ABSTRACT

Research studies focusing upon longitudinal assessment of instructional competency revealed that elementary school teacher education students rated themselves relatively high in classroom management, in contrast to reality and to literature on the subject of beginning teachers' performance. A study explored: (1) how classroom management skills are evaluated relative to other instructional skills, and teachers' and students' evaluations; (2) mastery of 10 individual classroom management skills and teachers' and students' perceptions of mastery; and (3) degree to which students improve in classroom management skills during student teaching, and teachers' and students' perceptions of progress. Student self-reports and cooperating teacher reports for 87 elementary school student teachers were examined. Pairwise comparisons and descriptive statistics were employed to analyze the data and answer the research questions. Results indicated that: (1) Teachers and students both rated classroom management relatively high compared to other instructional skills; (2) Teachers and students were in general agreement on the most easily mastered classroom management skills; and (3) Students rated themselves more modestly in the beginning of the student teaching experience and perceived themselves as making greater progress than did teachers, who ranked the student teachers higher at both points with less progress in the interim. Presentation at the ATE conference, New Orleans, January 30, 1984

In The University of Michigan's series of research studies focusing upon longitudinal assessment of instructional competency, a recent and somewhat surprising finding was that our elementary teacher education students rated themselves relatively high in classroom management, compared to the other seven content areas measured: planning, goals and objectives, evaluation, materials and equipment, activities and content, methods, student guidance and services. This seemed in some contrast to reality and to literature on the subject of beginning teachers' performance, and was, therefore, the impetus for further analysis of the phenomenon.

In this phase the writer included teacher data for the first time and examined in detail the variable of classroom management: the relationship of teacher ratings to student ratings; the reported mastery of classroom management skills relative to other instructional skills; and the relative mastery of the ten individual competencies which comprise the classroom management content area. Reworded as research questions to be answered, these become:

1. How are classroom management skills evaluated relative to other instructional skills? Do teachers and students differ in such evaluations?
2. Are all ten individual classroom management skills equally mastered? Do teachers and students differ in their perceptions of this mastery?
3. To what degree do students improve in classroom management skills from pre-student teaching to student teaching? Do teachers and students differ in their perceptions of this progress?

The sample group for the present phase of research consists of 87 elementary education students whose student teaching terms ranged from Winter, 1977,

through Winter, 1980, and for whom all three self-reports and the final teacher report for student teaching were in our files. (72 also had the final teacher report for pre-student teaching in our files.) A check of demographic data indicated that this sample resembled the total elementary education group very closely. The sample included regular elementary, early childhood, and special education students, all working toward the Michigan Provisional Teaching Certificate. The student self-report form included all 94 instructional competencies in the eight groups mentioned above and was completed by each student before and after pre-student teaching and after student teaching. The teacher forms listed 23 instructional competencies to be evaluated after pre-student teaching and 54 to be evaluated after student teaching.

Pairwise comparisons and descriptive statistics were employed to analyze the data and to answer the research questions.

CLASSROOM MANAGEMENT RELATIVE TO OTHER INSTRUCTIONAL SKILLS

In previous data analyses, student self-report data ranked classroom management skills first, ahead of the other seven content areas in seven of nine rank orderings: at three points in time (before and after pre-student teaching and after student teaching), and for three dimensions of competency (knowledge, demonstration and confidence). The two exceptions were a rank order of "2" in demonstration and confidence at the post student teaching level. (See Table 1) To examine whether this rank order was related to the overall competence of the student, knowledge data were analyzed separately for the highest scoring (25%) and lowest scoring (25%) students and for the total student group. All three student groups ranked classroom management first at all three points in time (See Table 2).*

*The N at that time (1982) was 89 and the data base included all 94 competencies. Subsequent analyses were conducted on the matched data from teachers and students (N=87) with a base of 23 items after pre-student teaching, and 54 after student teaching.

*Pairwise comparisons (t tests) indicated that the high-scoring group scored significantly higher than the low-scoring group ($p < .0000$) for all 8 content area subscores at all points in time. Students were assigned to high-scoring or low-scoring groups according to their total instructional competency scores (1st quartile and 4th quartile of rank-ordered scores). Base: 94 items in 8 content areas, student data only.

