Manpower Requirements for Planning, an International Comparison Approach. Volume 1.
Northeastern Univ., Boston, Mass. Dept. of Economics.
Pub Date Dec 66
Note-136p.
EDRS Price MF-$0.75 HC-$6.90
Descriptors-Codification, *Comparative Analysis, Employment Projections, *Employment Statistics, *Foreign Countries, Labor Force, *Manpower Needs, Occupational Clusters, Occupations

The purposes of this study were to collect and analyze manpower and production data from 19 countries and to test the relationship between the occupational composition of an industry and the production of that industry. Volume I presents the research methodology, explains the correlations which were used, describes the data and its collection difficulties, and makes an explanation of the occupational and industrial classification systems. A how-to-do-it manual describing the steps necessary to make manpower requirement projections from the given data is included. The appendixes include (1) 26 summary tables giving the occupational composition of industrial sectors for 19 countries, (2) cross indexes for industry titles and occupational titles of the International Manpower Study and the International Standard Industrial Classification, and (3) the authors' standard industrial code used in this study. Data tables from the study are available in Volume II (VT 005 772). (EM)

CONTENTS

PREFACE

The international comparison approach to manpower projections is not new. Over the years standard works on economic development have made reference to the ability of a nation to use the data of economically advanced nations as the target for its production and manpower goals. However, it has generally been noted that the necessary data for international comparisons are not available.

The purpose of this study was to assemble and systematize the necessary statistics from as many nations as possible. Another purpose was to test the hypothesis that there is a relationship between the occupational composition of an industry and the productivity of that industry. This relationship is the rationale for the use of the international comparison approach for manpower projections.

We began this research project in July 1963. Our principal efforts were to obtain detailed statistics on the occupational composition of the labor force, cross-classified by industry, from as many nations as possible. Because of significant variations in occupational and industry titles among the various nations, we had to develop our own occupational and industry classification systems. The former system contains 225 occupations and occupational groups under which we subsumed all the occupational titles used by the nations in our survey; the latter contains 58 industries and industry groups under which we subsumed all industry titles used by these countries. We were able to collect the detailed data from 19 different countries, seven of which furnished us with statistics for two different dates. In addition, we obtained various economic data from these nations

as well as data on educational attainment by occupations and occupational groups.

We are convinced that the international comparison approach to manpower projections is the most useful for developing nations. The correlations that we ran indicate that there is a relationship between the occupational composition of an industry and the level of productivity in that industry. We believe that the data presented in the report provides to nations who are engaged in manpower planning the basis for making projections of manpower requirements.

In Volume I we present an analysis of our approach and an explanation of the correlations which show the relationship between the occupational composition of an industry and the productivity of that industry. We describe the statistics collected and difficulties we faced in obtaining all the data. We explain how our occupational and industrial classification systems were derived, and how they differ from the International Standard Classification of Occupations (ISCO) and the International Standard Industrial Classification (ISIC). We also present a how-to-do-it manual, which describes the steps that must be taken to use our data for projecting manpower requirements. Included, of course, are the usual caveats about the casual use of our statistics and of the international comparison approach.

Volume II contains all the basic statistical tables. There are three sets of tables: the first set contains 26 country tables showing the occupational composition of the workforce in up to 58 industries or industry groups in each country; the second set contains 52 industry tables showing the occupational composition of each industry in the countries in our survey,

ranked by productivity; and the third set shows the relationship between the occupational structure of the workforce and the level of educational attainment for 16 countries.

In a study such as this the authors become indebted to numerous persons -- more than can be legitimately listed in this preface. We corresponded with more than one hundred persons in numerous countries around the world. All were helpful in one way or another. Some sent us the requested data; others gave us leads as to where or when the data could be found. We visited nearly a hundred additional persons in various countries, and again we found all very helpful, in some way or other. To all these individuals and their organizations, we extend our thanks. Collectively, all these people made this report possible.

Special acknowledgement of indebtedness or assistance must be made to a select number of individuals. First, we must acknowledge the aid given us by Mr. Everett Reimer, until September 1964, Social Development Advisor, Alliance for Progress, AID, and currently with the Department of Education, Commonwealth of Puerto Rico. It was Mr. Reimer who helped us formulate the project in the spring of 1963 and who assisted us in obtaining the necessary funds from the Bureau for Latin America, AID, that made this research possible. In addition, his ideas and suggestions helped us immeasurably.

We are also indebted to Mr. Joshua Levine, Regional Manpower Consultant, Bureau for Latin America, AID. His confidence in us and our project has permitted us to continue and expand our research. In addition, he gave us valuable advice on numerous substantive issues.

We also wish to acknowledge the assistance of Mr. Robert M. O'Brien, Assistant Director of the Computer Center at Northeastern University and

his assistant, Michael Allen. A number of graduate and undergraduate students worked with us at various times during the research, and to them we extend our thanks. At the early stages of this project we had the able secretarial services of Mrs. Rosemary Trask and Mrs. Victoria Peterson. To them we express our appreciation. At the final stages of the project, when we were going through numerous drafts of tables and manuscript, we had the able secretarial services of Miss Betsy Jones and Miss Clare Scherer, We express our special appreciation to them for their help and especially for being able to read our handwritings and for maintaining their composure while working for the three authors under the pressures of a tight schedule.

We alone bear all responsibility for the completed study -- both its good and bad points -- and for the views and judgments expressed.

I. INTRODUCTION

Rapid economic growth is one of the key goals of most developing nations of the world. To aid in these efforts, economic consultants and development specialists have been peddling their nostrums for approximately two decades. Few of these nations, however, have managed to attain their development goals, despite their efforts and the advice and assistance of outsiders. We have yet to find the solution to the basic problem of attaining a relatively high level of development and industrialization in a short period of time.

Economic development for almost all developing nations involves a sharp break with the past. Certain trends may continue in some sectors of the economy, but the major thrust of industrialization involves a new direction in the forward movement of various economic sectors. Developing nations generally find little in their past economic development that can help them plan rapid industrial growth. And even where the past trend could guide plans for the future, few developing nations would have sufficient usable statistics to compute an accurate trend.

Despite these problems, developing nations realize that some planning must take place if they are to be at all successful in increasing their rate of industrialization. General economic plans are being produced, developed, adjusted, and readjusted in most nations concerned with rapid growth and industrialization. The more realistic plans take into account manpower as an important factor for economic development. But too few economic planners consider human resources a major factor in the planning

process. Only in recent years has more emphasis been placed on manpower, but knowledge of this factor is still limited. To some economic planners manpower is an institutional factor which does not quite fit into a mathematical economic model of an expanding economy.

In our judgment, human resources is a key factor in the economic development of a nation, and therefore must be integrated with any general economic plan. Capital, physical resources and technique may be purchased or borrowed from abroad, but for numerous economic, social and political reasons a nation must use its own manpower to build and run the plants and facilities of its economy. When plans are made for the expansion and growth of specific economic sectors, plans must also be made for the manpower that will be required by these sectors. It thus becomes important to estimate future manpower requirements within the framework of a general economic plan because of the direct and close relationship between the projected output of an industry and the manpower required to produce that output. This cannot be done when no relevant past statistics exist to determine a trend; or when a sharp break with the past is projected for the future; or when the industry itself has not existed. Alternatives must be found.

When an industry or an economic sector already exists, one such alternative is to project future manpower requirements of an industry or sector from the occupational structure of its most modern plants. India, for example, has used this procedure in its plans for development of some industries. For many other industries, however, this procedure apparently has not been considered appropriate, and has not been used. Other nations

have undoubtedly used this approach in estimating future manpower requirements for expanding sectors of their economies.

Another alternative open to all developing nations, as well as to fully developed nations, is to use as guides the relevant manpower statistics from other countries. The nations of the world have attained various levels of development, and the experience of one country may be of assistance to others. The past attainment of one country may approximate the goal of a less-developed country. If the right kind of data were available for each nation of the world, a developing country could select from the array of these statistics those figures most applicable to its economic goal of five, ten, or fifteen years hence. Since manpower projections must be made for both demand and supply, the statistics needed for comparison have to cover both aspects of the future labor market.

This approach of using another country's attainment as a target was adopted by the planning and developing agencies of Puerto Rico in its "operations bootstrap." Puerto Rico assumed that the major sectors of its economy in 1975 would approximate the productivity levels of the United States in 1950, with the distribution of employment following a similar pattern. Perhaps data from other nations would have been more appropriate, but there was no real choice; no statistics other than those for the United States were in any way reasonably comparable and readily available. Despite the disparate levels of economic development between Puerto Rican industries and the industries of the United States, the comparisons were used and with considerable success.

There are few experts or writers in the field of manpower and human

resources development who do not recognize international comparisons as a basic method of making manpower projections. This method of making projections has had limited use because the relevant data have not been collected, analyzed, and made available in useful form to the developing nations of the world. Inevitably, mention of the international comparison method of manpower projections as a valuable approach is footnoted with the caveat that the necessary data are not available.

The goal of our research project was to make available to developing nations the relevant manpower statistics of various industries for selected countries which are at different levels of economic development. The past attainment of one country might approximate the goal of a less developed country. From such an array of data, a developing nation could select one set of manpower statistics as its target for some future level of development. Or, put differently, a developing nation could select the level of development of an industry in another country as its goal and then use the occupational distribution of that industry in the other country as the basis for its manpower requirements. The greater the number of nations represented in our continuum from high to low level of economic development, the greater the likelihood that a developing nation could find the set of statistics that most closely matches its target of future development. It would be possible, of course, for a nation to interpolate between sets of data, but steps between relevant sets of statistics would have to be kept as narrow as possible in order to minimize errors.

The first step in our research scheme was to examine the literature on various economic and manpower factors for a number of preselected

countries. This involved researching the various libraries in the area, as well as those in the United Nations in New York and the Pan American Union in Washington, D. C. At the United Nations we examined the census questionnaires and the interviewer instructions for numerous countries, and in some cases we were able to obtain a country's planned time schedule for the completion of the various parts of its census report. From the United States Bureau of Census, the United Nations and elsewhere, we were able to obtain the names and address of persons and agencies in various countries that might have the data we sought. In addition, we also canvassed the American Labor Attaches and the U.S. AID mission offices in various nations around the world.

