional information, or use specialized knowledge.

Quantitative literacy involves using numbers and arithmetic operations to complete a task. These tasks require the reader to locate and extract numbers from different types of documents that contain similar but irrelevant information, infer numbers from printed directions, or calculate numbers using multiple operations.

Quantitative Level 1 (Difficulty values 0–225). Although no quantitative tasks used in the IALS fall below the score of 225, experience suggests that such tasks would require the reader to perform a single, relatively simple operation (usually addition) for which either the numbers are already entered into the given document and the operation is stipulated, or the numbers are provided and the operation does not require the reader to borrow.

Quantitative Level 2 (Difficulty values 226–275). Tasks at this level typically require readers to perform a single arithmetic operation (frequently addition or subtraction) using numbers that are easily located in the text or document. The operation to be performed may be easily inferred from the wording of the question or the format of the material (for example, a bank deposit form or an order form).

Quantitative Level 3 (Difficulty values 276–325). Tasks at this level typically require the reader to perform a single operation. However, the operations are more varied—some multiplication and division tasks are found at this level. Sometimes two or more numbers are needed to solve the problem, and the numbers are frequently embedded in more complex displays. While semantic relation terms such as “how many” or “calculate the difference” are often used, some of the tasks require the reader to make higher order inferences to determine the appropriate operation.

Quantitative Level 4 (Difficulty values 326–375). With one exception, the tasks at this level require the

reader to perform a single arithmetic operation in which the quantities or the operations are not easily determined. That is, for most of the tasks at this level, the question or directive does not provide a semantic relation term such as “how many” or “calculate the difference” to help the reader.

Quantitative Level 5 (Difficulty values 376–500). Tasks at this level require readers to perform multiple op-

erations sequentially; the reader must pull out the features of the problem from the material provided or rely on background knowledge to determine the quantities or operations needed.

Note to Indicator 22: Educational attainment

The Current Population Survey (CPS), which is used for *Indicators 22, 32, 33*, and others, changed the questions used to obtain a respondent's educational attainment beginning in 1992. Before 1992, the educational attainment questions were 1) "What is the highest grade or year of regular school...has ever attended?" and 2) "Did ...complete the grade?" There were 19 response categories for grades 1–8, for the 1st–4th year of high school, and for the 1st–6th year of college.

If respondents attended grade 12, for example, but did not complete it, it was assumed that they had completed grade 11. If the highest grade respondents had completed was 9, 10, or 11, they were classified as high school dropouts. If the highest grade completed was 12 or greater, they were considered to have completed high school. If they had completed the 4th year of college or greater, they were considered to have completed college.

Beginning in 1992, the two questions were changed to a single question: "What is the highest level of school...has completed or the highest degree...has received?" In the new response categories, several of the lower levels were collapsed into a single summary category such as "1st, 2nd, 3rd, or 4th grades." At the high school level, a new category "12th grade, no diploma" was added. The biggest change was in the categories for high school completion and beyond, which are as follows:

- High school graduate, high school diploma or equivalent (e.g., GED);
- Some college but no degree;
- Associate's degree in college, academic program;
- Associate's degree in college, occupational or vocational program;
- Bachelor's degree (e.g., B.A., A.B., B.S.);
- Master's degree (e.g., M.A., M.S., M.Eng., M.Ed., M.S.W., M.B.A.);
- Professional school degree (e.g., M.D., D.D.S., D.V.M., L.L.B., J.D.); and
- Doctor's degree (e.g., Ph.D., Ed.D.).

The new question puts more emphasis on credentials received beginning at the high school level and puts less emphasis on the level attended or completed in college if that attendance did not lead to a credential.

This change created some uncertainty about the comparability of measures, such as high school completion rates and college completion rates over time. Below is a discussion of the possible effects the new question may have on high school and college completion rates.

High school completion: The earlier educational attainment question did not explicitly address high school equivalency certificates. Therefore, it is possible that an individual who attended grade 10, dropped out without completing that grade, and later took the GED test and received a high school equivalency credential would not have been counted as completing high school. The new question, however, explicitly treats these individuals as high school graduates. Since 1988, an additional question has been added to the October CPS to explicitly ask respondents whether they had taken the GED. The vast majority of those who responded "yes" were classified as high school graduates using the educational attainment question.

The earlier educational attainment question treated individuals who completed grade 12 as high school graduates. However, the new question added a new response category called "12th grade, no diploma," and these respondents were not treated as graduates. However, the number of individuals in this category historically has been very small. In summary, it appears that the question change has had minor effects on measured high school completion rates.

College completion: With the increasing prevalence of individuals taking more than 4 years to earn a bachelor's degree, some researchers are concerned that the college completion rate based on the category "4th year or higher of college completed" would overstate the bachelor's degree (or higher) completion rate. However, the college completion rates among those aged 25–29 in 1992 and 1993 using the new CPS question were very similar to the completion rates for those in 1990 and 1991 using the old questions. In summary, it appears that the question change has had a very small effect on measured college completion rates.

Some college: With the new question, someone who attends college for only a few months should respond "some college," but with the old question they should have responded "attended first year of college and did not complete it." In the past, the calculation of the percentage of the population with 1–3 years of college excluded these individuals. However, with the new question, the information to exclude them is not available, and those with only a few months of college are included in the "some college" category. So, in principle, the percentage of individuals with "some college" or an associate's degree would be expected to be larger than the percentage with 1–3 years of college. Therefore, it does not appear useful to compare the percentage of those with "some college or an associate's degree" using the new question, to the percentage of those who completed "1–3 years of college" using the old question.

Indicators 32 and 33 use labor force statistics for the civilian population and annual median earnings for wage and salary workers with different levels of educational attainment. The discussion above suggests that the "high school graduate with no further

education" category based on the new item is larger than before, because it includes all those with an equivalency certificate; however, it is actually smaller than before because it excludes those who completed "12th grade, no diploma" and those with only a few months of college. The latter group is now included in the "1–3 years of college" category.

Nevertheless, the employment and earnings of the respondents who have been added and dropped from each category are similar; therefore, the net effect of the misclassification on employment rates and average annual earnings is likely to be minor. For this reason, it is still useful to compare the employment rates and median annual earnings of recent cohorts with "some college or an associate's degree" to older cohorts who completed "1–3 years of college."

For further information on this issue, see Robert Kominski and Paul M. Siegel, "Measuring Education in the Current Population Survey," *Monthly Labor Review*, September 1993.

¹ Includes individuals who had at least completed secondary education.

² France's definitions of ISCED levels were changed so that they would be more similar to EUROSTAT definitions and would be easier to compare to the definitions of other countries. As a result, data for 1994 are not directly comparable with data for other years.

³ Data are for 1989.

NOTE: In the United States, completing secondary education is defined as graduating from high school or earning a GED; completing higher education is defined as earning a bachelor's degree or higher.

¹ These data only report the percentage of students who earned credit in each mathematics course while in high school and do not count those students who took these courses prior to entering high school. In 1992, for example, approximately 93 percent of students had taken algebra I at some point before graduating high school, either before or during high school, and about 70 percent had taken geometry.

² Percents less than 0.05 are rounded to 0.0.

SOURCE: U.S. Department of Education, National Center for Education Statistics, *The 1994 High School Transcript Study Tabulations: Comparative Data on Credits Earned and Demographics for 1994, 1990, 1987, and 1982 High School Graduates*, 1996.

Note to Indicator 24: High school transcript studies

This analysis contains data from high school transcript studies conducted by the National Center for Education Statistics (NCES). Data on average course credits, or Carnegie units, for high school graduates come from the following studies: the 1987, 1990, and 1994 National Assessment of Educational Progress (NAEP) High School Transcript Studies (1987, 1990, and 1994 data); and the High School and Beyond (HS&B) Transcript Study (1982 data). A description of these studies, including descriptions of the sampled populations, follows.

The 1987, 1990, and 1994 NAEP High School Transcript Studies were conducted using nearly identical methodology and techniques. The sample of schools was nationally representative, and included schools having grade 12 or 17-year-old students. The sample was also representative of graduating seniors from each school. Since the focus of the transcript studies was high school graduates, schools with 17-year-olds but without 12th grade were not included in the subsample used in these analyses. Of the remaining schools, only those students who graduated were selected.

Between May and November of 1994, high school transcripts were collected from 25,573 students who graduated in 1994. To be consistent with the 1982 study, students with an Individualized Education Program (IEP) were omitted from all estimates in the tables. Also, students with incomplete transcripts were dropped, bringing the number of transcripts analyzed to 24,374. These students attended 340 schools that had been sampled by the NAEP. In spring 1991, transcripts were collected from 21,607 students who graduated from high school in 1990. These students attended 330 schools that had been sampled for the NAEP.

The sample of schools for the 1987 High School Transcript Study consisted of a nationally representative sample of 497 secondary schools selected for the 1986 NAEP for grade 11, 17-year-old students, of which 433 schools participated. The 1987 study was restricted to students who were in grade 11 during the 1985–86 school year. There are 27,732 graduates from 1987 represented in the tables. Data for 1987, 1990, and 1994 in this analysis are from the NCES publication *The 1994 High School Transcript Study Tabulations*.

In 1982, HS&B collected high school transcripts for members of the sophomore cohort who were selected for the second follow-up survey (about 12,000 transcripts). As in the 1987, 1990, and 1994 NAEP

High School Transcript Studies, records were obtained from all types of high schools. However, because the 1982 HS&B used a different method to identify disabled students, students who had participated in a special education program were excluded from the tabulations to make the figures consistent.

Each of the transcript studies used the taxonomy of Classification of Secondary School Courses (CSSC), which contains approximately 2,200 course codes used to define course content and level. These studies also included additional course and student information, such as grade and credit received, grade level, graduation status, age, gender, and race/ethnicity.

The numbers in all the tables differ from previous editions of *The Condition of Education* for two reasons. First, a new exclusionary rule was applied to the transcripts beginning in 1996. Each year the transcripts must be examined for validity and completeness. Incomplete transcripts, those of students receiving special education diplomas, or those from schools which have unique definitions of credit hours were excluded. In previous years, transcripts showing that a student had taken more than 32 credit hours were excluded based on the supposition that their schools must be using shorter class periods than other schools, and thus one credit hour would not mean the same thing in these schools as in the average school. A case-by-case analysis of these schools showed that their class periods were no shorter than the average school; instead, these schools had particularly stringent graduation requirements. Therefore, the data for all years were recalculated to include these transcripts.

Second, in previous editions of *The Condition*, students who had taken algebra II or beyond in high school but had not taken algebra I or geometry were assumed to have taken these courses prior to entering high school and were included in the percentage of students who had taken these courses. Beginning with the 1996 edition, the numbers reflect only those students who took these courses *while in high school*. The numbers for these two subjects appear to have dropped from previous years, but in actuality, only the number of students who were included in the analysis has dropped.

Note to Indicator 25: Advanced Placement examinations

The Advanced Placement (AP) examinations are offered to high school students annually to give them an opportunity to demonstrate college-level achievement. Although students who have not studied extensively beyond the normal secondary school level are not advised to take these examinations, the AP program is open to all students. Most high school students take the examinations voluntarily; however, several states have legislation that supports and encourages participation in the AP program.

In this analysis, the number of students who took AP examinations and the number of examinations taken by these students were compared to 1,000 11th- and 12th-grade students, as defined by the October Supplement to the Current Population Survey (CPS). Data from the CPS include both public and private schools. This methodology differs somewhat from the methodology shown in *The National Education Goals Report, 1995*, which calculated enrollment figures based on the Common Core of Data (CCD). The CCD does not include data from private schools. Consequently, to produce private school enrollment data, the public school figures in the *Goals Report* were multiplied by a private school enrollment adjustment factor. As a result, data shown in this analysis are not directly comparable to data found in the *Goals Report*.

Subject definitions

The following are the specific subjects that comprise the AP examination subject areas presented in this analysis:

Social studies	U.S. History, European History, U.S. Government and Politics, Comparative Government and Politics, and Psychology;
English	English Language and Composition, and English Literature and Composition;
Foreign language	French Language, French Literature, German Language, Latin/Virgil, Latin Literature, Spanish Language, and Spanish Literature;
Calculus	Calculus AB and Calculus BC;
Computer science	Computer Science A and Computer Science AB; and

Science

Biology, Chemistry, Physics A, Physics B (mechanical), and Physics C (electricity and magnetism).

Examinations

Most of the AP examinations contain multiple choice and free-response sections. The examinations are graded based on scores from both types of responses. The program's examinations are criterion-referenced not normed-referenced, with cut scores established at five different points along these scales to designate a grade of 5, 4, 3, 2, or 1 (grade of 5: extremely well qualified; grade of 4: well qualified; grade of 3: qualified; grade of 2: possibly qualified; and grade of 1: no recommendation). The grades are determined by the chief readers who rely on their subject matter expertise, statistical equating data, and data from comparability studies. Cut scores frequently vary from year to year for each examination, reflecting changes in the level of exam difficulty. Therefore, the College Board does not recommend the use of grade data for trend analysis. Grades of 3 and above are usually accepted for college credit and advanced placement at participating colleges and universities, although credit varies among institutions. Descriptions of the AP examinations for these various subject areas are provided below.

Biology: A 3-hour examination on a college full-year introduction to biology: 90 minutes of multiple-choice questions, 90 minutes of selected problems, short essays, and chemical reactions.

Chemistry: A 3-hour examination on a college full-year introduction to chemistry: 90 minutes of multiple-choice questions and 90 minutes of selected problems, short essays, and chemical reactions.

Computer Science: Two examinations: Computer Science A (75 minutes of multiple-choice questions, 105 minutes of free-response questions), a college first-semester introduction to Computer Science (programming, methodology, programming in Pascal including recursion, data structures not including pointers, applications), and Computer Science AB (75 minutes of multiple-choice questions, 105 minutes of free-response questions), a college full-year introduction to Computer Science (programming methodology, programming in Pascal, algorithms, data structures). The Computer Science AB examinations no longer include a sepa-

rate grade report for the Computer Science A examination.

English: Two 180-minute examinations: English Language and Composition, and English Literature and Composition. Each examination covers a college full-year introductory English course. Both are 60 minutes of multiple-choice questions and 120 minutes of free-response questions. Candidates may take either or both examinations.

French: Two examinations, one on each of two college third-year courses: French Language (80–95 minutes of multiple-choice questions on listening and reading and 55–70 minutes of free-response writing and speaking); and French Literature (80–95 minutes of multiple-choice questions on literary passages, 35–50 minutes on one or more required works, and a 35–50 minute analysis of a presented text from the required reading list). Candidates may take either or both examinations.

German: A 3-hour examination on a college third-year German Language course: 110 minutes of multiple-choice questions on listening and reading and 70 minutes of free-response writing and speaking.

Government and Politics: Two 120-minute examinations (45 minutes of multiple-choice questions and 75 minutes of free-response questions) on each of two single-semester introductory college courses on government and politics: comparative and United States. Candidates may take either or both examinations.

History, European: A 3-hour examination on a college full-year introduction to European history in its global context from c. 1450 through 1970: 60–90 minutes of multiple-choice questions, a 15-minute reading period, a 30–50 minute exercise on the use of historical evidence, and one 40–60 minute essay chosen from several offered.

History, United States: A 3-hour examination on a college full-year introduction to United States history from colonial times to the present: 60–90 minutes of multiple-choice questions, a 15-minute reading period, a 30–50 minute exercise on the use of historical evidence, and a 40–60 minute selected essay.

Latin: Two 2-hour examinations on college middle-level Latin courses (Virgil and Catullus–Horace): each has 40–55 minutes of multiple-choice questions on Latin sight reading (common to both examinations) and 65–80 minutes of brief essays on required reading. Candidates may take either or both examinations.

Mathematics: Two 3-hour examinations, one on each of two college full-year mathematics courses: Calculus AB (introductory differential and integral calculus) and Calculus BC (extending one semester beyond AB and including advanced topics in integral calculus and sequences and series). Each examination has a 90-minute multiple-choice section and a 90 minute free-response section. A scientific, nonprogrammable, nongraphing calculator is required for each examination. Candidates may take only one examination.

Physics: Three examinations: Physics B, a 3-hour examination (half multiple-choice questions, half free-response questions) covering a college full-year, non-calculus course on general physics; Physics C (Mechanics); and Physics C (Electricity and Magnetism): two 90-minute examinations (half multiple-choice questions, half free-response questions) on each of two college semesters of introductory physics with calculus. Candidates may take either Physics B or C, not both.

Psychology: A 2-hour examination on a college one-semester introduction to psychology: a 75 minute free-response section consisting of two mandatory questions.

Spanish: Two examinations, one on each of two college third-year Spanish courses: Spanish Language (90 minutes of multiple-choice questions on listening comprehension, vocabulary, structure, and reading comprehension and 75–85 minutes of free-response writing and speaking); and Spanish literature (80 minutes of multiple-choice questions on listening comprehension, reading comprehension, and literary analysis, and 100 minutes of free-response essays on required authors and poetry analysis). Candidates may take either or both examinations.

Note to Indicator 27: Classification of fields of study

The data on degrees conferred by specific fields of study were obtained from the Integrated Postsecondary Education Data System (IPEDS) "Degrees and Other Formal Awards Conferred" surveys and the "Completions" surveys. The list below shows how related degree fields were reclassified into a consolidated degree field for this analysis.

<u>Consolidated degree field</u>	<u>Degree fields</u>
Humanities	Area and ethnic studies English language and literature/letters Foreign languages Liberal/general studies Multi/interdisciplinary studies Philosophy and religion Theology Visual and performing arts
Social/behavioral sciences	Psychology Social sciences and history
Natural sciences	Biological sciences/life sciences Mathematics Physical sciences
Engineering	Engineering Engineering technologies Construction trades Mechanics and repairs

Other technical/
professional

Agriculture
Architecture
Communications
Communication technology
Home economics
Law
Library/archival sciences
Military sciences
Parks and recreation
Precision production trades
Protective services
Public administration and services
Transportation and material moving

In the 1991–92 academic year, a new classification of instructional programs was initiated. The figures for the earlier years were reclassified when necessary to make them conform to the new taxonomy. To facilitate trend comparisons, certain aggregations have been made of the degree fields as reported in the IPEDS "Completions" surveys: "Agriculture and natural resources" includes Agribusiness and agriculture production, Agricultural sciences, and Conservation and renewable natural resources; "Business management and administrative services" includes Business and management, Business (administrative support), Marketing and distribution, and Consumer, personal, and miscellaneous services; and "Engineering-related technologies" includes Engineering-related technologies, Mechanics and repairs, and Construction trades.

