ABSTRACT

This study examined writing samples from across the United States to provide information on the writing of students in American high schools, students taking the General Educational Development Examination (GED), and a group of undergraduate students at Indiana University. The report includes findings on writing fluency, correctness of spelling, spelling variations, and the amount of estimated interference posed by misspelling. The samples for this study came from three national writing assessments, one state writing assessment program, and one comparison group of undergraduate students at Indiana University. Findings fall into two major categories: ()) words written (including the number of words per sample, the relationship of words written to the number of samples and of prompts, the most frequent words, and a sample of words which have either entered or left common usage since earlier studies); and (2) correctness of spelling (including the overal. percentage of correctness, the most frequently missrelled words, and the numbers of variations of spelling). (Twenty-one tables of data and five figures are included. Appendixes contain the most frequently written words for grades 9 through 12, GED, and Indiana University undergraduates, and the most frequently m sspelled words for the same groups.) (SR)

ACKNOWLEDGEMENTS

A fam.

The authors would like to thank a number of people who worked many long hours collecting writing samples, reading essays, coding vocabulary, entering data, and conducting computer analyses.

Sandra Mangurian, Director of Research at Harcourt Brace Jovanovich, provided advice, support, and encouragement throughout the project. Michael Beck of Beck Evaluation and Testing Associates, Diane Bloom of New Jersey Department of Education, Wendy Littlefair of Measurement Incorporated, Ina Mullis of National Assessment of Educational Progress, and Pat Porter of Texas Department of Education served as the national advisory panel for the study.

The writing samples were collected from a variety of sources. The Psychological Corporation provided the writing samples used in the norming of the **Metropolitan Achievement Test**. Thomas A. Williamson, President of The Psychological Corporation, and Joan Sonnenschien, Senior Project Manager, were key people in providing these samples, which helped to ensure the national representation of the writing samples. The **National Assessment of Educational Progress** (NAEP) provided data tapes of the NAEP writing assessment. These data further enhanced the national representation of the writing samples. Ina Mullis, Senior Consultant at NAEP, and a member of the Advisory Panel assisted in securing these data. We vould also like to thank Pat Porter for her help in securing writing samples from the Texas **TEAMS** assessments and for her membership on the Advisory Panel.

1

We were fortunate to have been allowed to include writing samples from the first **General Educational Development** (GED) writing test from the American Council on Education. Janet Baldwin, Senior Research Associate, has been very helpful in providing these samples along with a comparison sample of the same prompts written by grade 12 students.

Our college sample was gathered at Indiana University by Dr. Beth Greene, Jeff Pennington, and Donna Lockett. Dr. Greene helped to develop the writing protocol for the study and organized the administration and location of writers. She also has been an invaluable sounding board for members of the research team. We are grateful for her interest and contributions.

After the writing samples were collected, the task of coding and entering the data into computer files was begun. The management of the 6,000 samples and of the staff that counted spelling errors and entered the complete essays into the computer was a large task. We gratefully acknowledge the contributions of Bruce Robbins, who, during the first year of this study (Farr, Beverstock, & Robbins, 1988) helped design the data handling procedures for the elementary grade leve! study which were continued with the secondary and post-secondary data set. Cheryl Logsdon was superb in recruiting and managing a large staff of coders, readers, and typists. These staff people included: Rebecca Hart, Marian Brazzell, Kelley Miller, Jeff Pennington, John Rathgeb, Glenna Rudolph, Michelle Wozniak, Jennifer Uszler, Linda Applegate, Julie Anderson, Stacey Silverman, Trinette Scott, Sherrie Henry, Cathy Barnes, Steve Gardner, and Donna Lockett.

10

The creation and analysis of a data base as large as our original 23,000 samples from Grades 2-8 and the addition of this year's 6,000-plus required the development *ci* new programs for data entry, use of existing data base systems and data manipulating programs, and the development of many new programs to allow us to organize and analyze the data. The Indiana University Computing Service, provided excellent services which went far beyond the specifications of the job. We are especially grateful to Polley A. McClure, Dean of Academic Computing, and Doug Grover, Manager of Large Systems Support Services. Bob Eckert, Principal Analyst for the Computer Applications Group, developed the data base, carried out many of the analyses, and was unfailingly devoted to producing the most useful data set possible. It is difficult to imagine how we could have completed the project without Bob.

and the second se

.

Finally, we want to acknowledge the Center for Reading and Language Studies at Indiana University, which provided substantial support services and assisted with maintenance of the collection of writing samples.

1.

INTRODUCTION

Concern about the quality of education in this country is widespread, and spelling remains a barometer of the perceived quality of education. The continuing press coverage of the spelling includes praise for the National Spelling Bee, and criticism in, among others, the syndicated columns of James Kilpatrick. A recent article by Kilpatrick was headlined "Examples of bad spelling flood the mail" (Herald-Times, Bloomington, Indiana, 1989). The opening paragraphs illustrate the depth of feeling felt by many:

Are good spellers born, not made? Is there a spelling gene, good or evil concealed within every person's DNA? Is something wrong with the way spelling generally is taught in the schools?

I raise the rhetorical questions in a sense of dismay that verges on despair. The very least that an editor or publisher may ask of a writer is that the writer know how to spell. Yet every day's mail brings bloodcurdling examples of misspellings by reporters on newspapers of substantial circulation. How come?

Kilpatrick's questions lead us to ask whether the situation is as dire as he paints it, whether a "bloodcurdling flood" is indeed engulfing this country. First, an examination of Kilpatrick's examples reveals that many of the words that he labels as misspelled are words which are correctly spelled, but are rather incorrect usages (prostrate instead of prostate), while others are not conventionally accepted words (necesary instead of necessary). But in examining the seriousness of the situation, we must note that Kilpatrick did not doubt that he knew what the author meant in each of his samples. This demonstrates that, although the attention of the reader may be

momentarily diverted by an unconventional spelling, the reader can still interpret the message.

But, extending Kilpatrick's metaphor, are readers presently wading, swimming, or sinking in misspelled words? This question carries grout emotional weight because spelling symbolizes a broader understanding of literacy in the minds of the general public. This study provides some new information on the writing of students in American high schools, students taking the General Educational Development Examination (GED), and a group of undergraduate students at Indiana University. In this report we have included findings on writing fluency, correctness of spelling, spelling variations, and the amount of estimated interference posed by misspelling Word List Review

Word listing represents an effort to approach spelling and vocabulary empirically. The purpose for generating the lists is usually to provide a base for decisions about curriculum development. Despite the many attempts, development of the definitive writing vocabulary or spelling list is elusive. Questions continue to face the developer/* rearcher: Do children need to learn the words that children use or the ones that adults use? How much overlap is there between adult and child vocabularies? Can a permanent list be developed or does the list require periodic adjustments due to the changing nature of the language? How often would such a list need to be updated? Should spelling lists be based on the word's that children use in their writing -- or on those they might use if they could spell them correctly?

2

FRIC

Existing word lists have been compiled from three primary sources. One major set of lists has been developed from writing samples which have resulted in writing vocabulary lists (Bauer, 1916; Fitzgerald, 1951; Hillerich, 1966; Horn, 1926; Jones, 1913; Rinsland, 1945; Smith & Ingersoll, 1984; Tidyman, 1921). The second source of lists was developed from published texts which have resulted in printed vocabulary lists (Carroll, Devies, and Richman, 1971; Dolch, and Buckingham, 1936; Fry, 1957; Gates, 1935; Harris and Jacobsen, 1372 & 1975; Kucera and Francis, 1967; Sakiey and Fry, 1979; Thorndike, 1921 and 1931; Thorndike and Lorge, 1944). The third and least used source is oral language which has resulted in spoken vocabulary lists (Dale, 1931; Dale and Chall, 1948; Murphy, 1957; Jones and Wepman, 1966; Wepman and Hass, 1969; Moe and Hopkins, 1975).

One analysis of word lists has been the comparison of the words chosen for different spelling series and the grades at which the words are presented (Hagarty, 1981). The <u>Spelling List Concordance</u> (Indiana University, 1988) presents seven of the major publishers' lists, the grade placement for each word in each program, mean grade placement, grade placement range, and an agreement of placement index.

The Horn list, though now more than 60 years old, is frequently cited in the development of spelling lists. Horn (1926) listed 10,000 words most often used outside of school from 65 types of writing and 5,136,816 running words. (For comparison, the Indiana Writing Vocabulary Lists [Grades 2 through 12, GED and university] were developed from a total of 29,047 writing samples and a total of 4,229,814 running words.) Horn included business correspondence; personal

3

.a. 5

. 1

correspondence; vocabulary of the letters of people of more than average literacy ability, including well-known writers; vocabulary of letters printed in magazines and metropolitan newspapers; letters of application and recommendation; vocabulary of adult writing needs other than correspondence, such as minutes, resolutions, committee reports, and of excuses written to teachers by parents; and the vocabulary of the letters of a single individual.

Horn (1926) found that some words fell in the first 100 in frequency no matter how much material was tabulated: <u>1</u>, <u>the</u>, <u>and</u>, <u>to</u>, <u>a</u>, <u>of</u>, <u>be</u>, <u>in</u>, <u>we</u>, <u>have</u>. By comparison, the present study of grade 2 to 8 writing sample revealed that the words <u>the</u>, <u>a</u>, <u>and</u>, <u>was</u>, <u>to</u>, and <u>1</u> comprised 20% of all of the running words in the children's writing. Horn included slang, colloquial, and supposedly obsolete words in his list. However, he did not include proper names, and words of less than four letters "since these have relatively small spelling difficulty."

Another of the influential developers of lists based on writing is Fitzgerald (1951). Fitzgerald's list is often cited as a reference by many of the major publishers of spelling series. His commentary on the word lists, and particularly on the use of the word lists, remains valuable. He has written:

It seems certain now that the course of study should be scientifically planned in order that children can be guided in a well-organized curriculum to learn the spelling or words that they need to write effectively in the situations that call for writing.