From this early source material it became clear that some of the data that we considered important would not be readily available from some of our preselected nations. We therefore widened our scope, in order to obtain detailed data from a sufficient number of diverse countries to make our study meaningful.

II. THE WORKING HYPOTHESIS

Basic to any economic plan is the planning of production for the various sectors of the economy. Manpower planning is needed to complement the planning of production, and the link between the two types of planning is the relationship between the occupational composition of the labor force in a given industry and the productivity of that industry. The following hypothesis was developed to test this relationship:

> Since a given occupational composition reflects a given state of technology, (and hence productivity) there is a relationship between value added per employed person in a given industry and the occupational composition of the workforce in the same industry.[1]

The term "technology" is used in its broadest context, and reflects a variety of factors such as type of equipment, size of establishment, size of market, product mix and quality, degree of process integration, work practices, and the availability of ancillary services.

For the international comparison method of manpower projections to be more than hazardous guesswork, it was necessary to test the validity

---

1. Bear in mind that when we refer to occupations we mean functions. We are not evaluating the general capacity or the alternative abilities of the individual who happens to be performing a particular function. In other words, when we say that industry A requires a certain percentage of electricians to achieve a specified level of productivity, we assume that workers assigned the tasks and duties associated with the job description of electrician are in fact reasonably competent electricians and are working as electricians. In effect, we classify a worker according to his duties, as reported by him, and not according to anything else he can do. If a lawyer, for example, is working as a foreman and so reports himself, we consider him a foreman and not a lawyer.

of the hypothesis. Only if there is a relatively unique relationship between the productivity level of an industry and the occupational composition of that industry can developing nations use this method of manpower projections with some feeling of reliability. While the crucial test was made after all the data were collected from the various countries in our sample,[2] a pre-test using United States data was made at the initial stage of the project. This early pre-test gave us an indication of the relationship we could expect from international statistics.

The United States Census of Population provides occupational data by industry for every state, while the United States Census of Manufacturers and the Annual Survey of Manufacturers provide pertinent data on value added per employee and number of employees by industry. We used 1960 data, and we chose State data because of their comparability and the adequacy of the number of observations. We then tested whether State differences in the value added per employee of an industry were related to State differences in the occupational composition of that industry. The occupational composition consisted of 19 occupations and occupational groups, selected on the basis of distinctive job functions. For example, in the professional and technical category, we separated accountants, engineers, scientists and technicians. In the manual worker category, we separated operators and craftsmen; in the craftsmen category, mechanics, electricians, foremen. The percentage distribution of these 19 occupations or groups in the workforce of each industry in each state constituted the occupational composition of

---

2. The correlations using our international statistics to test this hypothesis is discussed in detail below.

each industry by state. A multiple correlation across states for each industry between value added per employee and occupational composition gave the coefficients presented in the following Table 1.

Table 1

Correlation Between Productivity and Occupational Distribution in Selected Industries in the United States - 1960[3]

Industry	(1) R^2	(2) R^2
Fabricated Metals	.586	.672
Food and Beverages	.768	.601
Chemicals	.623	.883
Machinery, exc. Electrical	.649	.672
Electrical Machinery	.549	.482
Apparel and other Fabricated Textiles	.614	.688
Printing and Publishing	.569	.617
Textiles	.472	.730
Rubber and Plastics	.458	.651

These correlations show a relationship between value added per worker and the occupational mix of a given industry. However, it must be stressed that the nature of the relationship is not the same for each

---

3. All coefficients of correlation are significant at the 5 percent level. The coefficients of column (1) were obtained from a linear correlation of the type $y = a + a_1 x_1 + a_2 x_2 + \ldots a_{19} x_{19}$, where y is value added per employee, x_1 is the percentage of occupation 1 in the total work force, x_2 the percentage of occupation 2, and so on.
The coefficients of column (2) were obtained from a linear correlation of the type $\log y = a + a_1 \log a_1 + a_2 \log x_2 + \ldots + a_{19} \log x_{19}$, where y, x_1, x_2 and so on are the same as in the first equation.

industry.[4] Each industry seems to have its own pattern of occupational change as productivity changes, and it is impossible to generalize from one industry to another. These results were, of course, based on the relationships in one country -- the United States -- where there are relatively few problems of data comparability. Nevertheless, the U.S. results provided us with an indication that similar relationships were likely to exist internationally. However, the testing of the hypothesis using international manpower statistics required the prior collection of manpower and economic statistics from a series of nations.

---

4. The particular type of relationship is defined by the correlation equation of the industry involved.

III. THE STATISTICS

Collecting the Data

The manpower data needed to test our hypothesis and to make available to developing nations a choice of occupational structures included a detailed cross-classification of occupations by industries. This was the minimum amount of data needed from each country to be included in our sample. To supplement this manpower data, we sought statistics on levels of educational attainment cross-classified by occupation. In addition, we were interested in collecting various economic data in order to develop a measure of industrial productivity free of the distortions due to currency exchange rates or due to tax and subsidy policies. We were also interested in collecting statistics on other factors that could influence productivity, such as size of establishment and concentration of industry.

If available at all in a country, the key set of manpower statistics would be available through a general population census. Since most countries conducted a decennial population census in either 1960, or 1961, we assumed that the data would be readily available for many countries by mid-1963, when we began our research project. After considerable international correspondence we discovered that few nations had completed the tabulation of their 1960 or 1961 census by early 1964. But even where the tabulations were completed or near completion, we found that the printing of the final volumes would add at least another year before the statistics would be available for general distribution. Efforts then had to be made to

obtain sets of various statistical tables before publication.

In addition to a constant flow of correspondence to nations around the world, requesting specific statistical information, we visited many countries to make personal requests for data. In some countries, such as England and France, we were able to purchase typed copies of statistical tables before they were sent to the printers. In other countries we were able to purchase computer print-out tabulations, and thus avoid long delays in the typing of tables or in the printing of the statistics. In some cases, such as in the Netherlands, Argentina and Israel, we contracted with governments for special tabulations because they had not planned to run the cross-tabulations we needed. We helped finance the machine tabulation of manpower data in one country in order to hasten the processing of the statistics. Some countries sent us specially prepared hand-tabulated pen-and-ink tables. In one case we purchased a microfilmed set of unpublished statistics. For a number of countries, expecially those with data from a 1950 or 1951 census, we had nothing more to do but purchase, or obtain free, copies of the published census reports. We finally collected detailed manpower statistics from 19 countries for seven of which we have data for two dates. We thus refer to 26 "country" tables of manpower statistics.

Statistics on educational attainment cross-classified by detailed occupations were not available in all the countries that had adequate occupational and industrial data. A number of nations had not considered significant the cross-tabulation of education and occupation, and therefore, had so posted their data that it was impossible to prepare such tables for us. Much of the economic statistics that we collected were not found among the data of population censuses but were part of regular or special industrial

censuses or surveys. Some such surveys were readily available; others were exceedingly difficult to obtain.

The large volume of statistics and data collected from so many countries and sources made it essential to put the information on computer punch cards. Only by using a computer could we store and process the information collected. Significant adjustments had to be made in the raw data to make them comparable enough for international comparisons. The occupational classifications presented the most serious problems of comparability.

Problems of Occupational Classification

At a minimum, international occupational data ought to permit inter-industry and intercountry comparisons of key occupations, either because they represent skills crucial for development or skills intimately linked to technological change. Occupational data thus have to be in sufficient detail to show well defined jobs which can then be combined into groups of closely related jobs on the same level of skill and requiring the same types and amounts of education and training. Furthermore, for purposes of international comparison, job groupings in different countries ought to include the same types of work. However, such comparability is more than a matter of job title; it also involves job content.

Population censuses are the source of most of the currently available occupational data. To varying degrees, all census data seem more concerned with reporting traditional job titles, regardless of their significance to the economy, than with reporting jobs essential for growth, or with determining whether the title fits the content of the job. For example, at least one major European country seems more interested in knowing how many barkeeps

it has than in knowing how many technicians of various types it has. Its technicians are grouped under one all-inclusive label, irrespective of what they actually do.

For the research, international occupational data present three interrelated problems, aside from the question of accuracy, which we assume solved for this discussion. The first problem, and conceptually the least serious of the three, is excessive aggregation, compounded by a failure to use similar groupings of data. Dissimilar groupings reflect in part differences in the degree in aggregation and in part, different combinations at the same level of aggregation. No country reports data in as great detail as that provided by the five-digit occupational titles of the International Standard Classification of Occupations (ISCO).[5] Most countries use either the three-digit unit groups of ISCO, its two-digit minor groups, or some variation of one or the other. An example of a five-digit ISCO occupation would be "Machine-Tool Setter, Metal Working," part of the three-digit unit group, "Fitter-Machinists, Toolmakers and Machine-Tool Setters," which in turn is part of the two-digit minor group, "Toolmakers, Machinists, Plumbers, Welders, Platers and Related Workers."[6]

Any aggregation above the three-digit level is relatively useless if one is interested in precise occupational comparisons. Unfortunately, once the data has been combined in dissimilar ways, it is impossible to make valid international comparisons unless one can decompose the figures, a

---

5. International Labour Office, International Standard Classification of Occupations (Geneva, 1958). However, New Zealand made available to us occupational data in considerably greater detail than this.

6. Ibid., pp. 113-114.

procedure precluded by the failure to publish occupational data in finer detail.

Aggregation presents another problem as well. It conceals what might be vital jobs in an occupational structure, by submerging them in a broad grouping. Broad groupings are particularly deceptive if they contain offsetting trends. Our own work with United States occupational data by industries and states suggest, for example, that certain specific occupations such as accountancy or mechanical engineering might be more important in distinguishing different sectors of an industry than a more inclusive group, such as one containing all professionals. Moreover, it makes a great deal of difference for educational planning whether it is necessary to provide physical plant and facilities to educate accountants or to educate engineers, and within the latter group, whether to educate electrical engineers or industrial engineers. The more advanced the occupational level, the greater the likelihood of specialization and the greater the difficulty of moving to another professional specialty even within the same profession.

