#### **ABSTRACT**

The Project on Equal Education Rights (PEER) measures progress in educational equality and documents the advancement of women and girls in education. State-by-state surveys of the status of females in education are used to measure this progress. The 1986 PEER report attempted to measure states' commitment to excellence and equity in education. Each state's commitment to education was measured by: (1) expenditures for education as a percentage of per capita income; (2) the ratio of students to teachers in classrooms; (3) teacher salaries; and (4) the high school graduation rate. To measure states according to how well young women were being prepared for higher education, the survey ranked them on: (1) the gap between high school women's and men's Scholastic Aptitude Test (SAT) scores; (2) women's expressed goals for higher education; and (3) their interest in "non-traditional" science careers. An assessment of women's college enrollments and the undergraduate and graduate degrees they received was also reported. The report evaluated women's participation in vocational training programs. PEER focused attention on the impact of combined sex, race, and disability bias and discrimination. Included in the report were state-by-state charts showing SAT mathematics and verbal scores, male and female differences on SAT tests, young women's graduate degree goals, young women's career aspirations in the physical sciences, public university and college enrollment, degrees awarded, and enrollment in vocational training programs. # The 1986 PEER Report Card: A State-by-State Survey of The Status of Women and Girls in America's Schools

B efore Congress enacted Title IX of the Education Amendments in 1972, sex discrimination in education was pervasive and accepted. Women and girls were assumed to "need" different educational experiences than men and boys, to prepare them for different lives as adults; before Title IX, it was quite legal for women and girls to be excluded from graduate and professional schools, from "men only" vocational and technical programs, from athletics programs, scholarship aid, and careers in educational administration. In the fourteen years since the passage of Title IX, substantial changes have occurred in women's participation in education at all levels and all areas of study; yet the glass still is only half full. Much remains to be done to ensure that sex equity in education is as pervasive as sex discrimination once was.

Laws such as Title IX (1972) and federal funding programs such as the Women's Educational Equity Act (1974) have made many of these significant changes possible and have enabled local school boards, parents, teachers, and equity advocates to transform the educational experience of a generation of girls and young women. Since 1979, the Project on Equal Eduction Rights has attempted to measure these changes and to document the progress of women and girls in education by conducting state-by-state surveys of the status of women and girls in education. PEER has focused on several key areas which traditionally have been bellwethers of sex bias in education: access to athletic opportunities, to "non-traditional" vocational education, to top-level administrative positions in education, and (in 1985) to computer education. These analyses were published as the

Back-to-School Line-Up (in 1979 and 1982) and The PEER Report Card: Update on Women and Girls in America's Schools — A State-by-State Survey (in 1985).

Excellence and Equity. For the first time, The 1986 PEER Report Card attempts to measure states' commitment to the twin goals of excellence and equity in education. The Report Card assesses each state's commitment to education by reviewing data on the state's expenditures for education as a percentage of per capita income, the ratio of students to teachers in classrooms, teacher salaries, and the high school graduation rate. In The 1986 Report Card, PEER also surveyed the states to determine how well young women are being prepared for higher education, compared to men. The survey ranks states on several measures: the gap between high school women's and men's SAT scores, young women's expressed goals for higher education, and their interest in "non-traditional" science careers. An assessment of women's college enrollments and the undergraduate and graduate degrees they receive also is included. The Report Card also evaluates women's participation in previously male-dominated vocational training programs offered in the nation's area vocational

In all of its research and analysis, PEER focuses particular attention on the impact of combined sex, race, and disability bias and discrimination. Thus, in collecting information for this report, PEER has sought data on both the race and sex of participants. Unfortunately, almost none of the available data are provided by both race and sex<sup>1</sup> and almost no information is available on the status of disabled women and girls. It is virtually impossible, therefore, to provide a

1413 K Street NW, 9th Floor, Washington, DC 20005

comprehensive state-by-state analysis of the status of women of color or of women with disabilities in education, thus limiting policymakers' ability to respond to many of the most pressing equity concerns facing women in education for the remainder of this century.

