ABSTRACT
        Instructional Accomplishment Information (IAI)
systems provide schools and school districts with information for
reviewing and planning their instructional programs at the class,
school, and district levels. This study demonstrated the use of IAI
information to illuminate further the instructional accomplishments
of schools priority program to which a district is committed. One of
the procedural principles suggested by Milazzo, Buchanan, and Schutz
(1981) for analyzing IAI district level databases in Racially
Isolated Minority (RIM) school or other special priority program
context was to identify those students who register instructional
accomplishments at or above the average for non-RIM (or non-program)
students. The procedure was applied to 89 Hispanic RIM schools in the
Los Angles Unified School District relative to the accomplishment
information yielded by the District's 1980 Survey of Essential
Skills. Demonstrating that the procedure was practical, the findings
showed that: a 5% random sample of student records was adequate to
preliminarily identify such schools; the procedure revealed
substantial positive accomplishments in Hispanic RIM schools; the
accomplishments did cluster in some RIM schools more than others; and
schools and schooling practices did make a difference in attaining
instructional accomplishments. (NQA)

IAI Information and Priority District Programs: A Case Study
Involving the Instructional Accomplishments of Hispanic Students
in Racially Isolated Schools

Barry Bachelor

ABSTRACT

Instructional Accomplishment Information (IAI) systems are designed to
provide school districts with information for reviewing and planning their
instructional programs. This study outlines and demonstrates a methodology
for using IAI information to illuminate further the instructional accomplish-
ments of schools priority program to which a district is committed. This
methodology is one aspect of that described by Milazzo, Buchanan and Schutz
(1981) for analysis of district level data bases. The particular context
for demonstration is that of Hispanic Racially Isolated Minority Schools
(RIMS). The study shows that there are substantial instructional accomplish-
ments in Hispanic RIM schools and that the accomplishments do cluster in some
schools more than others. That is, some Hispanic RIM schools are more
effective than others and this study identifies the effective subset.

IAI INFORMATION AND PRIORITY DISTRICT PROGRAMS: A CASE STUDY INVOLVING THE INSTRUCTIONAL ACCOMPLISHMENTS OF HISPANIC STUDENTS IN RACIALLY ISOLATED SCHOOLS

Barry Bachelor

Instructional Accomplishment Information (IAI) systems are designed to provide schools and school districts with information for reviewing and planning their instructional programs at the class, school, and district levels. The distinctive features of IAI systems are discussed by Milazzo and Buchanan (1980). Milazzo, Buchanan, and Schutz (1981) also describe a methodology for instructional interpretation and planning at the district level while Behr and Yee (1982) describe a complementary methodology at the class and school level.

The purpose of the present study is to demonstrate one of the interpretation and planning uses at the district level: Using IAI information to illuminate further the instructional accomplishments of schools priority program to which a district is committed. The particular context chosen for demonstration is that of Hispanic Racially Isolated Minority Schools (RIMS) in the Los Angeles Unified School District.

The methodology demonstrated is one aspect of that described by Milazzo, Buchanan, and Schutz (1981) for analysis of district level data bases. One of the key principles in the methodology is to isolate instructional accomplishments and then to track down the school and classroom practices that lead to the identified accomplishments:

> The commitment is to isolating RIMS accomplishments, and not just because it is beneficial to point to them--although that would be a refreshing change for RIMS. The intention is to isolate RIMS accomplishments so that they can be traced back to practices that

schools have some control over . . .. The research is for what
works in RIMS, to find it and hang onto it, and to generalize it to
other RIMS P. 7-8 .

One suggested procedural step for isolating the accomplishments is
to "identify those RIMS students who have accomplishment scores that are
at or above the district average; or, even better, at or above the
average for non-RIMS students" (p. 7). The present report describes the
results of applying the suggested procedural step in identifying "RIMS"
accomplishments of Hispanic students based upon accomplishment
information generated and accumulated in the Los Angeles Unified School
District during the 1979-80 school year.

Background: 1980 Survey of Essential Skills

Beginning in 1979, the Los Angeles Unified School District in
collaboration with SWRL has developed, installed, and operated an IAI
system. The system has several components:

- Survey of Essential Skills (SES)

  The SES are instruments for obtaining instructional accomplish-
  ment information in Reading, Mathematics, and Composition for
  grades 1, 2, 3, 4, 5, and 6. They are administered to all
  elementary school students each May. They register student
  accomplishments on the skills deemed essential for grade-by-
  grade progress in each subject area. The student materials are
  supported by teacher materials, inservice materials, etc.