The second and by far the more serious problem is the proclivity for classifying occupations by product or by process rather than by level of skill or by degree of work complexity. In part, but only in part, this preference reflects the use of socio-economic categories rather than those based on technological considerations. But is also reflects the absence of a universal system for determining the complexity or skill of a job. ISCO, for example, often groups together blue-collar workers engaged in the same activity or industry, regardless of skill level. This problem is prevalent on the three-digit level, but even the five-digit level of reporting is not immune. For example, ISCO has a five-digit occupation, "Electrical Fitter (Domestic Appliances)," who:

> Fits, assembles and repairs electrical domestic appliances in factory; performs basic tasks similar to those of Electrical Fitters, General ... but works on electrical domestic appliances, such as electric fans, vacuum cleaners and irons, of which special knowledge is required.[7]

Is this an all-around craftsman, a skilled fitter-assembler or merely a semiskilled assembler? He may do all the tasks specified, but the likelihood is that he specializes in just one or two at most. Such a definition, in short, gives the coder too much discretion, particularly since ISCO provides only a residual classification as an alternative.

The merging together of different skill levels makes it almost impossible to isolate occupations that probably are crucial for economic development. Skilled manual workers and first line supervisors too easily disappear in an abyss entitled, variously, "craftsmen and production workers" or in a classification based upon industry, as for example, "chemical and related process workers." It would seem essential to separate skilled production workers from semiskilled machine tenders or process workers. Similarly, unskilled workers or learners ought not be included with skilled and semiskilled workers. Typically only unskilled laborers appear by themselves, even though lack of skill is not only or even primarily a matter of whether or not the work requires brawn rather than brains.

The neglect of skill differences is not restricted to blue-collar workers. It is almost endemic among white-collar and service worker categories, which bear the burden of somewhat archaic social distinctions rather than more useful functional distinctions. All censuses as well as ISCO

---

7. Ibid., p. 126.

treat managerial and administrative personnel alike, as if the corporation president, the plant manager, and the department foreman performed work at the same level of difficulty and required the same amount of training and experience. In some censuses the working proprietor is segregated, but this is a relatively rare concession.

Luckily, a somewhat better job of distinguishing skill levels occurs in the classification of clerical and sales workers because many job titles coincide with differences in the degree of work complexity or the amount of skill required. But even in this case there are disturbing lapses. Very often there is one all-inclusive category for office machine operators or for all sorts of specialized clerks. Unfortunately, machine operators and specialized clerks include a fairly broad range of skill levels, the majority of a nation's clerical workers, and, frequently, rapidly growing occupations. Sales clerks who may not be much more than package wrappers and money collectors are indiscriminately dumped with sales people who have to persuade customers to buy expensive consumer durables.

Finally no census tries to differentiate service jobs by degree of complexity, except in a very rough, accidental fashion. Thus, service workers often are classified into those working in households and those working outside. The inference is that the former are at the bottom of the skill scale. ISCO has a fairly elaborate classification of service workers, but it is necessary to get to the five-digit level before skill differences can be distinguished. Even here, however, there are difficulties. First, skill differentiations are largely fortuitous, the result of conventional ways of labeling and grouping jobs rather than systematic efforts to rank them by complexity. Secondly, even the rough skill

differentiations discernible at the five-digit level have ambiguities.

A few examples are in order. How does a cook compare in terms of skill with a policeman, or a beautician with an airline stewardess? The difficulty is compounded when one tries to make comparisons among major groups. Is a keypunch operator or a telephone operator the equivalent of a stewardess? And how do all three compare with a rolling mill operator or a carpenter? There are no guidelines here. It is assumed, more or less, that the clerical worker and the service worker, excepting the drudge, needs more formal schooling than the blue-collar worker, and that therefore the former is "above" the latter in some way.

Our third problem involves job content. Census occupational data are gathered without trying to learn anything about the content of the jobs reported. Only job content can offer clues about the degree of complexity of the work and the degree of skill needed to perform it. For example, what is a cook? Is he a chef or an exalted counter clerk? Is a machinist an all-around craftsman, job setter or the operator of a specialized machine tool, possibly completely automatic? Questions of content are especially important when comparing the occupational structures of industries at different levels of mechanization. Job titles by themselves can confuse the difference between modern machine skills and traditional artisan skills. The more technically advanced an enterprise or industry, the greater the likelihood of specialization and the greater the likelihood that work will not require traditional skills, even though the traditional titles continue to be used. Thus, a low productivity textile industry might have a high proportion of skilled weavers, while a high productivity textile industry might have comparatively fewer weavers,

most of whom actually are semiskilled machine tenders. One could multiply such examples, not only with respect to manual worker jobs but also with respect to white-collar and service ones as well, as our earlier discussion suggests.

The occupational code we developed for our work[8] reflects many of the dilemmas noted above. We chose ISCO as our frame of reference on the grounds that other nations were more likely to use it, or a modified version of it, than they were to use the census categories of the United States. We first tried to rearrange ISCO's five-digit occupations according to broad skill categories, such as skilled, semiskilled and unskilled for manual worker occupations, and higher-skilled and lesser-skilled for white-collar workers and service occupations. However, the failure of ISCO to delineate blue-collar skill levels or to account separately for supervisors, and the failure of most census data to do the same or to report occupational data in sufficient detail, forced us to abandon our original effort. We finally adopted a classification system of 225 occupations or occupational groups based upon occupational titles reported by individual censuses rather than one based upon skill requirements.

Our original classification scheme had also sought to distinguish between blue-collar and service occupations that cut across industry lines (e.g., mechanic, driver) and those peculiar to an industry (e.g., tire builder, weaver). The objective was to minimize the number of classifications as well as to identify occupations that might affect multiple

---

8. Northeastern University, Classification of Occupations by Skill Level, 1964, unpublished, multilith.

industries, perhaps the entire economy. Our revised classification retains this distinction to the extent that existing census classifications do. Here again, however, job titles or names, rather than skill level or work content, are the basis for classifying and reporting data.

Problems of Industry Classification

Inasmuch as all of our occupational data were to be cross-classified by industry we had to devise an industrial classification system that was applicable to as many of the countries in the study as possible. In addition, our classification scheme had to distinguish industries crucial to development. In contrast to our difficulties developing uniform occupational classifications, differences in industry content posed comparatively few problems.

The first step was an examination of the census classifications of a number of countries in our sample, to determine how they actually grouped industries. The United Nation's International Standard Industrial Classification of all Economic Activities (ISIC), containing 134 detailed industries, became the basis of our classification system because the industry codes of most countries were very similar to ISIC. Although many nations used very detailed industry breakdowns in their statistics of employment by industry, they did not always use the same industry detail in their statistics of occupational composition. As a result we had to adjust various industry groupings to accord with those actually used by individual countries. Thus, some ISIC industries were combined, and divisions of others rearranged. The combinations allowed us to accommodate industry codes of varying degrees of detail. For example, most countries provided detailed occupational data for both "Agriculture" and "Forestry and Logging";

but a few countries combined the two and provided statistics for only "Agriculture, Forestry and Logging". Consequently, our classification scheme includes not only "Agriculture" and "Forestry and Logging," but also the combination of the two industries. The same arrangement was used with a few other industries, and here also our classification scheme includes both the individual industries and the combination of the two. Nevertheless, our industry classification scheme of 58 industry or industry groups varies in only minor ways from the two-digit categories of ISIC.

Problems of an Education Classification

Our view that the occupational composition of an industry's work force is a key determinant of an industry's productivity, and that a detailed classification of occupations is needed for efficient manpower planning, differs in some ways from the view that the educational level of a nation's population is a major determinant of productivity. It is not the educational level, but the skills of a nation's work force, that are most significant, and the two are not necessarily synonomous. In addition there are sufficient differences in the educational levels and the productivity levels of various industries so that nationwide figures become rather meaningless for planning purposes.

A great deal of attention has been paid and continues to be paid to the education for professional and technical occupations. One possible reason is that the gestation period of these occupations is long and that the way to become a professional is well defined and singular. Until recently educators and economists have paid much less attention to skilled manual workers, despite their numbers and the importance of their role in production. Nonetheless, the training of a craftsman may require years of formal

schooling and then more years of on-the-job training and work experience. The way to become a skilled worker, however, is less clearly defined than the way to become a professional. Training may be substituted for schooling and vice versa, and skills appropriate to one occupation may be transferable in varying degrees to other occupations. Thus, there are multiple paths of skill acquisition, all leading to the same objective -- the turning out of a person who can meet the work requirements of an occupation.

When a country cross-tabulates occupations with educational data, it is always in the framework of formal education in the regular school system. Informal schooling and on-the-job training is not considered part of the educational structure and thus is not included in the data.

Even when only formal schooling is included, however, inter-country comparisons are not easy to make. The school systems of the nations covered in our study differ in structure and use different terminology.[9] Fortunately, publications of the United Nations describe the educational systems and structures of various nations,[10] and make it possible to take account of such differences when making comparisons.

The chief obstacle in making international comparisons of educational data is that countries either group data differently or collect different information. In Canada, for example, years of schooling are grouped as follows: 0-4, 5-8, 9-12 and 13 years or more. In the United States, years of schooling are combined somewhat differently: 0-4, 5-7, 8, 9-11, 12, 13-15, 16 and 17 years or more. Other countries use still different

---

9. Differences in quality obviously exist, but they could not be pursued here.

10. See UNESCO, World Survey of Education - II, Paris, 1958.

intervals, and it is not always possible to establish uniform intervals because of overlapping.

A more serious problem is the use of methods other than years of schooling to present educational attainment. Some nations use the highest level of school completed; a few the age at which formal education is completed. It is almost impossible to translate these two classification systems into years of schooling completed. The number of years of various school levels differs among countries; moreover, there is no way of knowing how many years were spent by members of the population at uncompleted levels. Finally, age of completion is not necessarily the same as level or years of schooling completed because of variations in age of entry, rate of promotion, and the number of years of different school levels.

If education is at all significant for the planning of manpower, it is not the average level of education attained that is important; what is important is the <u>minimum</u> level of education needed before a person can learn to perform effectively the duties of an occupation. Developing nations with limited resources have to be especially careful to choose the most efficient and economical ways of imparting scarce skills. We had no way of determining the minimum level of education required of each occupation.

Because of the differences in classification methods and the uncertain meaning of reported amounts of education, we decided against developing a uniform classification system for educational attainment. Instead, our educational data by occupation are presented by the educational categories of the original data.