1982 data

Group Variable: Classroom Management

In this most recent analyses (1984), a comparison of means for each of the eight group variables (content areas) rated by students and teachers at the end of pre-student teaching and at the end of student teaching reveals that students rank classroom management first both times, and that teachers rank classroom management second both times. Table 3 reveals that the teacher means, with a rank order of 2, are higher than the student means with a rank order of 1, at both points in time. Pairwise comparisons data favored the teacher means over the student means with statistical significance ($p < .0013$) at the pre-student teaching level. The size of the difference

^aRank order of the means for eight groups of instructional competencies

(.40 on a five-point scale) ranked 4th in the rank order of differences by size for the eight competency group variables at that point in time. (See Appendix Table 9)

Pairwise comparisons data at the student teaching level show the difference (.147 on a five-point scale) was not statistically significant ($p < .06$) and ranked 6th of the eight competency group variables when ordered by size of difference. (See Table 3, also Appendix Tables 7-11)

Individual Variables Comprising Classroom Management

Pairwise comparisons data for seven individual classroom management variables at the pre-student teaching level favored teachers' means over student means with statistical significance in four such instances: Variables 42, 43, 48, and 50. (See Table 4) Mean differences for the other three individual classroom management variables were not statistically significant at the pre-student teaching level. (See also Appendix Table 8)

In a rank ordering by size of the twelve statistically significant differences at the pre-student teaching level, out of 23 instructional competency variables rated by both teachers and students at that time, the four individual classroom management variable differences ranked 7th, 8th, 11th, and 12th, ranging in size from .70 to .38 on a five-point scale. (See Appendix Table 9)

Pairwise comparisons data for ten individual classroom management variables at the student teaching level favored teachers' means over students' means with statistical significance in three such instances: variables 41, 47, and 48. (See Table 4) Mean differences for the other seven individual classroom management variables were not statistically significant at the student teaching level. (See also Appendix Table 10)

^aBased upon teacher and student mean ratings which were in close agreement

^bThree of seven such comparisons were not statistically significant after pre-student teaching; seven of ten such comparisons were not statistically significant after student teaching.

In a rank ordering by size of the 30 statistically significant differences at the student teaching level, out of 54 instructional competency variables rated by both teachers and students at that time, the three individual classroom management variable differences ranked 16th, 20th and 29th, ranging in size from .348 to .209 on a five-point scale. (See Appendix Table 11)

To summarize, in response to the first research question, classroom management is rated relatively high compared to other instructional skills, and both teachers and students agree on this generally. The differences are small, and favor teacher means over student teacher means in 16/17 such comparisons, seven of which were statistically significant.

RELATIVE MASTERY OF THE TEN INDIVIDUAL CLASSROOM MANAGEMENT VARIABLES

When means for the individual classroom management variables are rank ordered within the total group of instructional competency variables (54), it becomes evident that not only do classroom management variables as a group rank relatively high compared to other group variables, but some individual classroom management variables rank consistently higher than others. (See Appendix Table 12)

A comparison of the rank order of the seven individual classroom management variables rated after pre-student teaching by both teachers and students respectively, demonstrated the following:

PRE-STUDENT TEACHING

Perfect agreement (same RO by teachers and students)

- | | | |
|-----|--------|---|
| 1-1 | Var 42 | Develop and maintain an effective rapport with pupils |
| 2-2 | Var 48 | Follow classroom and/or school rules and standards |
| 3-3 | Var 43 | Stimulate interest and enthusiasm |
| 7-7 | Var 47 | Effectively anticipate and respond to classroom management problems |

Close agreement (difference of 1 in T/S RO)

T5 S4 Var 41 Maintain a classroom atmosphere in which pupils feel comfortable

T6 S5 Var 49 Take precautions necessary to safeguard the health, safety, and legal rights of pupils

Minor disagreement (difference of 2 in T/S RO)

T4 S6 Var 50 Reinforce goal-related behavior

(See also Appendix Table 13)

A comparison of the rank order of the same seven individual classroom management variables as rated by teachers and students after student teaching demonstrated the following:

STUDENT-TEACHING

Perfect agreement (same RO by teachers and students)

4-4 Var 49 Take precautions necessary to safeguard the health, safety and legal rights of pupils

6-6 Var 50 Reinforce goal related behavior

7-7 Var 47 Effectively anticipate and respond to classroom management problems

Close agreement (difference of 1 in T/S RO)