One of the most important causes of poor spelling in the past, and to a great extent even in the present day, is invalid word lists. In many curriculums words have been chosen without careful attention i) the validity of the sources. Words have been taken frequently from vocabularies which, although worthwhile for the purposes of the

investigators, are not highly valid for writing in the elementary school. Too many words are presented which are of too little value. Too large a number of words to learn, many of which are not recognized as useful by the child, is a cause for discouragement and failure. In some curriculums, as much emphasis is given to the presentation of words which a child will write infrequently as to the teaching of those which he will write frequently. (p. 7)

According to Fitzgerald (1951), the major concerns that face the developers of spelling

curriculum materials are the sources of words, their validity for the elementary school,

the number of words to be presented, whether the words make sense for students to

learn, whether the frequency of word use is taken into account, whether there is

differentiation for "gifted, average, slow-learning," and whether words are presented at

the appropriate grades. Fitzgerald (1951) states:

A most important fundamental for the spelling curriculum is a basic word list, scientifically selected and properly graded. (p. 3)

The investigations most useful for word selection in spelling are those based upon the real writing of child and adult. However, studies of oral and reading vocabularies are helpful in evaluating words for grade placement. (p. 5)

The Indiana University Concordance List (1988) has been developed to include

both the vocabulary used and the analysis of misspellings in one list, unlike many

earlier efforts.

Data on the misspelling of words are of particular importance in selecting spelling words for various graces. In brief, the procedure for word selection involves the use of valid research to determine words common to child and adult writing, to discover words common to child and adult writing, to discover words common to child and adult writing, to discover words common to child and adult writing, to discover words common to child and adult writing, to discover words common to child and adult adult writing, to discover words common to child and adult writing, to discover words highly crucial in adult writing which become progressively more valuable to children as they go from level to level, and to identify important words frequently used in child letter writing and school work but of low frequency in adult letter writing. (p. 39)

In deciding which words to use we must balance the children's present writing vocabulary needs with their future writing needs as adults. Some vocabulary is specific to children's contexts, such as <u>teacher's</u>, <u>Hailoween</u>, <u>Valentines</u>, <u>handkerchiefs</u>, <u>Santa Claus</u>, <u>arithmetic</u>, <u>doll</u>, <u>airplane</u>, <u>bicycle</u>, <u>classmate</u>. We need to examine these school-or-childhood specific words, the language of games, toys, and other language specific to the interests of children, and also should consider adult lists for future writing needs.

Another issue is the permanency of certain words. Horn studied the etymology of 5,000 words used in writing. His 5,000 words were collected in 1926 and he found that only 16 of these 5,000 words had entered the language since 1865. Two examples were <u>automobile</u> and <u>basketball</u>. He did note that new trade names frequently appeared on his lists. This has been corroborated in the present study, although many more new words have appeared due to the technological gains in the past 60 years. Meanings and popularity of words also change over time, as in the word <u>computer</u>, which not long ago was an infrequently used word that meant mathematician.

Sources of the Data

The writing samples had to meet several conditions to be included in this study. First, they had to be from national or state assessments of direct writing proficiency. "Direct" assessments of writing skill are based on a writing sample; the "indirect" method, generally refers to multiple-choice questions about writing correctness. Second, the samples as a whole were to be representative of the range of

socioeconomic status, region, and gender across the United States. Third, the samples were to have been holistically scored under known conditions. Fourth, some evidence of the reliability of the scoring of the essays had to be available. Finally, the samples were to have been written in response to specific prompts and with administration protocols that could be made available to the researchers.

This study has been possible only because direct measures of writing have increased dramatically in recent years. The direct assessment of writing includes several alternatives for scoring the writing samples -- primary trait, analytic, holistic, computer analysis, and T-unit, among others. Holistic scoring is preferable for direct writing assessments because it is the most researched, has been widely adopted and is the simplest to use (Sopko, 1988). According to Jongsma and Dean (1988),

Holistic scoring is best suited for reporting group performance, particularly in large scale evaluations such as district-vide or state-wide assessments. As such, holistic scoring offers a relatively simple way of assessing growth in writing proficiency over time, of measuring group differences in writing performance, and of determining the effectiveness of a writing program. (p. 12)

The writing samples included in this study allow comparisons of the writing vocabularies of students of differing writing proficiencies and at different grade levels.

The samples for this study (secondary and post-secondary samples) came from three national writing assessments, one state writing assessment program, and one comparison group of undergraduate students at Indiana University. The national assessments were two sets of the <u>Writing Test</u> from the <u>Metropolitan Achievement</u> <u>Tests</u>, published by The Psychological Corporation (1987) and, for comparison, a set of papers from the <u>National Assessment of Educational Progress 1984 Writing</u>

<u>Mechanics Data Tapes User Guide</u> (1988), <u>Assessment of the Conventions of Writing</u> (1986), and the 12th grade norming sample and first adult examinees of the <u>Tests of</u> <u>General Educational Development</u> (GED) writing test published by the American Council on Education (1987). Texas, through its <u>Texas Educational Assessment of</u> <u>Educational Skills</u> (TEAMS), contributed samples to the state-level portion of the study. Grateful appreciation is expressed to the cooperating assessment office: for permitting the use of their samples in this study. Table 1 provides an overview of the sources of samples included in this study at each grade level.

Geographic Region

Ĩ

ERIC

The samples were divided into four geographic regions of the country. These regions were defined as Northeast, Midwest, South, and West and was based on an assignment of states to each region by the National Education Association. This procedure splits the population of the United States into four approximately equal population units (National Education Association, 1977). See Table 3 for the regional distribution of the samples.

DESCRIPTION OF SAMPLE

Scoring

All of the essays (with the exception of the Indiana University essays) included in this study had been previously scored by experienced, trained readers prior to inclusion in this study. The availability of this rating for each paper represents a clear advantage for the present study over previous investigations of a similar nature. However, the use of several sources of papers, while providing a wide range of topics and student backgrounds, brought with it several scoring procedures and score scales. It was necessary to collapse these several scales into a single scale, so papers from the various sources could be combined and generalizations could be drawn across sets of papers. This step was accomplished by transforming the several

score scales into a single 1-99 scale. This transformed scale simply assigned 1 to the lowest obtainable score on each original scale, 99 to the highest possible such score, and intermediate values proportionately between these values. The transformed scale did not normalize the original scales or change the shape of their distributions in any way. The transformation simply permitted us to combine the several scales into a single combined scale metric.

Table 4 provides a summary of the mean scores of the samples in this sample clustered slightly above the mean for the scale. In Table 5, the standard scores are broken down by the proficiency level of the writers as measured by their scores on these samples.

 Table 5

 Means Scores by Proficiency/Grade/Source

Each of these assessments measures writing through eliciting a direct sample of writing. Each assessment provides standardized protocols, prompts, and scoring procedures. Although the writing assessments share many common traits, they also are characterized by differences. These differences can include amount of time for writing, the age and school status of the examinees, and the kind of prompt and the writing expected to result. Sources of the data, protocols, prompts, and scoring procedures will each be described in turn.

The Assessments

Metropolitan Achievement Test: Writing

<u>The Writing Test</u> is one part of the sixth edition of the <u>Metropolitan Achievement</u> <u>Tests</u> (MAT6). The first set of samples used in this study comes from the MAT6 norming set administered nationally in the spring of 1985.

12

The MAT6 <u>Writing Test</u> was normed concurrently with the MAT6 Survey Battery and the <u>Lancuage Diagnostic Tests</u>. A two-stage sampling procedure was employed. During the first stage, a nationally representative sample was selected to take the Survey Battery and Diagnostic Tests. Participants were selected to represent the national student population in terms of geographic region, socioeconomic status, school system size, and ethnicity. In the second stage, a subsample was randomly selected to participate in the standardization of the MAT6 <u>Writing Test</u>. (Wiser, 1988, p. 7)

These data were carefully chosen to be nationally representative and to provide

an anchor across all the data in this study, since each grade level from two to twelve

was included in the norming sample. The second set of Writing Test samples came

from an equating study in spring of 1987 and added new prompts to those normed in

1985.

,

A sample of 7,547 students, representing 31 school districts and 20 states, were assessed. The students were stratified by grade level with 2,269 third graders, 2,738 sixth graders, and 2,540 tenth graders participating. Because the study was for equating he prompts, not standardizing them, the sample was not selected to mirror national census data. However, an effort was made to sample school districts from a variety of geographic areas... (Jongsma and Dean, 1988, p. 5)

Since this was an equating study, the data from the second set of Writing Test

samples present a special opportunity to compare the responses of a single writer to a

pair of prompts. This comparison can be made both globally across the sample and

on a writer-by-writer basis.

There are three levels of the <u>Writing Test</u>: Level 1 for grades 2 through 4, Level 2 for grades 5 through 8, and Level 3 for grades 9 through 12. The test measures narrative/descriptive writing.

National Assessment of Educational Progress Writing Test

The National Assessment of Educational Progress (NAEP) is currently

administered by the Educational Testing Service under a grant from the United States

Department of Education. The national assessment has been "mandated by Congress

to collect data over time on the performance of young Americans in various learning

areas" (Norris, 1987).

Its primary goals are to detect and report the current status of, as well as changes in, the educational attainments of young Americans, and to report long-term trends in those attainments.

In 1984, NAEP conducted an assessment of attitudes and achievement in reading and writing for more than 100,000 students who were 9, 13, or 17 years old or in the corresponding modal grades 4, 8, or 11. For the writing portion of the assessment, nationally representative samples of students completed a variety of writing tasks and answered questions about their attitudes toward and experiences with writing and related activities.

The writing task "Hole in the Box" ... was administered to all three grade/age levels. Of the 8,970 essays collected for this task, a subsample of approximately 500 essays at each age (9, 13, and 17) was randomly sampled, scored, and used to examine students' writing ability to use the conventions of written English. (Norris, p. 1)

This subsample of 500 essays (randomly selected from the 8,970) is the sample

used in the current study. In selecting the samples, "nationally representative

probability subsamples were drawn from the total national sample....Results for these

papers provide good estimates of national levels of performance" (Appleber, Langer,

and Mullis, p. 10).