Problems of the Productivity Statistics

The ambiguities of inter-country comparisons of productivity have not been fully solved in economics. Despite numberous efforts to do so, progress has been slow and practical measures of comparison few. International differences in exchange rates, taxation and subsidy policies, wage levels, product mix, markets, depreciation policies, etc., seriously hamper the task of comparing productivities of industries in different countries.

Nevertheless, various criteria can be used to determine the relative productivity of an industry in one country vis a vis the same industry in another country. Where some physical measure of direct output is available, such as tons of coal mined, passenger-miles transported, or tons of iron produced, the task of comparison is rather simple. However, where no such direct measure is available, we must turn to less satisfactory measures. The alternatives may be some measure of output value per employee or some indirect measure of productivity, such as power consumed per worker. However, a physical measure of output is not applicable to most manufacturing industries. For these industries, therefore, we used the productivity measure of value added per worker in the local currency multiplied by an exchange rate, quoted in dollars, to express the result in dollars per worker. Where different exchange rates existed, we used the free market rate.[11]

---

11. This rate should be adjusted by a coefficient reflecting import tariffs, in the case of local industries that compete with foreign imports, or export taxes in the case of export industries. This would give a better approximation of the actual productivity. Only an exhaustive study of import and export regulations of each country can provide such information. The need for such adjustments can be seen in the case of Chile. Total production in mining in local currency multiplied even by the overrated official exchange rate, 60 percent higher than the free rate, still gives a figure much lower than the one obtained by multiplying the amount of physical productivity by international prices in dollars. The reverse happens with some sectors in manufacturing, where tariffs can be as high as 200 percent, or more.

We used this value added measure in dollars for most of the industries in our final table.

Productivity figures in local currency were generally derived from industrial censuses for the manufacturing sectors and from statistical yearbooks for other sectors. In some cases, such as for Finland, Yugoslavia, and Argentina, figures were specially supplied by the respective countries. Employment figures used to calculate value of output per worker were obtained from the same sources as production figures, and not from population censuses. In most cases, production figures reflect only those of establishments with five or more workers. In such cases, we assumed that the productivity of establishments with fewer than five workers was equal to the average productivity of the rest of the industry. Generally, in the manufacturing industries, the smaller establishments excluded from industrial censuses do not represent a relatively large part of industry output or employment.

All productivity data were adjusted by the average number of hours worked. Where data were available, the number of hours of the specific industry was applied; in other cases, an average for the broader sector, such as manufacturing, was used. This adjustment by hours is quite important since in some cases it meant a difference of as much as 20 percent in worker productivity. Where we had statistics for two years for the same country, such as for 1950 and 1960, the 1950 figures were adjusted by a price index, before applying the 1960 exchange rate.

Where figures in physical or value terms were not available, kilowatt hours per worker, horsepower per worker, or both, were used as a guide for placing the industry between two industries with known productivity data. In those few cases where data were not available for any of our productivity

indicators, the occupational structure of the industry served as the basis for locating the industry between two known points of reference.

The following is a list of the productivity indicators used to rank the industries of the different countries in the industry tables found in Volume II.

TABLE 2. INDUSTRY PRODUCTIVITY INDICATORS

	INDUSTRY	PRODUCTIVITY INDICATOR
001.	Agriculture, Forestry & Fishing	Value added/worker
002.	Agriculture	Value added/worker
003.	Forestry and Logging	Square foot of lumber/worker
004.	Fishing	Tons of fish caught/worker
005.	Mining & Quarrying	Value added/worker
006.	Coal	Tons of coal plus adjusted tons of lignite/wkr
007.	Metal	Tons of iron ore/worker
008.	Petroleum and Natural Gas	Tons of oil/worker
009.	Quarrying and Other	Value added/worker
010.	Construction	Value added/worker
011.	Manufacturing	Value added/worker
012.	Food and Beverages	Value added/worker
013.	Tobacco & Tobacco Prods	Value added/worker
014.	Textile Mill Products	Value added/worker
015.	Clothing & Other Fabr Textiles	Value added/worker
016.	Footwear	Value added/worker
017.	Leather & Its Prod (exc Ftwr)	Value added/worker
018.	Leather & Its Prod (inc Ftwr)	Value added/worker
019.	Furniture and Fixtures	Value added/worker
020.	Lumb & Wood Prod (exc Furn)	Value added/worker
021.	Lumb & Wood Prod (inc Furn)	Value added/worker
022.	Paper and Paper Products	Value added/worker
023.	Printing & Publishing	Value added/worker
024.	Rubber Products	Value added/worker
025.	Chemicals & Chemical Products	Value added/worker
026.	Petroleum & Coal Products	Value added/worker
027.	Stone and Clay Products	Value added/worker
028.	Glass, Stone & Clay Prods	Value added/worker
029.	Metal and Metal Products	Value added/worker
030.	Primary Metals	Value added/worker
031.	Iron & Steel	Value added/worker
032.	Nonferrous	Value added/worker
033.	Fabr Metal Prod (exc Mach)	Value added/worker
034.	Machinery (exc Electrical)	Value added/worker
035.	Electrical Mach and Equip	Value added/worker
036.	Transportation Equipment	Value added/worker
037.	Motor Vehicles, etc.	Value added/worker
038.	Profess & Scientific Instruments	Value added/worker
039.	Miscel Mfg (inc Instruments)	Value added/worker
040.	Transportation & Warehousing	Value added/worker
041.	Railroad	Passenger and ton KM cargo/worker
042.	Trucking	Number of commercial vehicles/worker
043.	Water	Occupational composition of labor force
044.	Air	Passenger miles/worker
047.	Communications	No. of letters, cables, phone calls/employee
048.	Utilities	Value added/worker
049.	Trade	Value added/worker
052.	Finance, Insurance & Real Estate	Value added/worker
053.	Services	Value added/worker
054.	Government	Purchases of goods and services/worker
055.	Education	Teacher-student ratio at primary and secondary level
056.	Medical	Inverse of infant mortality rate

The Statistical Tables of Volume II

As described above, we first had to rearrange the raw manpower data collected from the various countries according to our own classification system before we could prepare cross-tabulations, or run correlations between productivity and occupational mix. This step required the punching for each country of a set of computer cards containing the raw occupational and industrial data, and then its coding so that a second set of cards could be prepared containing the raw data grouped according to our occupational and industrial codes. With these cards we were able to use the computer to prepare the tabulations needed. Volume II of this study contains all of the statistical tables that are necessary for the international comparison method of projecting manpower requirements.

There are three basic sets of statistical tables. The first set contains 26 country tables. Each country table represents a country at a specific date, and presents the occupational distribution of the nation's working labor force by industry.[12] The occupational distribution contains 225 occupations or groups of occupations, and the data are given in employees per 1000 persons engaged in each of the 58 industries or industry groups in our classification system. Thus, each country table contains 225 occupations or occupational groups in each of up to 58 industries. The bottom row of each such table is "employees per 1000 active population sector:" The total active population of the country is also given. From these figures one can compute the total number of persons engaged in each of the industries. Where an asterisk appears the number of employees

---

12. A list of the countries and the dates of the data can be found in the Table of Contents of Volume II.

was less than one per 1000 active population in that sector.

The second set of tables in Volume II contains the statistics of the first set, but differently organized. It is the key set of tables for the projection of manpower requirements. This second set contains 52 separate industry tables,[13] and each of these gives the occupational composition of that industry for the 26 countries. Again, the same number of occupations is included and the composition is per 1000 persons engaged. What is crucial in these tables is the ranking of the country data. Each industry table ranks the countries by the level of productivity of that industry in the country. The measure of productivity is listed for each country's industry. Thus, within the range of productivities found in any single industry table one can find an occupational structure related to a specific level of productivity. Users of these tables can select a specific productivity level for an industry as a target, and then determine from the appropriate column the occupational structure associated with the selected productivity. Where necessary, users can also interpolate productivity levels and occupational structure statistics.

The third set of tables gives the cross-classification of occupations by educational attainment for 16 countries. As indicated, supra, we could not establish a single classification system for education. The educational attainment levels are those of the nation involved, but the occupational classification is the same as that of our other basic tables. Only 16

---

13. Because of difficulties in obtaining a meaningful measure of productivity, six industries of the 58 were not included in this set of tables. The omitted industries were: warehousing, other transportation, wholesale trade, retail trade, business services, and personal, recreation and miscellaneous services.

nations are represented because the other countries in our sample failed either to provide the necessary occupational detail or to classify occupations by educational attainment levels.

The view that educational levels in some of the more economically advanced countries exceed occupational needs seems to be supported by the variation these tables show in the years of schooling for specific occupations. In planning for the training of skills, the important considerations may be the minimum level of formal education needed before a person can learn to perform effectively in an occupation, and the different rates of substitution between formal education and other forms of training.

The Appendices

The appendices included in Volume I are an effort to help the reader use the tables of Volume II and to clarify some of the more complex problems raised by the statistics or by our classification systems of occupations and industries. Appendix A includes a series of summary tables of occupational composition for each of the countries included in our sample. The statistics are thus a cross-classification of 18 occupational groups by 10 economic sectors, and they provide a ready reference to the occupational and industry structure of all the nations in this study.

Appendix B lists the industries used in the classification system developed specifically for this study, and gives the code number equivalents of the International Standard Industrial Classification. With this list one can readily translate our industrial titles into the equivalent

ISIC code numbers.

Appendix D lists the occupations found in the classification system developed specifically for this study and gives the code number equivalents of the International Standard Classification of Occupations. Thus, the user of our statistics will be able to translate readily our occupational titles into their equivalent ISCC code numbers.

Nations tend to use occupational titles and industry titles to suit their own domestic needs. As a result, however, one frequently finds that the same or similar industry titles or occupational titles in two countries have different meanings and content. In our development of a series of industry titles and occupational titles, we had to subsume in our classification scheme the various titles used by the different countries. As a result, the coverage of any one of our titles may vary from country to country. Appendix C contains a series of notes, for each country in our own classification scheme, explaining the variations in the content of industries from that of the titles used in our own structure. Appendix E contains notes for the occupations. In this case, however, deviations from our occupational structure are not presented. Instead, we show the way in which we classified the titles used by each country to group the data it made available to us. The titles used by each country thus are arranged according to the occupations of our structure.