T2 S1 Var 42 Develop and maintain an effective rapport with pupils

T1 S2 Var 48 Follow classroom and/or school rules and standards

Minor disagreement (difference of 2 in T/S RO)

T3 S5 Var 41 Maintain a classroom atmosphere in which pupils feel comfortable

T5 S3 Var 43 Stimulate interest and enthusiasm

(See also Appendix Table 13)

A comparison of the rank order of all ten individual classroom management variables as rated after student teaching by both teachers and students demonstrates perfect agreement on variables 44 (RO 4-4), 49 (RO 6-6),

and 50 (RO 8-8); close agreement on variables 42 (RO 2-1), 47 (RO 9-10), and 46 (RO 10-9); minor disagreement for variables 43 (RO 5-7) and 48 (RO 3-1); and more disagreement for variables 41 (RO 3-7) and 45 (RO 5-2). (See also Appendix Table 13)

To answer the second major research question then, a summary review of all rank ordered lists including the ranking of the the individual classroom management variables among the total 54 instructional competency variables reveals fairly general agreement that the most easily mastered, from the point of view of the students, and the most clearly demonstrated, from the point of view of the teachers, was the cluster including variables concerning rapport with pupils (V 42), following school rules and standards (V 48); and maintaining creative, clean, comfortable surroundings (V 45), with the students rating V 45 consistently a bit higher than teachers and the teachers rating V 48 consistently a bit higher than students. Just as clearly, the most difficult to master from the student point of view, and the least demonstrated from the point of view of the teachers, was the cluster including variables concerning reinforcement of goal-related behavior (V 50), making transitions smoothly (V 46), and effectively anticipating and responding to classroom management problems (V 47), the last two being the most difficult. Students reversed their rating on 46 and 47 from pre-student teaching to student teaching, rating variable 47 the lowest of all that time.

PROGRESS IN MASTERING CLASSROOM MANAGEMENT SKILLS

One might reasonably expect progress in all skills from the end of the pre-student term to the end of the student teaching term. Based upon student self-report data, all but three of the ninety-four instructional competencies were rated sufficiently higher after student teaching to produce mean

differences with statistical significance (.0000 in most cases).* When these differences were rank ordered by size, the ranking of the ten classroom management variables among all 54 instructional variables rated by both teachers and students was as seen in Table 5.

The skills previously identified as easier to master (45, 48 and 42) do not show the greatest improvement, having already been ranked relatively high in the beginning. Of those identified as more difficult to master, variables 46 and 50 rank 2nd and 3rd of the ten in size of mean gains, while the third and most difficult, variable 47, shows the least gain of all ten (student data). The group variable, "classroom management", ranked 5th among the eight group variables when differences between student self-reported means after pre-student teaching and after student teaching are rank ordered. This difference was statistically significant ($p < .0000$). (See Appendix Table 14)

A parallel approach to measure student growth in classroom management skills might be to measure the change between the supervising teachers' rating after pre-student teaching and after student teaching. Considerable caution must be exercised in any such comparison, however, since these are two different groups of teachers, and since the number of variables being rated differs from pre-student teaching (23) to student teaching (54). Pairwise comparisons of the means for the 22 variables common to both rating forms, revealed that 16 of them were rated significantly higher after student teaching, as would be expected. Table 6 lists the three classroom management variables that were among the 16; mean differences were small.

*The three non-significant differences were in physical education and music methods which most students do not elect, and in goals and objectives which they study so intensively during pre-student teaching that little progress can be expected during student teaching.

TABLE 5

RANK ORDER BY SIZE OF THE MEAN DIFFERENCES,
PRE-STUDENT TEACHING TO STUDENT TEACHING, FOR
10 INDIVIDUAL VARIABLES OF CLASSROOM MANAGEMENT,
STUDENT SELF-REPORTS

<u>VAR</u>	<u>R:O: (54)</u>	<u>MEAN* DIFF</u>	<u>EASY/ DIFFICULT</u>	<u>STATEMENT</u>
44	12	.57746	M	Maintain expectations so that most children are able to meet them
46	16.5	.54167	D	Make transitions smoothly (between activities lessons, physical movements, periods of time)
50	19.5	.52778	D	Reinforce goal related behavior
49	25.5	.45883	M	Take precautions necessary to safeguard the health, safety and legal rights of pupils
45	28	.45070	E	Maintain creative, clean, comfortable, attractive surroundings
48	30	.44444	E	Follow classroom and/or school rules and standards
43	33.5	.43662	M	Stimulate interest and enthusiasm
42	37.5	.42254	E	Develop and maintain an effective rapport with pupils
41	42	.40845	M	Maintain a classroom atmosphere in which pupils feel comfortable
47	45.5	.40278	D	Effectively anticipate and respond to classroom management problems

*Five-point scale.

