ABSTRACT
                     First-year graduate students were asked to respond to
a biographical questionnaire which emphasized motivational variables
in addition to the usual demographic variables. It was hypothesized
that the students could select from a group of ability measures the
one best indicator of how well they would do in graduate school. To
test this hypothesis the sample was divided into parts, those who
felt tests were the best indicator of success (test choosers) and
those who felt that some other means of assessment was the best for
them (non-test choosers). Within-group regressions were then computed
and compared using path analysis techniques. The obtained empirical
least squares weighting system gave support to the possibility that
graduate students could identify those predictors which would yield
minimum errors of prediction for them. Indications of the importance
of motivational measures as predictors for "non-test choosers" were
suggested. The Experimental Biographical Questionnaire for Graduate
Students and statistical data for the 56 items are appended.

THE "TEST CHOOSER": A DIFFERENT APPROACH TO
A PREDICTION WEIGHTING SCHEME

## Abstract

First-year graduate students were asked to respond to a biographical
questionnaire which emphasized motivational variables in addition to the
usual demographic variables. It was hypothesized that the students could
select from a group of ability measures the one best indicator of how well
they would do in graduate school. To test this hypothesis the sample was
divided into two parts, those who felt tests were the best indicator of
success (test choosers) and those who felt that some other means of assess-
ment was the best for them (non-test choosers). Within-group regressions
were then computed and compared using path-analysis techniques. The obtained
empirical least squares weighting system gave support to the possibility
that graduate students could identify those predictors which would yield
minimum errors of prediction for them. Indications of the importance of
motivational measures as predictors for "non-test choosers" were suggested.

THE "TEST CHOOSER": A DIFFERENT APPROACH TO
A PREDICTION WEIGHTING SCHEME

Donald A. Rock

## Background

Use of the biographical information blank (BIB) as a predictive measure
has achieved a varying yet limited degree of success when used with student
populations. At first glance it may seem that much of this lack of con-
sistency is in part due to: (a) poor choice of the type of biographical
items and/or criteria and (b) an over-simplification on the part of the
researcher with regard to the possible complexity of the relationships
among biographical variables when used in the prediction model.

The most frequently used criteria have been: (a) academic grades which
are predicted with little degree of success particularly when the multiple
prediction equation incorporates tests and prior academic performance;
(b) several forms of nonscholastic "creative" achievement which have been
found in some cases to be more highly correlated with BIB measures than
intellectual or other ability measures (Anastasi, Meade, & Schneiders,
1960; Holland & Richards, 1966); (c) persistence in college (Willingham,
1965) with validation found at fairly low levels; and finally (d) vocational
or curriculum choice which bears modest but seemingly consistent relation-
ships to background information (Holland, 1962, 1963a,b; Stockin, 1964).

Other more recent research (Klein, Rock, & Evans, 1968; Rock, 1969),
suggests that regardless of criteria a more effective use of many BIB
items is as moderators or grouping variables rather than as simple linear
additive effects in the usual multiple regression models. That is, their
greatest potential appears to be as a means for subdividing the total

5

population into subgroups which, in turn, are characterized by differing levels of predictive accuracy. The question then arises how--or better yet, why--do these grouping variables lead to subgroups characterized by differing levels of predictability with respect to academic achievement?

One likely explanation for this phenomenon is that different predictors have different validities for different types of people. This situation calls for the matching of person with predictor. Thus the purpose of this study was (1) to identify those individuals for whom the usual predictors may not be optimum, and (2) to consider for these people the validity of non-test predictors, in particular measures of motivation.

The method used here to match person to predictor was simply to ask the individuals what method they felt was the most accurate assessment of their academic capabilities. Once gaining this information we were able to test the goodness of fit of their "personal belief" model with the empirical data by examining the empirically derived weights. This approach is somewhat related to the theoretical developments in the field of personal probability and its application to test item weighting schemes. That is, the test examinee in some sense is asked to indicate his or her confidence in the correct option (De Finetti, 1965; Shuford, Albert, & Massengill, 1966). In general, the higher the confidence level assigned by the examinee to the correct response, the larger the weight given the examinee for the correct response. In the context of this study the individual was asked via a biographical questionnaire which method he thought would best estimate his ability. If this scheme were carried to its logical conclusion, the weights in a multiple prediction system would reflect his personal assessment of

6

the value of various methods available for estimating his academic potential. Such a system would allow the applicant to put "his best foot forward," so to speak. The question is, how would such an ipsative weighting system affect overall predictive accuracy?

/ The above approach is designed to tap an individual's experiential past with respect to feedback he may have had concerning the relative success of various methods of assessing his academic achievements. It is hoped this approach will lead to a more individualized weighting system in prediction schemes. Instead of applying the usual "normative" weights that reflect minimizing the error of prediction on the average across the whole sample, the approach under investigation here is a "quasi-ipsative" approach which allows an individual to use his past experiences to select from among a set of assessment procedures the one that is "best" for him or her.