#### Commitment to Education

During the past several years, demands for education reform have led almost all states to examine their public education systems and develop new strategies for ensuring "quality" education for their children. In some states, sweeping changes are occurring, as competency tests for both teachers and students are required, graduation requirements for math and science are increased, pre-kindergarten programs are proposed, and school days are lengthened. While many states still are considering how to improve their schools, it seems certain that by the end of this decade, every state's public education system will have had a facelift.

Teachers' Salaries. According to PEER's analysis of state-by-state data from the US Department of Education<sup>2</sup> states still vary substanti lly on the resources they commit to education. Nowhere are these differences more apparent than in the range of teachers' salaries. Teachers in Alaska, with an estimated average salary of \$39,751, are the highest paid, while their counterparts in Mississippi earned the lowest salaries nationwide—an average of \$15,971. Indeed, the average salary for teachers nationwide is only \$23,582; clearly, teachers' salaries have not risen at the same rate as other professionals.

Expenditures Per Student. The amount of state funds provided to public education offers another measure of commitment to schools and children.3 PEER's state-by-state review of expenditures per student (the amount of money spent on each student in a school year) and expenditures as a percentage of per capita income (the amount of money spent on each student as a percentage of the state's average income) shows significant variations among the states. Alaska spends more money on each student (\$8,627) than any other state; Utah spends the least (\$2,053). Although federal funds used by a state to support its educational programs are included in this figure, it is interesting to note that during the period between 1982 and 1984, when federal funds were decreasing, the expenditures per student in some (but not all) states increased significantly. Nationally, the average amount spent on each student increased by one-third, from \$2,726 to \$3,173.

Expenditures as a percentage of per capita income might be one of the best indicators of commitment available since it is a measure that shows a direct correlation between what is spent and what is available. Once again, Alaska, the state with the highest per capita income, committed nearly one-half of it to education. In contrast, Tennessee and Nevada tie for last place at 20.2 percent and Georgia, California, and Alabama trail close behind with 20.4, 20.5 and 20.6 percent respectively.

Teacher/Student Ratio. Classroom size (teacher/student ratio) is often the barometer used to measure the general health of a school system. It is generally accepted that overcrowding in classrooms diminishes even the best teachers' ability to provide quality, individualized instruction. The national average is 18.3 students for every teacher. Wyoming has the lowest student/teacher ratio in the country, with only 12.6 students to every teacher. In contrast, Utah has the highest student/teacher ratio (24.1) while California, our most populous state, has the second highest student/teacher ratio, with 23.3 students for every teacher.

High School Graduation Rates. At a time when a high school diploma is the prerequisite for almost any type of employment, students are leaving school before graduating at an alarming rate. In 1984, according to US Department of Education statistics,<sup>5</sup> an estimated 71 percent of the students who had entered the ninth grade four years earlier graduated from high school.<sup>6</sup> Minnesota leads the states with a graduation rate of 89.3 percent—less than one percentage point shy of the national goal of 90 percent set by the President (to be met by 1990). The District of Columbia's graduation rate of 55.2 percent is the nation's lowest, although it is closely followed by Louisiana and Alabama with graduation rates of 55.7 and 62.1 percent respectively.

While the graduation rates for the states are not available by sex or race a 1983 US Department of Education publication? Indicates that young women are leaving school before graduating almost as often as male students and often for the same reasons. Both female and male drop outs listed "poor grades" and the belief that "school is not for me" as their top two reasons for leaving school. A key difference appeared when the third reason was listed. While young men listed "going to work" as their third reason for dropping out of school, young women listed "getting married" and "pregnancy" as their third (and fourth) reasons for quitting school.