- SES Reporting System

  The completed SES instruments are machine scannable so that
  results can be quickly processed and reports prepared for each
  individual student, for each school aggregrated by grade level
  within school, for each administrative area, and for the
  district as a whole. The computer software for scanning and
  processing the results is installed on the District's computer
  and is operated by District personnel. The reporting system is
  supported by appropriate print and inservice materials.

● SES 5% Sample

As part of the computer processing, approximately 5% of the individual student records are randomly selected and stored in a separate archival file for research purposes. Each student record contains demographic and accomplishment information as follows:

<u>Demographic</u>	<u>Accomplishments</u>
1. Attendance Information	For each subject area-- Reading, Mathematics, Composition:
2. Home School Code	
3. Ethnicity	1. Item responses
4. Sex	2. Skill area performance including writing sample performance at grades 3 and 6
5. Language Fluency (as applicable for bilingual program considerations)	3. Total performance

This 5% sample is used as the data base for the analyses performed in this report.

Classifying Schools by Student Language Classification Categories

For the present analysis, only those schools that had a two-thirds majority Hispanic enrollment and were designated as RIM schools were considered. There were 89 such schools in the data base. These 89 schools were then further subdivided into two types according to the proportions of FES (Functional English Speaking) and NES/LES (Non-English Speaking/Limited English Speaking) students in the school. This information is summarized in Table 1.

Table 1

School Characteristics

Main Characteristics of 89 Schools

    Designated "RIM" (Racially Isolated Minority) by the
      court
    Two-thirds or more Hispanic enrollment

Type 1 Schools (63 schools)

- two-thirds or more of Hispanic students in school
  classified as FES (Functional English Speaking)
- Average over 63 Schools: 82% Hispanic
                                79% FES

Type 2 Schools (26 schools)

- one-third or more of Hispanic students in school
  classified as NES/LES
- Average over 26 schools: 82% Hispanic
                                51% NES/LES

The remainder of the analysis in this report is confined to Type 1

schools (FES Hispanic RIM) because of the school district's testing

policy. The policy requires _every_ FES student to be assessed at every

grade level. Students classified as NES/LES are _not_ to be tested except

at Grade 6. Consequently, there are "full" data sets only for Type 1

schools, and it is these data sets upon which the analysis focuses.

Identifying Patterns of School Performance

Once the set of 63 FES Hispanic RIM schools had been identified,

the next step was to identify their overall performance relative to non-

RIM schools. For simplicity, performance of the District's white students was used as the proxy for the "performance of non-RIM schools."

When RIM schools are compared with "white" schools, scores for the overall group of white students is predictably higher than for the overall group of RIM schools (Milazzo, Buchanan, & Schutz, 1981). However, many Hispanic RIM students are performing above the white student average. The approach taken in this paper is to identify those Hispanic RIM schools (Type 1) that have a relatively large proportion of students performing at or above the average level for white pupils. An example illustrates the procedure.

In fourth grade mathematics the average district-wide percentage for white pupils is 80%. The average district-wide for Hispanic FES pupils is 68%. However, approximately one-third (33.5%) of the Hispanic FES pupils in the district performed above 80%. Further, "high scoring" Hispanic FES pupils attending RIM schools were enrolled in only 64% of the RIM schools. In other words, 36% of the Type 1 RIM schools had no Hispanic FES pupils performing above the white pupil average in fourth grade mathematics.

To determine whether a school had a large proportion of "high scoring" pupils, the district-wide proportion of Hispanic FES students exceeding the average "white" student score was used as the cut-off point. If a school's proportion of high scoring pupils in a particular grade and subject area exceeded the district proportion, it was simply given one point. The number of points was then summed for each school

across all subjects and grades. Because there are 6 grades and 3
subjects, each school can "score" anywhere from 0 to 18 "points."

In the previous example, district-wide, 33.5% of the Hispanic FES
pupils exceeded the white mean of 80% correct in fourth grade
mathematics. Each school in the sample was examined to see if its
proportion of high scoring pupils was at or above the district-wide
proportion of 33.5%. If it was, the school was assigned one point.
This process was carried out over the 18 comparison points (6 grades x 3
subject areas) and the results were summed.

Another way to think of this is to ask of each school, "Is this
school doing more than its share in contributing to the number of high
scoring pupils in, say, fourth grade mathematics?" If the answer is
yes, then give the school one point. This process was repeated for each
subject area in each grade and the number of the points was summed. The
results of this scoring process are shown in Table 2.

The distribution of points in Table 2 shows that there is
considerable variability in the number of times schools exceed the
district-wide proportions at the 18 comparison points. Forty-four
percent of the schools meet the criteria more than half of the time.
Approximately one-third of the schools meet the criteria five to nine
times, while nearly 20% of the schools scored four or less. Overall,
Table 2 shows that some schools are more effective than others, and that
these schools can be identified.