This proposed method is, however, a test of a theory toward prediction and not in itself concerned with causal relationships. It is hoped that through path analysis methods some indications of (a) what basis an individual uses for selecting a particular assessment procedure, and (b) relative impact of motivation on first year graduate achievement may also be ascertained.

## Method

Biographical questionnaire information, Graduate Record Examination scores including the advanced subject matter test (GRE-A) were collected on incoming first year graduate students at three universities. At the

end of their first year, grade point average (GPA) was collected for these students. The total sample of approximately 450 cases was then randomly subdivided into two subsamples, a validation sample (VS) and a cross-validation sample (CVS).

In addition to building the usual prediction equations and thus obtaining the "normative" validity information, the two samples were further subdivided into two parts according to their responses to a biographical item. This subdivision was based on whether they thought test scores would be the one best indicator of how well they would do in graduate school ("test choosers") or whether they would consider some other ability measure as being more representative of their future academic achievement ("non-test choosers"). Within-group predictions of GPA were then obtained.

The three predictors used were GRE-A, rank in class in undergraduate school (UGR), and a biographical scale on which the respondent indicated on a continuous scale his chances of achieving an A-grade point average or better. This variable will be referred to as SPFAA, the mnemonics standing for self-prediction of further academic attainment. The GRE-A and the SPFAA were selected because they were the two best predictors in the validation sample. Rank in class was included since it is tradition-ally used in most prediction systems.

The relative size of the within-group regression weights associated with test scores were compared with the other weights in the system in order to see if the empirically "best" weights simulated their "personal beliefs." In short, is there any empirical evidence that the applicant

himself can minimize his own error of prediction by selecting among various assessment methods the one which is the best indicator of success for him?

Simple path analysis methods were then applied to selected variables from both the BIB and the prediction equations in an effort to identify the direct as well as indirect determinants of (1) a person's self-perception of his or her academic ability (SPFAA) and (2) success in first year graduate school as measured by GPA. Path models within the two subpopulations (test choosers and non-test choosers) were compared in order to gain further insight into possible structural differences underlying their choice of assessment procedures.

## Results and Discussion

Table 1 presents the usual validity information for a multiple prediction scheme using GRE-A, chances of achieving a high GPA (SPFAA) and undergraduate rank in class (UGR) as independent variables in predicting graduate GPA.

----------------------------------

Insert Table 1 about here

----------------------------------

Inspection of Table 1 indicates that for the most part GRE-A and SPFAA carried almost equal weights in the prediction of graduate GPA. Having demonstrated evidence for the stability of the "normative" weights across both samples, the question of interest becomes how do they change, if at all, when the samples are further divided according to choice of assessment techniques?

Table 2 presents that information. Comparing the results found in Table 2 with those found in Table 1 lends support to the possibility that

---
Insert Table 2 about here
---

individuals can select the method of assessment which is "best" (best in the
sense that it minimizes the error of prediction) for them. Table 2 also
indicates that the students did indeed put their "best foot forward" when
selecting an assessment method. That is, those choosing tests did have
on the average considerably higher test scores than the remaining sample
(675 vs. 624 in sample 1, and 708 vs. 637 in sample 2).

What is even more interesting from a statistical point of view is
that those individuals choosing tests were a rather homogeneous group;
i.e., they all had rather high test scores and thus their group variance
was considerably restricted compared to the remainder of the sample. In -
spite of this restriction in range, the standardized partial regression
weights associated with the GRE-A test scores for this group are no longer
slightly less in absolute value than those weights associated with SPFAA
but are approximately three times as big in both replications [samples 1 (a)
and 2 (a)].

If one inspects the 0-order validity coefficients presented in Table 2,
the same pattern is replicated in both samples. That is, for those indi-
viduals who select tests, the validity coefficient associated with tests
is always substantially higher than those associated with the remaining
predictor variables. This pattern is reversed in the group of individuals
preferring other means of assessment. Another possible statistical artifact
which could bring about these results would be if grouping on preferences
for tests systematically spread the variance on the criterion, however, if
anything, the reverse occurred. That is, there is a slight restriction

in the variance of GPA for this group. There is some restriction in range
for SPFAA in sample 2 (a) compared to sample 2 (b), but the variance of
SPFAA is actually larger in sample 1 (a) than in sample 1 (b).