IV. TESTING THE HYPOTHESIS

As indicated, supra, the basic assumption upon which the international comparison approach to manpower projections depends is that there exists a relationship between a given occupational structure and productivity. Or, more specifically, there is a relationship between value added per employed person in a given industry and the occupational composition of the work force in the same industry.

The planning of an industrial sector requires considerable understanding of the way in which inputs are transformed into the desired outputs. In economic theory this transformation is represented by a production function that shows the outputs that can be obtained from various combinations of inputs, assuming a given state of knowledge. Most production functions in economic literature concentrate upon the combinations of capital and labor, and hence the substitution of capital for labor and vice versa. Little attention is paid to the type of labor that must be combined with a given type of capital.

Focusing attention on the types of labor rather than the relative amount of labor is a recent phenomenon. This reorientation was brought about, on the one hand, by the apparent increase in structural unemployment in highly developed economies and the growing awareness of the investment characteristic of education, and on the other hand, by the inability of some developing economies to achieve desired levels of productivity with a certain amount of capital because of a lack of skills. Solutions to the problems of unemployment and low productivity are hampered

by the general failure of economic theory to incorporate labor as anything but a homogeneous input, and by the paucity of research about the work force composition of different industries and its relationships to productivity.[14]

There is reason to believe the existence of a high degree of complementarity between a specific type of production method and the kind of labor force needed for it. In other words, a certain level of technology, and thus a certain level of productivity, is represented by a specific kind of organization and capital equipment that is made to work by a labor force whose occupational composition is well defined.

This assumption can be formalized as follows: The productivity of an industry is linked to a specific occupational distribution of its labor force; and the production function in this case is of the type

$$Q = F_1 (K, L_1, L_2, \ldots L_n),$$

where $L_1, L_2, \ldots L_n$ are the number of workers in occupations 1, 2, ... n, and where K is the amount of type of capital. We can rewrite the equation in the following way:

$$Q/L = F_2 (K/L, L_1/L, L_2/L, \ldots L_n/L)$$

where L is the total number of workers. If we also assume that K/L is a function of the occupation distribution of L, then it follows that:

$$Q/L = F_3 (L_1/L, L_2/L, \ldots L_n/L)$$

The statistics of Volume II were used to test this formulation.

We fitted the following functions to the data of manufacturing industries:

$$y = a + b_{11} x_{11} + b_{21} x_{21} + \ldots + b_{n1} x_{n1}, \text{ and}$$

---

14. We shall assume that productivity is the relationship of output to a factor of production. Since we are dealing mainly with the input of labor, we refer to the productivity of labor simply as productivity.

$$\log y = a + b_{11} \log x_{11} + b_{21} \log x_{21} + \ldots + b_{n1} \log x_{n1}$$

where y_1 = productivity (value added per worker) in industry 1; and x_{11} x_{21} ... x_{n1} are the proportions of occupations 1, 2, ... n in the labor force of industry 1.

The major groups used in our data were:

- x_1 = Professional and Technical Workers
- x_3 = Administrators and Managers
- x_4 = Clerical Workers
- x_6 = Sales Workers
- x_7 = Manual Workers

Tables 3 and 4 contain the final equations (after the variables without statistical significance were dropped), the degree of determination, the multiple F, the F value of each coefficient, the degrees of freedom, and the level of statistical significance. The linear function applies to Table 3; the log function applies to Table 4.

These tables show that variations in productivity can be explained by differences in occupational structures; that variations in the proportion of professional and technical workers are a major determinant of productivity in almost every industry; and that the importance of other groups vary from industry to industry, and depend on the type of curve that is used to fit the data. The only occupational group whose variations seem to exert no influence on productivity is that of clerical workers.[15]

---

15. The influence of a variable has no bearing on whether it appears in the formulation. The fact that a variable does not appear does not imply that this occupation is not needed. All occupations are needed and have to be planned for. If, for example, regardless of the level of productivity, 10 percent of the labor force has to be in occupation x, the variable x may not appear in the equation but may nevertheless play an important role in determining the need for occupation x in the economy.

Table 3. Multiple Correlations of Productivity and the Occupational Composition of Industries

		R^2	F	DF_1/DF_2	Significance Level
Manufacturing	$y = -2{,}991 + \underset{(17.32)}{82{,}54\ x_1} + \underset{(4.44)}{60.69\ x_3} + \underset{(2.29)}{39.44\ x_6}$	.708	13.79	3/16	.01
Food and Beverages	$y = 7{,}954 + \underset{(3.34)}{38.13\ x_3} + \underset{(1.63)}{38.67\ x_4} - \underset{(1.42)}{13.45\ x_7}$	.406	3.87	3/17	.05
Tobacco & Tobacco Products	$y = 123{,}748 - \underset{(4.70)}{157.57\ x_1} - \underset{(4.46)}{192\ x_3} - \underset{(11.15)}{144.56\ x_4} - \underset{(9.03)}{120.68\ x_7}$	.512	3.67	4/14	.05

The evidence seems to show that the same relationships between productivity and occupational mix hold for productivities well below those of United States industries. Thus, the idea that the productivity of an industry is reflected in the occupational composition of its labor force can be applied to international data. The difficulties in using international statistics are greater than those involved in using United States data, but the latter are not completely free of problems.[16] In any case, the spectrum of productivity levels is much wider on the international level, and we can therefore expect clear trends and more discernible patterns.

The results of these correlations clearly indicate that the data of the tables in Volume II can be used to project future manpower requirements. In all types of economic planning it is of particular importance to have proper information about the present and anticipated manpower requirements. Developing nations at various levels of productivity can make use of the statistics as the basis for projecting future manpower requirements.

---

16. One difficulty in using state data of the United States, in contrast to using international data, is that the occupational structure of an industry in a given state may come from establishments that specialize in the production of a few items. The product mixes of an industry in each of several industrially diversified countries probably are more alike than they are in each of several states in the United States. Specialization in the products of a given industry is apt to be sharper among states than among nations.

V. MANUAL FOR THE USE OF THE TABLES

Forecasting manpower requirements for the occupations of an entire economy must start from a detailed plan of the economy. Thus, it is imperative that a target for production or investment exist, since the projection of manpower requirements cannot be done in a vacuum. Most economic plans fix production targets for each sector according to expected consumption, imports and exports, or the investment goals necessary to generate a given production target.

The derivation from output targets of subsequent employment targets implicity assumes a given labor productivity. For example, if the plan calls for a target of $10,000,000 of value added in a given sector and a labor force of 4,000 workers, it assumes a productivity of $2,500 per worker. Or, if the investment goal is $20,000,000, but with a capital-output ratio of 2.0 and the same employment (or $1,250 investment per worker), we again come out with a productivity per worker equal to $2,500.

Regardless whether investment or production is given as the target, the link between output and that of manpower requirements is productivity. Because of the interdependency of production, employment and productivity, the fixing of two of the three automatically determines the third. This must be taken into account when planning. If we fix production and employment, productivity is being determined at the same time. If we fix production and productivity, employment is automatically determined.

A development process consists not only of expanding production but also of increasing productivity. For practical reasons, therefore, we

should leave employment as the dependent variable. (This, of course, may not be the case if the prime concern is employment, or if a study of supply conditions shows that a given productivity is incompatible with available manpower.)

Forecasting demand for different occupations in the economy can be divided into two major steps:

A) Determine a target of output by sector or industry

B) Determine a target of productivity by sector or industry

Example

Assume that country X plans an output of value added for the Textile Mill Products Industry of $17,000,000 by 1975, and plans to raise its productivity level in the industry from its actual level of $1,040 value added per worker to approximately $1,700 value added per worker. The plan for the Textile Industry calls, therefore, for an employment of $10,000 workers by 1975.

What occupational structure of the working force in the Textile Industry is needed to achieve this level of productivity? The table for Textile Mill Products, page 80 of Volume II, shows the occupational composition of this industry at various levels of productivity for different countries. These statistics may provide the answer.

This table shows that two countries have a similar value added per worker corresponding to the neighborhood of $1,700 per worker. These countries are Belgium and the Netherlands. These two countries provide us with a range of values for each of the occupational categories. The specific procedure for making a projection of required manpower involves the following steps:

1. Determine ranges for the major groups.

The table for Textile Mill Products gives the following ranges for the major groups:

	per 1000 employees
Professional and Technical	10-20
Administrators and Managers	23-27
Clerical Workers	71-81
Sales Workers	5-7
Manual Workers	810-853
Service Workers	32-36

2. Determine ranges for minor groups included in major groups.

(a) In the Professional and Technical groups we have the following occupations:

	per 1000 employees
Engineers	0-3
Technicians	7-13

Let us assume that there can be some substitution between engineers and technicians. (The educational data reveal, for example, that in the Netherlands a significant percent of technicians have university degrees. The title of engineer in that country is given only to persons with an equivalent of more than a masters degree in engineering.) The combined group of engineers and technicians would have a range of 10 to 13 per thousand.[17]

In the case of Accountants, none are listed for Belgium and the Netherlands. This does not imply that there are no accountants in the Textile Industry in either of these countries. It means only that these

17. Belgium has 10 engineers and technicians per 1000 employees in its Textile Industry, while the Netherlands had 13 per 1000. The Belgium figure is the sum of 3 engineers per 1000 and 7 technicians per 1000. The Netherlands data report only engineers and technicians combined.

countries did not separately classify accountants as defined by our classification system. (They probably were merged with bookkeepers.) Nevertheless, for planning purposes we can assume that the accountants are needed. In scanning the Textile Table we find that for the countries that list accountants as separate group, the range is from 2 to 5 per 1000 with an average of 3 per 1000.

(b) The range for Administrators and Managers is 23 to 27 per 1000. In view of the fact that specific proportions of these occupations do not seem to be too significant, we can use the range for the major group.

(c) For Clerical Workers, the ranges for the minor groups are:

	per 1000 employees
Bookkeepers	6-8
Telephone Operators	1
Office Machine Operators	1
Other Clerical Workers	58-71

The last category, Other Clerical Workers, is a catch-all group which includes all types of clerical workers except those specifically mentioned above. The statistics for any one country may be so aggregated that it is impossible to separate out a single critical occupations such as Secretaries, Stenographers and Typists, for example. For other countries, however, the data for this specific occupational group may be available; the range in a number of countries is from 11 to 15 per 1000. We could, therefore, use this range as the appropriate one, and subtract this range from the range 58-71 for Other Clerical Workers. This would provide the following set of ranges:

	per 1000 employees
Bookkeepers	6-8
Telephone Operators	1
Office Machine Operators	1
Secretaries, Stenographers and Typists	11-15
Other Clerical Workers	47-56

(d) Most of the people engaged in sales in this industry are Sales Representatives and the range is 5-7 per 1000.