Texas TEAMS Test: Writing

The writing samples from Texas used in this study came from the Written Composition Field Test administered in March 1986 to 5947 students in Grade 9. A stratified random sample of 499 of these essays were included in this sample. Writing assessment in Texas has been mandated by the state legislature and designed by school district personnel and Texas Education Agency staff as part of the <u>Texas</u> <u>Educational Assessment of Minimum Skills</u> (TEAMS), which is designed to promote effective writing instruction in the Texas public schools.

TEAMS encourages teachers to help their students to improve their ability to think and reason clearly, to advance their thinking from simple to complex ideas, and to express themselves in written form. Many language specialists contend that learning to write is one of the most difficult yet probably one of the most important things a child does. The TEAMS test helps to assure that all students attending the Texas public schools will receive instruction in effective writing skilis. (Texas Education Agency, pp. 4-5)

The assessments were field-tested to assess the potential usefulness of the topics for statewide use. The Texas design measures the ability of students to write for different purposes (persuasive, informative, and expressive) and in different modes (narrative, descriptive, and classificatory). The audience, formal or informal, is specified in the prompt. Elaboration is required and is considered to be an essential part of good writing. A student cannot score three or four on the exam without sufficient elaboration. (The scale ranges low to high from 0 to four.)

ERIC

General Educational Development

The Tests of General Educational Development (GED) are the most widely used high school equivalency examination. These tests are revised periodically to reflect current curriculum and instruction in U.S. high schools. Since the last revision in 1978, greater emphasis has been placed on writing skills and on higher level thinking skills such as those defined in Bloom's Taxonomy (1956). The 1988 version contains for the first time a writing sample and greater emphasis on higher level thinking skills in the multiple-choice questions. The samples included in this study were among the first in which the new version of the test was used.

Indiana University Undergraduates

The Indiana University Undergraduates portion of thi, study was undertaken during the spring semester of 1989 in cooperation with the Psychology Department, which requires enrollees in its introductory psychology course to participate in three experiments. Participation in this study served as one participation assignment. This psychology course meets general education requirements for an undergraduate degree at Indiana University. To be admitted to Indiana University, undergraduates must graduate in the upper 50 percent of their class in high school and score in the upper 50 percent on the Scholastic Aptitude Test (SAT). The age of students in this sample is similar to many GED examinees and is just a few years beyond the twelfth grade. This sample included 60.16 percent firs: , ear and 33.60 percent second-year students. Therefore, they are very similar in age to many GED examinees (30 percent of the GED samples in this study were written by 18, 19, or 20 years old; 66 percent of

16

the sample are 25 years and below). The sample included here represents about one fourth of the students taking introductory psychology that semester; the members of this sample were self-selected as they fulfilled their experiment participation requirement.

Testing Protocols

Į.

Metropolitan Achievement Test: Writing

The <u>Metropolitan Writing Test</u> protocol requires standardized testing conditions. The manual includes directions for preparing parents, students, and the test administrators (suggested to be the classroom teacher to minimize the students' anxiety) for the test. The test takes 30 minutes--10 minutes for the directions and 20 minutes of writing. The students are directed to write on the two pages provided in the test folder.

National Assessment of Educational Progress Writing Test

The directions to the students were,

Look carefully at the picture. Imagine yourself in the picture. Describe the scene and how you feel about what is going on around you. Try to make your description lively and interesting. (Norris, p. 2)

Students had about 16 minutes to write the essay.

Texas TEAMS Test: Writing

The Written Composition Test directs students to read the prompt and to write in response to it. The test is untimed. The students in this sample had at least one similar test in the seventh grade and many had also been given practice prompts in

class. While teachers had been made aware of the criteria for scoring of the lest, no discussion of those criteria was included in the directions to the students.

General Educational Development

The GED examinees are allowed 45 minutes to write. They are directed to "use all parts of the writing process in responding to the topic... they are encouraged to plan, draft and make some revisions and corrections" (Swartz, p. 14). Examinees are provided two lined pages for writing.

Indiana University Undergraduates

The Indiana University participants responded to a protocol similar to the GED protocol, in topin writing time and instructions. They were told that they were participating in a national study to examine claims that college students (as well as students at other levels) have become very poor writers. They were asked to write as well as possible in order to refute those assertions. They were not told that spelling would be a major point of analysis in the data. They were asked to fill out a background sheet that included their home state, gender, age, year in school, grade-point-average and self-assessment as a writer. Although this protocol is somewhat different from the conditions under which the rest of the samples were collected, the college students experienced test condition pressures similar to the rest of the writers in this study. Our goal was to elicit the <u>best</u> writing sample possible.

Prompts

The prompts both enable and constrain the writing. Within this study we have both picture-centered prompts and written statement prompts.

18

Metropolitan Achievement Test: Writing

For the Metropolitan test, students write to narrative/descriptive prompts.

For all prompts, students are directed to 'write a story about the picture...tell what is happening and what might happen next' in response to a pictorial stimulus. The narrative/descriptive type was selected in an effort to provide consistency across grade levels. That is, in the lower grades, nearly all writing is descriptive or narrative. However, in the upper grades, variety increases with a greater emphasis on expository and argumentative types, but not to the exclusion of narrative/ descriptive. By using the narrative/descriptive type, the MAT6 Writing Test is able to provide a consistent measure of growth across grade levels. (Jongsma and Dean, pp. 2-3)

National Assessment of Educational Progress Writing Test

In the NAEP students were given a picture prompt showing a large box with

hcles of various shapes in it and an eye locking out of one of the openings.

Texas TEAMS Test: Writing

In the TEAMS assessment at the lower grades, picture prompts are

accompanied by written directions. In grades seven and nine, some prompts do not

include pictures, but a picture is always included if the prompt is aimed at descriptive

writing. The prompts included in this sample were aimed at persuasive writing, one on

the length of the school week and the other on school uniforms.

General Educational Development

GED examinees write:

an original composition based on a single expository topic. The topics present an issue or a situation of general interest about which adults would be expected to have some knowledge. The topics are brief and are written at a reading level appropriate for adults. All of the topics use highly "directive" language...the topics advise examinees to 'state a view' or 'present an opinion' or 'explain why or how....' ...all are expository in

nature.... As such, the topics are distinguished from those that require formal argumentation." (Swartz, p. 13)

New topics are field-tested with GED examinees and with high school seniors to ensure that the test prompts provide adequate information to write a response and that the prompt elicits the appropriate rhetorical form. Scores on the new topics are then compared to earlier topics to ensure a similar difficulty level.

Indiana University Undergraduates

The Indiana University students wrote to one of five prompts written by the Indiana University research team to closely resemble the prompts used on the GED. The topics were developed to elicit opinions on issues of general interest.

<u>Scoring</u>

Metropolitan Achievement Test: Writing

All Metropolitan writing samples were scored by two trained readers at Maasurement, Inc. Papers were scored on an eight-point scale in which 1 was the lowest and 8 the highest possible score. If the scores assigned by the readers differed by more than two points, a third reading was conducted. A third reader was needed less than 1 percent of the time. The reliability of the scoring by readers ranged from .86 to .95 in the first samples, and .92 to .96 on the equating samples. A between-forms reliability of .70 to .75 is reported (Hogan, Farr, Prescott, and Balow, 1987). The validity of the MAT6 <u>Writing Test</u> is demonstrated through its relationship to related measures on the rest of the MAT6. The MAT6 <u>Writing Test</u> correlates with the other MAT6 tests between .40 and .70. The correlations are higher with the language subtests than other parts of the MAT6.

National Assesment of Educational Progress Writing Test

The NAEP samples were scored by "experienced English teachers, thoroughly trained in scoring students' adherence to the conventions of grammar and usage" (Applebee, Langer, and Mullis, p. 10). Papers received two overall scores--"primary trait" score which indicated how well the writer accomplished the specific writing task demanded by the prompt, and an "overall fluency," or holistic, score. For the NAEP samples, holistic scores of 1 to 3 were defined as poor samples and scores from 4 to 6 were considered good. In the eleventh grade the mean score was 3.21 with a standard deviation of 1.38. The samples were also coded for sentence types and errors in writing conventions. The samples were read by one reader with a 20 percent reliability check of rereadings. "Second scorers did not see the first scores and discrepancies were resolved by the scoring supervisor" (Beaton et al, p. 184). The percentages of exact score point agreement for this prompt varied from .86 to .92 (Beaton et al, p. 393).

Texas TEAMS Test: Writing

The TEAMS writing samples were holistically scored by Measurement, Inc. under the following conditions:

Approximately 140 qualified readers at each grade level are employed annually to score the 1.1 million TEAMS written compositions. Readers must have at least a bachelor's degree in English, journalism, education, or a related field. In addition, they must have teaching experience or other qualifying experience with children or in the assessment of writing. (Texas Education Agency, p. 13)

The scoring procedure used in the Texas writing assessment is called **focused holistic scoring** "because the criterion for assigning the score is the degree to which

the paper organizes ideas for a specified purpose and audience task" (Texas Education Agency, p. 13). To ensure uniform scoring, detailed scoring guides are prepared for every set of papers.

"0" papers, for example, do not address the task at all. "1" papers attempt to address the task, but fail to do so acceptably. "2" papers are minimally successful, "3" papers moderately so, and "4" papers successful. Specific characteristics of papers at each scoring level are drawn up in detail, so that there can be as little doubt as possible what score a given paper should receive. (Texas Education Agency, p. 13)

For the actual scoring, three readers scored each paper. They maintained a reliability

of .99 between-scorer agreement.

The directions for scoring include specific criteria for spelling, writing dialogue,

punctuation, run-on sentences, writing stories, and the constraints of the testing

situations. Although each of these criteria are to be considered in determining the

score, the section on spelling is most pertinent to the present study.

