Elementary and Secondary Education OERI position or policy.

In a recent nationwide assessment, over 80 parcent of 11th graders could interpret scientific data and make inferences about outcomes of experimental procedures. However, only 8 percent could draw conclusions using knowledge from the physical sciences and could apply the principles of genetics ( /ndicator 1:4 ).

In an international assessment of performance in science and mathematics in six countrie the 13 -year-old students in the United States were in the lowest performing group in both areas. In both science and mathematics, performance of U.S. sludents was significantly below that of students in Korea, Spain, anci the United Kingdom ( Indicators 1:3 and 1:5).

In 1987, significantly more high schooi graduates of all racial/ethnic groups earned four credits of English and three credits in social studies, mathematics, and science than in 1982 (/ndicator 1:8).

Nationally, about one out of every four 18and 19 -year-olds has not completed high school ( Indicator 1:9).

Those who are 20-24 years old who do not complete high school have signifi-
canily higher rates of unemployment than those in the same age group who have completed high school. White and Hispanic dropouts have Iower unemployment rates than black high school graduates ( Indicator 1:12).

The purchasing power of teachers' salaries was the highest in 30 years (Indicator 1:17).

Enrollment in public elementary schools began to increase in 1985 and is projected to continue rising through 1997. Enrollments, however, are not expected to reach the record highs attained in the 1970s ( Indicator 1:21).

Between 1976 and 1986, minority enrollment in public schools increased from 24 percent to 30 percent ( Indicator 1:22).

Cocaine use among high school seniors dropped significantly in 1988, for the second consecutive year. At the same time, alcohol use remained high, despite declines since 1979. In 1988, about two of every three seniors reported using alcohol in the month preceding the survey ( Indicator 1:25).

# THE CONDITION OF EDUCATION 1989

Sharon K. Horn
Acting Director
National Center for Education Statistics"The purpose of the Center shall be to collect, andanalyze, and disseminate statistics and other datarelated to education in the United States and in othernations."-Section 406(b) of the General EducationProvisions Act, as amended ( 20 U.S.C. 1221e-1).

## Commissioner's Statement

The Nationai Center for Education Statistics (NCES) gathers and publishes information on the status and progress of education in the United States. The Federal authorization (enacted in 1974 but with antecedents to 1867) for these activities states that the Center will "collect, collate, and from time to time, report full and complete statistics on the condition of education in the United States" (section 406 (b) (1) of the General Education Provisions Act). This legislation mandated an annual statistical report from the Secretary of Education on the subject. In 1988, the Hawkins-Stafford Elementary/Secondary School Improvement Amendments (Public Law 100-297, amending section 406 (d)(1)(C) of the General Education Provisions Act) changed that reporting responsibility to be that of the Commissioner of Education Statistics.

This year, as in 1988, the "indicators"-key data that measure the health of education, monitor important developments, and show trends in major aspects of education-are published in three volumes. The Condition of Education report encompasses the first two volumes, the first addressing elementary and secondary education and the second, postsecondary education. The third volume, 1989 Education Indicators, includes the text, tables, and graphs from the first two volumes, plus the technical supporting data, supplemental information, and data sources.
NCES began presenting statistical information as education indicators with the 1986 edition of The Condition of Education. Since then, the indicators have been developed through studies carried out by the Center as well as from surveys conducted elsewhere, both within and outside the Federal Government. Although indicators may be simple statistics, more often they are analyses-examining relationships; showing changes over time; comparing or contrasting subpopulations, regions, or States; or studying characteristics of students from different backgrounds. Data used for these indicators are the most valid and representative education statistics available in America today for the subjects and issues with which they deal.
Not all $f$ :ossible indicators are published in a given edition. No more than a total of $40-50$ indicators is presented in each year's repori. By contrast, the Center's other major annual compendium, the Digest of Education Statistics, includes more than 300 statistical tables, plus figures and appendices. The indicators, therefore, represent a consensus of professional judgment on the most significant national measures of the condition and progress of education at this time, but tempered, necessarily, ty the availability of current and valid information. The indicators reflect a basic core that can be repeated with updated information every year and supplemented by a more limited set of indicators based on infrequent or one-time studies.

Those indicators in the elementary and secondary education volume derive more from comprehensive data collected over time, while t.iose in the postsecondary volume are based on more recently developed data, reflecting a narrower array of topics descrioed by currently available timetrends and nationally representative statistics.

For elementary and secondary education, new indicators include:

- a science indicator from the most recently completed analysis of the National Assessment of Educational Progress;
- indicators on international comparisons of mathematics and science proficiency;
- an indicator on the racial and ethnic composition of elementary/secondary education, based on data from the Office for Civil Rights; and
- an indicator on the number of credits required by States for graduaiion from high school from new data of the Council of Chief State School Officers.

The expanded set of postsecondary indicators presented in 1988 is continued this year with selected additions. Indicators have been added on degrees awarded by colleges and universities according to the fields of study and gender of students. The National Science Foundation has provided new data on research and development spending by universities and trends in new doctorate recipients' entering universi'y employment.

The concept of education indicators has gained the attention of the U.S. Congress, national organizations, States, and localities. To assist the Center in conceptualizing and developing a set of education indicators most useful to policymakers and researchers, Congress recently mandated that NCES convene a special study panel of experts to "make recommendations concerning the determination of education indicators for study and report" (P.I. 100-297). The Commissioner is to submit the report of the panel to Congress upon completion of its work. NCES expects to revise The Condition of Education to reflect those recommendations. The panel will meet over the coming year. Its conclusions, however, will not greatly influence the 1990 edition of The Condition of Education, but its work could result in major changes beginning in 1991.

In developing indicators, the Cente: has participated in a widening national discussion about the types of measures that are useful in monitoring the progress of education. A number of local education agencies and States, such as California and Connecticut, are monitoring their reform agendas through education indicators. At the national level, the Council of Chiei State School Officers seeks to have consistent reporting by the States on a number of indicators that it hasidentified.

In future editions, the utility of this report should increase as more diverse, high quality data become available, especially as new time series can be constructed. Elementary and secondary education data will be enhanced by revisions in the basic data coliected about public schools in the Common Core of Data survey and by the results from the Schools and Staffing Survey (SASS), which covers both public and private schools. Some data from the first SASS are expected to be analyzed in time for the 1990 edition.

Data collection from more postsecondary institutions than the traditional, accredited 2 - and 4 -year colleges and universities has already begun. This expanded system, called the Integrated Postsecondary Education Data System (IPEDS), also includes information from nonaccredited institutions whether they are public or private, 4-year, 2-year, or less-than-2-year. Information from this broader group of institutions will provide a much clearer picture of what is happening in the full scope of postsecondary education.

Finally, the format of The Condition of Education is designed to present statistical information in an accessible manner for a general audience. As in the 1988 edition, the one-page narrative style is followed by an illustrative chart. The tables supporting each narrative and chart are placed in an appendix.
I hope you find the material helpful and invite you to send us comments on how to make future editions even more useful.

Emerson J. Elliott Acting Commissioner of Education Statistics

## Acknowledgments

The Condition of Education was prepared in the National Center for Education Statistics (NCES), Office of Educational Research and Improvement (OERI), by the Indicators and Multilevel Studies Branch of the Crosscutting Education Statistics and Analysis Division under the general supervision of Jeanne E. Griffith, Acting Division Director.

Curtis O. Baker, Acting Chief of the Indicators and Multilevel Studies Branch, coordinated the development and production of this edition after taking over from Carlyle Maw, who is now in the NCES Office of the Chief Statistician. Laurence Ogle, Gayle Rogers, and Mark Schwartz of the branch contributed indicators, both new and updated. Mary Frase was consulted for technical guidance and provided a challenge to improve the readability of the indicators. Brenda Wade helped type the manuscript and assemble the final document.

The staff members of the NCES Compilations, Projections, and Special Studies Branch were especially helpful. As the ones responsible for the preparation of the Digest of Education Statistics, they were a continuing source of advice on the problems associated with various data sets. Thomas Snyder, Charlene Hoffman, and Lisa Avallcie helped with many indicators. Debra Gerald and Paul Horn provided projections data.

Cynthia Hearn Dorfman from Information Services of OERI directed the publication of this edition with help from Lance Ferderer and Kate Dorrell. Phil Carr designed the cover.

From outside the Department of Education, the following people provided help in the collection and interpretation of data: Howard Hayghe, Diane Herz, and Wayne Howe from the Bureau of Labor Statistics; Murray Aborn from the National Science Foundation; and Paul Siegel and Wendy Bruno from the Bureau of the Census.

Several individuals served as invited external peer reviewers. They were: Peter Benson, President, Search, Inc.; Mary Crovo, Chief, Research, Evaluation and Statistical Services, Maryland State Department of Education; James Firnberg, former president of Louisiana State University-Alexandria; Virginia Hodgkinson, Vice President, Independent Sector; Lucie Lapovsky, Director, Division of Finance and Facilities, Maryland Higher Education Commission, Heidi Mahoney, Associate

Vice President for Academic Planning, SUNY College at Fredonia; Diane ScottJones, Associate Professor of Educational Psychology, University of Illinois. Jim Fox from the Office of Research, OERI, also served as a peer reviewer.

Douglas Wright, Office of the Chief Statistician (NCES), provided guidance on statistical interpretat:on and adjudicated the final document.

## Introduction

Since the early 1980s, the country has become increasingly aware of the range of critical issues facing its schools. These issues are nationwide and include problems of declining academic performance, concerns about teacher qualifications and availability, and use of drugs and violence in the schools. The issues have serious implications, not only for effective operation of the schools, but for the future of individual workers, U.S. economic competitiveness, and utimately for the structure and cohesiveness of American society.