¹ The female field concentration ratio is calculated as the percentage of females earning degrees who majored in a specific field divided by the percentage of males earning degrees who majored in the same field. Includes degrees conferred to U.S. and non-U.S. citizens.

² Principally composed of public administration at the master's degree level and agriculture and natural resources at the doctor's degree level. See the glossary for a full definition of "other technical/professional" fields.

NOTE: See the supplemental note to *Indicator 27* for a description of fields of study.

Note to Indicator 30: Labor market outcomes for non-college-bound high school graduates

The data for this analysis were drawn from the 1980 High School and Beyond (HS&B) Sophomore Cohort and the National Education Longitudinal Study of 1988 (NELS:88) sophomore cohort. The cases represented in the tables and figures are for early or on-time high school graduates who had earned at least 16 credits as shown on their high school transcripts and who had not entered post-secondary education within 2 years after graduation. Information about what courses students took, the number of credits they earned, and their overall grade point average is derived from high school transcript files for each cohort.

The labor market outcomes are for the first complete year after high school—1983 for the HS&B sophomores, and 1993 for the NELS graduates. To ensure comparability, the NELS sample was selected using a filter variable designed for this purpose (G10CHRT). The 1980 sophomore data and 1988 NELS samples were chosen for the analysis because they provided the most current and complete information available about non-college-bound high school graduates among NCES data sets.

NOTE: The estimates for the percentage of each cohort who worked were based on the ratio of the total who reported positive hours worked per week to the total sample size.

Table 31-1 Percentage of 1992–93 college graduates who were working in administrative or clerical support occupations, and the percentage who were unemployed, by sex and field of study: April 1994

Table 36-1 Percentage of elementary¹ teachers who reported assigning types of homework and teachers' use of homework, by control of school and years of teaching experience: School year 1994-95

Type of homework and teachers' use of homework	Public			Private		
	Total	Years of teaching experience		Total	Years of teaching experience	
		Less than 4 years	4 years or more		Less than 4 years	4 years or more
Percentage of teachers who reported assigning types of homework at least once a week ²						
Write a journal entry	43.4	50.9	42.4	37.1	34.3	37.6
Prepare a written report	16.5	17.9	16.3	14.8	10.2	15.7
Work on problems for which there is no obvious method of solution	15.5	23.3	14.5	10.0	10.2	9.9
Read the textbook or other assigned reading	73.6	69.1	74.2	78.0	81.9	77.2
Apply concepts or principles to different or unfamiliar situations	41.0	52.9	39.4	45.3	32.3	47.8
Read supplementary material	65.7	65.0	65.7	62.3	51.5	64.4
Complete routine exercises or problems from worksheets, workbooks, or text	79.2	79.9	79.1	88.4	89.0	88.3
Work on a project, gather data, or conduct an experiment	29.3	25.8	29.8	27.7	21.6	28.9
Prepare an oral report	12.9	11.2	13.2	8.8	9.6	8.6
Complete a short writing assignment	61.9	62.8	61.7	58.2	57.4	58.4
Percentage of teachers who often ³ used written homework in the following ways:						
Record only whether assignments were completed	47.7	48.9	47.5	54.4	53.4	54.6
Collect, correct, and keep assignments	41.2	46.7	40.5	52.6	39.5	55.1
Keep items in a student portfolio	35.1	44.3	33.8	37.0	26.6	39.1
Collect, correct, and return assignments to students	72.3	78.3	71.5	81.8	81.4	81.8
Have students exchange assignments and correct them in class	27.0	28.0	26.9	35.4	26.3	37.2
Have students correct their own assignments in class	38.2	35.0	38.6	46.9	33.7	49.4
Use assignments as a basis for class discussion	55.0	50.8	55.6	55.5	45.8	57.4
Use assignments as a basis for grading students	41.4	41.9	41.3	51.3	40.2	53.5
Use assignments as a basis for lesson planning	50.7	47.8	51.1	47.3	34.2	49.8

¹ Includes elementary teachers whose main assignment was teaching "general elementary" and who taught in both the 1993-94 and 1994-95 school years; therefore, new teachers are not included in this analysis. See the supplemental note to this indicator for further discussion.

² Includes those teachers who responded "almost every day" and "once or twice a week."

³ Includes those teachers who responded "always" and "often."

SOURCE: U.S. Department of Education, National Center for Education Statistics, Teacher Follow-up Survey, 1994-95.

Note to Indicator 36: The Teacher Follow-up Survey

The Teacher Follow-up Survey (TFS) provides information on movement within and outside of the teaching profession in public and private schools. TFS is a subsample of teachers in the Schools and Staffing Survey (SASS) and is conducted one year after each SASS cycle. The third TFS was conducted in the 1994–95 school year; two previous cycles of TFS were conducted in school years 1988–89 and 1991–92. The survey identifies and collects data from the following groups of teachers who participated in the SASS interview the previous year: 1) those who remained in the teaching profession, including those who remained in the same school and those who moved; and 2) those who left the teaching profession.

The 1994–95 TFS included questions on teaching methods, such as the use of homework and student portfolios. Respondents to the questions on teaching methods were those teachers who taught in both the 1993–94 and 1994–95 school years; therefore, the teachers' responses about their teaching methods represented a measurement of their actions in the 1994–95 school year, but do not consist of a complete random sample of the 1994–95 teacher work force. New teachers in the 1994–95 school year were left out of the survey.

Elementary teachers

The TFS questions asked teachers to identify their main teaching assignment. For *Indicators 36, 37, and 38*, the elementary teacher category consists of those teachers who responded that their main teaching assignment was “general elementary.” The elementary teacher category excluded those elementary teachers who taught special subject areas, such as art, foreign language, science, or special education. However, special area elementary teachers were included in the “total” column of *Indicators 37 and 38*.

Grouping of responses

In most cases, questions were asked in terms of “how many times in the past semester did you....?” In these cases, the response choices included: “almost every day,” “once or twice a week,” “once or twice a month,” “once or twice a semester,” or “never.” For the indicators in the *Condition*, the responses “almost every day” and “once or twice a week” were combined to create the “at least once a week” response category. For the indicator on the assignment of homework by elementary teachers, two questions that asked “how often did you....?” were used to create the response category. The responses to the questions included “always,” “often,” “sometimes,” “rarely,” and “never.” “Always” and “often” were combined to create the “often” response category used in this analysis.

Table 40-1 Percentage of teachers who participated in a formal teacher induction or a master or mentor program, by years of teaching experience and control and level of school: 1994

Control and level of school	Participated in a formal teacher induction program during first year of teaching			Master or mentor program
	1 year	2-3 years	4 years or more	
Public	59.9	54.8	23.3	11.3
Elementary	59.4	54.5	23.8	11.4
Secondary	60.7	55.3	22.5	11.3

NOTE: See the supplemental note to this indicator for definitions of classroom and student contact hours.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Study of Postsecondary Faculty, 1988 and 1993.

Note to Indicator 43: Teaching workload and research production of full-time postsecondary faculty

The 1988 National Study of Postsecondary Faculty (NSOPF) was a survey of faculty who had at least some instructional duties (such as teaching one or more courses) in for-credit, higher education courses during the fall 1987 term.

Unlike NSOPF-88, which was limited to faculty whose regular assignments included instruction, the faculty universe for NSOPF-93 was expanded to include anyone who was designated as faculty, whether or not their responsibilities included instruction, as well as other (nonfaculty) personnel with instructional responsibilities.

The analyses for this indicator include all those who had any instructional duties in the fall of 1987 and 1992. Therefore, it includes those faculty whose principal activity that semester was research, technical, clinical, service, or administration, as long as the faculty member taught at least one class for credit. In fact, in fall 1992, 15 percent of all faculty who taught at least one class for credit had a principal activity other than teaching.

The analysis for the indicators using NSOPF categorizes institutions of higher education into five types, as shown below. Remaining institutions, such as religious or specialized institutions, were included in the totals but are not shown separately.

Types of institutions

Research university: Institution among the 100 leading universities that receives federal research funds. Each of these universities awards substantial numbers of doctorates across many fields.

Doctoral university: Institution that offers a full range of baccalaureate programs and Ph.D. degrees in at least three disciplines, but tends to be less focused on research and receives fewer federal research dollars than the research universities.

Comprehensive institution: Institution that offers liberal arts and professional programs. The master's degree is the highest degree offered.

Liberal arts institution: Institution that is smaller and generally more selective than comprehensive colleges and universities. A liberal arts institution primarily offers bachelor's degrees, although some offer master's degrees.

2-year institution: Institution that offers certificate or degree programs through the Associate of Arts level. Two-year institutions, with few exceptions,

offer no bachelor's degrees, although some offer master's degrees.

Time allocation

NSOPF survey respondents were asked to estimate the percentage of total working hours they spent on each of the activities below:

Teaching: Includes teaching; grading papers; preparing courses; developing new curricula; advising or supervising students; or working with student organizations or intramural sports.

Research/scholarship: Includes conducting research; reviewing or preparing articles or books; attending or preparing for professional meetings or conferences; reviewing proposals; seeking outside funding; giving performances or exhibitions in the fine or applied arts; or giving speeches.

Professional growth: Includes taking courses or pursuing an advanced degree or other professional development activities to remain current in their field of practice.

Administration: Performing administrative activities.

Outside consulting or freelance work: Conducting outside consulting or other employment.

Service/other: Includes providing legal or medical service or psychological counseling to clients or patients; providing paid or unpaid community or public service, or service to professional societies/associations; or participating in other activities or work not listed above.

Classroom and student contact hours

Classroom hours: The number of hours per week faculty members spent teaching.

Student contact hours: The sum of the number of hours per week faculty members spent teaching over all classes, multiplied by the number of students in each class.

Class size: The total number of student contact hours divided by the mean number of classroom hours faculty spent per week.

Research Production

List below are the specific types of research produced by faculty and the corresponding categories used to discuss these activities in *Indicator 59*.

Articles/Creative works	Articles published in refereed professional or trade journals
	Articles published in nonrefereed professional or trade journals
	Creative works published in juried media
	Creative works published in nonjuried media or in-house newsletters
	Chapters in edited volumes
	Text books
	Other books
Presentations/exhibitions	Monographs
	Presentations at conferences, workshops, etc.
	Exhibitions or performances in the fine or applied arts
Other published reviews of books, articles, or creative works	Research or technical reports disseminated internally or to clients
	Patents or copyrights
	Computer software products

¹ Beginning in fall 1980, data include estimates for the expanded universe of private schools.

² Enrollment includes most kindergartners and a relatively small number of nursery school students.

³ Revised from previously published figures.

⁴ Estimates based on preliminary data.

NOTE: The private school enrollment figures for years 1971–75, 1979, 1981–82, 1984, and 1986 are estimated. The 1987 private school enrollment numbers are taken from the Private School Survey (PSS). Private school enrollment figures for grades K–8 and 9–12 for the years 1988–93 are estimated from the K–12 totals. Projections are based on data through 1994. Enrollment figures may not add to totals due to rounding.

¹ Beginning in fall 1980, data include estimates for the expanded universe of private schools.

² Enrollment includes most kindergartners and a relatively small number of nursery school students.

³ Revised from previously published figures.

⁴ Estimates based on preliminary data.

NOTE: The private school enrollment figures for years 1971–75, 1979, 1981–82, 1984, and 1986 are estimated. The 1987 private school

enrollment numbers are taken from the Private School Survey. Private school enrollment figures for grades K–8 private school enrollment numbers are taken from the Private School Survey (PSS). Private school enrollment figures for grades K–8 and 9–12 for the years 1988–93 are estimated from the K–12 totals. Projections are based on data through 1994. Enrollment figures may not add to totals due to rounding.

— Not available.

¹ Includes preschool children aged 3-5 and were served under Chapter 1 of the Education Consolidation and Improvement Act (ECIA) and those aged 0-5 served under Part B of the Individuals with Disabilities Education Act (IDEA), respectively.

² Prior to the 1987-88 school year, preschool disabled students were included in the counts by disabling condition. Beginning in the 1987-88 school year, states were no longer required to report preschool students (0-5 years) with disabilities by disabling condition.

³ Revised from previously published figures.

⁴ Data for 1995 are for children aged 3-21.

NOTE: This analysis includes students who were served under Chapter 1 of the ECIA and Part B of IDEA. Counts are based on reports from the 50 states and the District of Columbia only (i.e., figures from the U.S. territories are not included). Increases since 1987-88 are due in part to new legislation enacted in fall 1986, which mandates public school appropriate education services for all disabled children aged 3-5. Details may not add to totals due to rounding.

— Not available.

¹ Percents less than 0.05 are rounded to 0.0.

² Includes preschool children aged 3-5 who were served under Chapter 1 of the Education Consolidation and Improvement Act (ECIA) and those who were served under Part B of the Individuals with Disabilities and Education Act (IDEA), respectively.

³ Prior to the 1987-88 school year, preschool disabled students were included in the counts by type of disabling condition. Beginning in the 1987-88 school year, states were no longer required to report preschool students (0-5 years) with disabilities by disabling condition.

⁴ Revised from previously published figures.

⁵ Data for 1995 are for children aged 3-21.

NOTE: This analysis includes students who were served under Chapter 1 of the ECIA and Part B of IDEA. Counts are based on reports from the 50 states and the District of Columbia only (i.e., figures from the U.S. territories are not included). Increases since 1987-88 are due in part to new legislation enacted in fall 1986, which mandates public school appropriate education services for all disabled children aged 3-5. Details may not add to totals due to rounding.

Table 49-1 Teachers' perceptions and attitudes toward teaching, by control of school: School years 1987-88 and 1993-94

Perceptions and attitudes	Public		Private	
	1987-88	1993-94	1987-88	1993-94
Percentage of teachers who strongly agree with the following:				
Teachers in this school are evaluated fairly	37.8	42.0	51.8	55.2
The principal lets staff members know what is expected of them	48.3	48.0	54.4	56.1
The school administration's behavior toward the staff is supportive and encouraging	40.5	41.2	59.8	60.7
I am satisfied with my teaching salary	7.6	12.3	11.5	13.6
The level of student misbehavior (e.g., noise, horseplay, or fighting in the halls, cafeteria, or student lounge) in this school interferes with my teaching	11.7	13.8	4.6	4.5
Teachers participate in making most of the important educational decisions in this school	13.7	14.6	27.5	30.3
I receive a great deal of support from parents for the work I do	16.0	12.5	40.1	41.8
Necessary materials are available as needed by the staff	37.4	32.6	52.7	52.9
The principal does a poor job of getting resources for this school	3.9	3.8	3.5	2.3
Routine duties and paperwork interfere with my job of teaching	29.6	26.6	9.4	7.9
My principal enforces school rules for student conduct and backs me up when I need it	50.0	45.8	62.8	63.1
The principal talks with me frequently about my instructional practices	12.4	10.4	18.2	17.4
Rules for student behavior are consistently enforced by teachers in this school, even for students who are not in their classes	23.8	22.3	38.3	39.5
Most of my colleagues share my beliefs and values about what the central mission of the school should be	35.5	33.2	58.8	62.8
The principal knows what kind of school he/she wants and has communicated it to the staff	45.9	43.1	58.2	61.4
There is a great deal of cooperative effort among the staff members	35.3	33.7	56.7	57.8
In this school, staff members are recognized for a job well done	25.5	25.0	38.8	41.8
I have to follow rules in this school that conflict with my best professional judgment	5.9	5.4	4.1	3.4
I am satisfied with my class size	35.8	32.0	57.8	58.9
I make a conscious effort to coordinate the content of my courses with that of other teachers	40.5	38.2	42.9	42.4
Goals and priorities for the school are clear	40.2	37.9	55.9	58.0
The amount of student tardiness and class cutting in this school interferes with my teaching	11.7	7.9	3.9	1.8
I sometimes feel it is a waste of time to try to do my best as a teacher	7.6	6.5	3.3	2.7
I plan with the library media specialist/librarian for the integration of library/media services into my teaching	—	24.1	—	22.3
Library/media materials are adequate to support my instructional objectives	—	23.8	—	24.0
If I could go back to college and start again I would most likely* become a teacher again	66.0	69.5	76.2	80.5

— Not available.

* Includes those teachers who responded "certainly would become a teacher" and "probably would become a teacher."

In this school, staff members are recognized for a job well done	29.2	20.5	45.5	36.7
I have to follow rules in this school that conflict with my best professional judgment	5.2	5.6	2.9	4.1
I am satisfied with my class size	33.6	30.3	58.3	59.6
I make a conscious effort to coordinate the content of my courses with that of other teachers	44.6	31.3	47.9	34.8
Goals and priorities for the school are clear	43.9	31.5	61.2	53.5
The amount of student tardiness and class cutting in this school interferes with my teaching	3.5	12.7	1.5	2.4
I sometimes feel it is a waste of time to try to do my best as a teacher	5.1	8.0	2.4	3.3
I plan with the library media specialist/librarian for the integration of library/media services into my teaching	24.5	23.6	23.0	21.3
Library/media materials are adequate to support my instructional objectives	23.4	24.2	22.9	25.6
If I could go back to college and start again I would most likely* become a teacher again	72.5	66.3	81.5	79.0

* Includes those teachers who responded "certainly would become a teacher" and "probably would become a teacher."