Students progress through various stages as they learn to spell the thousands of words in their oral vocabularies. Some children progress more slowly than others through the stages of learning to spell. Some papers contain numerous errors while others are virtually free of errors. Individuals who have worked with elementary school students generally find it easy to decipher nonstandard spellings, since attempts to speil usually reflect both an underlying knowledge of phonology and knowledge of what has been learned up to this point about the orthographic representation of sounds. The students' scores will be affected if numerous errors in basic, familiar words occur. However, if nonstandard spelling of more complex words can be deciphered and the flow of words makes sense to the reader, the score on the written composition will not be affected. (Texas Education Agency, p. 17)

General Educational Development

GED examinees are directed to write approximately 200 words, but the number of words is not part of the scoring guide. The samples are scored either by GED or by state agencies trained by GED. The samples are scored holistically by two readers on a scale of 1 to 6 in which 1 is the lowest score and 6 is the highest. If the sample receives the same score or scores within one point of one another, the scores are added. If the scores differ by more than one point, the sample is read a third time, the three scores are averaged and the resulting score is doubled to represent two scores.

During the initial reading, the scores are divided into the "upper-haif" (scores of

4, 5, or 6) and "lower-half" (scores of 3, 2, or 1). Upper-half papers:

... make clear a definite purpose, pursued with varying degrees of effectiveness. They also have a structure that shows evidence of some deliberate planning. The Writer's control of the conventions of Standard Written English (spelling, punctuation, grammar, word choice, and sentence structure) ranges from fairly reliable at 4 to confident and ...complished at 6. (Swartz, p. 16)

In contrast, the lower-half papers:

... either fail to convey a purpose sufficiently or lack one entirely. Consequently, their structure ranges from *culimentary* at 3, to random at 2, to absent at 1. Control of the conventions of standard written English tends to follow this same gradient. (Swartz, p. 16)

DECISIONS: What is a Spelling Error?

What is a spelling error? On the surface the question seems simple. If the appropriate letters are not used, the word is misspelled. However, there are words that are not misspelled, but have been replaced by "correctly" spelled different words. Judging spelling is complicated by overlapping points of convention, including errors of usage, misplacement or omissions of apostrophes, and formations of plurals and abbreviations. There does not seem to be any simple principle to follow in declaring that a particular word choice is a misspelling.

Correct spelling is embedded in a larger question of writing conventions and correctness. It's not a simple task to draw a definitive line at which spelling ends and other conventions begin. For example, the many differences in dialects within the U.S. pose a challenge in considering verb forms and inflected endings. It was decided that incorrect verb forms and endings would not constitute spelling errors within this study since it would not be possible to find out whether what was written simply amounted to the writer's speech written down or a spelling error.

The complexity and multiplicity of American English required many decisions to be made about what would be marked as an error and what would not. An effort was made to preserve as much as possible our ability to look at the "interesting" features of spelling and usage as they presented themselves in the samples.

The following conventions were developed over the two years of these studies of writing vocabularies. Errors in the study included the following:

- 1. The misapplication of spelling rules, such as <u>recieve</u> for <u>receive</u>.
- 2. The addition or deletion of letters that seem to be based on mispronunciation of the word, such as <u>chiladren</u> for <u>children</u> and <u>libary</u> for <u>library</u>.
- 3. The substitution of an alternative letter for the correct letter (probably based on irregularity of spelling of the word or misapplication of a phoneme/grapheme relationship), such as <u>fite</u> for <u>fight</u>, <u>fond</u> for <u>found</u>, and <u>insted</u> for <u>instead</u>.
- 4. Reversals of letters, such as was for saw, dee for bee, and becuase for because.
- 5. Homonyms used incorrectly, such as deer for dear and him for hymn.
- 6. Inappropriate substitution of a real word for another real word, as in <u>the</u> for <u>they</u>. Such substitutions were coded as errors only when proofreaders were certain from context that the writer intended another word.
- 7. One word written as two words, such as <u>alot</u> for <u>a lot</u> and <u>incharge</u> for <u>in charge</u>. Also, two words written as one, as is <u>eventhough</u> for <u>even though</u>.
- 8. Possessives formed incorrectly, such as <u>Marys'</u> for <u>Mary's</u> and <u>childrens'</u> for <u>children's</u>. (When the writer does not attempt a possessive form where one belongs, we do not consider the error one of spelling, as in <u>it was Mary dog</u>.)
- 9. Unnecessary apostrophes in verbs, as in sit's and run's.
- 10. Omissions of colons in time and abbreviations which are not correctly formed, such as <u>Miss.</u> or <u>Mr.S</u> or <u>etc</u> are errors; other punctuation errors are not considered errors.
- 11. Contractions formed incorrectly, such as do'nt for don't and its for it's.
- 12. Plurals formed incorrectly, such as <u>babys</u> for <u>babies</u> and <u>sheeps</u> for <u>sheep</u>.
- 13. Invented words or spellings of superlatives as in the errors: He is the <u>bestest</u> player on the team. Bill is <u>gooder</u> at swimming than running. Other examples: <u>uprage</u> for uproar or outrage, <u>splurted</u> for splattered and blurted, <u>expendid</u> for expelled and suspended.
- 14. Non-words, such as he runned to the store or he hurt hisself.

,۲

15. A word that cannot be determined at all will be considered a misspelling and the closest approximation of the word will be considered the word attempted.

- 16. Misspelling of proper nouns for which there is a certain conventional spelling, such as <u>Yankies</u> for <u>Yankees</u> or <u>Sprute</u> for <u>Sprite</u> or <u>Indeana</u> for <u>Indiana</u>.
- 17. Misuse or omission of hyphens:
 - a. Begin with the dictionaries to determine if a word is a compound or is hyphenated. Dictionaries show compound nouns and some adjectives.
 - b. For the adjectives that are not listed, decide if the sentence will be ambiguous without the hyphen.
 - c. With a number, the hyphen is required if the number forms a compound with another modifier like <u>ten-foot</u> pole.
- 18. Quotations and Speech written down:
 - a. Decide if the writer is signalling a quotation from the context; don't depend on proper use of punctuation for quotations.
 - b. When the writer is clearly trying to represent speech like <u>Waaaaaaa Ta</u> <u>Gooocoool</u>, do not mark as an error.
 - c. Other words within the speech should be corrected. If the student wrote, "Whammm, wich way did it go?, correct the wich.
- 19. Non-word verb forms:

When the writer has used a non-word, replace it with the closest equivalent chosen on the basis of meaning rather than grapho-phonic (letters and sounds) similarity. For example, "Emily brang her favorite bat to practice." The preferred correction here would be brought (closer in meaning) rather than bring (closer in letters to brang).

The following usage errors were not counted as spelling errors in the study:

- 1. Verb agreements did not count as errors. For example the following underlined words were not considered errors: He <u>run</u> to the store. They <u>runs</u> across the street. However, a verb error which produces a word which is not an actual word was considered a spelling error. For example, He <u>runned</u> to the store.
- 2. Incorrect usage of comparative and superlative adjectives were not considered errors. For example in the following sentences, the underlined words were not considered errors: That book is the <u>best</u> of the two I have read. He is the <u>better</u> student in the whole class. However, the formation of non-words were considered errors. The following underlined words would have been considered

spelling errors: He is the <u>bestest</u> player on the team. Bill is <u>gooder</u> at swimming than running.

- 3. Incorrect pronoun usage was not considered to be a spelling error. For example, the following underlined words were not considered spelling errors: He went with who. <u>Her</u> is a good swimmer. However, the formation of non-words were considered spelling errors. For example, He hurt <u>hisself</u> when he fell.
- 4. Proper nouns for which there is uncertainty about variant spellings, as in personal names, were not considered errors.

As the study proceeded and as the proofreaders were informed by the first rounds of reading and marking many essays, issues emerged that needed to be resolved. The spelling of proper nouns posed certain difficulties. Readers were asked to consider all the proper nouns in terms of the reader's degree of certainty that the writer intended a word which has a definite, conventional spelling. Therefore, in the case of the spelling of someone's name, the degree of certainty is very low because the reader cannot be aware of possible variations of the spelling of a personal name. In the case of a well-known place name, the reader can be quite confident.

The same system seemed to apply well to product names. Product or trade names seemed less ambiguous than proper names, but questionable names could also stem from the writer's experience with products with which the proofreaders are not familiar and which were deliberately named to be similar to a more famous product. Proper nouns were coded as errors when the readers were sure of the correct spelling. If the reader was only somewhat sure, i.e. 50%, the coding reflected that doubt, and the words were not included in the vocabulary lists.

Differences in opinions represented in the various dictionaries contributed another source of ambiguity. This lack of agreement has been well documented

5

27

(Emery, 1973). In the National Assessment of Educational Progress, words which were spelled in different ways in different dictionaries were not marked as errors. In this study, the proofreaders attempted to find a *consensus* for the spelling convention for a particular word. Resolutions to these questions were listed and noted in memos 'o the entire staff. The following are examples of words with multiple "conventional" representations:

Considered Correct	Considered Incorrect
okay, OK, O.K.	okey
ali right, alright	allright

The dictionaries consulted in this study included but were not limited to: <u>The</u> <u>American Heritage Dictionary</u>, (Morris, 1985); <u>Webster's New World Dictionary of the</u> <u>American Language</u>, (Guralnik, 1972); <u>Webster's New Twentieth Century Dictionary of</u> <u>the English Language</u>, (McKechnie, 1979); <u>12,000 Words</u>: <u>A Supplement to Webster's</u> <u>Third New International Dictionary</u>, (1986); <u>Webster's Third New International</u> <u>Dictionary</u>, (Grove, 1986); <u>Webster's New International Dictionary</u>, (Neilson, 1957).

Other questions straddled the boundaries between usage and spelling. The appropriate use of hyphens involves both spelling and word use. John Benbow in the Oxford University stylebook offers the following caution: "If you take hyphens seriously, you will surely go mad" (Copperud, p. 187). This certainly expresses the difficulties that proofreaders found as they tried to make decisions about the appropriate use of hyphens. For instance, <u>time-out</u>, <u>time out</u>, and <u>timeout</u> were all listed as correct in the various dictionaries. These three versions of the words illustrate the dynamic nature of

language. At the time of publication of the dictionaries, and from the sources available to its editors, each of these was correct.