The Nation has responded to this situation by renewing its commitment to excellence ineducation. The thrust of this commitment constitutes a major reform movemant, involving government at all levels, school officials and teachers, institutions of higher education, as well as interested parents and cit zens. Reforms include expanded academic programs for students, improved safety programs for the schools, increased requirements for high school graduation, and new approaches to attract better qualified individuals to the teaching profession.
The indicators presented in this volume touch on many issues in elementary and secondary education. They are discussed below under five major headings: (1) school population and support; (2) the teaching profession; (3) school environment; (4) student academic performance; and (5) transitions.

## School Pepulation and Support

Changes in the size and characteristics of the school population create a context for demands that will be placed on educational institutions. While private school enrollment has changed little during the 1980s (Indicator 1:20), enrollment in the public schools has begun to rise slightly at the elementary level after declines in the 1970s. Secondary enrollment is expected to decline somewhat until about 1990 and then begin to increase again. However, neither level of enrollment is expected to reach the levels of the early 1970 s before the end of the 1990s (Indicator 1:21). The proportion of minority students in the public schools rose to almost 30 percent in 1986, up from 24 percent in 1976 (/ndicator 1:22). At the same time that minority enrollment has increased, special education enrollment has also increased (Indicator 1:23).

While total enrollment has been stable or declining, the balance among sources of financial support for public schools has been changing. Until 1979, local jurisdictions provided the largest share of funds to operate public schools. Since 1979, States have provided the most funds, reaching 50 percent in 1987. Federal funds that accounted for almost 10 percent of this support in 1980 declined to 6 percent by 1987 (Indicator 7: 13).

The total level of effort (including Federal, State, and local) to provide resources for public schools-a measure linking revenues per pupil to per capita income-has shown a long-term increase, although it has leveled off recently. The index of this effort increased by more than 70 percent from 1950 to 1986 and has remained at the same level since then (/ndicator 1:15). This increasing effort to pay for education has contributed to a continuing increase in current expenditure per pupil, which reached $\$ 3,977$ in 1986-87 (/ndicator 1:14). Closely associated with the increasing per pupil expenditure has been a reduction in the ratio of pupils per teacher. Since 1959-60, pupil/teacher ratios have declined by 32 percent at the elementary school level and 29 percent at the secondarylevel (/ndicator 1:18).

## The Teaching Profession

Teachers are vital to an educational system. However, since 1959-60, the proportion of classroom teachers has declined fiom 65 percent to 53 percent of the total staff (Indicator 1:16). There is an expected demand for increasing numbers of new secondary school teachers through 1995 (/ndicator 1:19). At the same time, States are imposing greater requirements of the teachers who may be hired by local school districts. As of 1988, 46 States require prospective teachers to pass some form of test prior to certification, and many States require a test at more than one of the following points: admission to teacher education, exit from teacher education, or just prior to initial certification (/ndicator 1:30). Increasing teacher salaries may improve recruiting efforts. Teacher salaries are now 76 percent higher than they were in 1980, in current dollar terms. In constant dollars, in 1988, they exceeded the previous high average that was in 1973 (/ndicator 1:17).

## School Environment

Adequate resources and good teachers are essential to good schools, but they are not sufficient. A safe, undisturbed setting with students in it who are ready to learn is
also necessary. Students in schools with numerous problems (such as student absenteeism, high teacher turnover, low standards for students, and vandalism) had lower reading scores than students in schools with fewer problems (Indicator 1:26). Disruptive behavior, one of the factors that can hinder learning, has increased over the past 5 years, according to teachers (Indicator 1:24), while drug and alcohol use has declined in recent years (Indicator 1:25). Teachers have identified two factors, outside of the schools' control, as major causes of students' difficulties in school: children's being left on their own after school and family poverty (Indicator 1:28). Despite the apparent concern about the school environment, the public's ratings of the public schools have not changed significantly in recent years (Indicator 1:27).

## Student Academic Performance

The academic performance of students, as measured by standardized tests, shows that students cannot perform many ordinary tasks. Only a smail portion of 17-yearolds perform at the highest proficiency levels. Where trend data are available, overail performance of U.S. students is not changing significantly. In fact, in comparison to students in other countries, U.S. students' performance is significantly lower in mathematics and science than that of students in most of the other countries tested (Indicators 1:3 and 1:5). While the gap between white and black and Hispanic student performance has been reduced, it remains significant. In the most fundamental area, reading, few students even in the 11t'i grade can defend their judgments and interpretations about what they read (/ndicator 1:1). Similar deficiencies show up in mathematics and science, where performance has been low for more than 10 years and has improved very little (Indicator 1:2 and 1:4). In the areas of U.S. history and literature, results are mixed. While students are familiar with early American history and she Bible, they show little familiarity with either recent U.S. history or literature (Indicator 1:6).

Scores on the ACT and SAT have remained low, but appear to have stopped declining since the early 1980s (Indicator 1:10). Students from private schools, especially nonsectarian ones, outperform those from public schools (Indicator 1:11).

The proportion of high school graduates completing the amount of "new basics" recommended by the National Commission on Excellence in Education in 1983 increased from 13 percent to almost 30 percent between 1982 and 1987 (Indicator 1:8). Only in requiring 4 years of English do more than 50 percent of the States require as many credits for graduation as recommended by the National Commission
on Excellence in Education. However, a total of 19 States now require the passing of a competency test for a high school diploma (/ndicator 1:29).

## Transitions

The percentage of 18-and 19-year-olds who have completed high school seems to have stabilized at around 75 percent (Indicator 1:9). The attainment of a high schoul diploma still has a positive economic impact. Unemployment rates for high school graduates (aged 20-24) are significantly lower than for high school dropouts. However, the unemployment rate for black high school graduates in this age group (20-24) continues to exceed that of white and Hispanic dropouts (Indicator 1:12).

## Conclusion

The school systems throughout the Nation face the formidable challenges of improving students' performance and coping with the changing social and economic environment. Current student performance may be insufficient to meet the demands that will be placed on them as they move to higher levels of schooling or into the workplace. Performance levels are changing very slowly despite increases in graduation requirements, relatively stable enrollments, substantial increases in teacher salaries, and the continued willingness of the public to support its schools.

The social and economic settings also confront schools with considerable problems. Poverty of students' families and drug and alcohol abuse continue to plague schools, but are outside of schools' abilities to control. In the near future, enroilment increases will raise the overall demand for new secondary teachers. The student body will become increasingly minority, and a substantial portion of that student body will not be native English-speaking.

Recent educational reforms have been instituted in response to some of these problems. The impact of these changes does not yet appear in national data. Taken together, these indicators point to the 1990s as a time of major testing for schools as demands intensify for a better educated work force that will enaible U.S. industry to face increasing competition from abroad.

## Indicators of Elementary and Secondary Education

22

## A. Outcomes: Student Performance

## Yndicator 1:1 Reading performance in grades 3, 7, and 11

- Average reading proficiency continues to be lower for black and Hispanic students than for white s!udents at all grade levels assessed.
- Students at all grade levels had particular difficulty with tasks that required them to elaborate upon or defend their judgments and interpretations about what they had read.

Reading skills are considered basic to the education process. So when some students lag in their reading achievement, they may find it hard to participate effectively in an economy requiring increasingly sophisticated job skills.
The National Assessment for Educational Progress (NAEP) * in 1986 tested the reading performance of various groups in grades 3,7 , and 11 of public and private schools and found it to be uneven. Specifically, black and Hispanic students performed at levels below those of white students. NAEP also found that 11 th graders in an academic curriculum had higher reading scores than those in general or vocational programs, and that black and Hispanic students were less likely io be in academic programs than white students.

The study also assessed students'ability to read, think, and write. Results indicated that while the Nation's students had the skills to derive a surface understanding of what they had read, they had difficulty when asked to defend or elaborate upon this surface understarding. NAEP evaluated responses according to their complexity. For example, about 80 percent of the third graders wrote "inadequate" or "minimal" responses to a story task, and only 18 percent produced a "satisfactory" response. Although the 11th graders performed with greater success, 36 percent wrote "inadequate" or "minimal" responses, and 22 percent wrote "elaborated" responses.

Chart 1:1 Average reading proficiency, by race and ethnicity: 1986

NOTE. The rarize of tra reading proiticiency scate was from 0 to 100. The average scores by grade were 38.1 for grade 3, 48.9 for grade 7, and 56.1 for grade 11.

SOURCE: National Assessment of Educational Progress, 1988.

## A. Outcomes: Student Performance

Indicator 1:2 Trends in mathematics performance of 9-, 13-, and 17-year-olds

- In 1986, mathematics proficiency of 17-year-olds was no higher than in 1973, but was slightly higher than in 1982.
- Between 1978 and 1986, 9- and 13-year-olds improved their mathematics performance slightly.
- Wille mathematics performance has improved, it remains low. Improvements occurred at the lower levels of the mathematics proficiency scale: even at age 17, 49 percent of students were unable to perform moderately complex procedures.

Poc: performance in mathemathics has been a national concern since the late 1960 s , when the National Assessmerit of Educational Progress (NAEP) began periodically assessing students' krowledge, skills, and attitudes. During a time when science and technology-which depend on mathematics-have played an increasingly important role in the Nation's economy and national security, mathematics scores have remained low.

Results from the 1985 NAEP Mathematics Assessment show a slight upturn ir, the mathematics performance of 17-year-olds compared to 1982.* Between 1978 and 1986, some improvement occurred among 9 - and 13 -year-olds. At all three agos, the improvements occurred in lower-level skills involving routine computations and measuroment problems but not in more complex procedures and analytical problemsolving.

Average mathematics achie'ement remains low for all three age groups. Over 25 persent or 13 -year-olds and 4 percent of 17 -year-olds were unable to perform at the 250 level cif tre mathematics scale that involves the four basic operations (addition, subtraction, multiplication, and division), one-step p. Jblem solving, and comparing information from graphs and charts. Only 6 percent of 17 -year-olds scored at the level involving multistep problem solving and algebra ( 350 scale level).