(e) In the major group of Manual Workers, or workers directly engaged in production, the minor group, Foremen and Supervisors, does not exist in our table for Belgium and the Netherlands. These countries do not include a separate classification for Foremen and Supervisors; nevertheless we know that this group exists and that it probably is included in the other groups. For example, the minor group, Textile Workers, probably includes foremen. Again, we can get a fairly good idea of the range of this group by looking at other countries in the table that define Foremen and Supervisors specifically.

The most common range for this minor group in countries that have a higher productivity than $1,700 per worker is 20 to 30 per 1000. We can, therefore, adopt this figure for our planning purposes.

The next important minor group is Textile Workers. Their range is 581 to 729 per 1000, with the following sub-groups:

	per 1000 employees
Fiber Preparers	52-106
Spinners and Winders	160-240
Weaver and Loom fixers	180-192
Knitters	28-40
Bleachers and Dyers	57-80
Other Textile Workers	69-106

The next sub-group is Textile Printers and Pressmen. The range for Textile Printers and Pressmen is quite wide, from 2 to 15 per 1000. In

many instances, however, this group is linked with the minor group of Bleachers and Dyers, and if we add these groups together we have the following range:

	per 1000 employees
Bleachers, Dyers and Printers	72-82

The range for Clothing Workers is 340-530 per 1000. Included are Tailors, Furriers, Sewers and Stitchers, and various miscellaneous apparel makers and similar workers.

The range for Metal Fabricating Workers, who include mostly Machine Setters, Smiths, and Machine Fitters and Erectors, is 9 to 14 per 1000, and for Construction Workers, 11-15 per 1000. In this latter group, the most crucial sub-groups are Carpenters and Joiners, 3-4 per 1000, and Electricians, 4-6 per 1000.

In the Transportation Workers group, the crucial sub-group is Truck Drivers, whose range is 6 to 7 per 1000. The sub-group, Dockworkers and Stevedores, includes all types of loaders and unloaders and variation in the figures can be attributed to classification differences since this sub-group could easily fit into the classification of Unskilled Laborers.

The range of Mechanics and Repairmen is 20-29 per 1000 and that of Stationary Engineers and Firemen is 8-11 per 1000.

The following is a summary of the most important occupational groups in the major category of Manual Workers:

	per 1000 employees
Foremen and Supervisors	20-30
Fiber Preparers	52-106
Spinners and Winders	160-240
Weavers and Loom Fixers	180-192
Knitters	28-40
Bleachers, Dyers and Printers	72-82
Other Textile Workers	69-106
Clothing Workers	340-530
Metal Fabricating Workers	9-14
Carpenters	3-4
Electricians	4-6
Truck Drivers	6-7
Mechanics and Repairmen	20-29
Stationary Engineers and Firemen	8-11
Mixed Skills	14-34

(f) In the Service Workers category we find the following sub-groups:

	per 1000 employees
Protective Service	2-3
Personal Service Workers[18]	30-33

3. Determine actual number of people needed in each occupational group.

In order to assess the total number of people needed in each occupation, we have to multiply the proportion of each occupation in the labor force of the industry by the employment figure of the industry. We assume a value for each occupation given by the mid-point of the range. In our case, total employment was projected at 10,000.

---

18. Mostly cleaning personnel

	Actual Number
Accountants	30
Engineers	30
Technicians	100
Managers and Administrators	250
Bookkeepers	70
Secretaries, Stenographers, Typists	130
Office Machine Operators	10
Telephone Operators	10
Messengers	10
Other Clerical Workers	515
Sales Workers	60
Foremen and Supervisors	250
Fiber Preparers	755
Spinners and Winders	2000
Weavers and Loom Fixers	1860
Knitters	340
Bleachers, Dyers and Printers	770
Other Textile Workers	875
Clothing Workers	435
Metal Fabricating Workers	115
Carpenters and Joiners	35
Electricians	50
Mechanics and Repairmen	250
Stationary Engineers and Firemen	95
Truck Drivers	65
Mixed Manual Workers	240
Protective Service Workers	25
Personal Service Workers	315
Total	9690

The remainder of the work force, 310 persons, consists mainly of laborers and other unskilled workers.

4. Determine the number of people in each occupation for the entire country.

The same procedure of 1, 2, and 3 followed for the Textile Industry must be repeated for each separate sector or industry. The total number of people required in each occupation for the entire country can be determined by adding the numbers in each occupation as obtained from tables similar to the one above.

VI. GENERAL COMMENTS

As the last section "Manual for Use of the Tables" clearly indicates, the use of the statistics in Volume II requires sophisticated judgment. A person who naively believes that our tables will produce answers mechanically will come to grief. There are no simple solutions and therefore a number of caveats must be mentioned.

A person should be familiar with the occupations and occupational structures of industries in his own country. He should understand the statistical operations involved in making manpower projections. He should be aware of the fact that the margin of error in projections often can be large. He should know that there is no substitute for good judgment, based upon knowledge of the labor market.

In limited ways the statistics furnished in Volume II can be used for purposes other than manpower projections. Where a nation knows the occupational structure of one of its industries, it may then use our statistical tables to estimate the productivity of the industry. It is possible to use the statistics as a guide in determining which industries are more labor-intensive and which are less so. In addition, the data can be used as a guide in identifying industries that use large proportions of specific occupations which are readily available or which are relatively easy to train.

The basic statistics presented in this study were collected from 19 countries, of which seven have data for two dates. We realize that had we been able to obtain similar data from additional nations our study

would have proved even more valuable. We are aware that most of our statistics are for countries whose levels of productivity are relatively high. For nations that are just beginning their industrialization process many of the nations in our sample may be too highly developed economically to be used as guides. Additional statistics for countries at the lower levels of productivity would clearly make this international comparison approach to manpower projections more useful. We made every effort to collect the detailed statistics needed for our study from as many countries as possible. We think we have the data from all those countries from whom such statistics are currently available. As more nations make detailed manpower statistics available, they should be analyzed and adjusted to make them comparable with the statistics of other countries.

Most nations of the world are currently planning their decennial population censuses of 1970 or 1971. We strongly urge that a more uniform system of occupations and occupational titles be used so that international comparisons can be made more easily. We also urge nations to collect and tabulate their occupational data on a three-digit basis and their industry data on a two-digit basis. Finally, we urge nations to cross-tabulate their detailed occupational statistics and their detailed industry statistics. Such tabulations from many more countries would contribute significantly to the use of international comparisons.

006 Coal	11 Coal Mining
007 Metal	12 Metal Mining
008 Petroleum and Natural Gas	13 Crude Petroleum and Natural Gas
009 Quarrying and Other	14 Stone Quarrying, Clay and Sand Pits 19 Other Non-Metallic Mining and Quarrying
010 Construction	4 Construction
011 Manufacturing	2-3 Manufacturing Less Part of 242 Repair of Boots and Shoes - Cobbling; repair shops that also make footwear are included in manufacturing Less 384 Repair of Motor Vehicle
012 Food and Beverages	20 Food Manufacturing Industries, except Beverage Industries 21 Beverage Industries
013 Tobacco and Tobacco Products	22 Tobacco Manufactures
014 Textile Mill Products	23 Manufacture of Textiles

015	Clothing and Other Fabricated Textiles	243 244	Manufacture of Wearing Apparel, except Footwear Manufacture of Made-Up Textile Goods, except Wearing Apparel
016	Footwear	241	Manufacture of Footwear Part of 242 Repairers who also make Footwear
017	Leather, and Its Products, Excluding Footwear	29	Manufacture of Leather and Leather and Fur Products, except Footwear and other Wearing Apparel
018	Leather and Its Products Including Footwear	241 29	Manufacture of Footwear Manufacture of Leather and Leather and Fur Products, except Footwear and other Wearing Apparel
019	Furniture and Fixtures	26	Manufacture of Furniture and Fixtures
020	Lumber and Wood Products, Except Furniture	25	Manufacture of Wood and Cork, except Manufacture of Furniture
021	Lumber and Wood Products, Including Furniture	25 26	Manufacture of Wood and Cork, except Manufacture of Furniture Manufacture of Furniture and Fixtures
022	Paper and Paper Products	27	Manufacture of Paper and Paper Products
023	Printing and Publishing	28	Printing, Publishing and Allied Industries
024	Rubber Products	30	Manufacture of Rubber Products
025	Chemicals and Chemical Products	31	Manufacture of Chemicals and Chemical Products
026	Petroleum and Coal Products	32	Manufacture of Products of Petroleum and Coal

027	Stone and Clay Products	331 333 334 339	Manufacture of Structural Clay Products Manufacture of Pottery, China and Earthenware Manufacture of Cement (Hydraulic) Manufacture of Non-Metallic Mineral Products Not Elsewhere Classified
028	Glass, Stone and Glass Products	33	Manufacture of Non-Metallic Mineral Products, except Products of Petroleum and Coal
029	Metal and Metal Products	34 35	Basic Metal Industries Manufacture of Metal Products, except Machinery and Transport Equipment
030	Primary Metals	34	Basic Metal Industries
031	Iron and Steel	341	Iron and Steel Basic Industries
032	Nonferrous	342	Non-Ferrous Metal Basic Industries
033	Fabricated Metal Products (except Machinery)	35	Manufacture of Metal Products, except Machinery and Transport Equipment
034	Machinery (except Electrical)	36	Manufacture of Machinery, except Electrical Machinery
035	Electrical Machinery and Equipment	37	Manufacture of Electrical Machinery, Apparatus, Appliances and Supplies
036	Transportation Equipment	38	Manufacture of Transport Equipment
037	Motor Vehicles, etc.	383 385 386	Manufacture of Motor Vehicles Manufacture of Motorcycles and Bicycles Manufacture of Aircraft