In an effort to gain further insight into these results, path analysis
procedures were introduced. Path analysis methodology has been developed
in biology (Wright, 1960) and economics (Goldberger, 1964) and has only
recently been applied in the social sciences (Blalock, 1969, 1971; Werts
& Linn, 1970). Figures 1 and 2 present the traditional path analysis

-----------------------------------------------

Insert Figures 1 and 2 about here

-----------------------------------------------

pictorial presentation of a hypothetical causal network among selected vari-
ables. Figure 1 is based on the pooled data from both samples 1 and 2 for
those who selected tests as the best estimators of their graduate school
success, while Figure 2 is the pooling of the observations from samples 1
and 2 for those who chose other than tests. Since the consistency of the
previous findings had been demonstrated by two independent replications,
the two replication samples were pooled in order to use all the data in
estimating the final parameters and their interrelationships.

New variables were introduced into the system in the path analysis
computations so that the patterns of interrelationships among predetermining
variables could be compared for these two apparently different populations
(i.e., those who chose tests vs. those who did not). The path analysis
diagrams in this case are simply a means for simplifying the interpretation
of somewhat complex causal relations. Arrows connecting any two variables
and going in one direction indicate which of the two is the predeterminer.

11

If the structural system is recursive, that is, no reciprocal causation, the $b^*_{ij}$ above "one way" arrows are simply standardized partial regression coefficients and their relative size indicates the importance of the jth variable as a determiner of the ith variable. For example, in Figure 1, $b^*_{y1}$ is slightly more than three times as large as $b^*_{y4}$ indicating that while they are both hypothesized determiners of GPA (Y), GRE-A is three times as important as SPFAA. Using path analysis methods (Anderson & Evans, 1974; Wright, 1960) one can also partition the total effect of a hypothetical causal variable such as GRE-A on GPA in Figure 1 into its direct effect ($b^*_{y1} = .39$), plus its indirect effect ($b^*_{41} \; b^*_{y4} = .03$), that is, GRE-A acting through SPFAA and a spurious effect ($r_{y1} - b^*_{y1} - b^*_{41} \, b^*_{y4} = .01$) due to its correlation with other variables preceding it in the system. The residual path-coefficients $E_4$ and $E_y$ estimate the effect of all unmeasured variables not included in the model that may cause variation in the two endogenous variables SPFAA and GPA.

When the arrows go in both directions this indicates that the direction of causality cannot be determined, and thus instead of having an estimate of a causal effect such as a regression coefficient we simply have a correlation coefficient. For example, in Figure 1 it was decided that no good case could be made for inferring direction of causality between GRE-A and UGR (undergraduate rank in class), therefore the path diagram only estimates the correlation.

Inspection of Figures 1 and 2 indicates that GRE-A and UGR are depicted as determiners of both GPA and SPFAA. "Accomplishment" is depicted as only a determiner of SPFAA. Accomplishment is a composite variable reflecting

12

amount of participation in professional activities, number of awards

received, etc. The rationale underlying this particular causal network

is that scores of SPFAA, the student self-prediction of his ability to

achieve a high GPA in the future, can be argued to be primarily a function

of feedback concerning his past academic achievements and related

activities.

Comparing Figure 1 with Figure 2 sheds additional light on how the

"test choosers" differ from the "non-test choosers" with respect to

patterns of interrelationship among the additional variables. For example,

for "test choosers" the GRE-A has considerably higher causal and/or cor-

relational relationships with GPA, SPFAA, and accomplishment. It would

appear that tests are a good predictor for these people in many cases.

Although GRE-A seems to have a generalizable validity for many activities

for "test choosers," it does not relate to their undergraduate ranks in

class. For the "non-test choosers," we have just the reverse profile.

That is, inspection of Figure 2 indicates that GRE-A is about two-thirds

as important in determining GPA and less than half as important in deter-

mining SPFAA for the "non-test choosers." Furthermore, it (GRE-A) has

essentially a zero relationship with accomplishment, compared to an r

of .22 for the "test choosers." Also, for the "non-test choosers," unlike

the "test choosers," there is some relationship between GRE-A and UGR.

Also, as one might expect, the largest determiner of SPFAA, essentially

a self-perception variable, for the "non-test choosers" is UGR while for

the "test choosers" it is GRE-A.

It should be noted here that while the GRE-A is a significant pre-

dictor for "non-test choosers," it simply becomes an even more important

predictor for the "test choosers." It also should be pointed out that the
GRE-A is an achievement test in a specific area and thus knowledge of one's
test score has a certain amount of built-in "face validity" for making
predictions of future academic achievement in that specific area. Thus it
is felt that these results may well apply only to achievement rather than
to aptitude tests.

A clearer picture of the differences between the "test chooser" and
the "non-test chooser" may be drawn. The "test chooser's" graduate GPA
is best predicted by his GRE-A score, and his self-perception of ability
to succeed in graduate school (SPFAA) is more related to achievement on
the GRE-A than to his undergraduate record. He is also somewhat "brighter"
in that his test scores, i.e., GRE-A, are considerably higher than those
of the "non-test chooser," while both his UGR and his first semester grades
in graduate school are only slightly higher than the "non-test chooser."