[^2]
## Chart 1:2 Trends in average mathematics proficiency

Mathematics proficiency scale

NOTE: Mathematics Proficiency Scale
Level $150=$ Simple arithmetic facts
Level $200=$ Beginning skills and understanding
Level $250=$ Basic operations and beginning problem solving
Level $300=$ Moderately complex procedures and reasoning
Level $350=$ Multistep problem solving and algebra.
SOURCE: National Assessment of Educational Progress, The Mathematics Report Card: Are We Measuring Up?, 1988.

## A. Outcomes: Student Performance

## Indicator 1:3 International comparisons of mathematics performance

- In the first International Assessment of Educational Progress, 13-year-olds from the United States scored in the lowest group in mathematics proficiency.

The mathematics abilities of students are important indicators of the results of schooling. In an increasingly technological world, mathematics skills of a nation's workers may be a crusial element of competitiveness. Workers with better mathematics skills may well be more productive workers.

Inthe first International Assessment of Educational Progress, 13-year-olds from the Urited States and 5 other countries (Canada, Ireland, Korea, the United Kingdom, and Spain) were assessed in a standardized fashion in mathematics proficiency. In mathematics, the results found four groups of students significantly different from one another. Students in the United States were in the lowest scoring group.

The mathematics proficiency of students in Korea was significantly higher than that of students in any of the other countries. At least one of the seven * different Canadian subgroups (in four provinces) was found in every proficiency group, except the top one. Spain, the United Kingdom, and the Republic of Ireland were in the third highest group.

The assessment war o'ssigned to examine abilities of students measured on a scale from 0 to 1000 , with a mean of 500 . At the 500 level on the scale, students could solve two-step mathematical problems. Students in the United States ranked very low in the percentages of 13 -year-olds abie to perform at this level. While 78 percent of Korean students could perform at this level, only 40 percent of those in the United States could do so.

[^3]Chart 1:3 Average mathematics proficiency of 13-year-old students in six countries: 1988

Country

* New Brunswick (English) is the median group of seven groups assessed in four Canadian provinces.

NOTE. Differences in performance among the four groups shown are statistically significant at the 0.05 level; differences within groups are not statistically significant.
Skills characteristic of different levels on the mathematics scale:
Level $300=$ Simple addition and subtraction
Level $400=$ Basic operations to solve simple problems
Level $500=$ Intermediate level skills to solve two -step problems
Level $600=$ Measurement and geometry concepts to solve more complex problems
Level $700=$ More advanced mathematical concepts.

## A. Outcomes: Student Performance

## Indicator 1:4 Trends in science performance of 9-, 13-, and 17-year-olds

- Between 1982 and 1986, 17-year-olds slightly improved their science performanse.
- While science performance scores have risen, they remain low; most students, even at age 17, were unable to perform at the upper levels of ihe scale.

Declining test scores in science have been an educational concern since the late 1960s when the National Assessment of Educational Progress (NAEP) began periodically assessing students' knowledge, skills, and attitudes. During this period, students' proficiency in science has remained low. Yet, scientific capability is considered vital to our national defense and economic competitiveness.

Results from the 1986 NAEP Science Assessment show an upturn in the average science performance of 17-year-old students when compared with 1982.* Among 9 -year-olds, there was some significant improvement over 1977. In 1986, there was no improvement in performance at the highest level by any age group compared to the 1982 assessmient.

Average science achievement scores for all three age groups remain low. The ability to apply scientific information, interpret data, and make inferences about outcomes of experimental procedures was exhibited by 28 percent of 9 -year-olds, 53 percent of 13 -year-olds, and 81 percent of 17 -year-olds. However, only 8 percent of 17-year-olds could integrate specialized scientific information, infer relationships, and draw conclusions using knowledge from the physical sciences and applying principles of genetics.

[^4]
## Chart 1:4 Trends in average science $r$ ficiency of 9-, 13-, and 17-year-olds: Selected years 1970-1986

Science proficiency scale

*While 9. and 13 -year-olds were assessed in the spring of 1970, 17-year-olds were assessed in the spring of 1969.

NOTE: Science Proficiency Scale
Level $150=$ Knows everyday science facts
Level $200=$ Understands simple scientific principles
Level $250=$ Applies basic scientific information
Level $300=$ Analyzes scientific procedures and data
Level $350=$ Integrates specialized scientific information.

## A. Outcomes: Student Performance

Indicator 1:5 International comparisons of science performance

- The science proficiency of U.S. students was well below the mean on the first International Assessment of Educational Progress.

The United States is in an increasingly competitive international economic climate. In such a world, the scientific capabilities of U.S. workers may indicate how competitive the country might be in the future.

In the first International inssessment of Educational Progress, 13 -year-olds from the United States and five other countries were assessed in a standardized fashion in science. Average proficiency levels fell into three groups, which were significantly different from one another. Students in the United States were in the lowest scoring group, well below the mean, along with Irish students and two groups of Canadian students.

Students in British Columbia and Korea performed significantly better than students from other countries and provinces. The middle group included students from the United Kingdom, Spain, and four Canadian groups. The assessment was designed to examine abilities of students measured on a scale from 0 to 1000 , with a mean of 500. At the 500 level on the scale, students could use scientific procedures and analyze scientific data. Students in the United States ranked very low in the percentages of 13 -year-olds able to perform at this level. While 72 percent of British Columbian students and 73 percent of Korean students could performat this level, only 42 percent of U.S. students could do so. These results parallel the results of the international mathematics proficiency testing (see Indicator 1:3)

[^5]
## Chart 1:5 Average science proficiency of 13-year-old students in six countries: 1988

Country

- Quebec (French) is the median group of seven groups assessed in four Canadian provinces.

NOTE: Differences in performance among the three groups are statistically significant at the 0.05 level; differences within groups are not statistically signilicant.

Skills characteristic of different levels of proficiency on the science scales:
Level $300=$ Knows everyday science facts
Level $400=$ Understands and applies simple scientific principles
Level $500=$ Uses scientific procedures and analyzes scientific data
Level $600=$ Understands and applies scientific knowledge and principles
Level $700=$ Integrates scientific information and experimental evidence.
SOURCE: International Assessment of Educational Progress, $A$ " orld of Differences, An International Assessment of Mathematics and Science, 1989.

## A. Outcomes: Student Performance

Indicator 1:6 Knowledge of U.S. history and literature

- In 1986, 80 percent or more of U.S. 11th graders had some knowledge of such aspects of history as ploneers in technology, colonial history, economic history, geography, Worid War II, slavery, and the Bill of Rights. Less than 30 percent correctly answered questions dealing with the approximate dates of historical events, recent hlstory, and the women's movement.
- In literature, 80 percent or more of 11th graders could answer questions involving the Bible, Shakespeare, black literature, children's classics, and wellknown American and English literature. Less than 30 percent identified the American and European authors of certaln, mostly modern, literary works.

History and literature transmit and unrich our cultur $\geqslant$ and serve as a basis for communication among literate people. The 1986 assessment in literature and U.S. history is the first major survey of students' knowiedge of specific factual content.
While no absolute standards exist for judging what all students "should" know, the results on specific items included in the assessment provide a profile of student knowledge. In U.S. history, ' 3 out of 20 high school juniors knew that Thomas Edison invented the light bulb, that Alexander Graham Bell invented the telephone, and that George Washington was President between 1780 and 1800 . However, fewer than one out of four knew when Abraham Lincoln was President or that Reconstruction refers to the readmission of the Confederate States to the Union. In literature, more than 9 out of 10 knew that Noah gathered pairs of creatures onto an ark, that Moses led the people out of Egypt and gave the 10 Conmandments, and that Romeo and Juliet's love was hindered by their feuding families. But fewer than one out of four knew that Tennessee Williams wrote A Street Car Named Desire or that Alexis de Tocqueville wrote Democracy in America.

Students enrolled in an academic program performed significantly better than students in a general program or vocational/technical programs. This may be because students in academic programs spend more time in school studying history and literature; moreover, academic students may be more interested in these subjects or may have more innate ability.

[^6]
## Chart 1:6 U.S. history item responses: 1986

Bottom live responses

[^7]
## A. Outcomes: Student Performance

## Indicator 1:7 Computer competence in grades 3, 7, and 11

- In a 1985-86 assessment of computer competence, students In each of grades 3,7 , and 11 generally averaged less than 50 percent correct on the te $3 t$ items.
- Even students who had used a computer, had studled computers in school, or had one at home generally averaged under 50 percent correct.

America's prominence in the world economy and its national security have become tied to computer-based technology. In 1983, the National Commission on Excellence in Education in $A$ Nation at Risk brought increased attention to computer science instruction by recommending it be required of all high school students as part of the "Five New Basics" along with English, mathematics, science, and social studies.

Recognizing the emerging vital importance of computer skills for employment opportunities and productivity, administrators of the National Assessment of Edıcational Progress included an examination of computer competence in three grades in 1986. The students' competence was tested in three areas: (a) computer technology, (b) computer applications (e.g., word processing and graphics), and (c) computer programming. Students generally had difficulty answering questions on the assessment. On the average, 3rd graders could only answer about 3 out of 10 items correctly; 7th graders, 4 out of 10; and 11th graders, fewer than 5 out of 10.* Low scores in using applications and in programming seem to be related to the low frequencies of computer use in most classrooms. For example, about two-thirds of students assessed had never written computer programs. It should be noted that these three areas involve various skills that may be emphasized differently at different schools.

Students who had access to or training on computers answered a higher percentage of items correctly. Specifically, the experiences of having ever used a computer, studying computers in school, and having access to a computer at home are positively related to computer competence. Nevertheless, even the performance of advantaged students averaged less than 50 percent correct.