Table 49-3 Public school teachers' perceptions and attitudes toward teaching, by percentage of students eligible for free or reduced-price lunch: School year 1993-94

Perceptions and attitudes	Total	Percentage of students eligible for free or reduced-price lunch			
		0-5	6-20	21-40	41 or more
Percentage of teachers who strongly agree with the following:					
Teachers in this school are evaluated fairly	42.0	41.3	41.1	43.5	42.3
The principal lets staff members know what is expected of them	48.0	46.8	46.4	49.0	49.1
The school administration's behavior toward the staff is supportive and encouraging	41.2	39.7	40.1	43.0	41.9
I am satisfied with my teaching salary	12.3	21.1	13.6	11.5	8.8
The level of student misbehavior (e.g., noise, horseplay, or fighting in the halls, cafeteria, or student lounge) in this school interferes with my teaching	13.8	8.2	10.3	13.1	18.3
Teachers participate in making most of the important educational decisions in this school	14.6	13.4	14.1	15.5	14.6
I receive a great deal of support from parents for the work I do	12.5	18.5	14.1	11.5	10.2
Necessary materials are available as needed by the staff	32.6	38.8	34.4	33.6	29.6
The principal does a poor job of getting resources for this school	3.8	4.2	3.6	3.6	4.2
Routine duties and paperwork interfere with my job of teaching	26.6	23.1	26.8	25.8	28.3
My principal enforces school rules for student conduct and backs me up when I need it	45.8	43.0	44.3	48.8	46.4
The principal talks with me frequently about my instructional practices	10.4	9.7	8.4	9.8	12.7
Rules for student behavior are consistently enforced by teachers in this school, even for students who are not in their classes	22.3	20.3	20.0	21.0	25.7
Most of my colleagues share my beliefs and values about what the central mission of the school should be	33.2	31.8	31.0	33.9	35.1
The principal knows what kind of school he/she wants and has communicated it to the staff	43.1	44.2	40.2	43.8	44.9
There is a great deal of cooperative effort among the staff members	33.7	32.7	33.5	34.8	34.3
In this school, staff members are recognized for a job well done	25.0	24.7	23.2	25.6	26.8
I have to follow rules in this school that conflict with my best professional judgment	5.4	4.8	4.2	4.6	6.9
I am satisfied with my class size	32.0	31.9	30.7	32.6	33.2
I make a conscious effort to coordinate the content of my courses with that of other teachers	38.2	41.4	37.6	37.0	39.1
Goals and priorities for the school are clear	37.9	38.5	35.2	38.3	39.6
The amount of student tardiness and class cutting in this school interfere with my teaching	7.9	5.7	7.1	7.4	9.4
I sometimes feel it is a waste of time to try to do my best as a teacher	6.5	5.5	6.0	5.5	7.4
I plan with the library media specialist/librarian for the integration of library/media services into my teaching	24.1	24.8	24.6	23.5	24.6
Library/media materials are adequate to support my instructional objectives	23.8	27.4	24.3	23.2	22.6
If could go back to college and start again would most likely* become a teacher again	69.5	72.1	68.2	69.9	69.5

* Includes those teachers who responded "certainly would become a teacher" and "probably would become a teacher."

¹ Federally supported student aid received through students (e.g., Pell grants) is included under tuition and fees.

² Includes doctoral-granting institutions with and without medical schools.

³ Revised from previously published figures.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars, and the Consumer Price Index (CPI) was used to forecast the HEPI to July 1996. Data for academic years 1976-77 through 1993-94 include only institutions that provided both enrollment and finance data. Details may not add to totals due to rounding. Alternative approaches to calculating adjusted costs and

expenditures can be found in the following publications: Kent Halstead, *Inflation Measures for Schools, Colleges, and Libraries: 1995 Update* (Washington, D.C.: Research Associates of Washington, September 1995), and Richard Rothstein with Karen Hawley Miles, *Where's the Money Gone?* (Washington, D.C.: Economic Policy Institute, 1995).

SOURCE: U.S. Department of Education, National Center for Education Statistics, Financial Statistics of Institutions of Higher Education Survey and Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment," "Financial Statistics," and "Institutional Characteristics" surveys.

¹ Federally supported student aid received through students (e.g., Pell grants) is included under tuition and fees.

² Includes doctoral-granting institutions with and without medical schools.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars, and the Consumer Price Index (CPI) was used to forecast the HEPI to July 1996. Data for academic years 1976-77 through 1993-94 include only institutions that provided both enrollment and finance data. Details may not add to totals due to rounding. Alternative approaches to calculating adjusted costs and

expenditures can be found in the following publications: Kent Halstead, *Inflation Measures for Schools, Colleges, and Libraries: 1995 Update* (Washington, D.C.: Research Associates of Washington, September 1995), and Richard Rothstein with Karen Hawley Miles, *Where's the Money Gone?* (Washington, D.C.: Economic Policy Institute, 1995).

SOURCE: U.S. Department of Education, National Center for Education Statistics, Financial Statistics of Institutions of Higher Education Survey and Integrated Postsecondary Education Data System (IPEDS), "Fall Enrollment," "Financial Statistics," and "Institutional Characteristics" surveys.

¹ Includes institutional and academic support. Libraries were excluded.

² Includes doctoral-granting institutions with and without medical schools.

NOTE: The Higher Education Price Index (HEPI) was used to calculate constant dollars and the Consumer Price Index (CPI) was used to forecast the HEPI to July 1996. Data for academic years 1976-77 through 1993-94 include only institutions that provided both enrollment and finance data. Details may not add to totals due to rounding. Alternative approaches to calculating adjusted costs and

expenditures can be found in the following publications: Kent Halstead, *Inflation Measures for Schools, Colleges, and Libraries: 1995 Update* (Washington, D.C.: Research Associates of Washington, September 1995), and Richard Rothstein with Karen Hawley Miles, *Where's the Money Gone?* (Washington, D.C.: Economic Policy Institute, 1995).

SOURCE: U.S. Department of Education, National Center for Education Statistics, *Digest of Educational Statistics, 1996*, tables 338-342 (based on the IPEDS/HEGIS "Fall Enrollment," "Financial Statistics," and "Institutional Characteristics" surveys).

Note to Indicator 55: International comparisons of education expenditures

The purpose of this analysis is to compare expenditures for education in public and private institutions, relative to the Gross Domestic Product (GDP) and school enrollment, across the developed countries for which data are available.

Definitions

Public education expenditures include funds provided to both public and private schools by federal, state, and local governments either directly or through students. This includes expenditures at public schools funded by public sources and subsidies to students at private schools from government agencies.

Private education expenditures are expenditures financed by private sources—households, private nonprofit institutions, businesses, and corporations. For example, this includes expenditures supported by public and private school tuition and fees, and expenses for books and materials that must be purchased by the students themselves.

Gross Domestic Product (GDP) is an aggregate measure of the value of goods and services produced in a country. GDP is Gross National Product (GNP) less net property income from abroad.

Thus, this analysis focuses on education expenditures at both public and private schools funded by both public and private sources.

Expenditures in the United States

Primary and secondary education

For the United States, *public expenditures for primary and secondary education* include expenditures in local public school districts; private schools; and schools administered by religious organizations, funded by state and local taxes; federal programs administered by the U.S. Department of Education (ED); and federal programs operated outside of ED that are not administered by state or local education agencies (e.g., Head Start, Department of Defense Schools, and schools operated by the Bureau of Indian Affairs).

Also included are federal expenditures to operate ED and other activities, such as research, statistics, assessment, and school improvement, and state expenditures to operate state departments of education and other direct state expenditures, including state schools for the deaf and blind and reform schools.

Some expenditures, such as those for federal or state agency administration and those for non-graded special education programs, cannot be assigned to particular grade levels by any obviously universally superior method. These expenditures defy strict grade-level categorizations. Like some other countries, the United States has chosen to prorate these expenditures over the grade levels based on the relative size of enrollments, staffing, and salaries. Other countries, however, have chosen not to allocate such expenditures, classifying them, instead, as “undistributed.”

Higher education

Public expenditures for higher education in the United States include expenditures at both public and private colleges and universities funded by federal, state, and local governments. The Integrated Postsecondary Education Data System (IPEDS), the core postsecondary education data collection program for NCES, gathers institutional reports for revenue received by both public and private institutions from both public and private sources. Expenditures by public and private, nonprofit institutions are separated into public and private expenditures based on the share of current fund revenues from federal, state, and local sources.

Most federal aid goes to students who then spend it on education (e.g., tuition) and non-education (room and board) services. It was assumed that 60 percent of federally administered Pell grants were spent on education by students.

With the exception of Pell grant money, public expenditures for less-than-2-year public and private institutions, including “proprietary” schools, were not available; therefore, *public expenditures for higher education* in the United States are biased downward. However, since the students participating in these institutions are also excluded from higher education enrollments, the estimate of *public expenditures per student* would be biased upward if the per student public expenditures in less-than-2-year institutions were less than those in other higher education institutions.

Per student expenditures

Per student expenditures are calculated as total expenditures, funded by both public and private sources, divided by enrollment in both public and private schools. This is a measure of the average investment per student in the education system.

The data for per student expenditures in higher education come directly from tables in *Education At A Glance (EAG)*, published by the Organization for Economic Co-operation and Development in 1996. However, the EAG tables include per student expenditures broken down by early childhood, primary, secondary, and tertiary education.

For this indicator, the primary and secondary figures were recalculated to generate one expenditure figure for the primary and secondary levels combined. This was done by, first, adding the full-time-equivalent enrollment (FTE) numbers for primary and secondary education to determine total FTE. Second, total expenditures were calculated by multiplying the FTE numbers by expenditures per student, for primary and secondary education, respectively, and then adding these two figures together to determine total expenditures for primary-secondary education. Finally, total expenditures on primary and secondary education were divided by total enrollment in the primary and secondary levels to determine per student expenditures for primary-secondary education.

How students are classified

The International Standard Classification of Education (ISCED) was designed as an instrument for presenting statistics of education internationally. Many countries report education statistics to UNESCO and the Organization for Economic Co-operation and Development (OECD) using the ISCED. In this classification system, education is divided into several levels.

The following are summary definitions used in this analysis:

- *Education preceding the first level (preprimary education)*, where it is provided, usually begins at age 3, 4, or 5 (sometimes earlier) and lasts from 1–3 years. For the United States, this would be mostly nursery schools and kindergarten classes.
- *Education at the first level (primary education)* usually begins at age 5, 6, or 7 and lasts for about 5 or 6 years. For the United States, the first level starts with grade 1 and ends with grade 6.
- *Education at the second level (lower secondary education)* begins at about age 11 or 12 and lasts for about 3 years. For the United States, the second level starts with grade 7 and ends with grade 9.
- *Education at the third level (upper secondary education)* begins at about age 14 or 15 and lasts for

about 3 years. For the United States, the third level starts with grade 10 and ends with grade 12.

- *Education at the fifth level (non-university higher education)* is provided at community colleges, vocational-technical colleges, and other degree-granting institutes whose programs typically take 2 years or more, but less than 4 years, to complete.
- *Education at the sixth level (university higher education)* is provided in undergraduate programs at 4-year colleges and universities in the United States and, generally, at universities in other countries. Completion of education at the third level (upper secondary education) is usually required as a minimum condition of admission, and admission is, in many cases, competitive.
- *Education at the seventh level (graduate and professional higher education)* is provided in graduate and professional schools that generally require a university diploma as a minimum condition for admission.
- *Education at the ninth level (undistributed)* is a classification reserved for enrollments, expenditures, or programs that cannot be unambiguously assigned to one of the aforementioned levels. Some countries, for example, assign nongraded special education or recreational nondegree adult education programs to this level. Other countries assign nothing to this level, preferring instead to allocate enrollments, expenditures, and programs to levels as best they can.

How expenditures are compared across countries

To compare expenditures per student in the United States to expenditures per student in other countries, expenditures must be denominated in a common currency. Conversion of other countries' expenditures to U.S. dollars facilitates comparison with expenditures in the United States. There are at least two methods of conversion: 1) market exchange rates, and 2) Purchasing Power Parity (PPP) indices.

The market exchange rate is the rate at which an individual can exchange the currencies of two countries. It is determined by relative confidence in the governments, their monetary systems, and the economies of the two countries and by the relative demand for the goods and services that the two

countries trade. Market exchange rates can be highly volatile.¹

PPP indices are calculated by comparing the cost of a fixed market basket of goods in each country. Changes over time in a PPP index are determined by the rates of inflation in each country. Since PPP indices are not volatile, they were used here to adjust expenditures and GDP figures.² Because the fiscal year has a different starting month in different countries, within-country GDP consumer price deflators from the OECD National Accounts database were used to adjust education expenditures where the national financial year does not coincide with the calendar year 1993.

Problems in comparing education expenditures across countries

Comparing national expenditures on education can be difficult because the data are dependent on numerous factors, including the size of the economy, the population, and enrollment rates. In addition, the coverage and character of the education expenditure data that countries submit to the OECD vary somewhat. Sometimes an individual expenditure item may be included in the expenditure data from one country, but may not be included in those from another. Below, is a discussion of some of the problems that exist in comparing education expenditures across countries.

Size of the economy: Because GDP levels are the measure against which education expenditures are compared in this indicator, a country's wealth has a significant effect on the amount of resources that can be devoted to education.

Size of the population: The youth population, constituting those between the ages of 5 and 29, is the population that demands the investment of resources in education and training. The greater this population is, the more a country has to spend on education; the smaller this population is, the less a country has to spend on education.

Enrollment rates: Enrollment rates also affect the amount of resources a country needs to invest in education. The proportion of persons between the ages of 5 and 29 who are enrolled either full time or part time in preprimary, primary, secondary, or tertiary education varies widely across countries. For example, this proportion ranges from less than 55 percent in the Czech Republic, Greece, Mexico, and Turkey to more than 67 percent in Australia, Belgium, Canada, and New Zealand.³

Discrepancies in expenditure data arise because one country may collect certain kinds of data that another country either does not collect, or does not collect in its "education" data collections. Or, one country may define what constitutes an "education" expenditure differently than another country does. Discrepancies between which expenditure items are included in one country's expenditure figures and not in another's tend to arise in four general domains:

Noninstructional (ancillary) services: Some countries provide fewer ancillary services in their schools and, thus, include fewer expenditures for such services in their education expenditure figures. Examples of ancillary services are school cafeterias; dormitories; intramural school sports programs; school health clinics or visiting school nurse services; attendance (i.e., truancy) services; and speech or psychological therapy services. U.S. schools tend to subsidize relatively more ancillary services through their education budgets than do schools in most other countries. In some countries (e.g., Germany), *none* of the aforementioned services are provided at the primary and lower secondary levels by many schools.

Private expenditures: Some countries' education systems receive large private contributions. The most common forms of private contributions to education are student tuition or fees; organizational subsidies, such as those provided by religious denominations to their own schools; and corporate in-kind contributions, such as those provided by German and Austrian firms to fund vocational courses on the shop floor for participating youth apprentices. Most national education statistics collections attempt to include estimates for such expenditures. However, other private expenditures can seem more ephemeral to education data gatherers. Students' or parents' own spending on school supplies, or community organizations' charitable grants and loans to individual students, for example, can only be estimated with the help of household expenditure surveys and diligent perusal of statistical collections outside the domain of traditional educational institutions.

The boundaries of education: Fewer (though, still some) inconsistencies arise when comparing just the *instructional* expenditures for *primary* and *secondary* public education in the *academic* track. But, the "borderlands" of education, in particular, tend to cause comparability problems. These borderlands include preprimary education and day care, special education, adult education, vocational/technical

education, and proprietary education. Some countries, for example, simply do not collect expenditure data for private “center-based” day care because they do not define this as “education.” Indeed, in some countries, even public day care is not managed by education authorities; rather, it is the responsibility of human services departments.

The exact location of each “boundary” also varies from country to country and even within each country. In Canada, for example, vocational/ technical students in Québec choose to enter vocational/technical college in the 12th grade, while in the other Canadian provinces with vocational/technical colleges, they enter in the 13th or 14th grade. Thus, vocational/technical students in the other provinces spend another year or two at the upper secondary level. The more time the average student spends in a level of education, the greater will be the expenditures at that level.

University research: Because university spending includes substantial expenditures on research, comparing expenditures on higher education can often be misleading. The proportion of total university spending that is invested in research varies widely, specifically because of variations in the proportion of total national research and development (R & D) that is performed within the domain of higher education institutions.

In addition to variations among countries regarding the production of R & D, countries have not reported their research spending to the same extent when submitting data that were used for this analysis. For example, some countries exclude separately funded or budgeted research, while others include nearly all research outlays by institutions of higher education, when reporting higher education expenditure figures.

Even these four domains do not include all the possible comparability problems. There remain, for

example, inconsistencies in how different countries treat public contributions to teacher retirement and fringe benefits, student financial aid, and hospitals.

The National Center for Education Statistics (NCES) has sponsored a study designed to examine the comparability of national figures on education expenditures. The two-volume study, entitled *International Expenditure Comparability Study*, involves 10 countries and examines in detail the content of the education expenditures data they reported to the OECD.

Thus far, participating education ministries have been receptive to the idea of improving comparability in the OECD data collection. Indeed, some countries had already modified their data submissions to the OECD for the 1991–92 school year, thus improving the comparability of education expenditures across countries for the data used for *The Condition of Education, 1996*. Further improvements were made to the data submissions to the OECD for the 1993–94 school year, the data used for this report. These changes were motivated in part by findings from the NCES expenditure comparability studies.⁴

NOTES:

¹ For a further argument against using market exchange rates, see Edith M. Rasel and Lawrence Mishel, *Short-changing Education*, Economic Policy Institute, January 1990.

² PPP indices for other aggregates such as private consumption expenditures are available. See Stephen M. Barro, *International Comparisons of Education Spending: Some Conceptual and Methodological Issues*, SMB Economic Research, Inc., April 1990, for a discussion of the strengths and weaknesses of using various indices.

* Detailed school earnings were computed using data only from teachers who reported those earnings; therefore, details do not add to total. Included in "total" and "other school compensation" are other sources of income reported after excluding outside income. Summer compensation was received in 1993. Data were calculated from the Schools and Staffing Survey Teacher Questionnaire.

Note to Indicator 57: Definition of student percentages and major/minor and certification in class subject

Definition of student percentages

Indicator 57 reports the percentages of students who were taught by full-time teachers with different qualifications. These values were calculated from Schools and Staffing Survey (SASS) information on the number of classes taught, the number of students in each class, the subject matter taught in each class, and the teachers' education and certification levels. The data collected from the teachers were weighted to properly represent national levels.