#### Preparing for College and Career

The Scholastic Aptitude Test (SAT). Each year thousands of young women and men who plan to attend college sign up with the Educational Testing Service (ETS) to take the Scholastic Aptitude Test (SAT) and an assortment of Achievement Tests (covering knowledge and skill in writing, science, foreign languages, and mathematics, for example) to fulfill a basic requirement of many of the nation's colleges and universities. Despite concerns about its reliability and fairness, the SAT continues to be used by most colleges and universities as a predictor of potential college achievement. The state-by-state data on SAT scores and on student attitudes reported below are derived from the College Board's annual report on the SAT.

Although SAT scores declined somewhat during the 1970s, during the past two years the scores have started to rise. However, at the same time hat the SAT scores of minority students are improving, the gap between the scores of female and male students is widening. In 1985, the male students' scores were an average of 59 points higher than

female students' scores; of a total possible score of 1600 (for both the verbal and math sections), the national average for male students was 936 as compared to 877 for female students—the largest gap in nearly twenty years.<sup>11</sup>

Women taking the SAT are scoring lower than men on both the verbal and math sections of the test. The national average for men on the math section is 499, while for women it is 452, a difference of 47 points. Men's national average score on the verbal section is 437, but women—who traditionally have outperformed men on the verbal test—have been losing ground; women's scores today average 425, 12 points below men.<sup>12</sup>

The SAT is extremely controversial as a predictor of minority and female students' success in college. In fact, the College Board and the Educational Testing Service have recently admitted that the SA'1 underpredicts the grades women can expect to earn in college; ETS also admits that it cannot explain this discrepancy. Other researchers have offered a variety of explanations, many of which suggest that sex bias in the test construction and content is affecting women's scores; for example, more of the test questions are set in a science context (where girls and women still are often discouraged from participating) rather than in the humanities, an area where women have traditionally been encouraged to excel. Further, the essay writing test in the verbal section and the data sufficiency question in the math section have been removed from the test; again, these are items on which emale students formerly excelled.

Some feminists have pointed out that the SAT was formerly written predominantly by women; they suggest that the increase in the number of male vriters may be producing subtle shifts in how questions are written that makes them less accessible to women.<sup>13</sup> Regardless of the reasons for women's lower scores, the fact that women's SAT scores fail to predict their performance as college students leaves these young women open to discrimination in the college admissions process.

Nationally, women's scores on the math section of the SAT average 47 points lower than men's. Hawaii reports the smallest difference between women and men at 31 points, while North Dakota reports the largest difference at a whopping 70 points. Further, women's scores cover a wide range nationwide. In Iowa, women taking the SAT outperformed their counterparts in other states with an average score of 549 on the math section. In South Carolina, the average score for women is only 406 in math, the lowest in the nation.

The gap between women and men on the verbal portion of the SAT is significantly smaller than for the math portion. In Kentucky, there was no gap at all—both the women and the men had an average score of 49l; in Michigan, Louisiana, and the District of Columbia, in contrast, women scored 23 points below men on the verbal section. Again, the range of women's scores is wide; women in South Dabota have the highest average score at 530 and women in South Carolina have the lowest score at 384.

Young Women's Graduate Degree Goals. Students taking the SAT provide the College Board with information

about themselves—their goals and aspirations as well as demographic characteristics. Among the questions asked of SAT-taking students is whether they plan to earn a master's degree or a doctoral degree PEER's analysis of seniors' responses to this question found very little difference between male and female aspirations for graduate degrees; 26 percent of the women respondents planned to complete a master's program, compared to almost 28 percent of the men. Nearly 19 percent of the men compared to 18 percent of the women planned to earn a Ph.D. It is interesting that Utah — the state with the smallest percentage of women attending its public colleges and universities as either full-time or part-time students—reported that fully one-third of women high school seniors planned to earn graduate degrees.