[^8]

## A. Outcomes: Student Performance

Indicator 1:8 Change in the percent of high school graduates earning credits in "new basics"

- The percent of high school graduates who earned 13 credits or more in "new basics" (English, social studies, mathematics, and science) increased substantially between 1982 and 1987.
- This increase was shared by all racial and ethnic groups.

A major part of the education reform movement has been to encourage students to take, and schools to require, an increased number of basic courses in English, social studies, science, and mathematics. The National Commission on Excellence in Education recommended 4 credits in English, 3 each in social studies, science, and mathematics, 2 in foreign languages, and 0.5 in computer science. This indicator does not include the last two subjects, because many schools do nct have computers for students, and many colleges do not require foreign languages for admission. If the number of students completing these requirements grows, the extent and impact of the current wave of reform will be apparent.

Between 1982 and 1987, the percent of high school graduates who completed 4 credits in English and 3 each in social studies, science, and mathematics more than docisled, from 13 percent to 29 percent. Asians showed the greatest percentage increase, from 21 percent to 48 percent, but no percentage growth of any racial/ ethnic group was lass than 12 percent.

While these increases are significant, they show that a majority of students still do not complete many basir, courses. While Asians continue to outdistance all other groups, blacks and Hispanics lag behind. Unfortunately, these data do not provide any information as to whether the increased credits are accompanied by an increased depth of knowledge and understanding. Also, an increase in the number of credits earned does not necessarily mean a proportional increase in course content.

[^9]Chart 1:8 Percent of high school graduates who earned recommended credits in "nnitiv basics," by racial/ethnic category: 1982 and 1987

NOTE. Recommended credits in "new basics" include 4 credits of English plus 3 each ol social studies, mathematics, and science.

39

## A. Outcomes: Completions

Indicator 1:9 High school completion, by race and ethnicity

- 'rationally, about one out of every four 18-and 19-yeas-olds has not completed high school.
- The proportion of 20- to 24 -year-olds who have completed high srhool has remalned around 84 percent since 1974.
- The proportion of black youths, aged 18 to 19 and aged 20 रo 24 , who have completed high school has increased steadily since 1974.

The public generally expects an 18- or 19-year-old to have a high school diploma or its equivalent, and most do. However, black and Hispanic youth lag behind white youth in this attainment. For example, in 1986, 77 percent of white 18- to 19-yearolds completed secondary school, but only 65 percent of black youth and 55 percent of Hispanic youth in this age group did so.

Many students complete their hig̣h schinol education in their early twenties. For example, the percentage of 20 - to 24 -year-olds who have completed secondary school is about 10 percentage points higher than for 18 - to 19-year-olds. For the two age groups, completion rates were:

| Year | Age: 18-19 |  |  | Age: 20-24 |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | White | Black | Hispanic | White | Black | Hispanic |
|  | Percent of age group |  |  | Percent of ago group |  |  |
| 1974 | 76 | 56 | 49 | 86 | 73 | 59 |
| 1980 | 76 | 59 | 46 | 85 | 74 | 57 |
| 1986 | 77 | 65 | 55 | 85 | 81 | 62 |

In 12 years, the percentage of blacks, both 18-19 and 20-24 years old, who have completed high school has increased considerably. Blacks $20-24$ years old are now almost as likely as whites to have completed high school.

[^10]Chart 1:9 Trends in high school completion rates, by race and Hispanic origin: 1974-1986

NOTE: Hispanics may be of any race.
SOURCE: Bureau of the Census, Current Population Reports.

## Indicator 1:10 College entrance examination scores

- After years of decline, Schclastic Aptitude Test (SAT) scores began rising in 1982. Scores have remained stable since 1985.
- ACT scores in English, social studies, and mathematics show a somewhat steady decline from 1970 to 1980. Mathematics continued to decline through 1983, while English and social studies stabilized. From 1970 to 1983, scores in the natural sciences remained relatively stable. Since 1983, scores in all areas have shown slight increases.

The Scholastic Aptitude Test (SAT) and the American College Testing Program Assessment (ACT) are the tests taken most frequently by college-bound students. Both are designed to predict success in the freshman year in college. The SAT tests general verbal and quantitative skills, while the ACT is more subject-matter oriented.

From 1963 to 1980, the general trend in average SAT scores for mathematics, verbal, and total (mathematics plus verbal) was downward, with most of the decline occurring prior to 1976. There was some improvement in scores between 1982 and 1985, with little change since then.

Trends for the ACT since 1970 are similar to the SAT. There was a period of decline in the 1970s, slight increases in the early 1980s and a somewhat stable performance pattern since the mid-1980s. The composite score, an arithmetical average of the 4 tests, shows periods of minor increases and decreases since 1976.

It is to be noted that the mix and percentage of students from the senior class taking these standardized tests have !'uctuated over time and could impact on level of scores over time.

[^11]
## Chart 1:10 Trends in college entrance examination scores

SOURCE: College Entrance Examination Board
Average ACT scores

SOURCE: American College Testing Program

## A. Outcomes: Completions

## Indicator 1:11 Scholastic Aptitude Test (SAT) scores, by control of high school

- In 1988, the mean verbal SAT score for students in independent schools was 30 points higher than for students in religiousiy affiliated schools and 44 points higher than for those in public schools.
- In 1988, the mean mathematics SAT score for students in independent schools was 47 points higher than for students in religiously affilated schools and 41 points higher than for those in public schools.

SAT scores have been watched for years as indicative of trends in high school graduates' abilities in mathematics and verbal skills. Because of the changing mix, by ability and ethnicity, of students taking these tests, definitive conclusions cannot be drawn on whether students with similar backgrounds perform better or worse now than in the past. Differences between the scores of public and private school students, however, may indicate an area for further analysis.
Public and private secondary schools differ in SAT scores for college-bound seniors. There also are differences between types of private schools. Prior to 1987, private schools were reported in a single category. Beginning in 1987, private schools were reported in two categories, "independent" and "religiously affiliated", which resulted in a more differentiated picture of SAT performance for public and private . schools.

From 1982 to 1985, public and private school students' mean mathematics SAT scores were comparable. During the same time period, the mean verbal SAT score of private school students was typically 14 points higher than that of public scnool students.
The following table shows the performance patterns in 1988 for public, religiously afiiliated, andindependent school students on SAT verbal (V) and mathematics (M) tests and their differences from the national mean.

|  | Mean |  | Mean (difference from national mean) |  |  |
| :--- | :---: | :--- | :--- | :--- | :--- |
|  | National |  | Fublic | Religiously <br> affiliated | Independent |
| V | 428 |  | $426(-2)$ | $440(+12)$ | $470(+42)$ |
| $M$ | 476 |  | $476(0)$ | $470(-6)$ | $517(+41)$ |

[^12]Chart 1:11 Mean verbal and math SAT, by control of high school: 1982-1988

NOTE: $A_{;}$of 1987, private is reported as religiously affiliated or independent.

Indicator 1:12 Unemployment rates of high school graduates and high school dropouts, 20-24 years old

- High school dropouts tend to have higher unemployment rates than high school graauates.
- Unemployment rates of blacks are much higher than rates of whites or Hispanics, whether dropouts or graduates.

Students are regularly urged to complete high school, partly because of the undesirable economic consequences of dropping out for both the individual and society. Recent Federal legislation has re-emphasized concern about oropouts by providing funding for dropout prevention programs.

For young adults, those who have dropped out of high school are more likely to be unemployed than those who completed high school. Since 1983, high school dropouts, aged 20-24, have had unemploynient rates 10-14 percentage points higher than those of graduates. Clearly, dropouts have not shared in the strong job mar!iet of recent years.

Unemployment rates vary significantly by race and ethnicity. A far greater proportion of blacks is unemployed than whites and Hispanics, whether dropouts or graduates. Black graduates $20-24$ years old have unemployment rates similar to those of white dropouts in this age group. For Hispanics, the unemployment rate of dropouts was not significantly cifferent from that for graduates in 1988, but the rate had been significant in every year between 1383 and 1987. Looking orly at unemployment rates may hide the fact that many of the indiviauals in eaci of these groups may be in relatively low paying jobs.

[^13]Chart 1:12 Unemployment rates of high school graduates and high school dropouts, by race and ethnicity: March 1983-March 1988

B. Resources

## B. Resources: Fiscal Resources

## Indicator 1:13 Public school revenues

- Since 1920, State and local governments have been the primary source of revenues for public elementary and secondary education; the Federal share has remained small.
- In 1979, an historic shift occurred when the States' share of revenues rose above the locals' share for the first time.
- Between the 1969-70 and 1986-87 school years, the State share of total revenues rose from about 40 percent to about 50 percent, the local share dropped from about 52 percent to about 44 percent, and the Federal share dropped from 8 percent to about 6 percent.

Public schools obtain revenues from three principal sources: local, State, and Federal governments. The share that each contributes is determined by many factors, including the public's perception of the role of various levels of government; the extent to which taxes are raised by various levels; the size of various tax bases; and the competing demands on tax revenues at various leveis. Historically, local governments have been limited primarily to property taxes and State grants as a basis for raising funds. In recent years, voters in some States have limited the use of property taxes to generate additional funds (e.g., Proposition 13 in California). By comparison, most Stategovernments use both the sales tax and income tax as revenueraising vehicles. Recently, some States have earmarked a percentage of the revenue from State Iotteries for education.

From school year 1919-20 through school year 1973-74, local governments provided more than 50 percent of all revenues for local elementary and secondary schools. Reflecting school finance reform efforts, iricluding court cases, by the 1978-79 school year, more funds were provided by State governments than any other source.

Since the 1978-79 schooi year, the percent contributed by State governments has continued to rise, but more slowly than in much of the 1970s. In the 1986-87 school year, the State governments' contribution was comparable to the combined contribution from local and Federal governments. The percent for each State government's contribution, however, may vary considerably from the total State governments' contribution of 49.8 percent in 1987.