Table 2

Distribution of FES Hispanic RIM
Schools Across the Point Scale

Total Points*	Number of Schools	Percent of Schools	Cumulative Percent
15	1	1.6	1.6
14	1	1.6	3.2
13	4	6.3	9.5
12	4	6.3	15.9
11	4	6.3	22.2
10	14	22.2	44.4
9	4	6.3	50.8
8	5	7.9	58.7
7	2	3.2	61.9
6	7	11.1	73.0
5	5	7.9	81.0
4	7	11.1	92.1
3	2	3.2	95.2
2	1	1.6	96.8
1	1	1.6	98.4
0	1	1.6	100.0

*For schools that did not contain data on all six grade levels the percentage of actual points earned to total possible points was calculated and then extrapolated to the full point scale.
Figure 1. Distribution of Hispanic RIM Schools Across the Point Scale

The information in Table 2 is graphically displayed in Figure 1 which highlights the fact that accomplishments are not uniformly spread across schools. The smoothed curve in Figure 1 clearly shows that the schools separate thr.. elves into two fairly distinct groups.

The total number of points is obviously the sum of the number of points accumulated in Reading, Mathematics and Composition across the six grade levels. Since the purpose of this paper is to identify instructional accomplishments in RIM schools, those schools that show accomplishments in a particular subject area are also of interest. Such accomplishments could be masked if only the total score is used to identify an effective school. For example, if a school obtains a point in all six grades of mathematics but does not receive any points in Reading or Composition, it would have a total score of six. Such a school would fall in the bottom fourth of the distribution and

would thus not be identified as as an "effective" school. But obviously
this school is doing an outstanding job in Mathematics and should
therefore be so acknowledged. Also, one may be interested in taking a
closer look at schools that do display uneven patterns. These schools
may be found to be over-emphasizing one subject at a real cost to
others. Or, one might look to see if subject areas may be used to
complement each other. The subject area score patterns are displayed in
Table 3.

The subject area patterns in Table 3 allow one to identify schools
that are demonstrating instructional accomplishments in certain subject
areas but not others. For example, the school with a 1 1 4 pattern
appears to be doing quite well in composition but exceeded the criterion
only once in reading and mathematics. This school could be selected as
an exemplar of composition instruction. Or, it may be beneficial to
investigate how this school might complement its reading program with
its composition program since the potential for positive generalization
is highly practicable. The few obvious inconsistencies, displayed in
Table 4, mostly involve one subject area dominating the other two
subject areas. I.e., one subject area appears strong while the other
two appear relatively weak.

Table 3

Subject Area Patterns

Total Points	Subject Area Points			Number of Patterns
	Reading	Mathematics	Composition

	0	1	3	1
3	1	2	0	1*
	0	2	1	1
2	0	2	0	1
1	0	0	1	1*

*Includes 1 pattern based on 5 grade levels rather than 6 grade levels. i.e., the school only has test data for five of the six grades. Straight proportional interpolation was applied to the 5-grade pattern to estimate the 6-grade pattern. (Schools with less than 5 grade levels of test data are excluded from this score pattern table. There are five such schools.)

Table 4

Unusual Patterns

| | Subject Area Points | | |
Points	Reading	Mathematics	Composition
13	3	6	4
11	5	3	3
10	2	5	3
	5	2	3
	3	5	2
9	4	4	1
8	2	2	4
6	1	4	1
	1	1	4

How well does the point scale distinguish among various levels of
instructional accomplishments? Figures 2, 3, and 4 display the average
percentage of Hispanic FES pupils school-wide that exceed the white
pupil mean at each point on the scale for each subject area. Looking at
Figure 2 we can see that all the schools that scored two points in
reading have an average of 27% of their pupils scoring above the white
pupils' mean. Similarly, for schools with three points, there was an
average of 31% of their pupils scoring above the white mean. The boxes
drawn about the mean represent one standard error and the lines extended

Figure 2. Average school-wide percentage of pupils
exceeding white pupil mean in reading by
the point scale with 95% confidence bands.

Figure 3. Average school-wide percentage of pupils
exceeding white pupil mean in mathematics
by the point scale with 95% confidence bands.

Figure 4. Average school-wide percentage of pupils exceeding white pupil mean in composition by the point scale with 95% confidence bands.

from the boxes are two standard errors giving an approximate 95%
confidence interval.

In some cases, there is no reliable difference between groups of
schools that differ by a single point. However, one can be reasonably
confident that there is a reliable difference between groups of schools
that differ by more than one point.