Young Women's Career Aspirations—The Physical Sciences. Nationally, only 10.6 percent of the high school senior women indicated a desire to major in the physical sciences—course work leading to significant scientific and professional careers that traditionally have been male bastions—as compared to 34 percent of men seniors. Wyoming and the District of Columbia lead the states with the largest percentage of high school women planning to study the physical sciences—at slightly more than 17 percent. However, young men still far exceed women in their interest in the physical sciences; Mississippi and Montana lead the states, with almost 45 percent of the young men in these two states planning to major in the physical sciences.

The state of Montana reported the greatest differences between male and female seniors—a gap of 32 percent, with 44.7 percent of male seniors and only 12.6 percent of females planning to major in the physical sciences. The second largest difference was reported by Nebraska; 40.9 percent of the young men and only 10.4 percent of the women list physical science as their intended area of study—a gap of 30.5 percent. In contrast, 32 percent of the men and 17 percent of the women seniors in the District of Columbia plan these majors — representing the smallest gap between women and men (15 percent).

It is interesting to compare these young women's aspirations with the actual numbers of bachelor's degrees awarded to women in the physical sciences. Of the women who received bachelor's degrees in 1980-1981 (the most recent year for which data are available), only 3 percent received degrees in the physical sciences, mainematics, and engineering—while 23 percent of the women earned degrees in education and 11 percent of the women majored in nursing and health-related professions.<sup>15</sup>

College Enrollments. In the late 1970s, the enrollment of women in postsecondary institutions finally reached the 50 percent mark, after more than a century of struggle against resistance to women's higher education. Indeed, Oberlin College, established in 1833, was the first postsecondary liberal arts institution to accept women—a full two hundred years after the establishment of colleges for men.

According to the US Department of Education, 16 women now represent at least 40 percent of the full-time student body entollment in public four year colleges and universities

in every state. Delaware leads the states with the largest female student population (54.8 percent), while Utah has the lowest female enrollment (41.4 percent). Nationally, women make up 48 percent of full-time students, but women account for more than half (55.7 percent) of part-time college students. Arkansas has the largest percentage of part-time women students (63.1 percent) and Utah has the smallest (44.9 percent). In seven states, women account for more than 60 percent of the part-time students enrolled in four year colleges and universities.

Degrees Awarded. National data<sup>17</sup> indicate that, for the 1983-84 school year, one-third of the doctoral degrees awarded were earned by women, while women earned 49.4 percent of master's degrees and received half of the bachelor's degrees awarded. Vermont leads the nation as the state with the highest percentage of graduate degrees awarded to women; 56.8 percent of the master's degrees and 56.4 percent of the doctoral degrees were earned by women. And Delaware awarded the highest percentage of bachelor's degrees to women (57.6 percent). Utah awarded the smallest percentage of bachelor's degrees (41.6 percent) and master's degrees (35.7 percent) to women. Alaska awarded the smallest percentage of doctoral degrees to women (16.7 percent, though only 6 Ph.D.s were awarded statewide—5 to men and one to a woman).

#### Vocational Education

Data on the status of women in vocational education were provided by the US Department of Education's Office for Civil Rights (OCR), from the results of a national survey of over 7000 institutions conducted in the fall of 1984.18 These data differ substantially from the data used in PEER's 1985 Report Card, which were provided by the US Department of Education's Vocational Education Data System (VEDS). While VEDS surveyed all vocational education programs, OCR gathered its data using a stratified sample which included every state, every type of school and all sizes of enrollment, in large and small facilities. Pata are provided for both occupational preparation programs (OPP) and apprentice training programs.

Area Vocational Centers. For The 1986 Report Card, PEER has chosen to focus on the enrollment of women in area vocational centers. According to the Office for Civil Rights, there are approximately 1,786 area vocational centers nationwide. These centers provide vocational education programs to students throughout a school system or a region; in addition to the centers' vocational training, the students usually receive the academic portion of their education in a local high school or other academic institution.<sup>20</sup>

This structure makes the area vocational center attractive to a broader segment of the population, particularly those who desire training in a specific vocational field and those "non traditional" students who are not attending high

school—including, for example, older students who are returning to school after years in the labor market, and young adults who dropped out of high school before graduating. The potential for this diversity in the student population makes area vocational centers particularly important as educational institutions for women, especially re-entry women, displaced homemakers, and low income women.