SOURCE: National Center for Education Statistics. Digest of Education Siatistice, 1988.

50

## B. Resources: Fiscal Resources

Indicator 1:14 Expenditure per pupil in public schools

- Between the 1949-50 and 1986-87 school years, current expenditure per pupil in constant dollars almost quadrupled, from $\$ 982$ to $\$ 3,977$ per pupil.
- Between 1977-78 and 1981-82, current expenditure per pupil in constant dollars remained relatively unchanged, but tt $\boldsymbol{7}$ began rising from 1982-83 to 1986-87.

One frequently used measure of financial resources available to public schools is per pupil expenditure. This measure is the ratio of expenditures for education to average daily attendance. Data on trends in per pupil expenditure provide information to policymakers at all levels of government on the overall availability of resources. However, they do not provide information about individual school district expenditures, the quality or type of resources provided. or their impact on the learning process.
Current expenditure includes spending for operating local public schools, inciuding such items as salaries, fixed charges, student transportation, books and materials, and energy costs. Excluded are long-term expenses of capital outlay and interest on school debt, as well as community service. Total expenditure includes current expenditure plus these long-term expenses. Total and current expenditure may be expressed in both current arid constant dollars, the latter adjusted for inflation.*
In constant dollais, current expenditure has grown at a faster rate than total expenditure, 305 versus 259 percent between school years 1949-50 and 1986-87, respectively. The growth rate of current expenditure, however, was not uniform. After rising steadily from 1949-50 to 1977-78, per pupil expenditure in constant dollars leveled off and remained relatively unchanged until 1982-83, when it began rising once again. (See Indicator 1:21 for public school enrollment from 1972).
Trends in current expenditure per pupil vary wideiy from State to State and may not necessarily reflect national patterns. While current expenditure per pupil in the United States rose almost 66 percent in constant dollars between school years 1969-70 and 1986-87, State-level percentage increases varied during the same period from 142 percent (Alaska) to 31 percent (Utah).

[^15]Chart 1:14 Trends in current expenditure per pupil in average daily attendance in public schools: Selected school years ending 1950-1987

NOTE: Plotted years: even, 1950-1976; all, 1977-1987.
SOURCE' National Center for Education Statistics, Statistics of State School Systoms and Revenues and Expenditures for Public Elementary and Secondary Education, Common Core of Data survey.

## B. Rescis s: Fiscal Resources

Indicator 1:15 National index of public school revenues per pupil in relation to per capita income

- The national index gauging per pupil revenues in relationship to per capita income has risen 64 percent since school year ending 1940.
- The national index fell 1 point between school years 1981 and 1982, but overall has risen 2 points since schcol year ending 1982.

Countries often report the percent of GNP devoted to education as a measure of fiscal resources going to education. The national index presented here is a refinement of that approach. The numerator is revenues per pupil,* a measure of the resources or services accorded the typical pupil. The denominator is income per capita, a measure of the typical taxpayer's ability to pay. Therefore, the index refiects what is spent on the typical student relative to the typical taxpayer's ability to pay.
Four factors make up this index: 1) the number of pupils enrolled in public schools, 2) public education revenues, 3) total personal income, arid 4) the total population. Between school years 1940 and 1988, the national index has risen 64 percent. This indicates that 64 percent more funds were available per student in 1987-88 in relation to per capita income than in 1939-40.
Changes over time in the overall index can be due to circumstances affecting any of the four factors. An increase in the index means either that per pupil revenues have grown relative to ability to pay, or that per capita income has declined relative to revenues per pupil. Conversely, a decline in the index demonstrates either that the resources accorded the typical pupil have declined relative to per capita income or that ability to pay has increased relative to per pupil revenues.

[^16]Per pupil education revenues
Per capita income
$\frac{\frac{\text { REV }}{\text { ENR }}}{\frac{\text { INC }}{\text { POP }}} \times 100$

NOTE. This formula does not include private school enrollments or revenues, nor does it take into account other types of suppori of the public schools, such as volunteer work by parents.

## B. Resources: Human Resources

## Indicator 1:16 Staff employed in public school systems

- Between 1959-60 and 1982-83, the proportion of ciassroom teachers has declined from 65 percent to 54 percent of total staff in the public schools.
- Since 1983, the composition of public school staff has changed iittle.

Today's public school systems employ a large number of personnel other than teachers, from district-level administrators io building maintenance workers. Diverse factors may cause the number and categories of staff to change over time. These factors include demographic changes as well as policy decisions at all levels of government. Enamples include: (1) changes in pupil enrollment; (2) changes in the pupil/teacher ratio; (3) changes in legislative requirements; (4) the increased use of different types of instructional personnel; and (5) the addition of noninstructional tasks and responsibilities.

The number and types of staff employed by the public school systems of this country have changed considerably. Between school years 1959-60 and 1987-88, total full-time-equivalent (FTE) staff doubled (from about 2 million to over 4 million). The number of teachers employed grew substantially (from nearly 1.4 million to more than 2.3 million). Despite this growth, the percentage of teachers in relation to the total staff declined during this period from 65 percent to 53 percent.

In school year 1987-88, school systems employed abcut 4.3 million FTE staff. If the number of instructional support staff (instructional aides, guidance counselors, and librarians) is added to the number of classroom teachers, all instructional personnel would account for more than 63 percent of total staff. Administrators and administrative support staff would comprise another 13 percent, while other support staff (including, among others, bus orivers, security officers, and cafeteria workers) would make up the remaining 24 percent.

Over the last 7 years, the percentages of classroom teachers, instructional support, administrators and administrative support, and other support have changed very little. However, during the last 3 years, enrollments have been rising in the elementary schools (see Indicator 1:21). To date, this increase : 1 enrollment has not been matched by a corresponding rise in the percentage of teachers on school staffs.

[^17]55

Chart 1:16 Classroom teachers as a proportion of total publi. school staff: Selected school years ending 1960, 1970, 1981, and 1985-1988

SOURCE: National Center for Education Statistics, Statistics of State School Systems and Digest of Education Statistics, various years.

## B. Resources: Human Resources

Indicator 1:17 Average annual salaries of public school teachers

- Since school year 1980-81, average teacher salaries, adjusted for inflation, have risen almost 19 percent after declining 14 percent between 1972-73 and 1980-81.
- Teacher salaries at both elementary and secondary leveis have risen at about the same rate ( 19 percent and 18 percent) since 1980-81.
- In 1987-88, the buying power of teachers' salaries was the highest in 30 years.

There is an emphasis on the need to improve the quality of students entering teacher education and to enhance the status and professionalism of current teachers. ${ }^{1}$ In response to this need, many States and local schooi districts have raised teacher salaries with the hope of attracting and retaining more and better teachers.

The average salary of a public elementary school teacher was $\$ 27,423$ in school year 1987-88. During the same year, the average salary of a public high school teacher was $\$ 28,895$. Through the 1970s, although the dollar amount of teachers' salaries was increasing, the buying power of teachers' salaries declined. Since school year 1980-81, salaries for both elementary and secondary school teachers have been rising steadily. Average salaries, when adjusted for inflation, ${ }^{2}$ have increasedby 19 percent; unadjusted, they have grown by close to 60 percent.

Education officials in all parts of the country are experimenting with teacher salary structures, creating new career steps, career ladders, merit pay schemes, and new positions with greater authority and responsibility. In the past, such experiments have been associated with increases in teachers' salaries. ${ }^{3}$

Salaries paid to teachers usually vary by length of service and level of education. Differences in average salaries are affected by changes in these factors as well as general salarylevels.

[^18]
## Chart 1:17 Trends in average annual salaries of teachers in public schools

SOURCE. National Education Association, Estimates of School Statistics, various years, copyrighted.

## B. Resources: Human Resources

## Indicator 1:18 Pupil/teacher ratios in public schools

- Pupil/teacher ratios are consistently higher in elementary schocis than in secondary schools.
- Pupil/teacher ratios have been dropping steadily since school year 1959-60 at both elementary and secondary levels.

The pupil/teacher ratio reflects the relationship between the number of students enrolled and the number of full-time-equivalent instructional personnel ${ }^{1}$ available to teach them. This ratio is of interest because of the popular assumption that with a lower pupil/teacher ratio higher student achievement will result. Research data, however, have gerierally not supported this assumption. ${ }^{2}$
Between 1959-60 and 1987-88, the pupil/teacher ratio in public elementary schools has declined from 28.7:1 to 19.5:1, a decline of 32 percent. During the same period, the pupil/teacher ratio in public secondary schools went from 21.5:1 to 15.3:1, a reduction of 29 percent.

[^19]

## Chart 1:18 Pupil/teanher ratios in public elementary and secondary schools

## B. Resources: Human Resources

Indicator 1:19 Demand for new hiring of public school teachers

- The projected annual demand for new hiring of elementary school teachers in public schools is expected io stabilize somewhat through 1997.
- For secondary school teachers, the projected annual demand is expected to increase rapidly from 1989 until 1995 before declining slightly.

Projections of the need for hiring teachers help school officials plan their budgets. Such projections also aid policymakers who must devise and implement incentives to attract qualified individuals to the teaching profession. And, as an indicator of the future job market, such projections help those considering teaching as a career. The projected demand for new hiring may change for a variety of reasons, including fluctuations in student enrollment, changes in the pupil/teacher ratio, and teacher turnover.*

The projected numbers shown depict national trends. But the demand for new hires will vary by geographical location and subject area as States experience different rates of teacher turnover and enrollment growth.