038 Professional and Scientific Instruments	391 Manufacture of Professional, Scientific, Measuring and Controlling Instruments 392 Manufacture of Photographic and Optical Goods 393 Manufacture of Watches and Clocks
039 Miscellaneous Manufacturing (including Instruments)	394 Manufacture of Jewellery and Prelated Articles 395 Manufacture of Musical Instruments 399 Manufacturing Industries Not Elsewhere Classified
040 Transportation and Warehousing	71 Transport 72 Storage and Warehousing
041 Railroad	711 Railway Transport
042 Trucking	714 Road Transport Not Elsewhere Classified
043 Water	715 Ocean Transport, except in Coastal Waters 716 Water Transport, except Ocean Transport
044 Air	717 Air Transport
045 Warehousing	72 Storage and Warehousing
046 Other	712 Tramway and Omnibus Operators 713 Road Passenger Transport, except Omnibus Operators 718 Services Incidental to Transport 719 Transport Not Elsewhere Classified
047 Communications	73 Communication
048 Utilities	5 Electricity, Gas Water and Sanitary Services
049 Trade	61 Wholesale and Retail Trade

050 Wholesale Trade	611 Wholesale Trade
051 Retail Trade	612 Retail Trade
052 Finance, Insurance and Real Estate	62 Banks and Other Financial Institutions 63 Insurance 64 Real Estate
053 Services	Part of 242 Repair of Boots and Shoes - Cobbling, excluding Repair Shops that also make Footwear 384 Repair of Motor Vehicles 8 Services
054 Government	81 Government Services
055 Education	821 Education Services
056 Medical	822 Medical and Other Health Services
057 Business	83 Business Services
058 Personal, Recreation, Miscellaneous	Part of 242 Repair of Boots and Shoes - Cobbling, excluding Repairers who also make Footwear 384 Repair of Motor Vehicles 823 Research and Scientific Institutions 824 Religious Organizations 825 Welfare Institutions 826 Trade Associations and Professional and Labor Organizations 827 Libraries, Museums and Botanical and Zoological Gardens 829 Community Services Not Elsewhere Classified 84 Recreation Services 85 Personal Services

APPENDIX C

INDUSTRY NOTES

Our industrial code, which closely follows the International Standard Industrial Classification of All Economic Activities (ISIC) of the United Nations, was used to standardize the industry classifications of the original data. Complete Standardization among countries was impossible because of differences in their industrial codes.

These notes list the industries in each country for which standardization was not possible and briefly indicate the nature of the deviation from our industrial code. Unlisted industries correspond to our code, provided data for these industries appear in our detailed country and industry tables. Note that a blank space in an industry column in these tables does not mean that an industry does not exist in a particular country. More likely, the industry is included with another industry because of the manner in which the country's industrial code grouped the original data.

INDUSTRY NOTES

COUNTRY	INDUSTRY NUMBER	NOTES
Argentina 1960	058	Includes Services to the Public
Belgium 1960	015	Includes Footwear
	056	Includes Veterinarian Services
	058	Omits Libraries, etc.
Canada 1961	056	Includes Welfare Services
Denmark 1960	012	Includes Tobacco and Tobacco Products
	045	Includes Travel Agencies, Marine Brokers and Salvage Companies
	046	Land Transport, including Tramways and Bus Lines
England and Wales 1961	045	Includes Services Incidental to Transport
Finland 1960	015	Includes Footwear
	042	Includes Road Transport, including Bus Lines
	056	Includes Social Services
	057	Includes Community Services
France 1954	002	Includes Forestry
	013	Includes Manufacture of Matches
	025	Includes Rubber Products
	033	Includes Manufacture of Diverse Metal Articles, chiefly hardware and tools; and Mechanical and Electrical Repairing
	034	Includes Transportation Equipment
France 1962	043	Includes Air Transport
	046	Land Transportation
	054	Includes Educational, Research, Social Welfare Services, etc.
	058	Includes Medical and Business Services
Ireland 1960	046	Omnibus and Other Road Passenger Transport

Israel 1960	038	Diamond Industry
	046	Road Passenger Transport
Netherlands 1960	001	Includes Land Reclamation
	015	Includes Footwear, except Rubber
	042	Includes Tramways and Bus Lines
New Zealand 1961	015	Includes Footwear
	055	Educational, Medical and Business Services
Norway 1960	015	Includes Footwear
	046	Land Transport
Puerto Rico 1960	034	Includes all types of machinery
Sweden 1960	012	Includes Tobacco and Tobacco Products
	025	Includes Petroleum and Coal Products
	034	Includes Electrical Machinery
	046	Air and Land Transport
Yugolslavia 1961	046	Road and Urban Transport

166	Painter & Paper	Painter & Paperhanger	7-81 Painters & Paperhangers, Construction & Maintenance
167	Bricklayer & Mason	Bricklayer, Stonemason & Tile Setters	7-91 Bricklayers, Stonemasons & Tile Setters
168	Electrician	Electrician	7-61 Electricians, Electrical Repairmen & Related Electrical Workers LESS: 7-61.30 Electrician (Vehicles) (see Other Mechanic & Repairman 194); 7-61.45 Electrical Repairman (see Radio & Electric Appliance Repairman 193); 7-61.50 Electrical Load Despatcher, Power Station (see Other Electric Power, Telephone & Telegraph Worker 176); 7-61.55 Electrical Switchboard Operator, Power Station (see Other Electric Power, Telephone & Telegraph Worker 176)

169	Plumber & Fitter	Plumber & Pipe Fitter	7-55	Plumbers & Pipe Fitters LESS: 7-55.80 Lead Burner (see Welder & Flame Cutter 145); part of 7-55.90 those installing hangers & brackets for supporting pipelines (see Other Construction Worker 172)
170	Other Constr Craft	Other Construction Craftsman	7-92 7-93 7-94 7-95 7-99.10 7-99.15 7-99.20 7-99.45 7-99.50 7-99.70 7-99.85	Plasterers Cement Finisher & Terrazzo Workers Insulation Appliers Glaziers Housebuilder, General Floor-Layer (Mastic Composition) Floor-Layer (Composition Tile) Building Maintenance Man Steeplejack Diver Scaffolding Erector, Metal or Wood
171	Constr Equip Oper	Construction Equipment Operator	4-11.45 8-74	Operator, Farm Equipment (Motor Driven) Operators of Earth-Moving & Other Construction Machinery N.E.C.
172	Other Constr Wkr	Other Construction Worker	Part of 7-54.10 Part of 7-55.90 7-71.55 7-99.25 7-99.30 7-99.35 7-99.40 7-99.55 7-99.60 7-99.65 7-99.80 7-99.90	Roofer (Metal) Those installing hangers & brackets for supporting pipe lines. Roofer (Wooden Shingles) Roofer (Slate, Tile & Similar Materials) Roofer (Composition) Roofer (Asphalt & Similar Materials) Roof Thatcher Sandblaster, Building Exteriors Steam Cleaner, Building Exteriors Paver Pipe Layer Construction Workers N.E.C., Other

173	Elect Pow & Tel Wkrs	Electric Power, Telephone & Telegraph Workers	7-61.50 Electrical Load Despatcher, Power Station 7-61.55 Electrical Switchboard Operator, Power Station 7-64 Installers & Repairmen, Telephone & Telegraph 7-65 Linemen & Cable Jointers
174	Lineman	Lineman & Cable Jointer	7-65 Linemen & Cable Jointers
175	Tel Instal & Repr	Telephone Installer & Repairman	7-64 Installers & Repairmen, Telephone & Telegraph
176	Other	Other Electric Power Telephone & Telegraph Worker	7-61.50 Electrical Load Despatcher, Power Station 7-61.55 Electrical Switchboard Operator, Power Station
177	Transportation Wkrs	Transportation Workers	Part of 4-41.90 Those hauling or snigging logs in forest to truck loading platform 5-99.20 Engine Driver, Mine & Quarry 5-99.30 Shuttle-Car Operator, Mine 5-99.50 Brakeman (Mine & Quarry) 6-1 Deck & Engine-Room Ratings (Ship) Barge Crews & Boatmen LESS: 6-12.40 Oiler & Greaser (Ship) 6-3 Drivers & Firemen, Railway Engine 6-4 Drivers of Motorized Vehicles 6-51.20 Brakeman (Railway) 6-62.40 Railway Signalman 6-62.50 Railway Shunter 6-91 Conductors, Road Transport 6-92 Workers In Transport Occupations N.E.C. LESS: part of 6-92.90 those selling tickets on means of transportation other than bus or train 6-94 Workers in Communication Occupations N.E.C. 8-81.20 Longshoreman 8-81.30 Boat Loader (Petroleum)

178	Loco Engr & Fm	Locomotive Engineer & Fireman	5-99.20 Engine Driver, Mine & Quarry 6-31 Drivers & Firemen, Railway Engine LESS: 6-31.70 Driver, Underground or Elevated Train (see Motorman 188)
179	Railway Brakeman	Railway Brakeman	5-99.50 Brakeman (Mine & Quarry) 6-51.20 Brakeman (Railway) 6-62.50 Railway Shunter
180	Signalman	Railway Signalman	6-62.40 Railway Signalman
181	Seaman & Boatman	Seaman & Boatman	6-11 Deck Ratings (Ship), Barge Crews & Boatmen
182	Engine-Room Rating	Engine-Room Rating	6-12 Engine-Room Ratings, Firemen & Oilers (Ship) LESS: 6-12.40 Oiler & Greaser (Ship) (see Oiler & Greaser 201)
183	Dockworker	Dockworker	8-81.20 Longshoreman 8-81.30 Boat Loader (Petroleum)
184	Other Maritime Wkr	Other Maritime Worker	6-92 Workers in Transport Occupations N.E.C. LESS: part of 6-92.90 those selling tickets on means of transportation other than bus or train (see Bookkeepers, Cashiers & Tellers 060) 6-94.90 Workers in Communication Occupation N.E.C., Other
185	Truck Driver	Truck Driver	6-41.40 Lorry & Van Driver (Heavy) 6-41.50 Lorry & Van Driver (Light)
186	Bus Driver	Bus Driver	6-41.30 Motor Bus Driver