The following procedure was used to calculate the percentage of mathematics students taught by certified mathematics teachers: First, for each full-time teacher who reported teaching a mathematics class, the sum of the weighted number of students in each mathematics class taught by that teacher was used to estimate the total number of mathematics students. Next, for each full-time teacher certified to teach mathematics, the sum of the weighted number of students in each mathematics class taught by that teacher was used to estimate the number of mathematics students taught by certified teachers. Finally, the estimate of the number of mathematics students taught by certified teachers was divided by the estimate of the total number of mathematics students in order to obtain the estimated percentage of mathematics students taught by a full-time teacher certified in mathematics. The percentages reported in each of the tables in this analysis were calculated by limiting the selection to specific class subjects and school and teacher characteristics.

Classes excluded from the text table and tables 57-1 through 57-4

Computer science was excluded from the tables in this analysis because the computer science major has existed only for a limited number of years.

Matching class subject to major/minor and certification field

There are many ways to match a major/minor field of study or certification in a teaching assignment field to a class subject. One method is to include both the general or specific field and the education major/minor parallel field as a match for a specific class subject. For example, a teacher who majored or minored or who was certified in mathematics or mathematics education could be defined as having majored or minored or having become certified in the subject of mathematics. A stricter definition

would exclude the mathematics teachers who majored or minored or who were certified in mathematics education. The more general definition was used for mathematics and science in all the tables in this analysis. The stricter definition was used for the specific science disciplines (biology, chemistry, and physics) in all tables.

For alternative classifications of fields see *Out-of-Field Teaching and Education Equality* (NCES 96-040).

Majored or minored in class subject

Teachers were classified as having majored or minored in a class subject if they had majored or minored in a field (shown in the right-hand column) that corresponds to the class subject listed in the left-hand column. Both undergraduate- and graduate-level degrees were considered in identifying major/minor matches to class subjects.

<u>Class subject(s)</u>	<u>Major / minor field(s)</u>
Mathematics	Mathematics, mathematics education, engineering, physics
Natural sciences	Geology/earth science, science education, other natural sciences and majors listed below
Biology/life science	Biology/life science
Chemistry	Chemistry
Physics	Physics

Certification in class subject

Certification refers to a teacher's advanced, standard, or probationary certification by a state or full certification by an accrediting body other than a state. Teachers with a temporary or emergency certification were not included as certified teachers in this analysis.

The table below shows teacher certifications classified by class subject. Teachers were classified as being certified in a class subject if they were certified in a teaching assignment field (shown in the right-hand column) that corresponds to the subject matter listed in the left-hand column. Only certifi-

cations as defined above were considered when matching subject matter.

<u>Class subject(s)</u>	<u>Certification in assignment field(s)</u>
Mathematics	Mathematics
Natural sciences	Geology / earth science, space science education, physical science, general science and all other sciences
Biology / life science	Biology / life science
Chemistry	Chemistry
Physics	Physics

Table 58-1 Change in teaching status of full-time teachers between the 1993-94 and 1994-95 school years, by control of school and age of teachers

* Institutions classified as colleges award primarily bachelor's degrees but may also award graduate degrees in a limited number of fields.

NOTE: The first column of the row for 4-year public institutions indicates that 17.3 percent of graduate-level courses offered by these schools were taught by nontenure-track faculty or staff. This

table is limited to courses taught at 4-year institutions that had tenure systems. Included here are faculty and staff who taught at least one course for credit in fall 1992 (a small percentage did not have faculty status). Faculty with clinical appointments were excluded.

SOURCE: U.S. Department of Education, National Center for Education Statistics, National Study of Postsecondary Faculty, 1993.

Note to Indicator 60: Nontenure-track faculty

Faculty and instructional staff were included in these tables only if they taught at least one course for credit in fall 1992. A small number of instructional staff who lacked faculty status at sampled institutions were also included, but "faculty" is used for ease of reading. Faculty who reported having a clinical appointment were also excluded, because their tenure status is different from others' and their teaching experience is likely to differ in other fundamental ways from that of faculty as a whole. Table 60-2, which uses courses rather than faculty as the unit of analysis, excludes all courses at 2-year institutions as well as all courses at institutions lacking tenure systems.

Academic discipline

In the 10-category academic discipline typology, Health sciences includes public health and health services administration; Humanities includes history, philosophy/religion, and English as a second language; Natural science includes mathematics, statistics, and computer science; and All other fields includes a range of vocational/technical fields, professional fields (e.g., architecture and law), theology, military studies, multi/interdisciplinary studies, public affairs, and science technologies.

Carnegie classification

Definitions of the Carnegie classifications are as follows:

Research I	Offer a full range of bachelor's through doctoral programs, give high priority to research, and receive \$40 million or more in federal support.
Research II	Offer a full range of bachelor's through doctoral programs, give high priority to research, and receive between \$15.5 and \$40 million in federal support.
Doctoral I	Offer a full range of bachelor's through doctoral programs and award at least 40 doctoral degrees annually in five or more disciplines.

Doctoral II	Offer a full range of bachelor's through doctoral programs and award at least 10 doctoral degrees in three or more disciplines, or 20 or more doctoral degrees in one or more disciplines.
Comprehensive I	Offer a full range of bachelor's through master's degree programs and award 40 or more master's degrees annually in one or more disciplines.
Comprehensive II	Offer a full range of bachelor's through master's degree programs and award 20 or more master's degrees annually in one or more disciplines.
Liberal Arts I	Offer primarily undergraduate degrees, award 40 percent or more of their bachelor's degrees in liberal arts fields, and are restrictive in admission.
Liberal Arts II	Offer primarily undergraduate degrees, award less than 40 percent of their bachelor's degrees in liberal arts fields, and are restrictive in admission.
2-year	Offer primarily associate of arts certificate or degree programs, and, with few exceptions, do not offer bachelor's degrees (this group includes community, junior, and technical colleges).
Other	Offer degrees ranging from bachelor's to doctoral, with at least 50 percent of the degrees awarded in a single discipline (including medical schools and other specialized institutions).

Standard Error Tables

337

General information about standard errors

The information presented in this report was obtained from many sources, including federal and state agencies, private research organizations, and professional associations. The data were collected using many research methods, including surveys of a universe (such as all school districts) or of a sample, compilations of administrative records, and statistical projections. Users of *The Condition of Education* should take particular care when comparing data from different sources. Differences in procedures, timing, phrasing of questions, interviewer training, and so forth mean that the results are not strictly comparable. Following the general discussion of data accuracy below, descriptions of the information sources and data collection methods are presented, grouped by sponsoring organization. More extensive documentation of procedures used in one survey as compared to another does not imply more problems with the data, only that more information is available.

Unless otherwise noted, all statements cited in the text were tested for statistical significance and are statistically significant at the .05 level. Several test procedures were used. Which procedure was used depended upon the type of data being interpreted and the nature of the statement being tested. The most commonly used test procedures were: 1) *t*-tests, 2) multiple *t*-tests with a Bonferroni adjustment to the significance level, 3) linear trend tests, and 4) sign tests. When a simple comparison between two sample estimates was made, for example, between the first and last years in a time series or between males and females, a *t*-test was used. When multiple comparisons between more than two groups were made, and even if only one comparison is cited in the text, a Bonferroni adjustment to the significance level was made to ensure the significance level for the tests as a group was at the .05 level. This procedure commonly arises when making comparisons between racial/ethnic groups and between the United States and other countries. A linear trend test was used when a statement describing a trend, such as the growth of enrollment rates over time, was made or when a statement describing a relationship, such as the relationship between a parent's educational attainment and a student's reading proficiency, was made. A sign test was used when a statement describing a consistent pattern of differences over the years was made.

The accuracy of any statistic is determined by the joint effects of "sampling" and "nonsampling" errors. Estimates based on a sample will differ somewhat from the figures that would have been obtained if a complete census had been taken using the same survey instruments, instructions, and procedures. In addition to such sampling errors, all surveys, both universe and sample, are subject to design, reporting, and processing errors and errors due to nonresponse. To the extent possible, these nonsampling errors are kept to a minimum by methods built into the survey procedures; however, the effects of nonsampling errors are more difficult to gauge than those produced by sampling variability.

The estimated standard error of a statistic is a measure of the variation due to sampling and can be used to examine the precision obtained in a particular sample. The sample estimate and an estimate of its standard error permit the construction of interval estimates with prescribed confidence that the interval includes the average result of all possible samples. If all possible samples were selected, and each were surveyed under the same conditions, and an estimate and its standard error were calculated from each sample, then approximately 90 percent of the intervals from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate would include the actual value; 95 percent of the intervals from two standard errors below the estimate to two standard errors above the estimate would include the actual value; and 99 percent of all intervals from 2.5 standard errors below the estimate to 2.5 standard errors above the estimate would include the actual value. These intervals are called 90 percent, 95 percent, and 99 percent confidence intervals, respectively.

To illustrate this further, consider the text table for *Indicator 1* and the standard error table S1 for estimates of standard errors from the National Household Education Survey (NHES). For the 1995 estimate of the percentage of 3-year-olds enrolled in center-based programs and kindergarten (37.4 percent), table S1 shows a standard error of 1.5. Therefore, we can construct a 95 percent confidence interval from 34.4 to 40.4 ($37.4 \pm 2 \times 1.5$). If this procedure were followed for every possible sample, about 95 percent of the intervals would include the

actual percentage of 3-year-olds enrolled in center-based programs and kindergarten.

The estimated standard errors for two sample statistics can be used to estimate the precision of the difference between the two statistics and to avoid concluding that there is an actual difference when the difference in sample estimates may be due only to sampling error. The need to be aware of the precision of differences arises, for example, when comparing mean proficiency scores between groups or years in the National Assessment of Educational Progress (NAEP) or when comparing percentages between groups or years in the Current Population Survey (CPS). The standard error (se) of the difference between sample estimate A and sample estimate B (when A and B don't overlap) is:

$$se_{A-B} = \sqrt{se_A^2 + se_B^2}$$

When the ratio (called a *t*-statistic) of the difference between the two sample statistics and the standard error of the difference as calculated above is less than 2, one cannot be sure the difference is not due only to sampling error and caution should be taken in drawing any conclusions. In this report, for example, using the rationale above, we would not conclude that there is a difference between the two sample statistics. Some analysts, however, use the less restrictive criterion of 1.64, which corresponds to a 10 percent significance level.

To illustrate this further, consider the data on reading proficiency of 9-year-olds in the 2nd text table for *Indicator 15* and the associated standard error table S15(b). The estimated average reading proficiency score for the sample of black 9-year-olds in 1971 was 170. For the (new) sample in 1994, the estimated average was 185. Is there enough evidence to conclude that the actual average score for all black 9-year-olds increased 15 points between 1971 and 1994? The standard errors for these two estimates are 1.7 and 2.3, respectively. Using the above formula, the standard error of the difference is calculated as 2.9. The ratio of the estimated difference of 15 to the standard error of the difference of 2.9 is 5.2. Using the table below, we see that there is less than a 5 percent chance that the 15 point difference is due only to sampling error and one may conclude that the proficiency scores of black 9-year-olds grew between 1971 and 1994.

Percent chance that a difference is due only to sampling error:

<i>t</i> -statistic	1.00	1.64	1.96
Percent chance	32	10	5

It should be noted that most of the standard errors presented in this report and in the original documents are approximations. That is, to derive estimates of standard errors that would be applicable to a wide variety of items and that could be prepared at a moderate cost, a number of approximations were required. As a result, most of the standard errors presented provide a general order of magnitude rather than the exact standard error for any specific item.

The preceding discussion on sampling variability was directed toward a situation concerning one or two estimates. Determining the accuracy of statistical projections is more difficult. In general, the further away the projection date is from the date of the actual data being used for the projection, the greater the possible error in the projection. If, for instance, annual data from 1980 to 1995 are used to project enrollment in elementary and secondary education, the further beyond 1995 one projects, the more variability in the projection. The enrollment projection for the year 2002 will be less certain than the projection for 1997. A detailed discussion of the projections methodology is contained in *Projections of Education Statistics to 2006* (National Center for Education Statistics, 1996).

Both universe and sample surveys are subject to nonsampling errors. Nonsampling errors can arise in various ways including: 1) from respondents or interviewers interpreting questions differently; 2) from respondents estimating the values that they provide; 3) from partial to total nonresponse; 4) from imputation or reweighting to adjust for nonresponse; 5) from inability or unwillingness on the part of respondents to provide correct information; 6) from recording and keying errors; or 7) from overcoverage or undercoverage of the target universe.

Sampling and nonsampling error combine to yield total survey error. Since estimating the magnitude of nonsampling errors would require special experiments or access to independent data, these magnitudes are seldom available. In almost all situations, the sampling error represents an underestimate of the total survey error, and thus an

overestimate of the precision of the survey estimates.

To compensate for suspected nonrandom errors, adjustments of the sample estimates are often made. For example, adjustments are frequently made for nonresponse, both partial and total. An adjustment made for either type of nonresponse is often referred to as an imputation—substitution of the “average” questionnaire response for the nonresponse. Imputations are usually made separately within various groups of sample members, which have similar survey characteristics. Imputation for item nonresponse is usually made by substituting for a missing item the response to that item of a respondent having characteristics that are similar to those of the nonrespondent. In editions prior to the 1992 edition of *The Condition of Education*, when reporting race-specific data from the CPS, Hispanics were usually included among whites and blacks (i.e., “Hispanics may be of any race”). Beginning with the 1992 edition of the re-

port, racial/ethnic data from the CPS excludes Hispanics from whites and blacks (e.g., whites are non-Hispanic whites and blacks are non-Hispanic blacks).

Unless otherwise noted, all dollar values in this volume are expressed in 1996 constant dollars. The Consumer Price Index (CPI) is used to convert current dollars for earlier years to 1996 dollars. The CPI index for calendar year 1996 is 156.9. See table 37 in *Digest of Education Statistics, 1996* (National Center for Education Statistics, 1996) for CPI adjustments.

How to obtain standard errors for the supplemental tables

To obtain estimates of standard errors for the statistics in the supplemental tables, please complete the request card located in this edition of *The Condition of Education*.

Baccalaureate and Beyond Longitudinal Study

The Baccalaureate and Beyond Longitudinal Study (B&B) is based on the National Postsecondary Student Aid Study (NPSAS) and provides information concerning education and work experience after completing the bachelor's degree. B&B provides cross-sectional information 1 year after bachelor's degree completion (comparable to the Recent College Graduate Study), while at the same time providing longitudinal data concerning entry into and progress through graduate level education and the work force. It also provides information on entry into, persistence and progress through, and completion of graduate level education—information not available through followups involving high school cohorts or even college entry cohorts, both of which are restricted in the number who actually complete a bachelor's degree and continue their education.

B&B will follow NPSAS baccalaureate degree completers for a 12-year period after completion, beginning with NPSAS:93. About 11,000 students who completed their degree in the 1992–93 academic year were included in the first B&B (B&B:93/94). In addition to the student data, B&B collected postsecondary transcripts covering the undergraduate period, providing complete information on progress and persistence at both the undergraduate and graduate levels. New B&B cohorts will alternate with BPS in using NPSAS as their base.

For additional information about B&B contact:

e-mail: Paula_Knepper@ed.gov

Beginning Postsecondary Students Longitudinal Study

The Beginning Postsecondary Students Longitudinal Study (BPS) provides information on persistence, progress, and attainment of students from their initial time of entry into postsecondary education through their leaving school and entering the work force. BPS includes traditional and

nontraditional (e.g., older) students and is representative of all beginning students in postsecondary education. BPS follows first-time, beginning students for at least 6 years at 2-year intervals, collecting student data, postsecondary transcripts, and financial aid reports. By starting with a cohort that has already entered postsecondary education (from the NPSAS:90), and following it for 6 years (with the first followup in spring 1992 and the second followup in spring 1994), BPS is able to determine to what extent, if any, students who start postsecondary education later differ in their progress, persistence, and attainment.

For additional information about BPS, contact:

Common Core of Data

The Common Core of Data (CCD) survey provides the National Center for Education Statistics (NCES) with a way to acquire and maintain statistical data on the 50 states, the District of Columbia, and five outlying areas from the universe of state-level education agencies. Information about staff and students is collected annually at the school, local education agency or school district (LEA), and state levels. Information about revenues and expenditures also is collected at the state level, and NCES joins the Bureau of Census in collecting school district finance data. Data are collected for a particular school year (October 1 through September 30) via survey instruments sent to the states by October 15 of the subsequent school year. States have 1 year in which to modify the data originally submitted.

For additional information about CCD, contact:

John Sietsema
Surveys and Cooperative Systems Group

High School and Beyond

High School and Beyond (HS&B) is a national longitudinal study of 1980 high school sophomores and

seniors. The base-year survey was a probability sample of 1,015 high schools, with a target number of 36 sophomores and 36 seniors in each schools. A total of 58,270 students participated in the base-year survey. Substitutions were made for noncooperating schools—but not for students—in those strata where it was possible. Overall, 1,122 schools were selected in the original sample and 811 of these schools participated in the survey. An additional 204 schools were drawn in a replacement sample. Student refusals and student absences resulted in an 82 percent completion rate for the survey.

HS&B first followup activities were conducted in the spring of 1982. The sample design of the first followup survey called for the selection of approximately 30,000 individuals who were sophomores in 1980. The completion rate for sophomores eligible for on-campus survey administration was about 96 percent. About 89 percent of the students who left school between the base-year and first followup surveys (dropouts, transfer students, and early graduates) completed the first followup sophomore questionnaire.

The sample for the second followup, which took place in the spring of 1984, consisted of about 12,000 members of the senior cohort and about 15,000 members of the sophomore cohort. The completion rates were 91 and 92 percent, respectively.

HS&B third followup data collection activities were conducted in the spring of 1986. Both the sophomore and senior cohort samples for this round of data collection were the same as those used for the second followup survey. The completion rates for the sophomore and senior cohort samples were 91 percent and 88 percent, respectively.