The use of hyphens to split words at the ends of lines was almost totally excluded from the study because the issue is one of syllabification and not of spelling per se. Many of the writers, particularly those in the earlier grades, demonstrated that they had not yet mastered that convention. One sub-category, hyphenation of compound words at the ends of lines, was retained, but only if that compound word was not written as one word elsewhere in the sample. This allowed a count of all the difficulties with compound words without penalizing a writer who knew the word was compound but didn't know to include the hyphen at the end of the line.

Decisions about the use of real words for other real words posed a particular challenge to the proofreaders. The proofreaders were competent users of standard acacemic English. They wanted to "fix" the instances which didn't "sound right" to their ears. For example, if the writer had <u>set</u> in a context for <u>sit</u>, it was to be left unmarked. Since the writer could not be asked for confirmation, it was assumed that she/he might have meant <u>set</u>; thus, it might not be a spelling error. The same applies to the use of <u>lay</u> and <u>lie</u>, which remained unmarked as errors for this study. In another real-word-to real-word substitution, it was found that writers often left off what seemed to be letters required for the context. A writer would often start a sentence with <u>the</u> in a context that clearly required <u>they</u>. Another area of difficulty was <u>a/an</u> in a context that implied <u>and</u>. These were marked as errors if the proofreaders were sure from the context what the writer intended.

29

4()

Verb forms provided many questions during the proofreading. As in the case of words like <u>lay</u> and <u>lie</u>, the proofreaders were tempted to mark such words as: <u>would have, would of, should have, should of, supposed to, suppose to</u>. Following the earlier decisions, and not being able to check the intention of the writers, these words were not marked as errors. With non-word verb forms, the decision was made to correct to the word with the closest real word for that meaning.

In general, it was decided to mark words so they could be studied as part of the analysis rather than leave them unmarked. Readers had to overcome a feeling that they were penalizing the writers by marking interesting but possibly unconventional words. Once the samples are transformed into vocabulary lists, the context of a particular word is not readily available. By marking such words as "errors," we retain the opportunity to examine unusual expressions, spellings, and word choices. We also link words that belong together to understand their use. Examples of these include the commonly misused <u>a lot</u> and names of places such as <u>San Francisco</u>. This was useful as well for the names of television shows (<u>Sesame Street</u>, <u>Thirty Something</u>) which are more interesting as units rather than divided into single words.

All the data remains in the data base, and it could be analyzed using different criteria or selection procedures. For example, the Oxford Concordance Program, the computer ana sis program used for this study, allows the display of the context both preceding and following a specified word. The vocabulary lists for particular prompts could be selected and compared by the grade levels of the writers. Entire samples

30

could be examined for different patterns of spelling correctness and errors since some writers seemed to spell words quite consistently and others seemed to meet words for the "first" time such time they wrote them.

PROCEDURES

The procedures of a study create the data and either enable or constrain the analyses and conclusions that can be drawn on the basis of the work. The research team endeavored to design and maintain highly reliable procedures to provide a reliable and useful database.

The research team employed a consistent procedure with all of the writing samples, regardless of their source or the time that they were received, with the exception of the NAEP data (which will be discussed below). Once the writing samples arrived at the Center for Reading and Language Study at Indiana University, the samples were assigned code numbers representing the origin of the samples and a unique essay identification number. When more writing samples were received from a particular source at particular grade levels than were required for the study, samples were selected randomly within the sample set for inclusion in the study.

All essays were read and coded for misspellings by three different readers, and one in every ten was read a fourth time to ensure reliability. The first reader circled as many misspellings as he or she could find and wrote the conventional spelling near each circled misspelling. The second reader then reread the essays, marked any misspellings that the first reader might have missed, and checked to make sure the second reader concurred with the first reader's marking.

31

After first and second readings were completed, the essays were given to typists who also had been trained in proofreading for misspellings according to the conventions of this study. The typists entered the complete essays with misspellings and their corrected versions (for example, <u>their=ther</u>) into a computer program written for this study. Typists proofread the essays as they typed, providing a third reading that focused on letter-by-letter reconstruction, rather than the meaning-focused work of the first and second proofreaders. Readers used colored pens and initialled essays they read, leaving a paper trail of the decisions made by the coders. Most samples were read from the original essays giving the readers the best possible chance of deciphering the subtleties of the students' handwriting. However, in some instances, photocopied samples were used.

The only samples removed from the study were those written completely in Spanish (only 9 out of the 6086 samples). No other languages were used in the samples. Only a few words were indecipherable; the unreadable words were specially coded and the essays were retained in the study.

After each packet of writing samples had been read three times and typed, researchers reviewed the work to ensure a greater degree of accuracy. During this review, every change made by a third reader/typist was reviewed for accuracy and at least one in every ten essays was proofread for accuracy in typing as well as for coding of misspellings. The writing samples were then combined from diskettes into larger data files, transformed into a suitable format for entry into the main-frame computer data base and entered into files on the main-frame for analysis.

32

The vocabulary lists were produced by a combination of programs, including the Oxford Concordance Program (Oxford University Computing Service, Versions 1.0 and 2.0) and programs written specifically for this study. These lists were then proofread by two readers to remove remaining typographical and coding errors and to mark two additional categories of words. The two additional categories were proper nouns: Personal names were not corrected for spelling because names are idiosyncratic, and it is almost impossible to determine correct spellings. Also, oral utterances which did not have conventional spellings (for example, "ahhhhhhhhhh") were not coded as errors. Finally, these "cleaned" lists were run through the final programs to produce the statistics and vocabulary lists in final form for publication.

The NAEP data required somewhat different procedures as the data was submitted on tape rather than individual writing samples. This eliminated handwriting as a variable and introduced typing ambiguities as a point of uncertainty. The NAEP procedures for identifying and coding errors were different from those used in this study since the NAEP analysis counts errors in a large number of categories (such as promoun reference, verb tense) without looking at individual words. In order to produce word lists using the Oxford Concordance Program, the readers read printouts of the NAEP data samples. We inserted the correct (or target) words for words which were coded by NAEP as errors and simply corrected unmarked spening errors which we assumed to be typos. These samples were read twice and checked for reliability before the changes were made on disk by the typists, who were also alerted to watch for idiosyncracies.

33

A second procedure was required by the use of the NAEP data. The original NAEP samples were weighted to represent the eleventh grade population in 1984 when the NAEP essays were administered. In order to have sufficient samples to compare the performance of black and white students, the NAEP data contains approximately equal numbers of essays written by black and white students. However, that distribution does not mirror the proportions of blacks and whites in the U.S., so each sample is assigned a weighting based on such factors as the writer's race and living situation (rural, suburban, orban).

Fractional weights do not cause difficulties if the method of analysis is simply counting the presence or absence of particular variables (number of words written correctly, number of complete sentences, etc.). However, in this study we were interested in the specific vocabulary of students and frequency of particular patterns of spelling variations. Since we could not use fractions of words, we reweighted the samples to the original 461 samples, cloned the samples by their weighting factors, and rounded to whole numbers. The samples were then run through the Oxford Concordance Program and the special list-generating programs.

Personnel

The director of this phase of the overall writing/spelling vocabulary study was a doctoral student in Language Education at Indiana University. She was co-director of the first year of the study which analyzed elementary writing samples. In the first year the co-directors designed the study procedures, trained personnel, closely supervised the work, and managed the data transformations and transfers. These techniques

were then used in the second year of the study. Personnel in the second year totaied 16 proofreaders and typists, seven of whom were veterans of the first year of the study; all 16 were carefully trained to achieve a high degree of consistency in marking. Employment of proofreaders and typists was based on interviews, a proofreading test, and typing tests. During initial training, each proofreader and typist practiced proofreading on training samples aimed at clarifying the study's decisions about handwriting, usage, and misspellings. After training, each proofreader's work was closely monitored. Proofreaders were expected to make no more than five marking errors in every 20 essays.

Resources used by the proofreaders and typists included a shelf of dictionaries, a scorer's manual contained a list of words the proofreaders frequently needed to look up and clarifications on marking, periodic memos from the director, and collaborative consultation with the director and with other readers and typists. There was very little turnover of staff after the initia: training period. Extensive effort was made to employ especially we'l-qualified and highly motivated readers and typists, since the quality of the data base and thus the entire study was dependent on the work accomplished by this staff. The careful screening and training efforts resulted in a quality group of workers, who not only marked or typed the writing samples with special care, but also made suggestions for analysis from their observations of the features of the student writing samples.

4C

RESULTS

The following descriptive statistics help to put the writing vocabulary lists into perspective. These descriptions fall into two major categories. The first category reports on the **words written**, including the number of words per sample, the relationship of words written to the number of samples and of prompts, the most frequent words, and a sample of words which have either entered or left common usage since the Horn (1926) and Rinsland (1945) studies. The second category contains data on the **correctness of spelling** in the samples including the overall percentage of correctness, the most frequently misspelled words, and the numbers of variations of spelling.

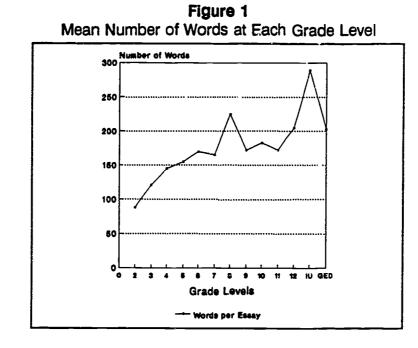

Words Written

<u>Number of Words per Sample</u>

Figure 1 contains the mean number of words per essay at each grade level from 2 to 12, Indiana University, and GED. These data must be interpreted carefully keeping in mind that the amount of time that students were given to write varied in the elementary grades from a low of 20 minutes to as much as two one-hour writing sessions. Nonetheless, it seems clear from these writing samples that students write more as they get older. As might be expected, the college students wrote the most. The GED and grade 12 students averaged similar numbers of words, which is not surprising, since the purpose of the GED exam is to provide evidence of high school equivalency. Longer writing times at grade eight (as much as 2 hours in the Georgia

assessment--47 percent of the samples) may explain the deviation from the general

trend of greater mean words as students move through the grades.