When the path analysis results are viewed in conjunction with the mean
differences for the two populations, one could make a case for SPFAA as a
measure of that slippery concept of motivation, at least for the "non-test
choosers." The reasoning underlying such a hypothesis is as follows:
First, it is the best single predictor of first semester graduate grades
for the "non-test choosers" who may be somewhat "overachievers." That is,
the "non-test choosers" as a group compared to the "test choosers" are
over one-half standard deviation below the "test choosers" on the GRE-A,
yet are approximately only one-quarter standard deviation below with respect
to first semester grades. Coupled with this fact is that for the "non-test
choosers" UGR is the best determiner of SPFAA. In fact the total nonspurious
effect of UGR on GPA is substantially greater for the "non-test choosers"

14

than for the "test choosers" (-.10 vs. .00). Undergraduate grades have often been referred to in the literature on prediction as our best available measure of motivation.

It is possible that the further standardized tests depart from aptitude content, the greater the possibility that the test itself is a good measure of motivation. That is, the test among other things is measuring the individual's motivation as well as ability to assimilate information in his specialty (GRE-A). This may not be true for all people, however, i.e., for the "test chooser" it may assess both his ability and motivation, while for the "non-test chooser" it may measure ability, thus it remains a significant predictor for these people also, yet we need an additional measure of motivation to round out the prediction equation. The separate path analysis results tend to confirm these tentative hypotheses. That is, for the "test chooser" the GRE-A scores are related to level of motivation, while for the "non-test chooser" the relation is considerably smaller.

Additional regression analyses were done separately within sample 1 and sample 2 in an attempt to define other biographical characteristics which might differentiate the "test chooser" from the "non-test chooser." The significant characteristics which were replicated in both samples suggest that the "test chooser" prefers objective tests to essay exams, reports that he generally studies less than his classmates and describes his parents as being somewhat dissatisfied with his undergraduate grades. The "non-test chooser" is simply characterized by the reverse of this profile, indicating his academic success appears to be more related to hard work than measured aptitude. If nothing else, the above discussion

points out the complexity of the motivational construct and how any particular measure may interact with different types of individuals. In this instance, SPFAA, a possible measure of motivation, is an important predictor for "non-test choosers," but is much less important for "test choosers."

These results suggest that a serious look should be taken at the possibility that the applicant should have a say in selecting the method of assessment which he feels should be most heavily weighted in considering his application. Such an ipsative weighting system allows the candidate to put his best foot forward thus accentuating his strengths. This would allow for a truly compensatory prediction system. Thus, if such an individualized weighting system can be demonstrated to lead to little or no decrease in predictive accuracy overall, the extra computation may well be justified. It is also felt that such a participatory approach may lead to a more positive attitude toward the whole selection procedure. Operationally the system could be set up so two predictions for every candidate could be made, one using the "ipsative" weights and one using the "normative" weights. Assuming that both systems were approximately equally valid, the institution could choose to make their decision based on the method which yields the highest estimate of the candidate's ability.

The question arises, how would one determine the ipsative or personalized weights? One obvious method would be simply to have the candidate select from competing methods the one he or she feels is most applicable. The "best" weights could then be empirically derived for those people selecting that particular method. The present results suggest that these "best" weights would reflect to a certain extent the candidate's weighting.

Another approach would be to estimate within-group regressions with inequality restrictions reflecting the candidate's weighting. Obviously, this approach has Baysian overtones and can be put into such s formal framework also. The comparative validity of various means of estimating the ipsative weights is a researchable question.

## Conclusions

First-year graduate students were asked to indicate through their responses to a BIB which ability measure was the one best indicator of how well they would do in graduate school.. The sample was then divided into two parts, those who felt tests were the best indicator of success (test choosers) and those who felt that some other means of assessment was the best for them (non-test choosers). Within-group regressions were then computed and compared using path analysis techniques. The obtained empirical least squares weighting system gave support to the possibility that graduate students could identify those predictors which would yield minimum errors of prediction for them. It was not, however, a case where tests could predict only for "test choosers." They were also a significant but comparatively less important predictor for "non-test choosers." Path analysis procedures were then used to identify differences as well as possible causes for these differences between "test choosers" and "non-test choosers." Indications of the importance of motivational measures as predictors for "non-test choosers" were suggested.

