# Outline

- Brief Discussion about U.S. Patents
- 7-Step Patent Search Strategy
- USPTO Patent Full-Text and Full-Image Database
  - Demonstrate the 7-Step Patent Search Strategy
  - Search by patent number
  - Accessing the full-text of the patent
- Google Patents
- Using Kirk-Othmer and Ullmann's for Patents

#### What is a Patent?

"A patent is a grant from a government that confers upon an inventor the right to <u>exclude</u> others from making, using, selling, importing, or offering an invention for sale for a fixed period of time." (Pressman, 2009, p. 9)

#### Types of Patents:

Utility - Most common type. New and useful process, machine, article of manufacture, compositions, or any new and useful improvement.

Design - New, original, and ornamental design for an article of manufacture.

Plant – Plants that can be reproduced through cuttings or grafting.

Pressman, D. (2009). Patent it yourself: Your step-by-step guide to filing at the U.S. patent office. Berkeley, CA: Nolo.

# Legal Requirements for a Utility Patent

- Must fit one of the five statutory classes
  - processes, machine, articles of manufacture, compositions of matter, and "new uses" of the above.
- Useful
- Novel
- Non-obvious

#### Where Would You Encounter Patents?

- As citations in the scientific or technical literature
- When searching the "prior art" for a patent application
- Evaluate the state-of-the-art of an industry or intellectual property of a company

# Why Search the Patent Literature?

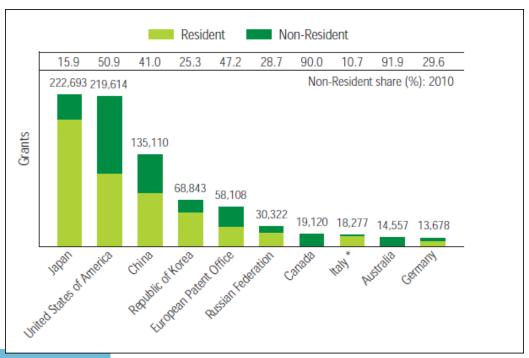

- Technical Information
  - Find solutions to technical problems
  - Locate information that isn't published in journals
- Legal Information
  - Prepare a patent application
  - Avoid patent infringement
- Business Information
  - Identify key innovators/companies
  - Identify and monitor technology trends

#### **Patent Statistics**

- Over 8,100,000 U.S. patents issued since 1836
- U.S. and Japanese account for 48% of in force patents

Patents granted at the top 10 offices, 2010

# The 7-Step Patent Search Strategy

#### Classification

- 1. Brainstorm keywords related to the purpose, use and composition of the invention.
- 2. Look up the words in the <u>Index to the U.S. Patent Classification</u> to find potential class/subclasses.
- 3. Verify the relevancy of the class/subclasses by using the <u>Classification Schedule</u> in the <u>Manual of Classification</u>.
- 4. Read the <u>Classification Definitions</u> to verify the scope of the subclasses and note "see also" references.

#### **Access Full-Text**

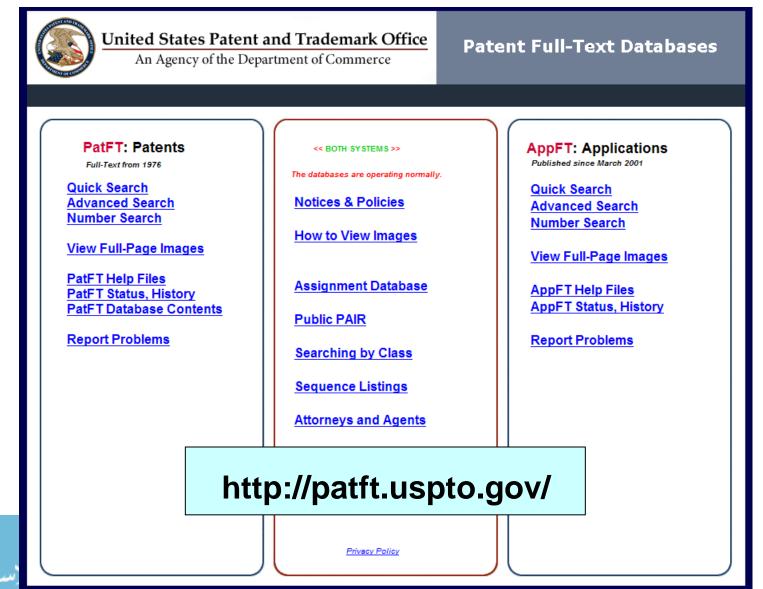

5. Search the <u>Issued Patents</u> and the <u>Published Applications</u> databases by "Current US Classification" and access full text patents and published applications.