High School Transcript Studies

As part of the first followup of High School and Beyond (HS&B), transcripts were requested in fall 1982 for an 18,152-member subsample of the sophomore cohort. Of the 15,941 transcripts actually obtained, 1,969 were excluded because the students had dropped out of school before graduation; 799

were excluded because they were incomplete; and 1,057 were excluded because the students graduated before 1982 or the transcript indicated neither a dropout status nor graduation. Thus, 12,116 transcripts were used for an overall curriculum analysis.

Transcripts of 1987 high school graduates were compared to transcripts of 1982 graduates to describe changes in course-taking patterns across this 5-year period. The sample of schools for the 1987 High School Transcript Study consisted of a nationally representative sample of 497 secondary schools selected for the 1986 National Assessment of Educational Progress (NAEP) for students in grade 11 who were 17 years old, of which 433 schools participated. The 1987 study was restricted to students who were in grade 11 during school year 1985–86 equaling 27,732 graduates. The 1990 High School Transcript Study was conducted using methodology and techniques nearly identical to those used in the 1987 study.

The analyses in the *Condition* focus on high school graduates, so only those students who had graduated from high school were included from the 1990 study, the 1987 High School Transcript Study, and from HS&B. Because the methods used to identify and define disabled students were different for the later studies, and in order to make the samples as comparable as possible, it was necessary to restrict the samples to those students whose records indicated they had not participated in a special education program. In the spring of 1991, transcripts were collected from 21,607 students who graduated from high school in 1990. These students attended 330 schools that had previously been sampled for the NAEP.

Between May and November of 1994, high school transcripts were collected from 25,573 students who graduated from high school in 1994. To be consistent with the 1982 study, students with an Individualized Education Program (IEP) were omitted. Also, students with incomplete transcripts were dropped, bringing the number of transcripts analyzed to 24,374. These students attended 340 schools that had previously been sampled by NAEP.

Integrated Postsecondary Education Data System

The Integrated Postsecondary Education Data System (IPEDS) surveys all postsecondary institutions, including universities and colleges, as well as institutions offering technical and vocational education beyond the high school level. This survey, which began in 1986, replaces and expands upon the Higher Education General Information Survey (HEGIS).

IPEDS consists of several integrated components that obtain information on where postsecondary education is available (institutions), who participates in it and completes it (students), which programs are offered and are completed, and which human and financial resources are involved in the provision of institutionally based postsecondary education. Specifically, these components include: fall enrollment in occupationally specific programs; salaries of full-time instructional faculty; completions (degrees awarded); finance; staff; institutional characteristics, including institutional activity; fall enrollment, including age and residence; and academic libraries.

For additional information about IPEDS, contact:

Roslyn A. Korb
Surveys and Cooperative Systems Group

e-mail: Roslyn_Korb@ed.gov

Fall Enrollment. This survey has been part of the IPEDS or HEGIS series since 1966. The enrollment survey response rate is relatively high; for example, the 1992 response rate was 86.9 percent.

Beginning in fall 1986, the survey system was redesigned with the introduction of IPEDS (see above). The new survey system comprises all postsecondary institutions, but also maintains comparability with earlier surveys by allowing HEGIS institutions to be tabulated separately. The new system also provides for preliminary and revised data releases. This allows NCES the flexibility to release early data sets while still maintaining a more accurate final database.

Salaries, Tenure, and Fringe Benefits of Full-Time Instructional Faculty. This survey has been conducted for most years between 1966–67 and 1985–86, and in 1987–88 and 1989–90. Although the survey form was changed a number of times during those years, only comparable data are presented in this report.

The data were collected from the individual colleges and universities.

Between 1966–67 and 1985–86 this survey differed from other HEGIS surveys in that imputations were not made for nonrespondents. Thus, there is some possibility that the salary averages presented in this report may differ from the results of a complete enumeration of all colleges and universities. Beginning with the surveys for 1987–88, the IPEDS data tabulation procedures included imputations for survey nonrespondents. The response rate for the 1993–94 survey was 90.1 percent.

Completions. This survey was always part of the HEGIS series. However, the degree classification taxonomy was revised in 1970 and again in 1980, with additional revisions in 1985 and 1990. Collection of degree data has been maintained through the IPEDS system.

Though information from survey years 1970–71 through 1981–82 is directly comparable, care must be taken if information before or after that period is included in any comparison. For example, degrees-conferred trend tables arranged by the 1982–83 classification were added to the *Digest of Education Statistics, 1992* to provide consistent data from 1970–71 to 1988–89. However, data on associate's degrees and other formal awards below the baccalaureate, by field of study after 1982–83, are not comparable with figures for earlier years. The nonresponse rate did not appear to be a significant source of nonsampling error for this survey. The return rate over the years was high, with a response rate for the 1992–93 survey of 88.2 percent. Because of the high return rate, nonsampling error caused by imputation was also minimal.

Financial Statistics. This survey was part of the HEGIS series and has been continued under the IPEDS system. Changes were made in the financial survey instruments in fiscal years (FY) 1976, 1982, and 1987. The FY 76 survey instrument contained numerous revisions to earlier survey forms and made direct comparisons of line items very difficult. Beginning in FY 82, Pell grant data were collected on federal restricted grants and contracts revenues and restricted scholarships and fellowships expenditures. The introduction of IPEDS in the FY 87 survey included several important changes to the survey instrument and data processing procedures. While these changes were significant, considerable effort has been made to present only comparable information on trends in this report and to note inconsistencies. Finance tables for this publication have been adjusted by

subtracting the largely duplicative Pell grant amounts from the later data to maintain comparability with pre-FY 82 data.

To reduce reporting error, NCES used national standards for reporting financial statistics. These standards are contained in *College and University Business Administration: Administrative Services* (1974 edition), published by the National Association of College and University Business Officers; *Audits of Colleges and Universities* (as amended August 31, 1974), by the American Institute of Certified Public Accountants; and *HEGIS Financial Reporting Guide* (1980), by NCES. Wherever possible, definitions and formats in the survey form are consistent with those in these three accounting texts.

Fall Staff. The fall staff data presented in this publication were collected in cooperation with the U.S. Equal Employment Opportunity Commission (EEOC). In 1989, survey instruments were mailed to 6,669 in-scope postsecondary education institutions, including 2,576 4-year schools, 2,739 2-year schools, and 273 public less-than-2-year schools. The universe of 5,002 less-than-2-year private institutions were represented by a sample of 1,071 institutions.

The 3,589 institutions of higher education (in the 50 states and the District of Columbia) in operation in 1989 form a subset of the universe of postsecondary institutions in this report. These institutions are accredited at the college level by an agency recognized by the Secretary, U.S. Department of Education; these institutions were previously surveyed under HEGIS, which IPEDS supersedes. The EEOC 1991 "Fall Staff" survey had an overall response rate of 84.9 percent.

Institutional Characteristics. This survey provided the basis for the universe of institutions presented in the *Education Directory, Colleges and Universities*. The universe comprised institutions that met certain accreditation criteria and offered at least a 1-year program of college-level studies leading toward a degree. All of these institutions were certified as eligible by the U.S. Department of Education's Division of Eligibility and Agency Evaluation. Each fall, institutions listed in the previous year's *Directory* were asked to update a computer printout of their information.

National Adult Literacy Survey

The National Adult Literacy Survey (NALS) was created as a new measure of literacy and funded by the U.S. Department of Education and by 12

states. It is the third, and largest, assessment of adult literacy funded by the federal government. The aim of the survey is to profile the English literacy of adults in the United States based on their performance across a wide array of tasks that reflect the types of materials and demands they encounter in their daily lives.

To gather the information on adults' literacy skills, trained staff interviewed nearly 13,600 individuals age 16 and older during the first 8 months of 1992. These participants had been randomly selected to represent the adult population in the country as a whole. In addition, some 1,100 inmates from 80 federal and state prisons were interviewed to gather information on the proficiencies of the prison population. In total, over 26,000 adults were surveyed.

National Assessment of Educational Progress

The National Assessment of Educational Progress (NAEP) is a congressionally mandated study funded by the Office of Educational Research and Improvement (OERI), U.S. Department of Education. The overall goal of the project is to determine the nation's progress in education. To accomplish this goal, a cross-sectional study was designed and initially implemented in 1969. Periodically, NAEP has gathered information about levels of educational achievement across the country. NAEP has surveyed the educational accomplishments of 9-, 13-, and 17-year-old students (and in recent years, students in grades 4, 8, and 12), and occasionally young adults, in 10 learning areas. Different learning areas were assessed annually and, as of 1980-81, biennially. Most areas have been periodically reassessed in order to measure possible changes in education achievement.

National Education Longitudinal Study of 1988

The National Education Longitudinal Study of 1988 (NELS:88) is the third major longitudinal study sponsored by NCES. The two studies that preceded NELS:88, the National Longitudinal Study of the High School Class of 1972 (NLS-72) and HS&B, surveyed high school seniors (and sophomores in HS&B) through high school, postsecondary education, and work and family formation experiences. Unlike its predecessors, NELS:88 began with a cohort of 8th-grade students.

NELS:88 is designed to provide trend data about critical transitions experienced by young people as they develop, attend school, and embark on their careers. It complements and strengthens state and local efforts by furnishing new information on how school policies, teacher practices, and family involvement affect student educational outcomes (i.e., academic achievement, persistence in school, and participation in postsecondary education). The base-year NELS:88 was a multifaceted study questionnaire with four cognitive tests, and questionnaires for students, teachers, parents, and the school.

Within the school sample, 26,000 eighth-grade students were selected at random. The first and second followups revisited the same sample of students in 1990, 1992 and 1994, when the 1988 eighth-graders were in the 10th and 12th grades and then 2 years after their scheduled high school graduation. A similar followup is being conducted in 1997.

National Household Education Survey

The National Household Education Survey (NHES) is the first attempt by NCES to go beyond its traditional, school-based data collection to a household survey. Historically, NCES has collected data from teachers, students, and schools through school-based surveys and from administrative records data through surveys of school districts and state education agencies. NHES has the potential to address many education issues that have not been addressed previously by NCES data collections.

During the spring of 1991, NCES fielded a full-scale NHES on early education. Approximately 60,000 households were screened to identify a sample of children aged 3-8. The parents of these children were interviewed in order to collect information about their children's educational activities and the role of the family in children's learning. The NHES:93 is a subsequent survey conducted in the spring of 1993. It addressed readiness for school and safety and discipline in school. The NHES:93 early childhood component focused on readiness for school in a broad sense and examined several relevant issues. The School Safety and Discipline component of the NHES:93 addressed a new topic for the NHES. It focused on four areas: school environment, school safety, school discipline policy, alcohol/other drug use, and education. In the NHES:95 survey, the Early Childhood Program Participation component provides information on infants', toddlers', and preschoolers' participation in a variety of early care and education settings, including both home-based and center-based arrangements. The survey component also includes data on kindergarten and primary school history and experiences.

In NHES, an adult education supplement was also fielded. Adult household members were sampled and questioned about their participation in adult education. The adult education component was, for the most part, adapted from the previous Current Population Survey (CPS) adult education supplements. However, unlike the CPS, NHES collects information on both adult education participants and nonparticipants. The NHES:91 survey identified and screened more than 60,000 households. During the survey, a knowledgeable adult was asked a series of questions to screen all household members for adult education participation in a sample of about 20,000 of these 60,000 households, resulting in interviews with approximately 9,800 adult education participants. In the NHES:95 survey, of the 23,969 adults sampled for the adult education component, 80 percent (19,722) completed the interview.

National Longitudinal Study of the High School Class of 1972

The National Longitudinal Study of the High School Class of 1972 (NLS) was the first major longitudinal study sponsored by NCES. NLS was designed to produce representative data at the national level on the cohort of students who were in the 12th grade in 1972. The 1972 base study was followed by follow-up studies in 1973, 1974, 1976, 1979, and 1986. The followup studies asked respondents about their education and work plans, community characteristics, family structure, attitudes and opinions, school characteristics, grade point average, credits earned, and financial assistance for postsecondary education. After NLS, NCES sponsored two other major longitudinal studies: High School and Beyond, and the National Education Longitudinal Study of 1988.

National Postsecondary Student Aid Study

NCES conducted the National Postsecondary Student Aid Study (NPSAS) for the first time during the 1986–87 school year. This survey established the first comprehensive student financial aid database. Data were gathered from 1,074 postsecondary institutions and approximately 60,000 students and 14,000 parents. These data provided information on the cost of postsecondary education, the distribution of financial aid, the characteristics of both aided and nonaided students and their families, and the nature of aid packages.

In response to the continuing need for these data,

NCES conducted the second and third cycle of NPSAS in the 1989–90 and 1992–93 school years.

The 1990 in-school sample involved approximately 70,000 students selected from registrar lists of enrollees at 1,200 postsecondary institutions. The 1993 sample was taken from 77,000 students at 1,000 postsecondary institutions. The sample included both aided and nonaided students. Student information such as field of study, education level, and attendance status (part time or full time) was obtained from registrar records. Types and amounts of financial aid and family financial characteristics were abstracted from school financial aid records. Also, approximately 16,000 parents of students were sampled in 1990 and 12,500 parents were sampled in 1993. Data on family composition and parent financial characteristics also were compiled. Students enrolled in postsecondary education for the first time in 1989–90 served as the base BPS. Students who received a bachelor's degree in 1992–93 served as the base for B&B.

National Survey of Postsecondary Faculty

The National Survey of Postsecondary Faculty (NSOPF-88) was a comprehensive survey of higher education instructional faculty in the fall of 1987. It was the first such survey conducted since 1963, and it gathered information regarding the backgrounds, responsibilities, workloads, salaries, benefits, and attitudes of both full- and part-time instructional faculty and staff in 2- and 4-year institutions under both public and private control. In addition, information was gathered from institutional and department-level respondents on such issues as faculty composition, new hires, departures and recruitment, retention, and tenure policies.

There were three major components of the study: a survey of institutional-level respondents at a stratified random sample of 480 U.S. colleges and universities; a survey of a stratified random sample of 3,029 eligible department chairpersons (or their equivalent) within the participating 4-year institutions; and a survey of a stratified random sample of 11,013 eligible faculty members within the par-

ticipating institutions. Response rates for the three surveys were 88 percent, 80 percent, and 76 percent, respectively.

The universe of institutions from which the sample was selected was all accredited nonproprietary U.S. postsecondary institutions that grant a 2-year (associate's) or higher degree and whose accreditation at the higher education level is recognized by the U.S. Department of Education. This includes religious, medical, and other specialized postsecondary institutions as well as 2- and 4-year nonspecialized institutions. According to the 1987 IPEDS, this universe comprised 3,159 institutions. The universe does not include proprietary 2- and 4-year institutions or less-than-2-year postsecondary institutions.

The second cycle of NSOPF, conducted in 1992-93, was limited to surveys of faculty and institutions, but with a substantially expanded sample of 974 public and private nonproprietary higher education institutions and 31,354 faculty. Unlike NSOPF-88, which was limited to faculty whose regular assignment included instruction, the faculty universe for NSOPF-93 was expanded to include anyone who was designated as faculty, whether or not their responsibilities included instruction. Under this definition, researchers and administrators and other institutional staff who hold faculty positions but who do not teach were included in the sample. The definition of the institution universe for NSOPF-93 was identical to the one used in NSOPF-88.

Postsecondary Education Quick Information System

NCES established the Postsecondary Education Quick Information System (PEQIS) to collect timely data on focused issues needed for program planning and policy development with a minimum burden on respondents. In addition to obtaining information on emerging issues quickly, PEQIS surveys are also used to assess the feasibility of developing large-scale data collection efforts on a given topic or to supplement other NCES postsecondary surveys.

The PEQIS panel is a nationally representative sample of approximately 1,500 2-year and 4-year postsecondary institutions in the United States. The panel consists of all types of postsecondary institutions at the 2-year and 4-year level, including universities, baccalaureate colleges, community colleges, trade and technical schools, and other postsecondary schools. PEQIS also includes a supplementary panel of less-than-2-year institutions. Depending on the topic of the survey, questionnaires either are sent to all institutions in the PEQIS panel, or to a subsample of the institutions, for example, institutions designated as higher education institutions.

For more information on PEQIS, contact:

Projections of Education Statistics

Since 1964, NCES has published *Projections of Education Statistics*, a report that shows projections of key statistics for elementary and secondary schools and institutions of higher education. Data are included for enrollments, instructional staff, graduates, and earned degrees. *Projections* includes several alternative projection series and a methodology section describing the techniques and assumptions used to prepare them. Data in this edition of *The Condition of Education* reflect the intermediate projection series only.

e-mail: Debra_Gerald@ed.gov

Recent College Graduates Study

NCES has conducted periodic surveys of individuals, about 1 year after graduation, to collect information on college outcomes. The Recent College Graduates (RCG) surveys have concentrated on those graduates entering the teaching profession.

To obtain accurate results on this smaller subgroup, graduates who are newly qualified to teach have been oversampled in each of the surveys.

The 1976 survey of 1974–75 college graduates was the first and smallest in the series. The sample consisted of 209 schools, of which 200 (96 percent) responded. Of the 5,506 graduates in the sample, 4,350 responded, for a response rate of 79 percent.

The 1981 survey was larger, with 301 institutions and 15,852 graduates. Responses were obtained from 286 institutions, for an institutional response rate of 95 percent, and from 9,312 graduates (716 others were determined to be out of scope), for a response rate of 62 percent.

The 1985 survey requested data from 18,738 graduates from 404 colleges. Responses were obtained from 13,200 students, for a response rate of 74 percent (885 were out of scope). The response rate for the colleges was 98 percent.

The 1987 survey form was sent to 21,957 graduates. Responses were received from 16,878, for a response rate of 79.7 percent. The 1987 *Transcript Study* collected transcripts for each student who was part of the 1987 sample.

The 1991 survey sampled 18,135 graduates and 400 institutions. The response rates were 95 percent for the institutions and 83 percent for the graduates.

Schools and Staffing Survey

The Schools and Staffing Survey (SASS) provides national- and state-level data on public and private schools, principals, schools districts, and teachers. The survey monitors teacher supply and demand conditions, school policies and programs, characteristics and qualifications of teachers and principals, and the general status of teaching and schooling. A proportion of the survey is devoted to school libraries and media centers as well as school librarians.