    1.  19 years or younger                  0.1

    2.  20                            0.5

    3.  21                            5.5

    4.  22                          32.2

    5.  23                          14.4

    6.  24                          9.2

    7.  25                          8.4

    8.  26                          6.2

    9.  27 years or older              23.0

    No response                      0.5

2. What is your sex?

    1.  Male                          64.2

    2.  Female                      35.8

    No response                      0:0

3. Please describe your marital status.

    1.  Single, don't expect to be married soon    48.9

    2.  Single, expect to be married soon    7.4

    3.  Married, no children          25.5

    4.  Married, one or more children    13.9

    5.  Widowed, divorced, separated    3.7

    No response                      0.7

4. How many dependents do you support: (Count yourself as one.)

|   |   | % |
|---|---|---|
| 1. | None | 22.8 |
| 2. | One | 51.1 |
| 3. | Two | 14.9 |
| 4. | Three | 5.1 |
| 5. | Four or more | 5.6 |
|   | No response | 0.5 |

5-6. Indicate the highest educational level attained by each of your parents.

|   |   | 5. Father % | 6. Mother % |
|---|---|---|---|
| 1. | 8th grade or less | 13.2 | 9.1 |
| 2. | Some high (secondary) school | 7.9 | 7.1 |
| 3. | High school graduate | 17.2 | 30.5 |
| 4. | Business or trade school | 5.3 | 8.4 |
| 5. | Some college | 15.3 | 19.2 |
| 6. | College graduate | 17.1 | 15.7 |
| 7. | Attended graduate or professional school, but did not receive a graduate or professional degree | 3.9 | 3.3 |
| 8. | Received a master's degree or its equivalent | 10.1 | 5.3 |
| 9. | Received a doctor's degree | 9.3 | 0.7 |
|   | No response | 0.8 | 0.6 |

7. Describe the extent of traveling you might have done as
   a result of family vacations, group trips, etc.

|  |  | % |
|---|---|---|
| 1. | I have done little or no traveling | 6.4 |
| 2. | I have traveled primarily within my own state of residence | 20.4 |
| 3. | I have traveled extensively within the United States | 32.2 |
| 4. | Most of my travel has been outside the territorial U. S. and I have seen little of the U.S. itself | 8.0 |
| 5. | I have done extensive traveling both within and outside the U.S. | 31.7 |
|  | No response | 1.2 |

8-9. In what section of the country did you spend most of your early
     life ? (Check one in each column)

|  |  | 8. | 9. |
|---|---|---|---|
|  |  | School Grades | |
|  |  | K-8 % | 9-12 % |
| 1. | Northeast: Conn., Maine, Mass., N.H., N.J., N.Y., Pa., R.I., Vt. | 12.2 | 11.4 |
| 2. | South: Ala., Ark., Del., D.C., Fla., Ga., Ky., La., Md., Miss., N.C., Puerto Rico, S.C., Tenn., Va., W. Va. | 8.7 | 7.4 |
| 3. | Midwest: Ill., Ind., Mich., Ohio, Wis. | 11.8 | 10.3 |
| 4. | Plains: Colo., Iowa, Kan., Minn., Mo., Mont., Neb., N. Mexico., N.D., Okla., S.D., Texas, Wyo. | 30.5 | 30.9 |

| | No response | 0.5 |

11. What is your current status with the selective service?

| 1. | I have been in the service | 20.5 |
|---|---|---|
| 2. | I have not been in the service | 67.5 |
| | No response | 12.0 |

12. Was any language other than English commonly used in your home while you were growing up?

| 1. | No | 81.1 |
|---|---|---|
| 2. | Yes | 18.5 |
| | No response | 0.4 |

13-14. Which of the following categories comes closest to your
parents' occupations? If either is retired, deceased,
or unemployed, indicate their former or customary
occupation.

|  | | 13. | 14. |
|---|---|---|---|
|  | | Father (or male guardian) | Mother (or female guardian) |
|  | | % | % |
| 1. | Unskilled (maid, waiter, housewife, service station attendant, domestic, janitor) or semi-skilled worker (typist, store sales, telephone operator, factory worker) | 9.0 | 51.4 |
| 2. | Service worker (policeman, fireman, barber, beautician, cook, military non-commissioned officer) | 4.5 | 2.8 |
| 3. | Skilled worker or craftsman (carpenter, electrician, plumber, auto mechanic, foreman, seamstress, enlisted man in armed forces) | 12.3 | 2.4 |
| 4. | Semiprofessional or technician (laboratory or medical technician, draftsman, bookkeeper, insurance salesman, secretary-stenographer, computer programmer, nurse) | 11.0 | 20.3 |
| 5. | Owner, manager, partner of a small business or lower level government official, military commissioned officer | 22.9 | 3.6 |
| 6. | Profession requiring a bachelor's degree (engineer, elementary or secondary teacher, high-level or technical sales) | 14.9 | 14.0 |
| 7. | Owner, high-level executive in a large business or in a high-level government agency | 9.3 | 0.3 |
| 8. | Profession requiring an advanced degree (doctor, lawyer, professor, etc.) | 14.7 | 1.9 |
| | No response | 1.3 | 3.3 |