All differences were statistically significant, V 47 at .0001, the rest at .0000.

"Difficult" was determined by relatively low rank ordered means.

The group variable V 67, classroom management, was ranked 5th of 8 instructional competency group variables with a mean difference (progress) of .46389 on a 5 point scale which was statistically significant ($p < .0000$).

TABLE 6

RANK ORDER BY SIZE OF THE MEAN DIFFERENCES,
PRE-STUDENT TEACHING TO STUDENT TEACHING, FOR
THREE INDIVIDUAL VARIABLES OF CLASSROOM
MANAGEMENT, TEACHER REPORTS

<u>VAR</u>	<u>R.O. (22)</u>	<u>MEAN* DIFF</u>	<u>SIG</u>	<u>EASY/ DIFFICULT</u>	<u>STATEMENT</u>
47	13	.48571	.0044	D	Effectively anticipate and respond to classroom management problems
49	14	.48529	.0105	M	Take precautions necessary to safeguard the health, safety and legal rights of pupils
41	15	.47826	.0200	M	Maintain a classroom atmosphere in which pupils feel comfortable

*Five-point scale

"Difficult-moderate-easy" determined by relative rank order of means.

There was no statistically significant difference in teacher means for the group variable, "classroom management," pre-student teaching to student teaching.

Four of the seven individual classroom management variables and the "classroom management" group variable were not ranked significantly higher by teachers after student teaching, as compared to pre-student teaching. A partial explanation for this may be found in the initially high teacher ratings given after pre-student teaching. Students were more conservative in their pre-student teaching self-reports and then showed growth in all classroom management variables, individual and group.

Contrary to student self-report data which reported the least increase in the most difficult classroom management variable, the teacher data evidence the largest mean difference for that same variable. (See Appendix Table 15)

The answer to the third research question regarding the degree of improvement in classroom management skills is a bit more complicated than

were the answers to the first two research questions. Students perceived themselves as making significant progress on all ten individual classroom management variables as well as the group variable comprised of those ten. Teachers rated these same students significantly higher after student teaching on only three of the seven individual classroom management variables they evaluated and did not rate them significantly higher on the group variable, "classroom management."

Students reported their least progress on a "difficult" variable, V 47, while teachers reported the greatest progress for students on this same variable, V 47.

Students reported significant degrees of progress on two other "difficult" variables, V 46 and V 50, while teachers did not rate them significantly higher after student teaching on either of these variables.

The reader is reminded that these are two different teacher populations and that teacher means for these individual classroom management variables were higher than student means in 16/17 such comparisons, and significantly higher in seven (4/7 at the pre-student teaching level and 3/10 at the student teaching level).

Students, then, rated themselves more modestly in the beginning and perceived themselves as making greater progress than teachers who ranked students higher at both points with less progress in the interim.

DISCUSSION

There are four conflicts in the assessment of competency in classroom management which merit discussion:

1. Between student self-reported competency in classroom management and the reality of performance by student teachers and beginning teachers

2. Between teacher ratings and student ratings of competency in classroom management
3. Between students' immediate and long range needs in the area of classroom management
4. Between new knowledge and the current state of instruction in the area of classroom management

The first and second conflicts flow directly from this research study. The first conflict was resolved to a considerable degree by data demonstrating that although the group variable, "classroom management" was indeed ranked relatively high by students, compared to seven other groups of instructional competencies, for the ten individual items comprising that group score, the students consistently discriminated three as difficult to master and rated themselves relatively lower on these items. The remaining seven are sufficiently general or ambiguous that students perceive them as easier to master, and in fact may master them, yet still have classroom management problems in field placements. The real crux of success in classroom management lies in behaviors closely associated with the three "difficult" items which the students recognized in self-reports.