In addition, new provisions of the two year old Carl D. Perkins Vocational Education Act of 1984 (P.L. 98-524) assure access to vocational education programs for persons who have been inadequately served — especially disadvantaged students, disabled students, women who are entering occupations that have previously been male dominated, adults who are in need of training and retraining, displaced homemakers, single parents, individuals with limited English proficiency and persons incarcerated in correctional institutions. Area vocational centers have the potential to serve many of these students and are thus worthy of a closer look by equity advocates.

"For Men Only". PEER has conducted a detailed state-by-state analysis of enrollment patterns in those occupational preparation and apprentice training programs that nationally report enrollments that are 65 percent or more male; the analysis focuses on nine occupational preparation programs—Agriculture, Communication Technologies, Engineering, Industrial Arts, Precision Production, Construction Trades, Mechanics and Repairer, Transportation, and Protective Services. Four apprentice training programs were surveyed, including Engineering, Precision Production, Construction Trades, and Mechanics and Repairer.<sup>21</sup>

Nationally, of the nine occupational preparation programs, Protective Services enrolled the largest number of women (42.59 percent, followed by Communications Technology (32.96 percent), Industrial Arts (32.92 percent), and Agriculture (32.1 percent). The occupational preparation programs with the fewest women enrolled were Mechanics and Repairer (4.1 percent) and the Construction Trades (4.1 percent).

Further, when the curollments by women of color are compared to enrollments of white women, they appear to indicate that women of color are more likely to break with tradition and enter areas that have been dominated by men. When compared to men within their racial/ethnic groups, women of color were far more likely to be enrolled in these male dominated programs than were their white female counterparts (as compared to white men).

While women of all racial and ethnic groups and men of color remain seriously underrepresented in vocational training leading to higher-paying jobs, PEER is encouraged to note that women of color are leading the way into these fields. Of the four apprentice training programs reviewed, for example, Engineering had the largest percentage of women enrolled—a very small 5.9 percent. But Native American women were 28.5 percent of the Native Americans enrolled in these programs, by far the largest proportion of any group of women when compared to men from the same

racial/ethnic group.22

In apprentice training in the Construction Trades, while women were merely 3.6 percent of all enrollees (and white women were 3.4 percent of white students), Black women were 7.2 percent of Black enrollees and Native American women were 3.9 percent of Native American students. White women were only 3.3 percent of white enrollees in apprentice training for Precision Production, but Asian American women were 7.6 percent of Asian American participants, Black women were 8.2 percent of Blacks enrolled, and Hispanic women were 14.2 percent of all Hispanic students.

Similar patterns appear in several occupational preparation programs. In Transportation, while women are 14 percent of participants, Asian American women are 31 percent of Asian American enrollees and Black women are 25 percent of Black participants. Asian American and Hispanic women have the highest female participation rates in Agriculture, at 43 percent and 40 percent respectively (compared to a participation rate of 32 percent for women overall). Asian American, Black, and Hispanic women are 21.4 percent, 27 percent, and 28 percent of Asian American, Black and Hispanic participants in Engineering, compared to all women (13.7 percent) and white women (9.5 percent). Finally, among students in Mechanics and Repairers programs, women are only 4 percent but Asian American women are 10.6 percent of Asian American students, Black women are 5.2 percent of Black students, and Hispanic women are 4.7 percent of Hispanic students.

Among the states, Pennsylvania and North Dakota each ranked "number one" twice, for having the highest percentage of women students enrolled in two of the nine occupational preparation programs that are dominated by men at the national level. In Pennsylvania, women were enrolled in Transportation (42.6 percent) and Agriculture (56.2 percent) programs at far higher rates than the national averages of 14 percent and 32 percent respectively. North Dakota outranks the other states in two occupational preparation programs—Construction Trades (10.6 percent) and Precision Production (29 percent).