187	Other Motor Veh Dr	Other Motor Vehicle Driver	6-41.20 6-41.60 6-41.90	Motor Car Driver Motor Cyclist Drivers of Motorized Vehicles, Other
188	Motorman	Motorman	5-99.30 6-31.70 6-41.15	Shuttle-Car Operator, Mine Driver, Underground or Elevated Train Train Driver
189	Transit Conductor	Transit Conductor	6-91.10	Conductor (Bus or Train)
190	Other	Other Transportation Worker	Part of 4-41.90	Those hauling or snigging logs in forest to truck loading platform
191	Mech & Repairmen	Mechanic & Repairmen	7-53 7-59.15 7-59.20 7-61.30 7-61.45 7-63	Mechanics-Repairmen (except Electrical & Precision-Instrument Repairmen) Gunsmith Locksmith Electrician (Vehicles) Electrical Repairman Mechanics-Reapirmen, Radio & Television
192	Auto Mech	Automobile Mechanic	7-53.70 7-53.75	Mechanic-Repairman (Motor Cycles & Motorized Pedal Cycles) Mechanic-Repairman (Motor Vehicles)
193	Radio & Appl Repr	Radio & Electric Appliance Reapirman	7-61.45 7-63	Electrical Repairman Mechanics-Repairmen, Radio & Television
194	Other	Other Mechanic & Repairman	7-53	Mechanics-Repairmen (except Electrical & Precision-Instrument Repairmen LESS: 7-53.70 Mechanic-Repairman (Motor Cycles & Motorized Pedal Cycles); 7-53.75 Mechanic-Repairman (Motor Vehicles) (see Automobile Mechanic 192)

3

194 Other (Con't.)	Other Mechanic & Repairman	7-59.15 Gunsmith 7-59.20 Locksmith 7-61.30 Electrician (Vehicles)
195 Hoist & Lift Opers	Hoist & Lift Operators	5-99.60 Cageman, Mine 8-72 Crane & Hoist Operators 8-73 Riggers & Cable Splicers
196 Crane & Hoist Oper	Crane & Hoist Operator	5-99.60 Cageman, Mine 8-72 Crane & Hoist Operators
197 Rigger	Rigger	8-73 Riggers & Cable Splicers
198 Stat Engrs & Fm	Stationary Engineers & Firemen	6-12.40 Oilers & Greasers (Ship) 8-71 Operators of Stationary Engines & Related Equipment & Boiler Firemen 8-76 Oilers & Greasers (Stationary Engines, Motor Vehicles & Related Equipment)
199 Stationary Engr	Stationary Engineer	8-71 Operators of Stationary Engines & Related Equipment & Boiler Firemen LESS: 8-71.80 Fireman (Steam Boiler), part of 8-71.90 those tending boilers in hot water systems (see Boiler Fireman, Ashore 200)
200 Boiler Fm, Ashore	Boiler Fireman, Ashore	8-71.80 Fireman (Steam Boiler) Part of 8-71.90 Those tending boilers in hot water systems
201 Oiler & Greaser	Oiler & Greaser	6-12.40 Oiler & Greaser (Ship) 8-76 Oilers & Greasers (Stationary Engines, Motor Vehicles & Related Equipment)
202 Fitter-Assemblers	Fitter-Assemblers	7-52 Fitter-Assemblers & Machine Erectors (except Electrical &

202	Fitter-Assemblers (Con't.)	Fitter-Assemblers	Precision-Instrument Fitter-Assemblers) LESS: 7-52.70 Erector& Installer, Machinery; part of 7-52.90 those erecting particular types of machinery & equipment not specifically mentioned elsewhere in this unit group (see Machine Fitter & Erector 142) 7-62 Electrical & Electronic Fitters
203	Assemblers	Assemblers	7-59.25 Assembler, Metal Products 7-69.20 Assembler, (Electrical Equipment) 7-69.30 Assembler, (Electronic Equipment)
204	Apprentices	Apprentices	
205	Laborers	Laborers	4-11.75 Farm Laborer Part of 4-2 Those doing Laborer's Work Part of 4-3 Those doing Laborer's Work Part of 4-4 Those doing Laborer's Work Part of 4-41.90 Those loading logs into chutes & stacking logs preparatory to transport Part of 5 Those doing Laborer's Work 5-99.40 Driver, Animal-Drawn Vehicle (Mine & Quarry) Part of 5-99.90 Those loading cars with loose material & pushing them along haulage ways 6-42 Drivers of Animals & Animal-Drawn Vehicles 6-43 Drivers Propelling Their Vehicles 8-81.40 Vehicle Loader (Railway & Road Transport) 8-81.50 Aircraft Loader 8-81.60 Porter, Warehouse 8-81.90 Longshoremen & Related Freight Handlers, Other LESS: those carrying hand baggage at railway or bus stations, airports or piers (see with Servant & Cleaner 223) 8-99 Laborers N.E.C.

206 Other Manual Wkrs	Other Manual Workers	7-41.40 Maker & Repairman, Orthopaedic Appliance 7-69.40 Sound-Recording-Equipment Operator 7-69.50 Public-Address-Equipment Operator 7-69.60 Cinema Projectionist 7-82 Painters (except Construction & Maintenance) 8-6 Packers, Labellers & Related Workers 8-75 Material-Handling-Equipment Operators Part of 9-99.90 Those posting advertising posters & notices on walls & billboards
207 Craftsman	Craftsman N.E.C.	7-41.40 Maker & Repairman, Orthopaedic Appliances 7-69.40 Sound-Recording-Equipment Operator 7-69.50 Public-Address-Equipment Operator 7-69.60 Cinema Projectionist
208 Other	Other Manual Workers N.E.C.	7-82 Painters (except Construction & Maintenance) 8-61 Packers, Labellers & Related Workers 8-75 Material-Handling-Equipment Operators Part of 9-99.90 Those pasting advertising posters & notices on walls & billboards
209 Service Wkrs	Service Workers	Part of 8-81.90 Those carrying hand baggage at railway or bus stations, airports or piers 9 Service, Sport & Recreation Workers LESS: part of 9-01.90 those investigating fire sites to determine causes of fire & degree of personal or company liability--if any--or to appraise damage done; 9-6 Athletes, Sportsmen & Related Workers; 9-7 Photographers & Related Camera Operators; 9-8 Embalmers & Undertakers; 9-99.50 Bookmakers, Sport; part of 9-99.90 those rendering first aid to individuals, those pasting advertising posters & notices on walls & billboards

210 Protect Serv Wkrs	Protective Service Workers	9-0	Fire Fighters, Policemen, Guards & Related Workers LESS: part of 9-01.90 those investigating fire sites to determine cuase of fire & degree of personal or company liability--if any--or to appraise damagé done
211 Policeman	Policeman	9-02 9-09.20 Part of 9-09.90	Policemen & Detectives Inquiry Agent, Private Those serving summonses on persons to be tried for crimes & misdemeanors or on those whose properties are to be foreclosed, & those maintaining order in courtrooms
212 Fire Fighter	Fire Fighter	9-01	Fire Fighters & Related Workers LESS: part of 9-01.90 those investigating fire sites to determine cause of fire & degree of personal or company liability--if any--or to appraise damage done (see Other Clerical Worker 066)
213 Guard & Watchman	Guard & Watchman	9-09	Guards & Related Workers N.E.C. LESS: 9-09.20 Inquiry Agent, Private (see Policeman 211); part of 9-09.90 those serving summonses on persons to be tried for crimes or misdemeanors or on those whose properties are to be foreclosed, those maintaining order in courtrooms (see Policeman 211); part of 9-09.90 those patrolling beaches & swimming pools to prevent accidents & to rescue bathers from drowning (see Other Protective Service Worker 214)
214 Other	Other Protective Service Worker	Part of 9-09.90	Those patrolling beaches & swimming pools to prevent accidents & to rescue bathers from drowning

215 Personal Serv Wkrs	Personal Service Workers	Part of 8-81.90 Those carrying hand baggage at railway or bus stations, airports or piers 9-1 Housekeepers, Cooks, Maids & Related Workers 9-2 Waiters, Bartenders & Related Workers 9-3 Building Caretakers, Cleaners & Related Workers 9-4 Barbers, Hairdressers, Beauticians & Related Workers LESS: 9-41.70 Bath Attendant 9-5 Launderers, Dry Cleaners & Pressers Part of 9-99.90 Those performing non-medical & non-technical services for patients in hospitals, those performing personal services for users of lavatories & restrooms & keeping such places clean & tidy, those carrying the baggage of hotel guests & running errands for them, those cleaning & polishing shoes
216 Barb & Beautician	Barber & Beautician	9-41 Barbers, Hairdressers, Beauticians & Related Workers LESS: 9-41.70 Bath Attendant (see Other Service Workers 224)
217 Waiter & Bartender	Waiter & Bartender	9-21 Waiters, Bartenders & Related Workers LESS: part of 9-21.90 those removing used linen & dishes from table, those arranging tables & chairs, those washing & drying glasses & cleaning bars (see Servant & Cleaner 223)
218 Hostess & Steward	Hostess & Steward	9-11 Housekeepers, Housekeeping Stewards & Matrons 9-19.70 Concierge (Hotel) 9-19.80 Steward, Ship, Deck or Cabin 9-19.85 Air Hostess Part of 9-19.90 Those taking care of needs & comfort of train or bus passengers

219	Laund & Dry Clean	Laundry Worker & Dry Cleaner	9-51	Launderers, Dry Cleaners & Pressers
220	Cook & Chef	Cook & Chef	9-12	Cooks
221	Hosp Attendant	Hospital Attendant	Part of 9-99.90	Those performing non-medical & non-technical services for patients in hospitals
222	Building Caretaker	Building Caretaker	9-31 9-32.40	Building Caretakers Chimney Sweep
223	Servant, Cleaner	Servant & Cleaner	Part of 8-81.90	Those carrying hand baggage at railway or bus stations, airports or piers
			9-19.20	Maid (except Private Service)
			9-19.30	Maid (Private Service)
			9-19.40	Maid (Personal)
			9-19.50	Valet (Private Service)
			9-19.60	Nursemaid
			Part of 9-19.90	Those attending children in showers and restrooms of schools & institutions; those rendering valet services to guests & employees of a hotel; those performing various tasks in preparation of food, such as cleaning & peeling vegetables
			Part of 9-21.90	Those removing used linen & dishes from tables & chairs, those arranging tables & chairs, those washing & drying glasses & cleaning bars