SASS is a multilevel linked set of surveys that allows comparison between public and private schools and linkages of teachers and principals to

their schools and school districts. There are four components: the Teacher Demand and Shortage Survey, the Principal Survey, the School Survey, and the Teacher Survey. In the year following each SASS, a followup survey of teachers is conducted to measure teacher attrition and mobility.

SASS was first conducted in the 1987–88 school year, and again in 1990–91 and 1993–94. It will be conducted again in 1999–2000. The 1993–94 SASS sample consisted of approximately 9,900 public schools, 3,300 private schools, and 5,500 public school districts associated with the public schools in the sample. From these schools, about 57,700 public school teachers and 11,500 private school teachers were sampled.

The public school sample for the 1993–94 SASS was based upon the 1991–92 school year Common Core of Data (CCD), the compilation of all the nation's public school districts and public schools. The private school sample for the 1993–94 SASS was selected from the 1991–92 Private School Universe Survey (PSS), supplemented with list updates from states and some associations available in time for sample selections.

Public-use and restricted-use microdata files are available on CD-ROM or 9-track tape. Summary data from the 1993–94 SASS can be found in *Schools and Staffing in the United States: Selected Data for Public and Private Schools, 1993–94* (NCES 95-191). More detailed results from the 1993–94 SASS are published in *Schools and Staffing in the United States: A Statistical Profile, 1993–94* (NCES 96-124). Data by state are available in *SASS by State—1993–94 Schools and Staffing Survey Selected State Results* (NCES 96-312). Further information about the sample may be obtained from *1993–94 Schools and Staffing Survey: Sample Design and Estimation* (NCES 96-089). Data from previous SASS collections are published in the 1987–88 and 1990–91 *Profile* (NCES 92-127 and 93-146, respectively), as well as the 1987–88 and 1990–91 versions of the sample design report (NCES 91-127 and 93-449, respectively).

Office of Special Education and Rehabilitative Services

U.S. Department of Education

Annual Report to Congress on the Implementation of the Individuals with Disabilities Education Act

The Individuals with Disabilities Education Act (IDEA), formerly the Education of the Handicapped Act (EHA), requires the Secretary of Education to annually transmit to Congress a report that describes our school systems' progress in serving the Nation's disabled children. The annual report contains information on such children served by the public schools under the provisions of Part B of the IDEA and on children served in state-operated programs (SOP) for the disabled under Chapter I of the Education Consolidation and Improvement Act (ECIA). Statistics on children who receive special education and related services in various settings and on school personnel who provide such services are reported in an annual submission of data to the Office of Special Education and Rehabilitative Services (OSERS) by the 50 states, the District of Columbia, and the outlying areas. The child-count information is based on the number of disabled children who receive special education and related services on December 1 of each year for IDEA and October 1 for Chapter I of ECIA/SOP.

Bureau of the Census U.S. Department of Commerce

Current Population Survey

Current estimates of school enrollment and social and economic characteristics of students are based on data collected in the Bureau of the Census' monthly household survey of about 60,000 households, known as the Current Population Survey (CPS). The CPS covers 729 sample areas consisting of 1,973 counties, independent cities, and minor civil divisions throughout the 50 states and the District of Columbia. Up to 1993, the sample was selected from 1980 census files and is periodically updated

to reflect new housing construction. In 1994, the questionnaire for the CPS was redesigned, and the computer-assisted personal interviewing (CAPI) method was implemented. In addition, the 1990 census-based population controls with adjustments for the estimated population undercount were also introduced.

The primary function of the monthly CPS is to collect data on labor force participation of the civilian noninstitutional population. (It excludes military personnel and inmates of institutions.) In October of each year, questions on school enrollment by grade and other school characteristics are asked about each member of the household.

For additional information refer to the *Current Population Reports*, Series P-20, or contact:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

School Enrollment. Each October, the CPS includes supplemental questions on the enrollment status of the population aged 3 and older. Annual reports documenting school enrollment of this population have been produced by the Bureau of the Census since 1946. The latest report is *Current Population Reports, Series P-20, School Enrollment—Social and Economic Characteristics of Students: October 1994*.

For additional information about the CPS school enrollment data, contact:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

Educational Attainment. Data on years of school completed are derived from two questions on the CPS instrument. Biennial reports documenting educational attainment are produced by the Bureau of the Census using March CPS data. The latest report is *Current Population Reports, Series P-20, No. 476 Educational Attainment in the United States, March 1993 and 1992*.

Beginning with the data for March 1994, tabulations are controlled to the 1990 census. Estimates for earlier years were controlled to earlier censuses.

For additional information about educational attainment data, contact:

Education and Social Stratification Branch
Population Division
Bureau of the Census
U.S. Department of Commerce
Washington, DC 20233

Voting and Registration. In November of election years, the CPS includes supplemental questions on voting and registration within the civilian noninstitutional population. CPS voting estimates exceed counts of the actual number of votes cast. On balance, the CPS overstates voting in Presidential elections by 10–20 percent of the total number of persons reported as having voted.

Data on voter participation by social and economic characteristics of the population of voting age have been published since 1964 in *Current Population Reports*, Series P-20. The latest report is "Voting and Registration in the Election of November 1994."

American College Testing Program

The American College Testing (ACT) Assessment is designed to measure educational development in the areas of English, mathematics, social studies, and natural sciences. The ACT Assessment is taken by college-bound high school students, and the test results are used to predict how well students might perform in college.

Prior to the 1984–85 school year, national norms were based on a 10 percent sample of the students taking the test. Since then, national norms have been based on the test scores of all students taking the test. Moreover, beginning with 1984–85, these norms have been based on the most recent ACT scores available from students scheduled to graduate in the spring of the year in which they take the test. Duplicate test records are no longer used to produce national figures.

The 1990 ACT assessment is significantly different from previous years. Consequently, it is not pos-

sible to make direct comparisons between scores earned in 1990 and scores earned in previous years. To permit continuity in the tracking of score trends, ACT has established links between scores earned on ACT tests administered before October 1989 and scores on the new ACT.

For additional information about the ACT Assessment, contact:

The American College Testing Program
2201 North Dodge Street
P.O. Box 168
Iowa City, IA 52243

American Federation of Teachers

The American Federation of Teachers (AFT) reports national and state average salaries and earnings of teachers, other school employees, government workers, and professional employees over the past 25 years. The AFT's survey of state departments of education obtains information on minimum salaries, experienced teachers reentering the classroom, and teacher age and experience. Most data from the survey are reported as received, although some data are confirmed by telephone. These data are available in the AFT's annual report *Survey and Analysis of Salary Trends*. While serving as the primary vehicle for reporting the results of the AFT's annual survey of state departments of education, several other data sources are also used in this report.

For additional information about this survey, contact:

American Federation of Teachers
555 New Jersey Avenue, NW
Washington, DC 20001

College Entrance Examination Board

The Admissions Testing Program of the College Board comprises a number of college admissions tests, including the Preliminary Scholastic Assessment Test (PSAT), the Scholastic Assessment Test (SAT), and Advanced Placement (AP) examinations. High school students participate in the testing program as sophomores, juniors, or seniors—some more than once during these 3 years. If they have taken the tests more than once, only the most recent scores are tabulated. The PSAT and SAT report subscores in the areas of mathematics and verbal ability.

The SAT results are not representative of high school students or college bound students nationally since

the sample is self-selected. Generally, tests are taken by students who need the results to attend a particular college or university. The state totals are greatly affected by the requirements of its state colleges. Public colleges in a number of states require ACT scores rather than SAT scores. Thus, the proportion of students taking the SAT in these states is very low and is inappropriate for any comparison. In recent years, about 1 million high school students have taken the examination annually.

For additional information about the SAT, contact:

College Entrance Examination Board
Educational Testing Service
Princeton, NJ 08541

National Education Association

Estimates of School Statistics

The National Education Association (NEA) reports revenues and expenditure data in its annual publication, *Estimates of School Statistics*. Each year the NEA prepares regression-based estimates of financial and other education statistics and submits them to the states for verification. Generally, about 30 states adjust these estimates based on their own data. These preliminary data are published by NEA along with revised data from previous years. States are asked to revise previously submitted data as final figures become available. The most recent publication contains all changes reported to the NEA. Some tables in *The Condition of Education* use revised estimates of financial data prepared by the NEA because it is the most current source. Since expenditure data reported to NCES must be certified for use in the U.S. Department of Education formula grant programs (such as Chapter I of the ECIA), NCES data are not available as soon as NEA estimates.

The International Association for the Evaluation of Educational Achievement

IEA Reading Literacy Study

In the period 1989–92, the International Association for the Evaluation of Educational Achievement (IEA) conducted a Reading Literacy Study in 32 systems of education. The study focused on two

levels in each of these systems: 1) the grade level where most 9-year-olds were to be found; and 2) the grade level where most 14-year-olds were to be found.

To obtain comparable samples of students, multi-stage sampling was used in each country and schools or classes were typically drawn with a probability proportional to the size of the school or class.

Additional information is available in the IEA report, *How in the World Do Students Read?* by Warwick B. Elley.

The Third International Mathematics and Science Study

The Third International Mathematics and Science Study (TIMSS) is the largest, most comprehensive, and most rigorous international comparison of education ever undertaken. During the 1995 school year, the study tested the mathematics and science knowledge of half a million students from 41 nations at five different grade levels. At the same time, the students, their teachers, and the principals of their schools were asked to respond to questionnaires about their backgrounds and their attitudes, experiences, and practices in the teaching and learning of mathematics and science.

TIMSS is a collaborative research project sponsored by the International Association for the Evaluation of Educational Achievement (IEA). The TIMSS International Study Center is housed in the Center for the Study of Testing, Evaluation, and Educational Policy (CSTEPP) at Boston College. The TIMSS International Study Director, Albert E. Beaton, directs the international activities of the study, together with his staff at the International Study Center. To contact the TIMSS International Study Center:

Organization for Economic Co-operation and Development

The Organization for Economic Co-operation and Development (OECD) publishes analyses of national policies in education, training, and economics

378

Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Ireland, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, United Kingdom, United States, and Yugoslavia.

Since only developed nations, mostly European, are included in OECD studies, the range of analysis is limited. However, OECD data allow for some detailed international comparisons of financial resources or other education variables to be made for this selected group of countries.

Glossary

384

Academic support: (See Expenditures.)

Adult education: College, vocational, or occupational programs, continuing education or noncredit courses, correspondence courses and tutoring, as well as courses and other educational activities provided by employers, community groups, and other providers.

Advanced degree: Any formal degree attained after the bachelor's degree. Advanced degrees include master's degrees, doctoral degrees, and professional degrees.

Appropriations (federal funds): Budget authority provided through the congressional appropriation process that permits federal agencies to incur obligations and to make payments.

Appropriations (institutional revenues): An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Associate's degree: A degree granted for the successful completion of a subbaccalaureate program of studies, usually requiring at least 2 years (or equivalent) of full-time college-level study. This includes degrees granted in a cooperative or work-study program.

Auxiliary enterprises: (See Revenues.)

Average daily attendance (ADA): The aggregate attendance of students in a school during a reporting period (normally a school year) divided by the number of days that school is in session during this period. Only days on which the students are under the guidance and direction of teachers should be considered days in session.

Average daily membership (ADM): The aggregate membership of a school during a reporting period (normally a school year) divided by the number of days that school is in session during this period. Only days on which the students are under the guidance and direction of teachers should be considered days in session. The average daily membership for groups of schools having varying lengths of terms is the average of the average daily memberships obtained for the individual schools.

Baccalaureate degree: (See Bachelor's degree.)

Bachelor's degree: A degree granted for the successful completion of a baccalaureate program of studies, usually requiring at least 4 years (or equivalent) of full-time college-level study. This

includes degrees granted in a cooperative or work-study program.

Bilingual education: Programs in which students with limited English proficiency are taught using their native language.

Carnegie unit: A standard of measurement used for secondary education that represents the completion of a course that meets one period per day for 1 year.

Catholic school: (See Orientation.)

Cohort: A group of individuals who have a statistical factor in common, for example, year of birth.

Certificate: An award granted for the successful completion of a subbaccalaureate program of studies, usually requiring less than 2 years of full-time postsecondary study.

College: A postsecondary school that offers general or liberal arts education, usually leading to an associate's, bachelor's, master's, doctor's, or first-professional degree. Junior colleges and community colleges are included under this terminology.

Combined elementary and secondary school: A school that encompasses instruction at both the elementary and secondary levels. Examples of combined elementary and secondary school grade spans would be grades 1–12 or grades 5–12.

Computer and information sciences: A group of instructional programs that describes computer and information sciences, including computer programming, data processing, and information systems.

Constant dollars: Dollar amounts that have been adjusted by means of price and cost indexes to eliminate inflationary factors and allow direct comparison across years.

Consumer price index (CPI): This price index measures the average change in the cost of a fixed-market basket of goods and services purchased by consumers.

Control of institutions: A classification of institutions of elementary/secondary or higher education by whether the institution is operated by publicly elected or appointed officials (public control) or by privately elected or appointed officials and derives its major source of funds from private sources (private control).

Core subjects: *A Nation at Risk* recommended that all students seeking a high school diploma be required to enroll in a core curriculum called "New Basics." The core subjects included in this plan are 4 units of English; 3 units each of science, social studies, and mathematics; and 0.5 units of computer science.

Cost of college attendance: Cost of living for students attending postsecondary institutions, including tuition and fees, books, room and board, child care, transportation, and other miscellaneous expenses.

Current dollars: Dollar amounts that have not been adjusted to compensate for inflation.

Current expenditures (elementary/secondary): Expenditures for the day-to-day operations of the schools. Expenditures for items lasting more than one year (such as school buses and computers) are not included in current expenditures.

Current expenditures per pupil in enrollment: (See Expenditures.)

Current-fund expenditures: (See Expenditures.)

Current-fund revenues: (See Revenues.)

Dependent student: A student who under federal criteria is considered to be financially dependent on his or her parents or guardians. Most full-time students are considered dependent until they are 24 years old.

Doctor's degree: An earned degree carrying the title of Doctor. The Doctor of Philosophy degree (Ph.D.) is the highest academic degree and requires mastery within a field of knowledge and demonstrated ability to perform scholarly research. Other doctorates are awarded for fulfilling specialized requirements in professional fields, such as education (Ed.D.), musical arts (D.M.A.), business administration (D.B.A.), and engineering (D.Eng. or D.E.S.). Many doctor's degrees in both academic and professional fields require an earned master's degree as a prerequisite. First-professional degrees, such as M.D. and D.D.S., are not included under this heading. (See First-professional degree.)

Dropout: The term is used both to describe the event of leaving school before graduating and the status of an individual who is not in school and who is not a graduate. Transferring schools, for example, from a public to a private school, is not regarded as a dropout event. A person who drops out of school may later return and graduate. At

the time the person left school initially, he or she is called a *dropout*. At the time the person returns to school, he or she is called a *stopout*. Measures to describe these often complicated behaviors include the event dropout rate (or the closely related school persistence rate), the status dropout rate, and the high school completion rate.

Educational and general expenditures: (See Expenditures.)

Educational attainment: The highest grade of regular school attended and completed.

Elementary school: A school classified as elementary by state and local practice and composed of any span of grades not above grade eight. Preschool or kindergarten is included under this heading only if it is an integral part of an elementary school or a regularly established school system.

Elementary/secondary school: As reported in this publication, includes only regular schools (i.e., schools that are part of state and local school systems, and also most not-for-profit private elementary/secondary schools, both religiously affiliated and nonsectarian). Schools not reported include subcollegiate departments of institutions of higher education, residential schools for exceptional children, federal schools for American Indians, and federal schools on military posts and other federal installations.

Employed: Includes civilian, noninstitutionalized persons who 1) worked during any part of the survey week as paid employees; worked in their own businesses, professions, or farms; or worked 15 hours or more as unpaid workers in a family-owned enterprise; or 2) who were not working but had jobs or businesses from which they were temporarily absent due to illness, bad weather, vacation, labor-management dispute, or personal reasons, whether or not they were seeking another job.

Engineering and engineering technologies: Instructional programs that describe the mathematical and natural science knowledge gained by study, experience, and practice and applied with judgment to develop ways to economically use the materials and forces of nature for the benefit of humanity. Includes programs that prepare individuals to support and assist engineers and similar professionals.

English: A group of instructional programs that describes the English language arts, including com-

position, creative writing, and the study of literature.

English as a Second Language (ESL): Programs that provide intensive instruction in English for students with limited English proficiency.

Enrollment: The total number of students registered in a given school unit at a given time, generally in the fall of a year.

Expected family contribution (EFC): The amount that a family is expected to pay toward meeting costs of postsecondary attendance (both students and parents of dependent students are expected to make contributions). This amount is determined through an analysis of need (i.e., the Congressional Methodology) and is based on taxable and nontaxable income and assets as well as family size, the number of family members attending postsecondary institutions, extraordinary medical expenses, and so forth. For dependent students, the EFC consists of both a parental contribution and a separately calculated student contribution. The minimum student contribution in 1988–89 was \$700 for freshmen and \$900 for other undergraduates.

Expenditures: Charges incurred, whether paid or unpaid, which are presumed to benefit the current fiscal year. For elementary/secondary schools, these include all charges for current outlays plus capital outlays and interest on school debt. For institutions of higher education, these include current outlays plus capital outlays. For government, these include charges net of recoveries and other correcting transactions other than for retirement of debt, investment in securities, extension of credit, or as agency transaction. Also, government expenditures include only external transactions, such as the provision of prerequisites or other payments in kind. Aggregates for groups of governments exclude intergovernmental transactions among the governments.

Academic support: This category of college expenditures includes expenditures for support services that are an integral part of the institution's primary missions of instruction, research, or public service. Includes expenditures for libraries, galleries, audio/visual services, academic computing support, ancillary support, academic administration, personnel development, and course and curriculum development.

Current expenditures (elementary/second-

ary): The expenditures for operating local public schools, excluding capital outlay and interest on school debt. These expenditures include such items as salaries for school personnel, fixed charges, student transportation, school books and materials, and energy costs. Beginning in 1980–81, expenditures for state administration are excluded.