#### **Review and References**

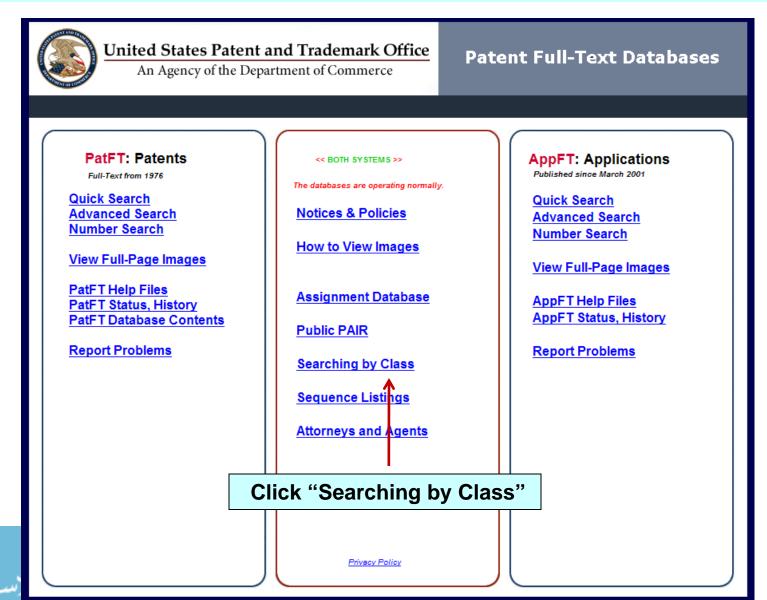

- 6. Review the claims, specifications and drawings of documents retrieved for relevancy.
- 7. Check all references and note the "U.S. Cl." and "Field of Search" areas for additional class/subclasses to search.

ulfate or acid sulfate radical (SO<sub>4</sub>2-).

Ternary compound containing hydrogen

This subclass is indented under subclass 512.1. Products or processes in which the compound is ternary and consists of sulfur, oxygen and hydrogen only.

Sulfuric acid 4

This subclass is indented under subclass 521. Products or processes in which the ternary compound is sulfuric acid (H<sub>2</sub>SO<sup>4</sup>).

(1) Note. This subclass provides for sulfuric acid ( $H_2SO_4$ ) including fuming sulfuric acid which is sometimes termed oleum or Nordhausen acid for which sometimes the formula  $H_2S_2O_7$  may be designated. However, this compound is actually  $H_2SO_4$  with  $SO_3$  dissolved therein and is classified in this subclass.

Nitrogenous impurity or utilizing nitrogenous catalyst or reactant

This subclass is indented under subclass 522. Processes in which during the manufacture of the sulfuric acid a compound of nitrogen is used as a catalyst or as a reactant, or is present as an impurity which requires removal.

Click the red P link to see all the patents for a particular subclass

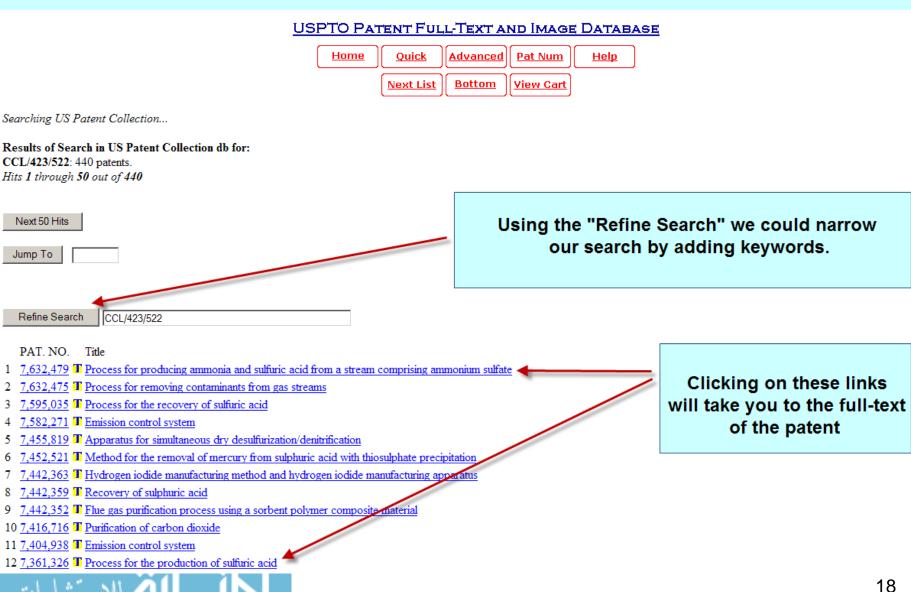

uric acid is produced from sulfur dioxide oxygen (air) and water or steam by means of nitrogen oxides

on of sulfur dioxide by burning sulfur or sulfur compounds. Sulfuric acid is produced in the lead chamber ans of nitrogen oxides (catalysts or reactants). The gases leaving the reaction chamber contain practically t the oxidation of SC<sub>2</sub> to SO<sub>3</sub>. These nitrogen oxides are recovered by absorption in H<sub>2</sub>SO<sub>4</sub> in so called towers is conveyed to the beginning of the system where it is denitrated in so called Glover towers by

means of the entering hot gases containing sulfur dioxide.