As was the case in the samples from grades 2 though 8, the high school, GED, and Indiana University samples were for the most part first draft writing; the writers had from 16 to 45 minutes to complete their writing. In some cases, students used part of that time to plan, outline, or even write a first draft. Evidence of this planning, such as writing outlines on the margins or cover sheets, was most frequent for the GED and Indiana University samples.

Table 6 provides the average number of words per sample. The average at each grade level was fairly close across the grades with the exception of the responses to the NAEP prompt. The NAEP is the only assessment included here which utilized only one prompt with all the students tested, and this particular prompt

may have elicited, on average, shorter responses. The NAEP writers, despite the iower mean, also had the widest range of numbers of words written (from a low of two words to a high of 668) and also the longest single sample for any of the assessments. Also, NAEP students had a slightly shorter amount of writing time than the other assessments in the study. However, the amount of time does not fully explain the differences because the MAT writers had only four more minutes to write and yet, on average, wrote nearly twice as many words.

Number of Words by Glade Level					
Grade	Mean	S.D.	Range		
Nine	172.5	70.25	10-444		
Ten	183.1	, 79.52	24-431		
Eleven ¹ NAEP MAT	93.3 171.9	91.30 81.33	2-668 9-448		
Twelve	205.1	68.85	0-469		
GED	203.1	58.71	0-470		
IU	289.7	76.81	134-561		
¹ Sources reported differently due to differences in the writing time.					

Table 6Number of Words by Grade Level

While the mean number of words written is similar in grades 9, 10, and 11, there is an increase (about 25 words) for the grade 12 and GED essays. The Indiana University student essays were substantially longer. Amount of writing time does not explain the difference because GED, IU and 64 percent of the grade 12 writers (those writing to the GED prompt) all had similar or identical writing protocols. In grades 9 through 12 and the GED, the longest samples contained 400 plus words (with the

exception of the NAEP discussed above), but the longest samples from the IU writers were about 100 words longer than the average high school essay. The shortest IU sample, for example, was nearly as long as the average number of words for the grade 9 essays. It should be pointed out that a cross-section of Indiana University students (or U.S. college students) represent only the top 50% of the cross-section represented by high school scores, since only around 50% of the high school students attend college.

When the mean number of words are categorized by proficiency levels based on the writing scores on the samples (see Table 7), very consistent numbers of words written appear. That is, the average number of words for each writing level group were fairly similar across grade levels.

 Table 7

 Mean Number of Words by Proficiency, Grade and Source and the Ranges Low to High

Clearly, the "low" writers wrote much less than the writers whose samples scored higher. The "low" samples averaged only a fourth the length of the samples with the highest scores, and were even half the length of samples in the "low-mid" ranking just above them. These low writers were actually below the mean number of words written by grade two students (mean = 88) as reported for the elementary grades (Farr, Beverstock & Robbins, 1988). This was in sharp contrast to the most proficient writers whose mean essay lengths match the mean words per sample of the IU undergraduates. "//hile length of writing sample was not a criterion for assigning scores, data analyzed for grades 2 to 8 suggests that the number of words written does correlate with the overall rating of the essays. For example, the correlations of

word length with essay scores for grades 2 to 8 ranges from a low of .35 at grade 3 to a high of .84 at grade 8. Generally, the correlations are stronger at the higher grades than at the lower grades. Correlations for grades 2 to 8 were determined as part of a writing conventions study of a sample of essays at those grade levels. The grade 2 to 8 results provide a reasonable basis to conjecture that the grades 9 to 12 correlations would be significant.

Influence of Numbers of Samples and Prompts

Writing prompts create a writing universe, making a particular vocabulary likely and other words much less likely. The numbers of different words written in any set of writing samples will be influenced by several factors: the number of different prompts, the character of the prompts, and the number of writing samples included. It would be useful for researchers to know the minimum number of samples that need be examined to comprehensively describe the writing vocabulary of students at a particular grade level without wasting research time and resources on excess or unnecessary samples.

In this discussion, the count of **unique words** means the number of **different** words attempted by the writers, regardless of the correctness of spelling. We attempted to determine how many samples would be required to arrive at **redundancy**, that is, the number of writing samples at which the addition of more samples would not appreciably raise the number of unique words. Using the grade 3 data (a total of 7637 essays), three samples of 500, 1,000, and 3,000 essays were drawn. Across the three sets of essays the percent of words spelled correctly was

41

very stable (500 [91.1%]; 1,000 [91.1%]; 3,000 [91.2%]). This finding demonstrates a consistency from sample to sample that suggests that the sample of 500 is a sufficient number for documenting the degree of spelling correctness at a grade level.

In sharp contrast, however, the number of unique words was not stable for these three samples (500 [3,637 unique words]; 1,000 [5,356 unique words]; 3,000 [9,052 unique words]), as shown in Figure 2. There was a 32 percent increase in total unique words from the sample of 500 essays to the sample of 1,000 essays. There was a 69 percent increase comparing the sample of 1,000 to the sample of 3,000. And from the sample of 500 to the sample of 3,000 there was a 149 percent increase. These results are provided in Table 8 and indicate that the number of unique words did not stabilize across the samples and more samples at closer intervals would be required to discover at what sample size redundancy might occur These results would not support any prediction of a ceiling in terms of the total unique words if more prompts were added to the data base.

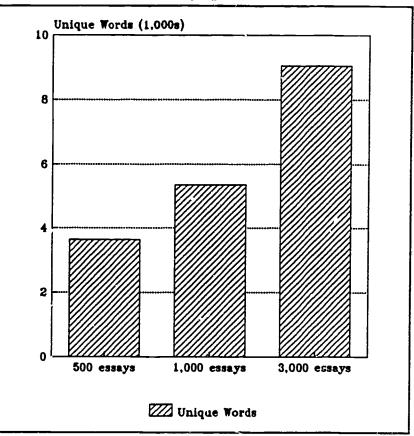

Figure 2 Numbers of Unique Words in Samples of Varying Sizes

Table 8Sample Size Increased and ResultingNumber of Unique Words Increased

Number of Essays	Sample Size Increase	Percent of Sample Size Increased	Number of Words Increase	Percent of Words Increased
500			3,637	
1,000	500	100%	1,719	47%
3,000	2,500	600%	5,415	149%

ļ

Table 9 contains the number of prompts, samples and unique words at each of the grade levels in the study. A consistent patter does not emerge from these figures, suggesting that further research is needed to ferret out the relationship between numbers of prompts and the resulting numbers of unique words.

Grade	Number of Prompts	Number of Samples	Number of Unique Words
Nine	4	1,078	6,029
Ten	8	675	5,310
Elevan	3	954	6,017
Twelve	15	881	7,947

<u>IU</u>	5	369	6,749

Table 9
Number of Prompts by Grade Level and Unique Words

The Most Frequently Written Words

The lists of the most frequently written words for each grade level from 9-12, GED and Indiana University students are included in Appendix A. The lists include the word, the number of times it was attempted (whether it was written correctly or not), the number of attempts as a percentage of all the words written at that level, the percent of time it was spelled correctly, and the number of spelling variants.

Many word list studies have identified the words that make up a large percentage of the running words in the texts composing the study. For this analysis, the lists of most frequent words were assembled by taking the most frequent words from each grade or group, and putting them in order according to their overall average percentage of the total words on the list. Each word occurs among the top

44

55

60 words in percent of usage for at least one of the groups (most, of course, rank that highly in more than one group). The words <u>television</u> and <u>tob</u>, occurred in the top 20 words in one or more groups, but ranked so much lower in the other groups that their overall averages did no' warrant being included in these lists. Both of these words were elicited by specific prompts used in the assessment. An effort was made to keep the averages among the groupings as close to the target amounts as possible (20%, 20%, 10%). Table 10 displays the first 20 percent of words written. Table 11 contains the next 20 percent of words written, and Table 12 displays the next 10 percent of the most frequently written words. Together these 66 words comprise half of the words written. In contrast, the elementary writers' most frequent half of words was made up of 16 fewer words than the high school writters' list; 50 words account for half of the running words in grades 2 though 8 (Farr, Kelleher, Lee, Beverstock, and Robbins, 1989).

In grades 2 through 8, the most frequent six words (the, and, to, a, was, I) account for 20 percent of all the words written (Farr, Kelleher, Lee, Beverstock, and Robbins, 1989). The most frequent 20 percent at the high school level are shown in Table 10. In grades 9 through 12, GED, and IU, the most frequent 20 percent of words written was made up of eight words (the, to. and, a, of, in, is, I). Opposite each of the eight words is its percentage of the total words written for each of the grade levels. The Total Line indicates the total of the percentages of use of these words at each grade level; while close τ_{o} 20 percent, the actual percentage of words written varies from 20 to 22 percent. The Average Column indicates the mean percentage of

RIC

45

;:

all the words written across each of the grade levels. Within the list of eight words, <u>the</u> constitutes about 25 percent, <u>to</u> is about 16 percent, <u>and</u> and <u>a</u> are about 13 percent, <u>of</u> is 10 percent, and the remaining three, <u>in</u>, <u>is</u>, and <u>1</u>, are each about 8 percent.

One difference between the elementary level list of the most frequent 20 percent of words and the high school list is that the word was was not written as frequently by the older writers; in fact, it is close to the bottom of the second 20 percent of their most frequently written words. At the high school level, more words, eight as opposed to six, are required to make up the most frequent 20 percent; three "new" words appeared, <u>of</u>, <u>in</u>, and <u>is</u>. Table 10 shows that the first 20% of words were basically the same at each of the high school, GED, and IU levels.

 Table 10

 Most Frequent Words Used First 20% of all Words Used

The Dolch list is one of the most often used lists of common words, so it provides a point of reference for the results of this study. Each of these most frequent eight words are included in the Dolch list of words; was is on that list as well.