Current expenditures per pupil in enrollment: Current expenditures for the regular school term divided by the total number of students registered in a given school unit at a given time, generally in the fall of a year.

Current-fund expenditures (higher education): Money spent to meet current operating costs, including salaries, wages, utilities, student services, public services, research libraries, scholarships, fellowships, auxiliary enterprises, hospitals, and independent operations. Excludes loans, capital expenditures, and investments.

Educational and general expenditures: The sum of current-fund expenditures on instruction, research, public service, academic support, student services, institutional support, operation and maintenance of plant, and awards from restricted and unrestricted funds.

Instruction: This category includes expenditures of the colleges, schools, departments, and other instructional divisions of higher education institutions, and expenditures for departmental research and public service, which are not separately budgeted. Includes expenditures for both credit and noncredit activities. Excludes expenditures for academic administration where the primary function is administration (e.g., academic deans).

Scholarships and fellowships: This category of college expenditures applies only to money given in the form of outright grants and trainee stipends to individuals enrolled in formal course work, either for credit or not. Aid to students in the form of tuition or fee remissions is included. College work-study funds are excluded and are reported under the program in which the student is working. In the tabulations in this volume, Pell grants are not included in this expenditure category.

Expenditures per pupil: Charges incurred for a particular period of time divided by a student unit

of measure, such as enrollment, average daily attendance, or average daily membership.

Family income: The combined income of all family members 14 years old and older living in the household for the period of 1 year. Income includes money income from jobs; net income from business, farm, or rent; pensions; dividends; interest; social security payments; and any other money income.

Federal aid: Student financial aid whose source is the federal government. This aid can either be provided by or administered by a federal agency. Federal agencies providing aid include the Department of Education, Department of Health and Human Services, Department of Defense, Veterans Administration, and the National Science Foundation. Federal aid can be in the form of grants, loans, and work-study aid.

Federal funds: Amounts collected and used by the federal government for the general purposes of the government. There are four types of federal fund accounts: the general fund, special funds, public enterprise funds, and intragovernmental funds. The major federal fund is the general fund, which is derived from general taxes and borrowing. Federal funds also include certain earmarked collections, such as those generated by and used to finance a continuing cycle of business-type operations.

First-professional degree: A degree that signifies both completion of the academic requirements for beginning practice in a given profession and a level of professional skill beyond that normally required for a bachelor's degree. This degree is usually based on a program requiring at least 2 academic years of work prior to entrance and a total of at least 6 academic years of work to complete the degree program, including both prior-required college work and the professional program itself. By NCES definition, first-professional degrees are awarded in the fields of dentistry (D.D.S or D.M.D.), medicine (M.D.), optometry (O.D.), osteopathic medicine (D.O.), pharmacy (D.Pharm.), podiatric medicine (D.P.M.), veterinary medicine (D.V.M.), chiropractic (D.C. or D.C.M.), law (J.D.), and theological professions (M.Div. or M.H.L.).

First-time teachers: Individuals who are teaching full time in the Nation's school system for the first time. These teachers include recent college graduates, former substitute teachers, or individuals who

had other jobs besides teaching either inside or outside the field of education.

Fiscal year: The yearly accounting period for the federal government, which begins on October 1 and ends on the following September 30. The fiscal year is designated by the calendar year in which it ends; for example, fiscal year 1992 begins on October 1, 1991, and ends on September 30, 1992. (From fiscal year 1844 to fiscal year 1976 the fiscal year began on July 1 and ended on the following June 30.)

Foreign languages: A group of instructional programs that describes the structure and use of language that is common or indigenous to individuals of the same community or nation, the same geographical area, or the same cultural traditions. Programs cover such features as sound, literature, syntax, phonology, semantics, sentences, prose, and verse, as well as the development of skills and attitudes used in communicating and evaluating thoughts and feelings through oral and written language.

Free lunch eligibles: The National School Lunch Program's assistance program for low income children. Families with school-age children who fall below the poverty level and have no other significant assets are eligible to receive government assistance in the form of free or reduced-price school lunches.

Full-time enrollment: The number of students enrolled in higher education courses with a total credit load equal to at least 75 percent of the normal full-time course load.

Full-time-equivalent (FTE) enrollment: For institutions of higher education, enrollment of full-time students, plus the full-time equivalent of part-time students as reported by institutions. In the absence of an equivalent reported by an institution, the FTE enrollment is estimated by adding one-third of part-time enrollment to full-time enrollment.

Full-time instructional faculty: Those members of the instruction/research staff who are employed full time as defined by the institution, including faculty with released time for research and faculty on sabbatical leave. Full-time counts exclude faculty who are employed to teach less than two semesters, three quarters, two trimesters, or two 4-month sessions; replacements for faculty on sabbatical leave or those on leave without pay; faculty for preclinical and clinical medicine; faculty who are donating their services; faculty who are mem-

bers of military organizations and paid on a different pay scale from civilian employees; academic officers whose primary duties are administrative; and graduate students who assist in the instruction of courses.

Full-time worker: One who is employed for 35 or more hours per week, including paid leave for illness, vacation, and holidays. Hours may be reported either for a survey reference week, or for the previous calendar year, in which case they refer to the usual hours worked.

GED recipient: A person who has obtained certification of high school equivalency by meeting state requirements and passing an approved exam, which is intended to provide an appraisal of the person's achievement or performance in the broad subject matter areas usually required for high school graduation. (See General Educational Development Test.)

General Educational Development (GED) Test: A test administered by the American Council on Education as the basis for awarding a high school equivalency certification.

Geographic region: 1) The four regions used by the Bureau of Economic Analysis of the U.S. Department of Commerce, the National Assessment of Educational Progress, and the National Education Association (NEA) are as follows (note that the NEA designated the Central region as the Middle region in its classification):

<i>Northeast</i>	<i>Southeast</i>
Connecticut	Alabama
Delaware	Arkansas
District of Columbia	Florida
Maine	Georgia
Maryland	Kentucky
Massachusetts	Louisiana
New Hampshire	Mississippi
New Jersey	North Carolina
New York	South Carolina
Pennsylvania	Tennessee
Rhode Island	Virginia
Vermont	West Virginia
<i>Central (Middle)</i>	<i>West</i>
Illinois	Alaska
Indiana	Arizona
Iowa	California
Kansas	Colorado
Michigan	Hawaii
Minnesota	Idaho

Missouri
Nebraska
North Dakota
Ohio
South Dakota
Wisconsin

Montana
Nevada
New Mexico
Oklahoma
Oregon
Texas
Utah
Washington
Wyoming

2) The regions used by the Bureau of the Census in Current Population Survey (CPS) tabulations are as follows:

<i>Northeast</i>	<i>Midwest</i>
(New England)	(East North Central)
Maine	Ohio
New Hampshire	Indiana
Vermont	Illinois
Massachusetts	Michigan
Rhode Island	Wisconsin
Connecticut	
(Middle Atlantic)	(West North Central)
New York	Minnesota
New Jersey	Iowa
Pennsylvania	Missouri
	North Dakota
	South Dakota
	Nebraska
	Kansas
<i>South</i>	<i>West</i>
(South Atlantic)	(Mountain)
Delaware	Montana
Maryland	Idaho
District of Columbia	Wyoming
Virginia	Colorado
West Virginia	New Mexico
North Carolina	Arizona
South Carolina	Utah
Georgia	Nevada
Florida	
(East South Central)	(Pacific)
Kentucky	Washington
Tennessee	Oregon
Alabama	California
Mississippi	Alaska
	Hawaii
(West South Central)	
Arkansas	
Louisiana	
Oklahoma	
Texas	

Government appropriation: An amount (other than a grant or contract) received from or made available to an institution through an act of a legislative body.

Government grant or contract: Revenues from a government agency for a specific research project or other program.

Graduate: An individual who has received formal recognition for the successful completion of a prescribed program of studies.

Graduate Record Examination (GRE): Multiple-choice examinations administered by the Educational Testing Service (ETS) and taken by applicants who plan to attend certain graduate schools. Two generalized tests are offered, plus specialized tests in a variety of subject areas. Ordinarily, a student will take only the specialized test that applies to the intended field of study.

Grants: Also known as scholarships, these are funds for postsecondary education that do not have to be repaid.

Gross Domestic Product (GDP): Gross national product less net property income from abroad. Both gross national product and gross domestic product aggregate only the incomes of residents of a nation, corporate and individual, derived directly from the current production of goods and services. However, gross national product also includes net property from abroad. (See also Gross National Product.)

Gross National Product (GNP): A measure of the money value of the goods and services available to the nation from economic activity. GNP can be viewed in terms of expenditure categories, which include purchases of goods and services by consumers and government, gross private domestic investment, and net exports of goods and services. The goods and services included are largely those bought for final use (excluding illegal transactions) in the market economy. A number of inclusions, however, represent imputed values, the most important of which is rental value of owner-occupied housing. GNP, in this broad context, measures the output attributable to the factors of production, labor, and property supplied by U.S. residents.

Guidance counselor: (See Staff, elementary/secondary education.)

High school: A secondary school offering the final years of high school work necessary for gradua-

tion, usually including grades 10, 11, 12 (in a 6-3-3 plan) or grades 9, 10, 11, and 12 (in a 6-2-4 plan).

High school program: A program of studies designed to prepare students for their postsecondary education and occupation. Four types of programs are usually distinguished as academic, vocational, general, and personal use. An academic program is designed to prepare students for continued study at a college or university. A vocational program is designed to prepare students for employment in one or more semiskilled, skilled, or technical occupations. A general program is designed to provide students with the understanding and competence to function effectively in a free society, and usually represents a mixture of academic and vocational components. A personal use program provides a student with general skills in areas such as health, religion, and military science.

Higher education: Study beyond secondary school at an institution that offers programs terminating in an associate's, bachelor's, or higher degree.

Higher education institutions (general definition): Institutions providing education above the instructional level of the secondary schools, usually beginning with grade 13. Typically, these institutions include colleges, universities, graduate schools, professional schools, and other degree-granting institutions.

Higher education price index: A price index that measures average changes in the prices of goods and services purchased by colleges and universities through current-fund education and general expenditures (excluding expenditures for sponsored research and auxiliary enterprises).

Humanities: Instructional programs in the following fields: area and ethnic studies, foreign languages, letters, liberal/general studies, multi/interdisciplinary studies, philosophy and religion, theology, and the visual and performing arts.

Independent operations: A group of self-supporting activities under the control of a college or university. For purposes of financial surveys conducted by the National Center for Education Statistics, this category is composed principally of federally funded research and development centers (FFRDC).

Inflation: An upward movement in general price levels that results in a decline of purchasing power.

Institutional support: The category of higher education expenditures that includes day-to-day

operational support for colleges, excluding expenditures for physical plant operations. Examples of institutional support include general administrative services, executive direction and planning, legal and fiscal operations, and community relations.

Instruction: (See Expenditures.)

Instructional expenditures (elementary/secondary): Current expenditures for activities directly associated with the interaction between teachers and students. These include teacher salaries and benefits, supplies (such as textbooks), and purchased instructional services.

Instructional staff: Full-time-equivalent number of positions, not the number of different individuals occupying the positions during the school year. In local schools, includes all public elementary and secondary (junior and senior high) day-school positions that are in the nature of teaching or in the improvement of the teaching-learning situation. Includes consultants or supervisors of instruction, principals, teachers, guidance personnel, librarians, psychological personnel, and other instructional staff. Excludes administrative staff, attendance personnel, clerical personnel, and junior college staff.

International Standard Classification of Education (ISCED) levels: The International Standard Classification of Education (ISCED) was designed as an instrument for presenting statistics on education internationally. Many countries report education statistics to UNESCO and the Organization for Economic Co-operation and Development (OECD) using the ISCED. In this classification system, education is divided into several levels. The levels that follow are presented in *The Condition of Education*.

Education preceding the first level (early childhood education) where it is provided, usually begins at age 3, 4, or 5 (sometimes earlier) and lasts for 1–3 years. For the United States, this would be mostly nursery schools and kindergarten classes.

Education at the first level (primary education) usually begins at age 5, 6, or 7 and lasts for about 5 or 6 years. For the United States, the first level starts with grade 1 and ends with grade 6.

Education at the second level (lower secondary education) begins at about age 11 or 12 and lasts for about 3 years. For the United States, the second level starts with grade 7 and ends with grade 9.

Education at the third level (upper secondary education) begins at about age 14 or 15 and lasts for approximately 3 years. For the United States, the third level starts with grade 10 and ends with grade 12.

Education at the fifth level (nonuniversity higher education) is provided at community colleges, vocational-technical colleges, and other degree-granting institutions in which programs typically take 2 years or more, but less than 4 years to complete.

Education at the sixth level (university higher education) is provided in undergraduate programs at 4-year colleges and universities in the United States and, generally, at universities in other countries. Completing education at the third level (upper secondary education) is usually required as a minimum condition for admission. Admission is competitive in most cases.

Education at the seventh level (graduate and professional higher education) is provided in graduate and professional schools that generally require a university diploma as a minimum condition for admission.

Education at the ninth level (undistributed) is a classification reserved for enrollments, expenditures, or programs that cannot be unambiguously assigned to one of the aforementioned levels. Some countries, for example, assign nongraded special education or recreational nondegree adult education programs to this level. Other countries assign nothing to this level, preferring instead to allocate enrollments, expenditures, and programs to levels as best they can.

Labor force: Individuals employed as civilians, unemployed, or in the armed services during the survey week. The “civilian labor force” is composed of all civilians classified as employed or unemployed. (See Employed and Unemployed.)

Life sciences: Life sciences are instructional programs that describe the systematic study of living organisms. Life sciences include biology, biochemistry, biophysics, and zoology.

Limited-English-proficient: A concept developed to assist in identifying those language-minority students (children from language backgrounds other than English) who need language assistance services, in their own language or in English, in the schools. The Bilingual Education Act, reauthorized in 1988 (P.L. 100-297), describes a limited-English-proficient (LEP) student as one who

- 1) meets one or more of the following conditions:
 - a) a student who was born outside the United States or whose native language is not English;
 - b) a student who comes from an environment where a language other than English is dominant; or
 - c) a student who is an American Indian or Alaskan Native and comes from an environment where a language other than English has had a significant impact on his/her level of English language proficiency; and
- 2) has sufficient difficulty speaking, reading, writing, or understanding the English language to deny him or her the opportunity to learn successfully in English-only classrooms.

In practice, many ways of making this determination about an individual student are being used by school systems across the United States. These include various combinations of home language surveys, informal teacher determination, formal interviews, and a number of types of assessment tests for classification, placement, and monitoring of progress.

Loan: Borrowed money that must be repaid.

Local education agency (LEA): (See School district.)

Master's degree: A degree awarded for successful completion of a program generally requiring 1 or 2 years of full-time college-level study beyond the bachelor's degree. One type of master's degree, including the Master of Arts degree, or M.A., and the Master of Science degree, or M.S., is awarded in the liberal arts and sciences for advanced scholarship in a subject field or discipline and demonstrated ability to perform scholarly research. A second type of master's degree is awarded for the completion of a professionally oriented program, for example, an M.Ed. in education, an M.B.A. in business administration, an M.F.A. in fine arts, an M.M. in music, an M.S.W. in social work,

and an M.P.A. in public administration. A third type of master's degree is awarded in professional fields for study beyond the first-professional degree, for example, the Master of Laws (LL.M.) and Master of Science in various medical specializations.

Mathematics: A group of instructional programs that describes the science of logical symbolic language and its applications.

Metropolitan population: The population residing in metropolitan statistical areas (MSAs). (See Metropolitan Statistical Area.)

Metropolitan Statistical Area (MSA): A large population nucleus and the nearby communities that have a high degree of economic and social integration with that nucleus. Each MSA consists of one or more entire counties (or county equivalents) that meet specified standards pertaining to population, commuting ties, and metropolitan character. In New England, towns and cities, rather than counties, are the basic units. MSAs are designated by the Office of Management and Budget. An MSA includes a city and, generally, its entire urban area and the remainder of the county or counties in which the urban area is located. An MSA also includes such additional outlying counties that meet specified criteria relating to metropolitan character and level of commuting of workers into the central city or counties. Specified criteria governing the definition of MSAs recognized before 1980 are published in *Standard Metropolitan Statistical Areas: 1975*, issued by the Office of Management and Budget. New MSAs were designated when 1980 counts showed that they met one or both of the following criteria:

- 1) Included a city with a population of at least 50,000 within their corporate limits; or
- 2) Included a Census Bureau-defined urbanized area (which must have a population of at least 50,000) and a total MSA population of at least 100,000 (or, in New England, 75,000).

Minority: Any racial/ethnic group that is non-white is considered minority. (See Racial/ethnic group.)

Modal grade: The modal grade is the year of school in which the largest proportion of students of a given age are enrolled. Enrolled persons are classified according to their relative progress in school, that is, whether the grade or year in which they

were enrolled was below, at, or above the modal (or typical) grade for persons of their age at the time of the survey.

A Nation at Risk: A report published by the U.S. Department of Education in 1983 highlighting deficiencies in knowledge of the Nation's students and population as a whole in areas such as literacy, mathematics, geography, and basic science.

Natural sciences: A group of fields of study that includes the life sciences, physical sciences, and mathematics.

Nonmetropolitan residence group: The population residing outside metropolitan statistical areas. (See Metropolitan statistical area.)

Nonsupervisory instructional staff: Persons such as curriculum specialists, counselors, librarians, remedial specialists, and others possessing education certification but not responsible for day-to-day teaching of the same group of pupils.

Nontenure-track faculty: Faculty members who were either not on the tenure track or whose faculty status lacked a tenure system at the sampled institution.

Nursery school: (See Preprimary.)

Obligations: Amounts of orders placed, contracts awarded, services received, or similar legally binding commitments made by federal agencies during a given period that will require outlays during the same or some future period.

Orientation (private school): The group or groups, if any, with which a private elementary/secondary school is affiliated, or from which it derives subsidy or support. Such organizations include the following:

Catholic school: A private school over which a Roman Catholic church group exercises some control or provides some form of subsidy. Catholic schools for the most part include those operated or supported by: a parish, a group of parishes, a diocese, or a Catholic religious order.