Correlations among the subject areas given in Table 5 confirm what
is evident by visual inspection of the patterns. Correlations between
subject areas are moderately high the correlations between subject areas
and the total aggregate are very high. These correlations indicate that
selecting schools on the basis of the total aggregate would also select
most of those schools that had high subject area scores. However, it
would also miss the distinctive pattern features that are evident within
and between subject areas.

Table 5

Correlations Between Subject Areas
and Total Aggregate

	Reading	Mathematics	Composition	Total
Reading	--			
Mathematics	.61	--		
Composition	.56	.51	--	
Total*	.86	.82	.81	

*The adjusted total was used for cases with missing grade-level
information.

Identifying Effective Schools

The final step in the process is to set some point or pattern criterion and identify by name those schools that meet or exceed. For example, one criterion could be:

a. either a total school score of 9 or more,

b. or, a score of 4 or more in a subject area

Setting a cut-off score always involves some degree of arbitrariness. Nine and four are cut-off points that do identify schools where the majority of the grade-by-subject-area instructional programs appear to be relatively effective on a comparison basis. Schools meeting the criterion appear to have more consistent accomplishments across grade levels and/or subject areas than those schools below the cut-off points. When the above criteria are applied to the 63 FES Hispanic RIM schools in Los Angeles, 34 schools (54%) meet these particular criteria.

Figure 5 displays the same type of information that was given in Figures 2, 3, and 4. Here the percentage of pupils exceeding the white pupil mean is plotted against the total score broken out by approximate quartiles. The information displayed here and in Figure 1 suggests that a score of 9 is a very reasonable cut-off point for selecting schools. Further, one can be reasonably confident that those schools below the cut-off are different than those above the cut-off. Using a total score of 9 as a cut-off will select those schools that are meeting the criteria a majority of the time. It is also the point where the top 50% of the schools would be selected. To also include those schools that
Figure 5. Average school-wide percentage of pupils
exceeding white pupil mean by total number
of points in quartiles with 95% confidence
bands.

have a score of 4 or more in a subject area would add two additional schools.

"Selected/non selected" should not be equated with "accomplishments no accomplishments." There are certainty accomplishments in the non-selected schools. The procedure simply ranks the schools on specified criteria and selects from the top of the list. Further study can then identify RIMS schooling practices that create the student and school performance patterns. Milazzo, Buchanan, and Schutz (1981) have provided a fairly comprehensive list of factors that are likely to account for these differences in performance. Factors such as:

- textbook series used and period of use

- average length of classroom lesson

- percentage of textbook lessons completed

- percentage of substitute teacher days

- percentage of classroom time controlled by specialist

- percentage of school day spent disciplining students

- percentage of school day spent directing aide

are a few that are mentioned by Milazzo et al., that need to be investigated to determine their effect on student performance.

Subsequent study of the schools should of course be observant of demographic and non-school factors as well. It is unlikely, however, that demographic or non-schooling characteristics account for most of the variability. The schools are all Hispanic RIM schools with roughly equal levels of English-language fluency. Though there are demographic variations between these schools, it is unlikely that they account for

the instructional accomplishment differences. Table 6 shows the
breakdown of selected and not- selected schools by administrative area
and indicates that the selection of schools does not appear to be
related to administrative areas.

Table 6

Number of Selected vs. Not-Selected
Schools by Administrative Area

| | Number of Schools | | |
Area	Selected	Not Selected	Totals
1	2	1	3
2	7	10	17
4	0	1	1

7	7	4	11
Totals	34	29	63

χ^2 (4) = 3.35; n.s.

<u>Summary</u>

One of the procedural principles suggested by Milazzo et al. for
analyzing IAI district level data bases in a RIMS or other special
priority program context is to identify those students who register
instructional accomplishments at or above the average for non-RIM (or
non-program) students. This study applies the procedure to Hispanic RIM
schools in the Los Angeles Unified School District relative to the
accomplishment information yielded by the District's 1980 Survey of

Essential Skills. The findings demonstrate that the procedure is

practical, showing in particular that:

1. a 5% random sample of student records is adequate to
   preliminarily identify such schools

2. the procedure reveals the many positive accomplishments of the
   special priority program--RIM schools

3. the accomplishments do cluster in some RIM schools more than
   others (i.e., the accomplishments are not uniformly spread
   across all RIM schools); the procedure identifies 34 Hispanic
   RIM schools

4. the preceding findings provide sound evidence that schools and
   schooling practices do make a difference in attaining
   instructional accomplishments

5. the next logical step is to track down the schooling practices
   in the identified schools that contribute to the observed
   pattern of accomplishments

6. the distribution of schools involved provides a very manageable
   basis for follow-up efforts