The actual numbers of annual new hires are expected to remain consistently higher for public elementary schools than for public secondary schools between 1989 and 1997. Total demand for new hiring is expected to swell more than 24 percent by 1995, when it will peak. Most of this expected increase can be attributed to a rise of 57 percent in new hiring at the secondary schod level between 1988 and 1995. While secondary schools will seek to fill 53,000 teaching slots in the fall of 1989, about 86,000 positions are projected to open in 1995. Various factors may account for this large jump, including rising secondary school enrollments (see Indicator 1:21) and teacher turnover. Demand for secondary school teachers is expected to decline after 1995, to a level of 83,000 in 1997. Larger enrollments are expected to contribute to greater demand for new hiring of elementary school teachers earlier in the 1980 s, but the demand should level off starting in 1989, rising only 2 percent over the projection period.

## C. Context: Student Characteristics

## Indicator 1:20 Public and private school enrollment trends

- After a period of relative stability in the early 1980 s , public elementary school enrollment rose in 1986, while private elementary school enrollment remained essentially unchanged.
- High school enrollment in public schools rose during the eariy and mid-1970s, then began a downward trend through the early 1980 s , and then stabilized; private school enrollment at the high school level changed little during this period.

Education in the United States benefits from a long history of traditions regarding its schools. The tradition of public education has been complemented by a history of private, religiously oriented schools, as well as nonparochial or independent institutions.

Elementary school enrollment dropped sharply in both public and private schools in the 1970s, but zhanged little during the first half of the 1980s. An increase in public elementary enrollment occurred in 1986. High school enrollment in public schools rose in the early to mid-1970s and then turned downward, continuing on that path through the early 1980 s. It has stabilized since. ${ }^{1}$ Private high school enrollment has remainedrelatively stable since $1970 .{ }^{2}$

The percentage of all students who attend private schools has remained fairly stable since 1970. In 1986, almost one in nine students in kindergarten through grade 12 aitended a private school. ${ }^{3}$

[^21]Chart 1:20 Trends in public and private school enrollment, by grade level: 1970-1986

SOURCE: Bureau of the Census, Current Poculation Reports.

## C. Context: Student Characteristics

## Indicator 1:21 Trends in public school enrollment: 1972-1997

- Total public elementary/secondary school enrollment declined during most of the 1970s and early 1980s.
- Enrollment in public elementary schools began to increase in 1985 and is projected to continue rising through 1997.
- The number of public secondary school students is expected to continue fallIng until 1991 and then begin to increase as students pass through the education system.

Total public elementary and secondary enrollment declined through most of the 1970s and into the early 1980s as the baby boom generation grew older and moved through and out of the school system. Separately, the pattern for elementary and secondary enrollment ${ }^{1}$ differed somewhat from the total enrollment trend. The number of elementary school students re3ched a record high in 1969, while secondary school enrollments peaked in 1976.
In part, because the children born during the baby boom years of 1946 to $1964^{2}$ tended to delay marriage and childbearing, their offspring did not begin to produce a rise in public school enrollment figures until 1985. This baby boomlet is expected to continue swelling the number of elementary school students through 1997 (though the numbers will not return to record levels). Secondary school enrollments are expected to continue falling through 1990, and then the large numbers of elementary school students moving on to high school will raise secondary school enrollments.

State-b:-Stats trends in elementary and secondary enrollment present an extremely varred picture. ${ }^{3}$ Local economic and demographic characteristics and growth patterns vary substantially from State to State, directly affecting the size of a State's school-age population.

[^22]Chart 1:21 Trends in public school enrollment: Fall 1972-1997

SOURCE. National Center for Education Statistics, Projections of Education Statistics to 1997-98, 1988.

## C. Context: Student Characteristics

Indicator 1:22 Public school enrollment by race and ethnicity: 1976, 1984, and 1986

- From 1976 to 1986, there was an increase in the number and proportion of minority students enrolled in the public schools.
- Hispanic enrollment grew from 2.8 million in 1976 to over 4 million in 1986, up 44 percent. During the same period, Asian enrollment increased from 535,000 to over 1 million, a proportional increase of 116 percent.
- White enrollment decreased by almost 13 percent during the same time period.

Between 1976 and 1986, the ethnic and racial composition of the puilic schools underwent considerable change, caused by a rapidly increasirig minority population. The greatest expansion occurred among the Asian and Hispanic populations. These increases portend a greater degree of heterogeneity of language and culture in the schools. Since many minorities come from impoverished families, as well, the changing enrollment patterns present the public schools and policymakers with challenges which must be met with bold and effective programs.

Nationally, the majority of the student population remains white. Twelve years ago white studenis accounted for ajout 76 percent of public school enrollment. That figure dropped to approximately $7^{\prime \prime}$ ) percent in 1986. At the same time, n.inority student enrollments increased from 24 percent of total enrollment in 1976 to almost 30 percent in 1986. In 1986, almost one out of every three students in American public scheols was a minority student.

Asians experienced the most rapid growth during the 1976-86 period. They accounted for 2.8 percent of the total school enrollment in 1986, up from 1.2 percent in 1976, mcre than doubling their enrollment figures. Hispanics gained almost 45 percent, and accounted for 9.9 percent of total 1986 school enrollment.

From 1976 to 1984, enrollment figures for both blacks and whites declined, wiile Hispanic and Asian enrollment increased. In 1985, the elementary schools began experiencing a baby boomlet. Whites along with every minority group except American Indians experienced an upsurge in eirollment rates.

## C. Context: Student Characteristics

Indicator 1:23 Special education enrollment in federally supported programs

- The total number of special education students rose between 1976-77 and 1987-88 from 3.7 to 4.4 million, due primarily to the growth in the number of students classified as learning disabled. This growth exceeded that of all the other groups combined.
- As a percen' of the total public school enrollment, the number of special education students rose from 8 percent in 1976-77 to 11 percent in 1987-88. This percentage has changed little in the last 5 years.

The Education of the Handicapped A:i, e, nacted by Congress in 1975, ensures the availability of a "free and appropriate public education" to all children with handicapping conditions. Examining changes in the number and distribut:on of such students helps educators and policymakers assess the efforts to comply with this mandate and forecast the need to generate more resources.
Since the !aw was implemented on September 1, 1978 the number of children enrolled in federally supported special education programs has risen each year. ${ }^{1}$ The increases were primarily dus to the growing number of children classified as learning divabled. ${ }^{2}$ This trend continued through 1988. During the same time period, the number of students classified as inentally retarded declined.

[^24]
## Chart 1:23 Trends in the , umber of handicapped students served in federally

 supported education programs: School years ending 1977-1988

## C. Context: Learning Environment

## Indicator 1:24 Teacher perceptions of disruptive behavior in the public schools

- About 44 percent of teachers surveyed in 1987 said that disruptive student behavior had increased in the last 5 years.
- In the teachers' view, school discipline policies have improved significantly since 1980; still, half reported that policies were not consistently applied.

Research on effective ;chools has identified a safe, orderly environment as a prerequisite to promoting student academic success. Educators and others are, therefore, interested in examining indices of student discipline and ciassroom environment.

In assessing the incidence of student disruptive behavior in 1987, 19 percent of public school teachers surveyed by the U.S. Department of Education felt there was "much more" disruptive behavior in their schnols than 5 years before; another 25 percent indicated there was "somewhat more" now. Indeed, almost one-third of the teachers surveyed stated they had seriously considered leaving teaching because of student misbehavior.

To obtain trend information on public school teachers' assessment of student discipline, findings from this survey were compared with polls conducted earlier in the 1980s by the National Education Association (NEA). Teachers in the 1987 Department of Education survey were considerably more positive about the discipline policies of their schools than their NEA counterparts in 1980. So, while teachers report an increase in disruptive behavior, perhaps they are finding it inter!eres less with their teaching because stronger discipline folicies exist for dealing with it. The table below shows various positive characteristics of school discipline policy and the percent of teachers who said these characteristics described their school.

|  | School discipline policy characteristic |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Year | In writing | Stric! enough | Comprehensive <br> enough | Clear | Consistently <br> applied |
|  |  |  | Percent |  |  |
| 1980 | 69 | 39 | 42 | 60 | 33 |
| 1987 | 93 | 66 | 72 | 80 | 50 |

## C. Context: Learning Environment

## Indicator 1:25 Student drug and alcohol abuse

- Cocaine usage among high school seniors dropped significantly in 1988.
- While alcohol usage has gensrally declined since 1979, the rates of usage remain high. In 1988, almost iwo of every three seniors reported using alcohol in the month preceding the survey.

Drugs and alcohol interfere with thinking and reduce academic achievement. Neighborthoods near schools are often magnets for drug dealers, who can be students themselves. Crimes of violence may accompany or result from substance abuse. In these circumstances, school effectiveness and the achiey?ment of all students can suffer.

Drug and alcohol abuse, despite its health- and life-threatening consequences, is widespread among American students. Acquaintance with such substanceswhether sedatives, hallucinogens, or stimulants-generally begins in adolescence and, increasingly, is beginning at even younger ages. iVhile alcohol and ilegal drug use has declined in the 1980s, it remains widespread. For example, by the time they are high school seniors, more than one-half of the students will have tried an illicit substance.

The rise in cocaine usage among siudents has been particularly dramatic in the last decade or so. In just 4 years, from the class of 1975 to the class of 1979, the proportion of students who reported using cocaine in the previous year doubled, from almost 6 percent to 12 percent. The share of students who ever used cocaine during a 1-year period peaked in 1985 at 13 percent. However, by 1988, this proportion had dropped to less than 8 percent. Similarly, the number or high school seniors who reported using cocaine in the previous 30 days declined from almost 7 percent in 1985 to just over 3 percent in 1988. There is evidence, however, that the inexpensive and highly addictive form of cocaine called "crack" has not followed the general decline in cocaine usage, especially in urban areas and among high school dropouts.*

[^26]Chart 1:25 Trends in the use of drugs and alcohol by high school seniors: 1975-1988

SOURCE: National Institute on Drug Abuse, Drug Use Among American High School Students, College Students, and Other Young Adults, 1989.