Table 11 displays the 28 words which make up the second 20 percent of words written. All of these words, with the exception of one word, <u>people</u>, also appear on the Dolch list. The older writers use of words is more distributed than in the elementary grades. While the younger writers had a total of 22 words in their second 20 percent, the older writers had 28 words in the second 20 percent of the words written. While these 28 words are quite close to 20 percent of the words written at most of the high school grade levels, the IU percentage is two to three percentage points lower. The university writers use a somewhat more diverse set of words, so each word contributes a somewhat lower percentage of all the words written than each word does with the high school and GED writers. Among the notable words in this group: <u>they</u> was used more than twice as often in 9th grade as in the IU sample; <u>he</u> was used frequently in high school grades, especially 10st, but drops dramatically in the IU and GED samples; <u>can</u> was used less frequently in grades 9 through 12, and rises sharply in the GED sample.

 Table 11

 Most Frequent Words Used Second 20% of 3ll Words Used

ľ

2

The 10 percent of words which completes a full 50 percent of words written is made up of an additional 30 words. Table 12 makes clear the decrease in the frequency of use of each of these words because the previous 20 percent of words totaled 28 words. The words continue to be heavily represented on the Dolch list: only four of these 30 words were not included (time, more, man, and should). Among the notable words in this group: <u>dood</u> was used less frequently in grades 9 through 12, but its frequency rises sharply for the GED writers; his was used in grades 9 through 12, but almost drops out in the GED and IU samples; me was little used at all levels except 11th grade, where its frequency is more than twice that of next highest level; man was used in grades 9 through 12, almost drops out of the GED sample, and falls completely out of the IU sample data; should was used consistently in 9th. 12th, the GED and IU samples, and almost drops out of 10th and 11th grades; and had, him, and were used consistently in grades 9 through 12, but almost disappears in the GED and IU samples. The relative frequency of these words probably has most to do with the specific writing elicited by the prompt. For example, should is an important word in argumentative or persuasive writing (certainly a feature of the GED prompts), so it is not surprising that the students responding to those prompts used should frequently. The choice of words, and the relative frequency of words, remains one of the interesting questions that could be investigated further with this database.

Table 13Tables 10, 11, and 12 Totals

Overall, the frequency of the words making up 50 percent of the words written remains fairly consistent until 12th grade; at which point their frequency drops and continues to drop for GED and IU samples. These words, for the most part, are not words which could be considered specifically elicited by the prompts. Instead, these words serve as the major structural components in these samples.

Changes in the Common Use of Words

.

1

One potential function of the Indiana Vocabulary Lists is to provide evidence of changes in language use over time. The words listed in Table 14 were collected from earlier word lists (Horn, 1926; Rinsland, 1945) and are no longer in common usage.

beau	corset	jobber
bloomers	davenport	mumble-the-peg
breeches	festoon	nigh
bungalow	flapper	primer
camphor	flatiron	shan't
chattel	forenoon	'twas
cookstove	fret	utterance
coolies	grippe	victrola

 Table 14

 Previously Frequent Words Not Appearing in Present Lists

These two lists were read looking for words which seemed likely to not appear in the present lists. Candidate words were then checked against the lists. Those words for which no match was formed are included in Table 14. This was not a definitive checking of the older lists against the IU list. Rather, it is just a sampling of words which were included on former writing lists and which now seem to be seldom used.

Although they are less frequently used, they have not left the language. Certain words, such as <u>bloomers</u>, can still be considered a common word if used in certain contexts (in regard to flowers, or to people, referred to as "late bloomers"), but were once more common in other contexts. Other words, such as <u>braces</u>, are still in common usage, but certain meanings have fallen out of use. (Braces was once a common term for suspenders, and still is used in that context in Britain.) <u>Utterance</u> is a favorite in the speech and linguistics fields but may not be as commonly used as in the early part of the century.

Likewise, there are many new words that either were not around or not in common usage in the past. Words such as <u>computer</u>, <u>electronic</u>, <u>radar</u>, <u>stereo</u>, and <u>television</u> are everyday words related to developments in technology. A word such as <u>racquetball</u> is new because the sport did not exist until fairly recently. Medical and psychological terms such as <u>antisocial</u> and <u>antibiotics</u> were not found in the old word lists either, but are now part of the common vernacular. Also, new words have come into common usage, such as <u>cookout</u>, that were not used before.

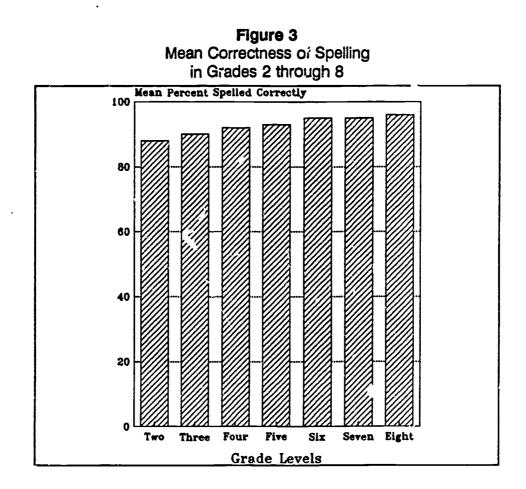

Spellina Correctness

Percentage of Words Spelled Correctly--Grades 9 and Above

In the first year of this study, it became clear that despite the widespread public belief that students in the United States are poor spellers, the percentage of words misspelled consistently decreases as writers enter higher grades (Farr, Beverstock & Robbins, 1988). These data, as shown in Figure 3, illustrate the continued pattern of increased proficiency observed in the data collected in the grades two through eight portion of this study. From a low of 84 percent correct at grade two, the percent correct climbs steadily to about 96 percent at the eighth grade. Table 14 contains the percent of words spelled construct the progression toward greater correctness with a mean percent correct of 97 percent in grades 9 through 12. The trend of growing correctness can be discussed numerically, but the numbers cannot determine what amount is sufficient correctness--that judgement is a social judgment.

53

÷

We can examine this progression with to sets of figures. The first set of figures in Table 15 reveals the percentage of words spelled correctly for all of the writing samples at each grade level. Table 15 also lists the percent correct for the most frequent 500 words written at each level. [Note: Grade level, GED and IU lists of the 500 most frequently written words at each level can be found in Appendix A.] The mean percent correct for the 500 most frequent the 500 most frequent for the 500 most frequent. Correct for the 500 most frequent correct for the 500 most frequent for the 500 most frequent. Solution words at each level can be found in Appendix A.]

writers fall below the average of 97 to 98 percent correct. Their mean of 94 to 95 percent correct more closely matches the grades seven and eight writers in the earlier study.

Percent of Words Spelled Correctly by Grade Level for all Writing Samples and for the Most Frequently Written 500 Words

These results raise the implicit question of spelling avoidance. Are we simply seeing that students learn to avoid writing the words that they are likely to misspell? Or is this a combination of both growing spelling skills as well as a sense of when to write correctly?

In Table 16, the mean percent correct by proficiency, grade level, and source is displayed. There is a greater difference in mean correctness between samples judged high and low in the holistic scoring than differences among the samples at all grades in the same proficiency range. The within-grade-level differences range from a low of three percentage points to a high of 15. No trend among these differences was

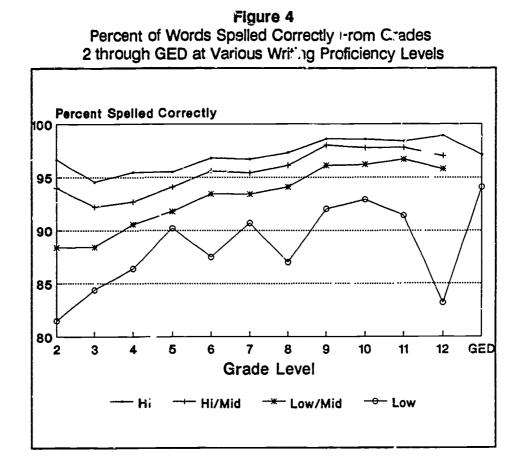

found. Mean correctness within the samples designated "high," "high-middle," and "low middle" samples is consistent across grade levels. There is much less consistency in mean correctness among the samples in the "low" group. Among the "low" samples at each of the grade levels, there is a range of 12 percentage points from a mean high of 95 percent correct down to 83 percent correct. Figure 4 demonstrates that among the groups and across all the grade levels, the mean percentage spelled correctly at each grade level remains in similar relationship. The "high" papers were always spelled most correctly and the "low" papers were always spelled least correctly.

Grade	High	High/Mid	Low/Mid	Low
Nine (Texas)	98.01	97.55	96.27	95.01
Nine (MAT)	98.88	98.08	95.52	91.06

Percent Correct by Proficiency/Grade/Source	Table 16						
	Percent Correct by Proficiency/Grade/Source						

56

Sometimes a mean can hide many scores which vary substantially from the mean. That is not true in this data. In this case (as summarized in Table 17), very few writers fell beic w 90 percent correct. In fact, writers with less than 50 percent correct range downwards from just 4 percent of all the high school writers. This contrasts sharply with the development of correctness in the elementary grades. In second grade about half of the samples were below 90 percent correct, and 90 percent was the mean correctness of writers at grade three found in the first year of the study (Farr, Beverstock, hobbins, 1988). In the elementary grades, the percentage of writers who spelled fewer than 90 percent of their words correctly declines rapidly, reaching

57

RC

just 6.9 percent in the eighth grade. The GED writers (with nearly 10 percent of the writers below 90 percent correct) more closely matched the seventh grade performance on this measure. This is further evidence that in terms of percent of words written correctly, only a few of the high school writers are producing writing which has more than 10 percent of the words misspelled. They are clearly joined in this by the Indiana University writers; less than one percent of that sample had more than 10 percent of the words misspelled.

Percent of	Samples Below 909	
Grade	% Below 90%	Number
Nine	4.36	47
Ten	3.85	26

Tweive	3.63	33
GED	9.53	41
IU	0.27	1
¹ Not available fo	or the NAEP	

 Table 17

 Percent of Samples Below 90% Correct

The pattern of increasing correctness is further bolstered by the percentages of samples which were written with 100 percent correct spelling (see Table 18 below). This does not imply an expectation that writers will never misspell any words. Rather it is confirmation that writers in United States high schools can, in a writing assessment of first draft writing, spell correctly much of what they write.