Michigan leads the way in two apprentice training programs, Engineering — at an impressive 50 percent—and Precision Production, at 16.6 percent.

Other states have made substantial progress in increasing women's enrollments in traditionally "male only" programs. These national pace setters in occupational preparation programs include: Oregon (Mechanics and Repairer—10.4 percent); New York (Engineering—39.4 percent); Missouri (Industrial Arts—96.7 percent); and Maryland (Communication Technologies—88 percent).

Pace setters in apprentice training include: Ohio (Construction Trades—24.6 percent) and Georgia (Engineering — 11.8 percent).

The state with the worst record for the enrollment of women in traditionally male-dominated vocational programs is Alabama, with a 100 percent male enrollment in four

program areas—more than any other state. While Alabama leads the other states it is not alone. In fact, 33 states and the District of Columbia have one program area in which enrollments are 100 percent male; 13 states have all male participants in two program areas.

Further, apprentice training programs—which often lead directly into high paying jobs in the skilled trades—still are most likely to remain 100 percent male. For example, Precision Production programs in 13 states and the Mechanics and Repairer programs in 11 states and the District of Columbia remain completely male-dominated.

#### Notes

<sup>1</sup>The only statistical information available for this report that shows enrollments cross-tabulated by both race and sex comes from the Office for Civil Rights (OCR) in the US Department of Education, which reports vocational education enrollments by race and sex.

<sup>18</sup>US Department of Education, Office for Civil Rights, "Vocational Education Civil Rights Survey, Area Vocational Centers," OCR:

Washington, DC, 1984 (unpublished data).

<sup>19</sup>Adjustments have been made by OCR to correct errors that could occur if some schools did not respond, were closed, or did not offer vocational educational programs; adjustments also were made to correct for possible misclassification of institutions by type of school in the original sample, duplication or deletion of an institution within or across type of schools in the original sample. Finally, while OCR data are available in two forms, reported data aggregated to a state-by-state level and data projected to a state-by-state level, PEER elected to use

the projected data, in an effort to provide a more complete portrayal of the status of women and minorities in area vocational centers. Data for all 48 states and the District of Columbia were analyzed; data for He waii and Nebraska were not available from the Office for Civil Rights.

20 American Vocational Association, "Fact Sheet: Vocational Education

Today," AVA: Arlington, VA, (undated), page 2.

<sup>21</sup>PEER did not include those apprentice training program areas which met the enrollment criteria (more than 65 percent male) but enrolled fewer than 1000 students nationwide.

<sup>22</sup>Although the percentage is significant, the actual numbers are miniscule—only 5 Native Americans, two of whom are women, are enrolled. Nationally, only 1,493 Native Americans are enrolled in Engineering apprentice training.

PEER, the Project on Equal Education Rights of the NOW Legal Defense and Education Fund, is one of the leading national advocacy programs for educational equity for women and girls of all racial and ethnic groups, both disabled and non-disabled.

PEER's National Affiliate Network links activists and educators in a national community of concern for the advancement of

women and girls.

Created in 1974, PEER has received support from various sources, including the Carnegie Corporation, the Ford Foundation, several corporations, and the Women's Educational Equity Act

PEER appreciates the cooperation of the Office for Civil Rights and the Center for Statistics (US Department of Education), the Educational Testing Service and the College Board, which provided most of the data portrayed in this report.

The data analyses were conducted by PEER staff members Jennifer Tucker and Theresa Cusick, with invaluable assistance from Derek Johnson of the University of Michigan, who served an internship at PEER. Assistance also was provide I by Kristen Brink of the University of Michigan and Betsy Christ of the University of California at Berkeley, who served as interns at PEER. The Rebort Card was prepared by Jennifer Tucker, PEER Senior

Program Associate, and Leslie R. Wolfe, Director.