## C. Context: Learning Environment

Indicator 1:26 Principals' perceptions of school climate and reading performance

- Students enrolled in schools where the principals rated eight problems ${ }^{1}$ as "not a problem" had higher reading scores than students in schools where principals rated them "minor" or "moderate."
- High school principais cor-idercd problems in their schools to be more serious than elementary school principals, especially in the areas of absenteeism, teacher motivation, low standards for students, and vandalism.
- Principals' average ratings indicate that private schools have fewer probiems than public schools.

Educators can contribute to an efie.:tive learning environment through strong leadership in emphasizing priorttes, such as basic skills and academic success, having high expectations for all students, creating a safe and orderly atmosphere, and involving parents. ${ }^{2}$
Principals were asked to rate eight potential problems in their schools. Students in schools where these factors were rated as "minor" or "moderate" had lower reading scores than students in schools where they were not considered problems. In no school was the principal's rating "serious." The difference in reading scores was significant after taking into account student background characteristics such as race and ethnicity, parental education, and reading materials in the home.
High school principals rated their school problems as more serious than did elementary school principals. Lack of parental interest and lack of discipline were identufied as minor or moderate problems in two-thirds of all schools. In 1 out of 10 high schools, student absenteeism and lack of parental interest were rated as "serious."
Principals' average ratinys indicate that private schools experierice fewer problems than public schools, particularly at the high school level.

[^27]Chart 1:26 Average adjusted reading proficiency, by average rating on school problems and grade: 1984

NOTE. Reading proficiency scale scores were adjusted for race and ethnicity, language spoken in the home, parental education, and number of reading materials in the home.

SOURCE. National Center for Education Statistics, 'School Climati and Reading Performance, Survey Report, 1988.

## C. Context: Perceptions

## Indicator 1:27 Public opinion of public schools

- The public has consistently rated its own local schools higher than it has rated the public schools nationally.
- In 1938, local public schools were rated higher by public school parents than by nonpublic schoo! parents and by peuple with no children in school.
- The public's confidence in schools has not changed significantly since 1984.

Public schools depend upon public support. Polls of the public's perception of the schools are gauges of the strength of that support. The annual Gallup Poll of the Public's Attitudes Toward the Public Schools provides data on the public's ratings of the schools. This poll has become a barometer, closely watched and debated each year by educators and policymakers.

The most recent poll shows that in 1988 , the public continued to grade its local schools higher than the Nation's schools as a whole. Local public schools were graded $A$ or $B$ by 40 percent of responds $\sin 1988$, while only 23 percent rated the Nation's public schools A or B. This has changed little since 1984.

In recent years, the Gallup organization has distinguished between ratings by public school parents, nonpublic school pa:ents, and those without children in school. In 1988, parents of children in public schools were more likely to give local public schools an A or B grade ( 51 percent) than parents of children in nonpublic schools ( 33 percent) or those with no childrenin school (37 percent).

[^28]

Percent of the public grading public schools $A$ or $B$
Percent

Percent of the public grading local public schools A or B, by type of school involvement

Percont

SOURCE: The Gallup Poll, various years.

## C. Context: Perceptions

Indicator 1:28 Teachers' perceptions of student problems and education improvement strategies

- Teachers feel that a major reason students have difficulty in school is because they "are left on their own after school."
- Parents, more than teachers, feel that school-initiated policies can improve education.

Research has shown that students with behavioral and academic problems could be school dropouts. In a 1987 survey, teachers viewed the phenomenon of "latchkey" children as a major problem. Half of the teachers surveyed felt that "children who are left on their own after school'" was a major cause of school difficulties. Poverty in the home was the second most frequently cited cause, but the first most cited by teachers in districts of below average wealth.

Parents and teachers were both asked to rate the extent to which they felt each of seven criticisms of parents was valid. About 60 percent of teachers and parents surveyed felt that "many" or "most" parents leave their children alone too much after school. While 17 percent of parents of public school children surveyed acknowledged that their children are alone after schnol 1 or 2 days per week, 24 percent said that they are alone almost every day. Parents of black, junior high, and high school studerits are the most likely to say that their children are on their own almost every day after school, regardless of geographical location, parental income, or education levels.

Most solutions to 2. student's school problems require cooperation between parents and teachers, whether those solutions are school-intiated or home-based. However, on the extent to which they felt the reform would "help alot" to iniprove education, parents and teachers surveyed differed on six of seven possible strategies. Of the six, the four that were school-initiated (such as "having the school notify the parents immediately about any problem involving their child") were favored by parents more than teachers. But teachers overwhelmingly supported one home-based strategy ("having parents spend more time with their children in support of school and teachers"). The sixth strategy ("getting teachers and parents to meet together and talk about school policies') involved both home and school.

[^29]Chart 1:28 Percent of teachers who think that each factor is a "major cause" of students' difficr"ties in school: 1987

SOURCE. The Metropolitan Life Survey of the American Teacher 198;. Strengthening Linhs Between Home and School.

## C. Context: Requirements

Indicator 1:29 State requirements for graduation from high school

- Approximately 67 percent of the States require the number of English credits and almost 50 percent require the number of social studies credits recommended by the National Commission on Excellence in Education.
- About 16 percent of the States require the recomme.rded number of credits in mathematics and $\begin{aligned} \\ \text { percent require this number in science. }\end{aligned}$
- A total of 19 States now require the passing of a competency test for high school graduation.

Graduation requirements are a measure of the academic rigor in the curriculum. They identify n inimal requirements demanded of all students. Individual studer.ts may, and often do, elect a program of studies that exceeds the requirements. For example, college-bouna students often complete programs that exceed State requirements. In 1983, the National Commission on Excellence in Educatic. 7 drew attention to this measure of school performance by recommending a minumum of 4 years of Englisit and 3 years eaci, of mathematics, science, and social studies.

The 1980s has seen a movement toward increasing State requirements for graduation. However, despite the movement towards establishing a more rigorous academic curriculum, many States still do not require as many credits as recommended by the National Commission on Excellence in Education. By the 1987-88 academic year, only 34 States required 4 years of English, and only 24 required 3 years of social studies. In the area of mathematics and science, most States required no more than 2 years in each. However, many local school districts require more than their States do, and many stuients are taking more credits than their States require (see Indicator 1:8).

Accompanying the movement to increase course requirements for high school graduation, some States have imposed a competency test that must be passed before a din. . .na will be granted. A total of 19 States nowimpose such a test.

[^30]Chart 1:29 Number of course credits required by States for high school graduation, selected subjects: 1988

${ }^{1}$ Number of credits recommended by the National Commission on Excellence in Education.
${ }^{2}$ Includes those States with no requi:?ments in the subject.
SOURCE. Ccuncil of Chief State School Officers, 1988 Policies and Practices Questionnaire.

## C. Contexi: Requirements

## Indicator 1:30 State requirements for teacher preparation

- By the fall of 1988, 46 States had enacted some form of competency tesiing as part of the process of certifying teachers.
- Within this group, 32 States require that students take an examination in order to be admitted to a teacher education program.

States have taken the lead in seeking ways to improve the quality of teachers in elementary and secondary schools. 「o screen new teacher candidates, most States use some form of competency testing. With these tests, States hope to screen out teaching candidates who are deficient in basiz skills and knowledge.
One subject of debate concerns what competency tests should cover. No nationally accepted test exists, so some States use commercially developed tests, and some use tests of their own design, while a few leave the choice of tests up to the colleges or universities. All tests cover basic skills, subject matter, teacining methods, or some combination of these.

There is m agreement on the best time to administer suci) tests. Some States require a test, rior to initial certification, some States test prior to completing a teacher education program, but increasingly States are requiring a test before a student may be admitted to a teacher education program. By 1988, 32 States required a test at this point; two others will have them in place by 1990. A total of 46 States currently require a test at one of these points; two more States will have one or more tests in place by 1990. There are onay three States that have neither prescribed tests prior to initial certification nor any planner!.

As the National Board for Professional Teaching Standards develops and administers its tests, some standardization may occur. Such standardization would, it is hoped, enable compifent teachers to move from one State to another more easily.

Indicator 1:9

Table 1:9-1 High school completion rates of persons aged 18-19 and 20-24, by race and Hispanic origin: 1974-1986

| Year | Age 18-19 |  |  |  | Age 20-24 |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | White | Black | Hispanic* | Total | White | Black | Hispanic* |
|  | Percentage of age group |  |  |  | Percentage of age group |  |  |  |
| 1974 | 73.4 | 76.2 | 55.8 | 48.9 | 83.9 | 85.6 | 72.5 | 59.0 |
| 1975 | 73.7 | 77.0 | 52.8 | 50.0 | 83.9 | 85.9 | 70.5 | 61.3 |
| 1976 | 73.1 | 75.4 | 58.2 | 50.9 | 83.7 | 85.4 | 71.9 | 58.0 |
| 1977 | 72.9 | 75.7 | 54.9 | 50.7 | 83.7 | 85.1 | 73.4 | 56.6 |
| 1978 | 73.5 | 76.3 | 54.9 | 48.9 | 83.7 | 85.2 | 73.5 | 58.7 |
| 1979 | 72.8 | 75.3 | 56.4 | 53.7 | 83.2 | 84.9 | 71.8 | 55.8 |
| 1980 | 73.7 | 76.1 | 59.3 | 46.1 | 83.8 | 85.1 | 74.3 | 57.1 |
| 1981 | 72.5 | 74.8 | 59.6 | 47.2 | 83.7 | 85.0 | 75.7 | 59.3 |
| 1982 | 72.0 | 74.5 | 58.2 | 51.7 | 84.1 | 85.4 | 76.2 | 60.2 |
| 1983 | 72.7 | 75.6 | 59.1 | 50.3 | 83.3 | 84.6 | 75.8 | 56.6 |
| 1984 | 73.3 | 75.5 | 63.0 | 58.3 | 34.6 | 85.7 | 79.3 | 60.7 |
| 1985 | 74.6 | 76.7 | 62.8 | 49.8 | 85.3 | 86.0 | 80.8 | 67.4 |
| 1986 | 74.6 | 76.6 | 64.9 | 54.7 | 84.8 | 85.4 | 81.0 | 61.6 |

*Most of the year-to-year differences in completion rates for Hispanics are not statistically significant due to the small size of the Hispanic sample. Hispanics may be of any race.
NOTE- Separate analyses were not done for Asians because they are not identitable from the October Current Population Survey data tapes.