15. What was the approximate annual income of your family during
    your last two years of undergraduate college?

    |   |   | % |
    |---|---|---|
    | 1. | Less than $4,000 | 8.9 |
    | 2. | $4,000 to $7,999 | 16.2 |
    | 3. | $8,000 to $11,999 | 22.1 |
    | 4. | $12,000 to $19,999 | 26.1 |
    | 5. | $20,000 and over | 20.7 |
    | | No response | 5.9 |

16. What kind of secondary school (high school) did you attend?

    |   |   | |
    |---|---|---|
    | 1. | Public | 81.4 |
    | 2. | Private, nonreligious, nonmilitary | 4.3 |
    | 3. | Protestant denominational | 1.5 |
    | 4. | Catholic | 11.4 |
    | 5. | Received an adult education or GED (high school equivalency) diploma | 0.1 |
    | 6. | Other | 0.8 |
    | | No response | 0.5 |

17-18. About how many students were there in your graduating classes?
       (For #18, response should be number for entire
       University, not for a college or department
       within the University.)

| | | 17. High School % | 18. University % |
|---|---|---|---|
| 1. | Fewer than 50 | 10.3 | 1.2 |
| 2. | 50 - 199 | 24.9 | 5.7 |
| 3. | 200 - 499 | 32.4 | 14.1 |
| 4. | 500 - 999 | 26.7 | 14.3 |
| 5. | 1,000 or more | 4.5 | 62.5 |
| | No response | 1.1 | 2.2 |

19-20.  Indicate your academic rank in your graduating classes.

| | | 19.<br>High School<br>% | 20.<br>College<br>% |
|---|---|---|---|
| 1. | Top ten percent ⎱ (highest fifth) | 62.0 | 37.5 |
| 2. | 11 - 20 percent ⎰ | 18.7 | 24.3 |
| 3. | 21 - 40 percent (next highest fifth) | 9.3 | 17.6 |
| 4. | 41 - 60 percent (middle fifth) | 5.2 | 7.4 |
| 5. | 61 - 80 percent (next lowest fifth) | 1.5 | 1.6 |
| 6. | 81 - 100 percent (bottom fifth) | 0.8 | 0.8 |
| | No response | 2.5 | 10.8 |

21.  How would you describe your general reading ability
     in comparison to that of your college classmates?

| | | % |
|---|---|---|
| 1. | My reading rate is low, and my comprehension is average | 7.3 |
| 2. | My reading rate and comprehension are both average | 25.6 |
| 3. | My reading rate is high, and my comprehension is average | 9.4 |
| 4. | My comprehension is above average, and my reading rate is average | 32.0 |
| 5. | My reading rate and comprehension are both above average | 24.6 |
| | No response | 1.0 |

22. During an average week of your senior year as an undergraduate how much time did you spend on the following outside reading (i.e., not required reading)? Please circle one number in each row.

1. None or almost none
2. About 1/2 hour a week
3. About 1 - 2 hours a week
4. About 3 - 4 hours a week
5. About 5 - 6 hours a week
6. About 7 - 8 hours a week
7. About 9 or more
No response

| | % | % | % | % | % | % | % | % |
|---|---|---|---|---|---|---|---|---|
| Mystery, westerns, adventure, science fiction, etc. | 5.4 | 0.9 | 0.9 | 1.2 | 3.7 | 8.8 | 11.5 | 67.6 |
| Science, Mathematics and Engineering | 6.4 | 3.4 | 1.1 | 1.9 | 5.4 | 11.8 | 12.5 | 57.6 |
| Novels, short stories, drama, poetry, literary criticism, etc. | 3.5 | 4.1 | 2.0 | 5.4 | 13.0 | 25.1 | 20.3 | 26.6 |
| History, economics, anthropology, current political and social issues, social criticism, etc. | 4.2 | 4.3 | 2.5 | 4.8 | 11.2 | 24.6 | 21.0 | 27.5 |
| Psychology | 6.4 | 1.0 | 0.9 | 1.6 | 4.0 | 11.0 | 16.4 | 58.6 |
| Sports and leisure time | 5.6 | 3.6 | 1.8 | 3.1 | 8.3 | 16.6 | 19.0 | 42.0 |
| Automotive mechanics, technological "how-to-do-it" publications | 7.2 | 0.3 | 0.3 | 0.4 | 1.2 | 4.7 | 7.6 | 78.4 |
| Newspapers and/or news periodicals (Time, Newsweek, etc.) | 1.5 | 8.0 | 6.4 | 12.9 | 24.8 | 32.5 | 9.9 | 3.9 |

23-24. How would you rate the academic standards of your high
school and undergraduate college?

|  | 23. High School % | 24. College % |
|---|---|---|
| 1. Very high | 29.4 | 37.9 |
| 2. Fairly high | 33.7 | 39.2 |
| 3. About average | 26.9 | 20.8 |
| 4. Probably below average | 6.1 | 1.3 |
| 5. Definitely below average | 3.5 | 0.3 |
| No response | 0.4 | 0.5 |

25. The following question concerns your grades in the most recent
courses you took in certain undergraduate college subjects. For
each subject circle the number corresponding to your final grade.
If you took more than one subject in an area, estimate an average
final grade.