Other religious school: A private school that is affiliated with an organized religion or denomination other than Roman Catholicism or that has a religious orientation other than Catholicism in its operation and curriculum.

Nonsectarian school: A private school whose curriculum and operation are independent of

religious orientation and influence in all but incidental ways.

Other technical/professional fields: A group of occupationally oriented fields, other than business, computer science, education, and engineering, which includes agriculture and agricultural sciences, architecture, communications, communications technologies, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Outlays: The value of checks issued, interest accrued on the public debt, or other payments made, net of refunds and reimbursements.

Part-time enrollment: The number of students enrolled in higher education courses with a total credit load less than 75 percent of the normal full-time credit load.

Part-time worker: One who is employed for 1-34 hours a week, including paid leave for illness, vacation, and holidays. Hours may be reported either for a survey reference week, or for the previous calendar year, in which case they refer to the usual hours worked.

Part-year worker: One who was employed at least 1 week but fewer than 50 weeks during the previous calendar year, including paid leave for illness, vacation, or other reasons.

Percentile (score): A value on a scale of zero to 100 that indicates the percent of a distribution that is equal to or below it. For example, a score in the 95th percentile is a score equal to or better than 95 percent of all other scores.

Personal income: Current income received by persons from all sources minus their personal contributions for social insurance. Classified as "persons" are individuals (including owners of unincorporated firms), nonprofit institutions serving individuals, private trust funds, and private noninsured welfare funds. Personal income includes transfers (payments not resulting from current production) from government and business such as social security benefits and military pensions, but excludes transfers among persons.

Physical sciences: Physical sciences are instructional programs that describe inanimate objects, processes, or matter, energy, and associated phenomena. Physical sciences include astronomy, astrophysics, atmospheric sciences, chemistry, geology, physics, planetary science, and science technologies.

Portfolio: A collection of student-generated artifacts. Portfolios are used to provide evidence over a period of time about the range and extent of a student's performance and growth.

Postsecondary education: The provision of formal instructional programs with a curriculum designed primarily for students who have completed the requirements for a high school diploma or equivalent. This includes programs of an academic, vocational, and continuing professional education purpose, and excludes vocational and adult basic education programs.

Poverty level: Poverty status is based on reports of family income on the March Current Population Survey. Families or individuals with gross incomes below the poverty threshold are classified as below the poverty level. Poverty thresholds in 1992 ranged from \$7,143 for a person living alone to \$28,745 for a family of four or more.

Prekindergarten: (See Preprimary.)

Preprimary: Elementary education programs for children who are too young for first grade. The year before first grade is called kindergarten; the year(s) before kindergarten is called preschool, nursery school, or prekindergarten. Not included in prekindergarten is essentially custodial care provided in private homes. Prekindergarten programs may be provided in regular elementary schools (with kindergarten, first-grade and higher grade programs) or in preschools (with only prekindergarten programs).

Private school or institution: A school or institution that is controlled by an individual or agency other than a state, a subdivision of a state, or the federal government, which is usually not supported primarily by public funds, and is not operated by publicly elected or appointed officials.

Proprietary institution: An educational institution that is under private control but whose profits derive from revenues subject to taxation.

Purchasing Power Parity (PPP) Indices: Purchasing Power Parity (PPP) exchange rates, or indices, are the currency exchange rates that equalize the purchasing power of different currencies, meaning that when a given sum of money is converted into different currencies at the PPP exchange rates, it will buy the same basket of goods and services in all countries. PPP indices are the rates of currency conversion which eliminate the difference in price levels among countries. Thus, when expenditures

on GDP for different countries are converted into a common currency by means of PPP indices, they are expressed at the same set of international prices, so that comparisons among countries reflect only differences in the volume of goods and services purchased.

Racial/ethnic group: Classification indicating general racial or ethnic heritage based on self-identification, as in data collected by the Bureau of the Census, or on observer identification, as in data collected by the Office for Civil Rights. These categories are in accordance with the Office of Management and Budget standard classification scheme presented below:

American Indian/Alaskan Native: A person having origins in any of the original peoples of North America and maintaining cultural identification through tribal affiliation or community recognition.

Asian/Pacific Islander: A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian subcontinent, or the Pacific Islands. This area includes, for example, China, India, Japan, Korea, the Philippine Islands, and Samoa.

Black: A person having origins in any of the black racial groups in Africa. Normally excludes persons of Hispanic origin. Those measures that do not exclude persons of Hispanic origin are noted accordingly.

Hispanic: A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.

White: A person having origins in any of the original peoples of Europe, North Africa, or the Middle East. Normally excludes persons of Hispanic origin. Those measures that do not exclude persons of Hispanic origin are noted accordingly.

Reentrants: Teachers who left the school system for a period of time, and have now returned to classroom teaching.

Remedial course (postsecondary): Courses provided in reading, writing, or mathematics for college students lacking those skills necessary to perform college-level work at the level required by the institution; thus, what constitutes remedial courses varies from institution to institution.

Remedial education: Instruction for a student

lacking the reading, writing, or mathematics skills necessary to perform college-level work at the level required by the attended institution.

Revenues: All funds received from external sources, net of refunds, and correcting transactions. Noncash transactions such as receipt of services, commodities, or other receipts "in kind" are excluded, as are funds received from the issuance of debt, liquidation of investments, and nonroutine sale of property.

Auxiliary enterprises: This category includes those essentially self-supporting operations that exist to furnish a service to students, faculty, or staff, and that charge a fee that is directly related to, although not necessarily equal to, the cost of the service. Examples are residence halls, food services, college stores, and intercollegiate athletics.

Current-fund revenues (higher education): Money received during the current fiscal year from revenue that can be used to pay obligations currently due, and surpluses reapportioned for the current fiscal year.

Salary: The total amount regularly paid or stipulated to be paid to an individual, before deductions, for personal services rendered while on the payroll of a business or organization.

Salary workers: Any person who worked one or more days during the previous year and was paid on the basis of a yearly salary is considered a salary worker.

Scholarships and fellowships: (See Expenditures.)

Scholastic Assessment Test (SAT): An examination administered by the Educational Testing Service and used to predict the facility with which an individual will progress in learning college-level academic subjects.

School climate: The social system and culture of the school, including the organizational structure of the school and values and expectations within it.

School district: An education agency at the local level that exists primarily to operate public schools or to contract for public school services. Synonyms are "local basic administrative unit" and "local education agency."

School year: The 12-month period of time denoting the beginning and ending dates for school

accounting purposes, usually from July 1 through June 30.

Science: The body of related courses concerned with knowledge of the physical and biological world and with the processes of discovering and validating this knowledge.

Secondary school: A school that has any span of grades beginning with the next grade following an elementary or middle school (usually grade 7, 8, or 9) and ending with or below grade 12. Both junior high schools and senior high schools are included.

Social and behavioral sciences: A group of scientific fields of study that includes anthropology, archeology, criminology, demography, economics, geography, history, international relations, psychology, sociology, and urban studies.

Social studies: A group of instructional programs that describes the substantive portions of behavior, past and present activities, interactions, and organizations of people associated together for religious, benevolent, cultural, scientific, political, patriotic, or other purposes.

Socioeconomic status (SES): The SES quartile variable used for both High School and Beyond and the National Education Longitudinal Study of 1988 was built using parental education level, parental occupation, family income, and household items. Students were placed in quartiles based on their standardized composite score. By definition, one quarter of each cohort will reside in the bottom SES quartile, even if education levels, income, and the number of persons in more prestigious occupations increase. The terms high, middle, and low SES refer to the upper, middle two, and lower quartiles of the weighted SES composite index distribution.

Staff assignments, elementary and secondary school:

District administrative support staff: Personnel who are assigned to the staffs of the district administrators. They may be clerks, computer programmers, and others concerned with the functioning of the entire district.

District administrators: The chief executive officers of education agencies (such as superintendents and deputies) and all others with district-wide responsibility. Such positions may be business managers, administrative assistants, coordinators, and the like.

Guidance counselors: Professional staff whose activities involve counseling students and parents, consulting with other staff members on learning problems, evaluating the abilities of students, assisting students in personal and social development, providing referral assistance, and working with other staff members in planning and conducting guidance programs for students.

Instructional (teacher) aides: Those staff members assigned to assist a teacher with routine activities associated with teaching (i.e., those activities requiring minor decisions regarding students, such as monitoring, conducting rote exercises, operating equipment, and clerking). Volunteer aides are not included in this category.

Librarians: Staff members assigned to perform professional library service activities such as selecting, acquiring, preparing, cataloging, and circulating books and other printed materials; planning the use of the library by students, teachers, and other members of the instructional staff; and guiding individuals in their use of library books and materials that are maintained separately or as part of an instructional materials center.

Other support services staff: All staff not reported in other categories. This group includes media personnel, social workers, data processors, health maintenance workers, bus drivers, security, cafeteria workers, and other staff.

School administrators: Those staff members whose activities are concerned with directing and managing the operation of a particular school. They may be principals or assistant principals, including those who coordinate school instructional activities with those of the local education agency (LEA) and other appropriate units.

Stopout: (See Dropout.)

Student membership: The count of students enrolled (at a particular school, district, or county, etc.) on or about October 1.

Subbaccalaureate degree: Award granted for the successful completion of studies at either 2-year or less-than-2-year institutions. Subbaccalaureate degrees typically include associate's degrees and certificates.

Support services expenditures (elementary/secondary): Current expenditures for activities which support instruction. These services include school building operation and maintenance, school administration, student support services, student transportation, instructional staff support, school district administration, business services, research, testing, and data processing.

Tax expenditures: Losses of tax revenue attributable to provisions of the federal income tax laws that allow a special exclusion, exemption, or deduction from gross income or provide a special credit, preferential rate of tax, or a deferral of tax liability affecting individual or corporate income tax liabilities.

Technical/professional fields: A group of occupationally oriented fields of study, other than engineering and computer science, that includes agriculture and agricultural sciences, architecture, business and management, communications, education, health sciences, home economics, law, library and archival sciences, military sciences, parks and recreation, protective services, and public affairs.

Tenure-track faculty: Faculty members who were either tenured or on the tenure track at their institution.

Total expenditure per pupil in average daily attendance: Includes all expenditures allocable to per pupil costs divided by average daily attendance. These allocable expenditures include current expenditures for regular school programs, interest on school debt, and capital outlay. Beginning in 1980-81, expenditures for state administration are excluded and expenditures for other programs (summer schools, community colleges, and private schools) are included.

Tuition and fees: A payment or charge for instruction or compensation for services, privileges, or the use of equipment, books, or other goods.

Type of higher education institutions:

4-year institution: An institution legally authorized to offer and offering at least a 4-year program of college-level studies wholly or principally creditable toward a baccalaureate degree. In some tables a further division between universities and other 4-year institutions is made. A "university" is a postsecondary institution that typically comprises one or more

graduate professional schools. (See also University.)

2-year institution: An institution legally authorized to offer and offering at least a 2-year program of college-level studies that terminates in an associate's degree or is principally creditable toward a baccalaureate degree.

Undergraduate students: Students registered at an institution of higher education in a program leading to a baccalaureate degree or other formal award below the baccalaureate such as an associate's degree.

Unemployed: Civilians who had no employment but were available for work and 1) had engaged in any specific job-seeking activity within the past 4 weeks, 2) were waiting to be called back to a job from which they had been laid off, or 3) were waiting to report to a new wage or salary job within 30 days.

University: An institution of higher education that consists of a liberal arts college, a diverse graduate program, and usually two or more professional schools or faculties, and is empowered to confer degrees in various fields of study.

Urbanicity:

- 1) In the Schools and Staffing Survey, school location is categorized based on the classification in both the Common Core of Data (CCD) and the Quality Education data (QED), as drawn from U.S. Census data and definitions. The results are summarized in three variables:

Central city: central city of an MSA (Metropolitan Statistical Area).

Urban fringe/large town: area surrounding a central city but within a county constituting an MSA.

Rural/small town: outside an MSA.

- 2) In the High School and Beyond Survey, urbanicity is classified based on the Curriculum Information Center code as follows:

Urban: within a central city of an MSA.

Suburban: within an MSA but outside the central city area.

Rural: outside a designated MSA.

Vocational education: Organized educational programs, services, and activities that are directly related to the preparation of individuals for paid or unpaid employment, or for additional prepara-

tion for a career, requiring other than a baccalaureate or advanced degree.

Work-study: A generic term for programs designed to provide part-time employment as a source of funds to pay for postsecondary education as well as a federal program that is administered through postsecondary institutions.

Year-round worker: One who was employed at least 50 weeks during the previous calendar year, including paid leave for illness, vacation, or other reasons.

NATIONAL CENTER FOR EDUCATION STATISTICS

The purpose of the Center is to collect and report "...statistics and information showing the condition and progress of education in the United States and other nations in order to promote and accelerate the improvement of American education."

 Welcome	 Search
 What's New?	 Publications
 Education at a Glance	 Data and Surveys
 Frequently Asked Questions	 Projects with Partners
 Other Education Sites	 Locate Education Expertise

[Dept. of Education](#) [Help](#) [Education Gopher](#)

The National Center for Education Statistics (NCES) is the Nation's principal education statistics agency. Our Web site provides access to a wide range of statistical information about education in the United States and other nations.

The NCES home page includes:

A *Welcome* section describing the NCES and its statistical programs.

What's New offers a description of recently released reports, databases and upcoming conferences.

Education at a Glance provides direct links to NCES materials which describe or analyze education topics such as crime in public schools, access, and costs of higher education.

Frequently Asked Questions provides responses to questions about NCES data.

Other Education Sites includes links to other education related sites including federal and state education agencies.

Search provides a link to NCES information via a keyword and concept index.

Publications gives you the capability to find publications by subject or survey. Data products are also listed here by release date.

Data and Surveys provides detailed information on all NCES surveys and provides direct links to publications and data bases that can be freely downloaded.

Projects with Partners provides descriptions and links of NCES collaborative projects with state education agencies, education associations, task forces, and other groups.

Locate Education Expertise provides a search mechanism that allows you to locate NCES and other Department of Education staff by topic, survey, or name.

How to access the NCES home page: The home page may be accessed directly at:

<http://www.ed.gov/NCES/>

Addresses for some of our more interesting or popular information include:

<http://www.ed.gov/NCES/pubs/ce/> (*The Condition of Education*)

<http://www.ed.gov/NCES/pubs/D96/> (*Digest of Education Statistics 1996*)

<http://www.ed.gov/NCES/NAEP/> (for information on education assessment)

<http://www.ed.gov/NCES/timss/index.html> (*The Third International Mathematics and Science Study*)

<http://www.ed.gov/NCES/ipeds/index.html> (for information on the nation's colleges and universities)

<http://www.ed.gov/NCES/ccd/index.html> (for information on the nation's public elementary and secondary schools and school districts)

Additional ways to obtain and retrieve NCES education statistics include our File Transfer Protocol (FTP) and Gopher sites at:

<ftp://ftp.ed.gov/ncesgopher>
<gopher://gopher.ed.gov:10000>

Future plans include improving our search capabilities and allowing customers to retrieve portions of our data bases by user-defined selection criteria.

The National Education Data Resource Center

The National Education Data Resource Center (NEDRC) was established by the U.S. Department of Education's National Center for Education Statistics (NCES) to serve the education information needs of teachers, researchers, policymakers, and others who need access to the most current education data. Data sets for some 16 studies maintained by NCES are currently available through NEDRC and there are plans to include additional databases, as well as to link database files to allow for higher level analyses.

You can contact the NEDRC to request specific analyses of education data sets; assistance for on-site research at NEDRC facilities; tables, graphic materials, or detailed reports from education studies and surveys; and limited programming analysis (e.g., cross tabulations). The following studies are currently available through NEDRC:

- Schools and Staffing Survey (SASS)
- Private School Survey (PSS)
- National Survey of Postsecondary Faculty (NSOPF)
- Common Core of Data (CCD)
- High School and Beyond (HS&B)
- National Postsecondary Student Aid Study (NPSAS)
- National Longitudinal Study (NLS)
- National Education Longitudinal Study (NELS:88)
- Integrated Postsecondary Education Data System (IPEDS)
- Recent College Graduates Study (RCG)
- Beginning Postsecondary Students (BPS)
- National Household Education Survey (NHES)
- Public Library Survey (PLS)
- Academic Library Survey (ALS)
- National Assessment of Educational Progress (NAEP)

To request research information from the NEDRC, call 703-845-3151, fax 703-820-7464, or E-mail the NEDRC at nedrc@inet.ed.gov. To receive the information you need, make your request as specific as possible, including the name and year of the data set (e.g., NELS:88), specific survey (e.g., NELS: Parent Questionnaire), population of interest (e.g., public school teachers with one year of experience), data elements (e.g., set and subject taught), and analysis type (e.g., cross tabulations). Please let us know how you wish to receive the requested material: diskette, hard copy, or via E-mail.

The Condition of Education 1997

User Survey

According to the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number. The valid OMB control number of this information collection is 1880-0529. The time required to complete this information collection is estimated to average 15 minutes. If you have any questions concerning the accuracy of the time estimate or suggestions for improving this form, please write to U.S. Department of Education, Washington, DC 20202-4651. If you have comments or concerns regarding the status of your individual submission of this form, write to NCES, 555 New Jersey Ave, NW, Washington, DC 20208.

To help us improve future editions of *The Condition of Education*, we would greatly appreciate your comments. You can return either part of this form by mail to the address listed on the reverse side of this form or FAX it to 703-820-7465.

1. How often do you use *The Condition of Education*? Every day Once a week Once a month Once a year First time ever
2. Do you have access to the World Wide Web? Yes No
3. Do you have a CD-ROM drive? Yes No
4. What is the main use you make of *The Condition of Education*? (Mark (x) one)
 1. To answer occasional or ad hoc questions 3. Background material for articles, speeches, etc.
 2. Policy formulation/analysis 4. Research on specific subjects
 5. Other (please describe) _____

5. Do you have any comments or suggestions on the format or content of *The Condition of Education*?