Percent of Samp Words wer	ble in which 1 e Spelled Cor	
Grade	100%	Number
Nine	12.51	135
Ten	13.61	92
Eleven NAEP ¹ MAT	14.60	72

GED	4.10	87
IU	24.32	90
¹ Not available for	r NAEP	

Table 18

The samples which contained no errors vary from 13 to 15 percent at the high school level, decline to 4 percent with the GED writers, and comprise nearly 25 percent of the IU samples. In grades two through seven, about 3.5 percent of the samples were 100 percent correct and in grade eight there is a sudden leap that nearly doubled the perfect samples to 6.5 percent. In terms of completely correct samples, the GED writers more closely match the results in grades two through seven than in the higher grades.

Most Frequently Misspelled Words

Appendix B contains the lists of the most frequently misspelled words at each of the six grade levels (9, 10, 11, 12, GED, and undergraduate). These lists include the word, the number of attempts to write it, the percent of times it was written incorrectly, the number of times it was written incorrectly, and the number of variant spellings. Only a few words appear consistently acros s the lists. Tables 19 and 20 contain some

59

of the most frequently misspelled words. In Table 19, the words are all sets of homonyms Only the first word in each set appeared on the lists of the most frequently misspelled words. The other(s) are included for contrast and to demonstrate that while spelling the first one may be difficult for writers, the others are not nearly as troublesome. In each case, the most frequent misspelling was the "correct" spelling of one of its set of homonyms. For example, too is most often misspelled as to in every grade. To is one of the most frequently used words while both too and two are much less commonly used. You're is most often misspelled as its. In every instance where its is misspelled, it was as it's. They're is most often misspelled as their, and then secondly as there. There is most often misspelled as their. Their is most often misspelled as there, and then secondly as there.

Table 20Other Frequently Misspelled Words

Besides the homonyms, whether to write words as compounds or to use hyphens, the possessive forms, and words that may be pronounced quite differently than their spelling, appeared as frequent sources of confusion. <u>A lot</u>, the bane of English teachers, is almost always misspelled as <u>alot</u>. <u>Part-time</u> was most often misspelled as <u>part time</u>, leaving out the hyphen, and secondly as <u>parttime</u>. <u>Full-time</u> was most often misspelled as <u>full time</u>, leaving out the hyphen, and secondly as <u>fulltime</u>. <u>Man's</u> was most often misspelled as <u>mans</u>. <u>Probably</u> may have a variety of pronunciations which lead to variant spellings, the most frequent of which were <u>probaly</u> and <u>probly</u>.

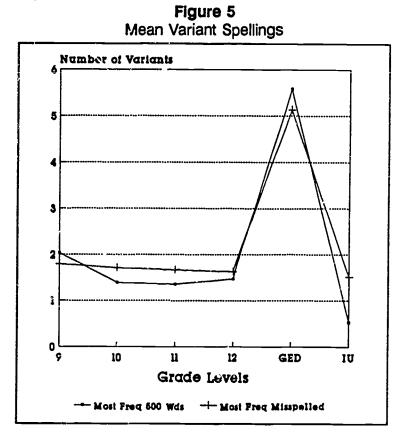

73

Spelling Variations

The mean number of variants for the misspelled words provides another look at the spelling of these writers. By the high school and college level, the numbers of variant spellings has dropped. One assumes that writers are surer of what the possible spellings are and so produce fewer variants. Figure 5 demonstrates the substantial differences between the GED writers and all the other writers in terms of variations in spelling. The GED writers average about three times as many variant spellings as the high school writers and nearly six times as many as the IU students. For example, in the spelling of the word <u>sesame</u>, an example of a word which is not frequently written, the GED writers used 35 variant spellings for <u>sesame</u> while the grade twelve writers had only one, and the IU students only wrote it correctly. <u>People</u>, a very frequently written word, is never lower on our lists of rnost frequent words than 20th. At grade nine there are 13 variants, at grades ten and eleven 8 variants, while the IU group had orly 2 variants.

One possible interpretation would suggest that this wide number of possibilities for the GED writers indicates that writing for them often involves choices and attention at a letter by letter level, possibly replacing attention which might have been focused on the writers' message. Alternatively, perhaps the GED writers are risk-takers who try to spell to communicate while IU students avoided words they are not sure how to spell. An examination of the word lists with attention to the number of variants provides insights into this aspect of correctness.

Another look at the relative correctness of the Indiana University writers and the GED writers is provided by a comparison of the proportions of words which were always spelled correctly, words which were always spelled incorrectly, and words

4ى

spelled both correctly and incorrectly. Difficulty in spelling some words persists as is demonstrated by the small (just 4 percent) but documented percentage of words the IU writers consistently misspelled. On the other hand, the GED writers spelled 13 percent incorrectly every time they attempted to write them; therefore, the GED writers had three times as many words which were never written correctly as the Indiana University writers (see Table 21).

Both Correctly and Incorrectly					
	IU N (%)	GED N (%)			
Total Words Always Spelled Correctly	5,881 (87)	5,474 (57)			
Total Words Always Spelled Incorrectly	288 (4)	1,280 (13)			
Total Words Spelled Both Correctly & Incorrectly	580 (9)	2,922 (30)			
Total Words	6,749	9,676			

Table 21

Proportion of Words Always Spelled Correctly, Always Spelled Incorrectly, and Spelled

We can conclude that the samples in this study demonstrate that correctness of spelling continues to increase through high school, is higher for students sampled at Indiana University, and is much lower for the GED writers. The GED writers often have had some interruption in the usual flow of schooling. They may not have been writing as consistently as the others sampled here. In any case, the GED writing samples contrast sharply with the high school and university writing samples. Differences between these groups may be attributable to the different ability levels of each group. The IU students represent the top half of the group, the GED test-takers may

represent a below average group, and the high school seniors represents a broad cross-section of students.

LIMITATIONS

During the course of both the elementary and secondary phases of this study some limitations have emerged. Several are related to the writing process itself. Others relate to the specific kinds of writing that are the basis of the study and the conditions under which the writing took place.

Writing Samples

The writing samples were gathered from students across the country and were analyzed as products. Consequently, although there were many occasions when the readers wished they could ask the writer what was meant in a passage, they were unable to directly question the writer about his/her intentions. For example, proof readers did not know whether unusual names were misspelled names, names made up by the writer and "correct" as we read them, or unusual, but actual names.

Handwritir , poses another complication when the writer is inaccessible. While some of the writing is clear and fairly easy to interpret, other samples pose substantial difficulty in judging whether the writer actually misspelled a word or whether we have simply misinterpreted the letters based on poor letter formation. The proofreaders noted that reading the students' handwriting brought back memories of strategies they had used to protect themselves from making errors: making a word illegible if uncertain of the correct spelling, using ambiguously spaced apostrophes in contractions and possessives, marking faint hyphens and apostrophes when uncertain

66

if they are needed, and breaking compound words at the end of the line when unclear whether the word should be one word or hyphenated. All of these strategies have resulted in decisions which may or may not reflect what the writer knew about spelling and usage. We had no way to represent the flexibility of handwriting as we entered the essays into the computer. Although we were only infrequently hampered by the constraints of the keyboard, we cannot say our data represent every orthographic intention in every writing sample.

Assessments

The samples in this study were all written in response to carefully designed prompts and gathered under test conditions. This kind of writing adds strengths to the study, such as: inclusion of students who were very good, average and poor writers; samples collected from students under known conditions and scored by a system for which there was known reliability and validity; student writers motivated by the test conditions to do their best writing within the time limitations; and samples from students across the country in a nationally representative sample. However, as assessment writing, the data does not encompass the wide range of formal writing which takes place inside and outside of school, such as the personal correspondence of earlier studies (Horn, 1926). Test conditions may impose restrictions on the words that students choose to write if they are trying to avoid spelling errors. Spelling avoidance has been difficult to document and remains a source of ambiguity in the development of vocabulary lists (Farr, Beverstock, & Robbins, 1988).

67

Additionally, the words written were obviously prompted by the specific writing prompts. These prompt-specific words might well not appear with the same frequency if those prompts had not been the basis of the writing. For example, a picture prompt which shows people in an employment office requires the use of such words as <u>part-time job</u>, <u>application</u>, and <u>experience</u>. These words would not be unusual for students to write, but may be more heavily represented because the writing was in response to that prompt. This limits the ability to generalize frequencies of the vocabulary most elicited by the writing task. Because of the topic constraint, students also may h² been limited in the use of other words which might have occurred had they been writing on subjects of their own choosing. These concerns are partially compensated for, however, by our interest in percentages of misspellings of particular words. We are less interested, for example, in the frequency of the word experience than in the proportion of instances in which students misspelled the word.

Although this study is distinguished for its use of samples which have all been scored holistically, there are differences in the scoring protocols among some of the various assessments. This has been partially accounted for by assigning standard score equivalents for the assessments, but differences remain in weighting in the scoring. For instance, and most germane to this study, the Texas TEAMS scoring protocol seemed to place greater emphasis on spelling accuracy than did the MAT samples. Thus, samples with poorer spelling received lower scores on the TEAMS than they might have on the MAT. However, all scoring procedures indicated an expectation of reasonably conventional spelling as a trait of good writing.

68

The writers had different amounts of time to write the samples, ranging from 20 minutes for the MAT (73% of total samples) to 45 minutes for the GED/IU, and the TEAMS tests were untimed. This obviously means that the samples are not directly comparable on the basis of the amount of time the students had to write.

Error Count

Each occurrence of a misspelling is counted as an error. A writer whose only error was writing <u>base ball</u> instead of <u>baseball</u> 11 times in the essay would be counted as having milde 11 errors instead of one. Also, the totals include these multiple occurrences without distinguishing whether eleven writers made the error once or one writer misspelled a word eleven times. The complete nature of our data base will make further analysis of the error distributions possible.

<u>Time Span</u>

The writing samples were written from the fall of 1934 to the fall of 1988, representing a four-year span of time. The sample represents that span of time, rather than a single administration of an assessment.