1. Did not take any courses in this subject area
2. 59 or below (F)
3. 60 - 69 (D)
4. 70 - 79 (C)
5. 80 - 89 (B)
6. 90 - 100 (A)
No response

| | % | % | % | % | % | % | % |
|---|---|---|---|---|---|---|---|
| Art | 4.5 | 18.4 | 16.3 | 4.9 | 0.4 | 0.2 | 55.4 |
| Biological Sciences | 4.2 | 24.2 | 27.0 | 10.4 | 1.1 | 0.5 | 32.5 |
| English or Literature | 2.9 | 32.4 | 41.7 | 13.3 | 1.3 | 0.5 | 8.0 |
| Foreign Language | 4.2 | 30.2 | 26.5 | 13.0 | 2.6 | 0.9 | 22.7 |
| Mathematics | 4.0 | 27.6 | 27.7 | 14.9 | 3.1 | 0.8 | 21.9 |
| Music | 5.5 | 18.6 | 11.4 | 3.4 | 0.5 | 0.1 | 60.6 |
| Physical Sciences | 3.7 | 28.8 | 31.2 | 13.2 | 2.1 | 0.5 | 20.5 |
| Social Sciences | 2.7 | 48.0 | 35.4 | 6.6 | 0.5 | 0.2 | 6.7 |

26. In the average humanities or social science course, do you generally prefer:

%

1. Objective examinations (e.g., true-false, multiple choice)      28.8

2. Essay examinations      68.9

No response      2.2

27. Indicate your judgment of each of four testing procedures. Please circle one number in each row.

1. Tend to overestimate my knowledge or ability
2. Fairly estimate my knowledge or ability
3. Tend to underestimate my knowledge or ability
No response

| | % | % | % | % |
|---|---|---|---|---|
| Objective or multiple-choice examinations | 2.8 | 30.1 | 46.4 | 20.6 |
| Essay type examinations | 1.8 | 14.0 | 77.2 | 7.1 |
| Tests in which speed is a factor | 1.9 | 50.9 | 33.6 | 13.6 |
| Oral examinations | 7.2 | 26.0 | 60.0 | 6.8 |

28. Would you say that your college grades:

%

1. Grossly under-represented your ability      8.8

2. Slightly under-represented your ability      32.9

3. Fairly represented your ability      47.0

4. Slightly over-represented your ability      10.0

No response      1.2

29. With regard to your classroom assignments, did you regard
yourself as a more consistent and harder worker than the
typical student in your college classes?

%

1. Definitely not, I worked less than my classmates·                11.2

2. Generally I worked less than my classmates                       25.9

3. Generally yes, I worked harder than my classmates                46.0

4. Definitely yes, I worked harder than my classmates               13.9

No response                                                          3.1

30. How would you describe your parents' or guardians' satisfaction
with your undergraduate college grades?

1. Very dissatisfied                                                 4.0

2. Somewhat dissatisfied                                             5.7

3. Fairly satisfied                                                  25.0

4. Very satisfied                                                    62.5

No response                                                          2.7

31. In terms of your own personal satisfaction, how much importance
did you attach to getting good grades?

1. None or not much                                                 10.1

2. A moderate amount                                                32.1

3. Quite a bit                                                      34.2

4. A great deal                                                     23.0

No response                                                          0.5

32. During your senior year did you ordinarily find writing papers a very difficult task, or did you have relatively little difficulty in getting your ideas down on paper?

| | | % |
|---|---|---|
| 1. | I found writing papers a very difficult task | 9.1 |
| 2. | I frequently experienced some difficulty in writing | 23.8 |
| 3. | More often than not I did not experience great difficulty | 32.5 |
| 4. | I had little or no difficulty in expressing myself in writing | 33.3 |
| | No response | 1.3 |

33. The following statements deal with accomplishments you may have achieved in your field. Please check whether you have done any of the following during your academic experience. (Check a number for each accomplishment.)