SOURCE US Department of Commerce, Bureau of the Census, "School Errollment-Social and Economic Characteristics of Students, October [various years]," Current Population Reports, Series P-20, and unpubilshed tabulations.

Table 1:9-2 High school completion rates of persons aged 25-34, by race and Hispanic origin: 1974-1986

| Year | Total | White | Black | Hispanic * |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Percentage of age group |  |  |  |
|  |  |  |  |  |  |
| 1974 | 81.1 | 82.6 | 68.4 |  |  |
| 1975 | 81.9 | 83.6 | 67.5 | 59.2 |  |
| 1976 | 82.3 | 83.6 | 71.4 | 53.4 |  |
| 1977 | 83.6 | 84.9 | 72.0 | 56.2 |  |
| 1978 | 84.6 | 85.9 | 74.4 | 55.0 |  |
| 1979 | 85.0 | 86.3 | 74.7 | 54.3 |  |
| 1980 | 85.4 | 86.7 | 76.4 | 56.1 |  |
| 1981 | 85.9 | 86.8 | 78.6 | 54.9 |  |
| 1982 | 86.3 | 87.3 | 79.7 | 56.6 |  |
| 1983 | 86.7 | 87.6 | 80.2 | 57.5 |  |
| 1984 | 86.8 | 87.9 | 79.9 | 58.9 |  |
| 1985 | 86.3 | 87.2 | 80.7 | 59.4 |  |
| 1986 | 86.5 | 87.4 | 80.1 | 60.0 |  |

- Hispanics may be of any race.

NOTE: For any given year, 18- to 19-, 20- to 24-, and 25 - to 34 -year-olds represent different groups of people. Therefore, these tables should be used with caution when attempting to make inferences about the completion rates of a specific group as it ages. Separate analyses were not done for Asians because they are not identifiable from October Current Population Survey data tapes.

-Not available.

- An unexplained diop occurred in the number and proportion of private school students in 1984, according to the
Bureau of the Census. However, the 1984 data appear to be an anomaly, since the 1985 and 1986 figures for private Bureau of the Census. However, the 1984 data appear to be an anomaly, since the 1985 and 1986 figures for private school students are very similar to those for 1983 and are consistent with the level from 1979 through 1983.
NOTE: Detail may not add to total due to rounding.

Table 1:30-1 Teacher preparation assessment requirements, by State: 1988Continued

| State | Admission to teacher education | Exit from teacher education | Initial or provisional certification | Regular or perf.anent certification | Recertification or maintenance of certification |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Ohio ${ }^{11}$ | BS, 10 | BS, PS, CK, 10 | BS, PS, CK | No test | No test |
| Oklahoma | BS, PS | No test | CK | CK | No test |
| Oregon | BS, CK | No test | BS | 10 | No test |
| Pennsylvania ${ }^{11}$ | No test | No test | BS, PS, CK | No test | No test |
| Rhode Island | No test | 10 | BS, PS, 10 | No test | No test |
| South Carolina | BS | PS, CK, 10 | PS, CK | PS, CK | No test |
| South Dakota | BS | No test | No test | iNo test | No test |
| Tennessee | PS | No test | PS, CK | No test | No test |
| Texas | BS | 10 | PS, CK | 10 | 10 |
| Utah | No test | No test | 10 | 10 | No test |
| Vermont | No test | No test | No test | No test | No test |
| Virginia | BS, PS, CK, 10 | No test | BS, PS, CK | 10 | No test |
| Washington | BS | ${ }^{12}$ No test | ${ }^{12}$ No test | No test | No test |
| West Virginia | BS | CK, IO | CK, 10 | No test | No test |
| Wisconsin | ${ }^{13} \mathrm{BS}$ | ${ }^{14} \mathrm{CK}$ | ${ }^{14} \mathrm{BS}, \mathrm{CK}$ | ${ }^{14} \mathrm{BS}, \mathrm{CK}$ | No test |
| Wyoming | BS | No test | No test | No test | No test |

Key to types of tests required:
BS $=$ Basic skills;
PS=Professional skills;
CK=Content knowledge;
$10=$ In-class observation.
${ }^{1}$ Requirements or tests are under development.
${ }^{2}$ No State policy, some tests administered by universities.
${ }^{3}$ May be waived by the State.

* Basic skills test required for persons holding out-of-State certificates.
${ }^{5}$ Provided student's score is in the 40lh or higher percentile on the ACT.
- Optional in lieu of other requirements.
${ }^{7}$ Also required for reinstatement of expired license.
${ }^{8}$ institutions must test for reading, language arts, and mathematics, no specific test is required.
${ }^{9}$ Required in 1990.
${ }^{10}$ Required beginning in 1992.
${ }^{11}$ Tests for admission to and exit from teacher education programs are estabished by the coliege or university.
12 Professional skills test planned.
${ }^{13}$ Required fall of 1989.
${ }^{14}$ Required spring of 1991.

## Special Fourth Class

## Center Releases Report on the Condition of Elementary and Secondary Education

High school completion rates have changed dramatically in the past dozen years. Although almost 25 percent of 18 - and 19 -year-olds do not complete high school, by the time they reach ages 20 through 24 an additional 10 percent have received diplomas. The proportion of black youths who completed high school by age 18 and 19 increased considerably between 1974 and 1986. By age 24, blacks are almost as likely as whites to have completed high school.

These facts and more can be found within the pages of the Condition of Education, 1989: Volume 1. Elementary and Secondary Education, recently released by the National Center ior Education Statistics (NCES) of the Department of Education's Office of Educational Research and Improvement. Included in this volume are data on student performance, completions, economic outcomes, resources, and the characteristics of students and their environment.

This year, as in 1988, NCES has published indicators-key data that measure the health of education, monitor important developments, and show trends in major aspects of education-in three volumes. The Condition of Education repori encompasses the first two volumes, the first addressing elementary and secondary education and the second, postsecondary education. The third volume, 1989 Education Indicators, includes the text, tables, and graphs from the first two volumes, plus the technical supporting data, supplemental information, and data sources.

Copies of The Condition of Education, 1989: Volume 1, Elementary and Secondary Education are available for $\$ 5.50$ each from the Superintendent of Ducuments, U.S. Govermment Printing Office, Washington, DC 20402. Ask for stock number 065-000-00377-5. The Condition of Education, 1989: Volume 2, Postsecondary Education is also available from the U.S. Government Printing Office, stock number 065-000-00378-3, for 56.50 each. You may pay by check or money order (payable to the Superintendent of Documents), VISA, or MasterCard. For your convenience, an order form is printed on the back of this announcement.

## Superintendent of Documents Publication Order Form

[^0]:    NOTE. These acknowledgments recognize only those who developed new indicators for this edition and who updated indicators repeated from the 1986 and 1987 editions. Mention is not made of those who contributed to the initial development of continuing indicators and who were identified in earlier editions.

[^1]:    - NAEP is a congressionally mandated project that has assessed reading achievement five tumes, most recently in the 1985-86 school year. Because some new procedures were introduced in the 1985-86 assessment, the 1985-86 results were not comparable to those of earlier assessments. Therefore, trend information is not available. With the 1988 assessment, adjustments will be made to the 1985-86 data to allow for comparisons with previous NAEP reading tests.

[^2]:    - NAEP has assessed mathematics achievement four times-in 1973, 1978, 1982, and 1986. SOURCE. National Assessment of Educational Prog.sss, The Mathematics Report Card. Are We Measuring Up?, 1988.

[^3]:    - Four groups were in schools whose language of instruction was English, and three were in schools whose language of instruction was French.

[^19]:    ${ }^{1}$ Full-time-equivalent teachers inciude not only regular classroom teachers but aiso those, such as art, music, and special education teachers, who do not have regular classroom assignments. This category excludes staff who are not teachers but who provide educational services outside the classroom, such as counselors and librarians.
    ${ }^{2}$ U.S. Department of Education, Proyrams for the Improvement of Practice, Class Size and Public Policy: Polltics and Panaceas, 1988.

    SOURCE: U.S. Department of Education, National Center for Education Statistics, Statistics of Public Elementary arid Secondary Day Schools, various years, and Common Core of Data survey. various years.

[^20]:    *Teacher turnover rate is assumed to be 4.9 percent at the elementary level and 5.6 percent at the secondary level (Bureau of Labor Statistics, unpublished tabulations). Turnover accounts for a far greater share of new hiring than do other factors, such as enrollment increases.

[^21]:    ${ }^{1}$ See Indicator 1.21 for a discussion of projected public school enrollment to 1997-98. Projected enrollments are not available for private schools.
    ${ }^{2}$ An unexplained drop occurred in the number and pioportion of private school students in 1984, according to the Bureau of the Census. However, the 1984 data appear to be an anomaly, since the 1985 and 1986 figures are consistent with the trend for 1979 to 1983.
    ${ }^{3}$ There are two major sources of data on private school enrollment. the annual School Enrollment Supplement to the October Current Population Survey (CPS) and intermittent Private School Surveys conducted by the National Center for Education Statistics. The two sources sometries produce differing estimates of the total number and proportion of private school students. For further discussion of data sources on private schc. ${ }^{2}$ enrollment, see U.S. Department of Education, The Condition of Education, 1986 Edition, pp. 186-201.