The second conflict was based upon the hypothesis that if students rated themselves unrealistically high, the teachers' ratings would disagree with student ratings. Both the condition and the hypothesized consequence have been rejected. The student were shown to be realistic and discriminating in self-reports, and, more surprising than the initially unexplained relatively high student self-ratings, the teachers rated students consistently higher than the student rated themselves, both in group and individual item scores, and across the range of "easy", "moderate," and "difficult" items.

They were in perfect agreement with students on the identification of the three most difficult skills. (See Appendix Table 13)

The third and fourth conflicts relate to the instructional implications of the study. A large part of the anxiety about student teaching derives from the, "What will I do...?" syndrome. Students want and need immediate solutions to immediate problems. At the same time university instructors aim to having students develop a rich repertoire of strategies as a resource for many kinds of problems. There is no easy resolution of this conflict. The continuing tension must be recognized, however, and attended to in instruction or neither the immediate nor the long range goals will be realized.

The final conflict is a generic one, perhaps more of a dissonance or a gap than a conflict: the difference between new knowledge and the current state of instruction. This is a good news-bad news situation. The good news is the exciting wealth of new theories and materials on discipline and classroom management. The bad news is that not enough of it is reaching the pre-service teachers during their training. Today we read about a continuum of approaches to classroom discipline so broad it encompasses approaches classified as Instruction/Organization, supported by Madeline Hunter, Carl Wallen, Johanna Lemlech, Carolyn Evertson and Jere Brophy; Interactive/Interpersonal, supported by Carl Rogers, Tom Gordon, William Purkey, Richard Schmuck, and Curwin and Fuhrman; Problem Solving, supported by William Glasser, Frank Maple and Tom Gordon; Behavioristic, supported by Hill Walker, Wesley Becker and Daniel O'Leary; and Behaviorism/Punishment, supported by Lee Carter and James Dobson (Jones, 1982).

NSSE dedicated its 1979 yearbook to the topic of classroom management with excellent articles discussing such topics as power and authority; direct and indirect influence and control; and tradition, charisma, expertise and legality as modes of authority (Spady & Mitchell, 1979). The lead article by Johnson & Brooks presents a sophisticated model of classroom management which demonstrates why classroom management skills are not easily mastered.

Educational Testing Service in 1983 produced a monograph on classroom management which defines some 60 classroom management strategies, classifies them into eight categories, and indicates for each one whether empirical evidence supports that strategy, condemns it, or whether no empirical evidence exists. The researchers and supporters of each are also identified. (Wever, et al, 1983). A nine-page bibliography attests to the ample resources now available in this field.

Historically, our response to student needs was simply conventional wisdom and personal experiences handed down from supervising teacher and university instructor/supervisor to student teacher. As more specific methods were developed they were presented in a session or two of methods or educational psychology courses or student teaching seminars. Now there are complete courses in behavior modification in Psychology departments. With the advent of the taxonomy evident in the ETS publication, it is clear that more systematic approaches to such instruction are essential. Unfortunately, while some universities now require a three credit course in classroom management, others are constrained by limitations on education credits, and all students are pressured by a continually expanding teacher education curriculum. This only proves that creative planning and persuasive efforts

are essential to the improvement of curriculum in the classroom management area. Nor are students alone in their needs. University instructors, supervising teachers and principals alike must increase their own knowledge in this field in order that students may gain 1) a better conceptual framework within which to study the immediate problems which so greatly concern them (a better theoretical base); 2) more resources to draw upon in solving their immediate problems (practical solutions); and 3) better informed mentors to help them analyze their own needs, values and styles, to realize their choices, and to recognize their progress in mastering their skills in this critical area of classroom management.

T - TEACHER S - STUDENT PST - PRE-STUDENT TEACHING ST - STUDENT TEACHING

See Table 8 for variable means

*Rank orders are given for comparisons within the seven classroom management variables rated by both teachers and students after pre-student teaching; for comparisons within the ten CM variables rated by students after pre-student teaching and for both teachers and students after student teaching; and for comparisons within the total group (53 or 54) of instructional competencies rated by students after pre-student teaching and by both teachers and students after student teaching.

Variables 44, 45 and 46 are not rated by supervising teachers after pre-student teaching.

1984 data