| | | No % | Yes % | No Response % |
|---|---|---|---|---|
| 1. | Attended one or more meetings of a scholarly or professional society | 42.4 | 55.8 | 1.9 |
| 2. | On my own (not a course assignment) read scholarly or professional journals and/or books | 19.2 | 79.9 | 0.8 |
| 3. | Was author (or co-author) of a paper or address given at a meeting of a professional society, or published (or in press) in a scholarly or professional journal in my field | 86.0 | 12.0 | 2.1 |
| 4. | Was member of a student honorary group in my field | 58.4 | 39.4 | 2.2 |
| 5. | Won a prize, award, or other special recognition for work in my field | 68.6 | 29.0 | 2.4 |
| 6. | Held a paid job (half-time or more) on a continuing basis in my field | 54.6 | 43.8 | 1.6 |
| 7. | Have been responsible on a continuing basis for supervising the work of others in my field | 76.5 | 21.1 | 2.5 |
| 8. | On my own (not a course assignment) carried out a research project | 69.3 | 29.0 | 1.6 |

34. Did your college require you to write a senior thesis or take comprehensive examinations?

|  | % |
|---|---|
| 1. No | 76.4 |
| 2. Yes | 22.7 |
| No response | 0.9 |

35. The following phrases describe selected methods of instruction. Please circle the number in each row which designates your preference.

- 1. It is usually not preferable
- 2. You neither like nor dislike it
- 3. It is very preferable
- No response

|  | % | % | % | % |
|---|---|---|---|---|
| Lecture | 1.3 | 33.7 | 48.3 | 16.6 |

| Being able to maintain a high level of motivation within a relatively unstructured environment | 1.7 | 11.6 | 43.0 | 43.7 |

53. The following question refers to various opportunities which are generally open to Ph.D.'s. Assuming you had to make a decision concerning your post-graduate work, indicate the relative importance of the following opportunities in your selection of a post-graduate position. Please circle one number in each row.

   1. Of little or no importance

   2. Of some importance

   3. Very important

   No response

| | % | % | % | % |
|---|---|---|---|---|
| Opportunities to do research | 11.6 | 33.1 | 35.4 | 19.9 |
| Opportunities to teach | 11.5 | 43.5 | 30.2 | 14.9 |
| Opportunity to work in administration | 12.0 | 11.7 | 25.8 | 50.6 |
| Opportunity to do post-doctoral work | 12.5 | 16.0 | 38.7 | 32.9 |

54. In choosing a career, how important would you consider each of the following opportunities to be?

   1. Of little or no importance

   2. Of some importance

   3. Very important

   No response

| | % | % | % | % |
|---|---|---|---|---|
| Opportunity to work with ideas and theories | 0.8 | 50.1 | 41.9 | 7.2 |
| Opportunity to work with people | 0.8 | 70.4 | 25.1 | 3.8 |
| Opportunity to work with objects and things | 1.2 | 15.8 | 41.0 | 42.0 |
| Opportunity to be a leader | 1.0 | 28.8 | 48.3 | 21.9 |

55. People find different factors important in their choice of a job. Please circle one number beside <u>each</u> factor, indicating its importance to you.

1. Of little importance
2. Of some importance
3. Very important

No response

| | % | % | % | % |

* Question #56 is based on the Rotter Locus of Control Scale. See the following page for this question.

Fifty-six s through l show the individual item means for the 12 items that comprise the scale. Fifty-six m is the mean across the sample for the total score.

56. Mark one number in <u>each row</u> according to how you feel about the statement?

    1. Strongly disagree

    2. Disagree somewhat

    3. Agree somewhat

    4. Strongly agree

| | | | | |
|---|---|---|---|---|
| Chance and luck are not very important in my life | 4 | 3 | 2 | 1 |
| These days a person doesn't really know on whom he can count | 4 | 3 | 2 | 1 |
| Getting a good job depends more on the length of your hair than on your ability | 4 | 3 | 2 | 1 |
| Nowadays a person has to live pretty much for today and let tomorrow take care of itself | 4 | 3 | 2 | 1 |
| Many times I feel that I have little influence over the things that happen to me | 4 | 3 | 2 | 1 |
| It's hardly fair to bring children into the world the way things are | 4 | 3 | 2 | 1 |
| In spite of what some people say, the condition of the black man is getting worse | 4 | 3 | 2 | 1 |
| There is little use appealing to the authorities because often they aren't really aware of the problems of the average black man | 4 | 3 | 2 | 1 |
| Success is a matter of hard work; luck has little to do with it. | 4 | 3 | 2 | 1 |
| Students from disadvantaged social backgrounds should receive preferential treatment in college admissions policies | 4 | 3 | 2 | 1 |
| The "people" have little influence within the present political system | 4 | 3 | 2 | 1 |
| Special interest groups having large financial backing have the greatest impact on governmental policy | 4 | 3 | 2 | 1 |