# Step 6 – Review the Claims, Description, and Drawings. Claims Define the Unique Features of the Invention and Determine Patentability

#### Claims

#### What is claimed is:

- 1. A process for producing high purity sulfuric acid comprising: a) adding hydrogen peroxide solution having a concentration of 1-70% to 24-70% technical grade oleum in a sufficient amount to lower the SO.sub.2 concentration to below 10 ppm, b) evaporating SO.sub.3 in the oleum at 90-130.degree. C. in a falling film evaporator, c) removing traces of sulfuric acid and nitrosyl sulfuric acid from the resultant SO.sub.3 gas stream escaping from the evaporator by means of a demister, d) enriching the high purity SO.sub.3 with inert gas, and e) absorbing the SO.sub.3 in sulfuric acid at a concentration of 90-99% to form said high purity sulphuric acid.
- 2. A process according to claim 1, wherein a portion of the high purity sulfuric acid stream obtained is recycled back to the absorption step.
- 3. A process according to claim 1, wherein high purity deionized water is added to said high purity sulfuric acid to adjust the concentration thereof, of the high purity sulfuric acid to a desired concentration, the and wherein the concentration adjustment is closed loop controlled by conductivity measurement.
- 4. A process according to claim 1, wherein the high purity sulfuric acid obtained is filled into PTFE-lined storage vessels or containers.
- 5. A process according to claim 1, further comprising removing particles from the resultant high purity sulfuric acid using a three-stage filtration.
- 6. A process according to claim 5, wherein in the removal of particles by filtration PFA or PTFE filters having a pore size of 0.1 .mu.m to 1 .mu.m are used.
- 7. A process according to claim 1, wherein absorption of SO.sub.3 is performed cocurrently in a PTFE-lined reactor containing packing elements of PFA.
- 8. A process according to claim 1, wherein the heat of reaction formed is removed in a tube bundle reactor made of PFA or fluorinated polyolefins under an inert gas cushion downstream of adsorption of SO.sub.3.
- 9. A process according to claim 1, wherein said high purity SO.sub.3 is enriched with ultrapure nitrogen or highly purified air as said inert gas to an inert gas concentration between 1 to 50%.
- 10. A process according to claim 1, wherein said demister is made of high purity PFA or fluorinated polyolefins.
- 11. A process according to claim 1, wherein vent gases from the absorption step are treated with pure sulfuric acid in a scrubber.

# The Description provides a brief summary of the invention, description of drawings (if any), background information on the invention, and a detailed description of the invention

#### Description

The present invention relates to a novel process for producing high purity sulfuric acid for use in the semiconductor industry.

Pure sulfuric acid can be produced on an industrial scale by passing SO.sub.3 into dilute sulfuric acid, by combining SO.sub.3 and pure water or by distillation of sulfuric acid at atmospheric or reduced pressure.

The quality of the sulfuric acid produced is affected not only by the design of the plants and the quality of the raw materials used, but also by the type and quality of the materials of construction used in the plant. These have an appreciable bearing on the level of undesirable metal ions, but also on the level of particles.

It is known to produce relatively high purity concentrated sulfuric acid by having SO.sub.3 evaporated or expelled from oleum in a distillation flask and then introduced into dilute pure sulfuric acid. In particular embodiments, the evaporation is occasionally carried out in a falling film evaporator. Generally, the equipment used for producing pure sulfuric acid is made of glass or of enamel-lined steel. Depending on the quality used, these materials may leach ionogenic and/or particulate impurities.

Existing processes have the disadvantage that, in the event of nonuniform evaporation, the gas stream may entrain drops of liquid in the form of a fine mist and any impurities present therein into the end product. This happens in particular on conducting the evaporation in falling film evaporators customarily used on an industrial scale, but also on using distillation flasks.

Another disadvantage is the SO.sub.2 still present in the sulfuric acid after purification.

It is an object of the present invention to provide an improved, economical way of producing on an industrial scale for use in the semiconductor industry a high purity sulfuric acid that is ideally free of metal ions and SO.sub.2, but ideally also free of particles in particular.

This object is achieved by a continuously operable process for producing high purity sulfuric acid for the semiconductor industry, which is characterized in that a) hydrogen peroxide solution having a concentration of 1-70% is added to 24-70% technical grade oleum in a sufficient amount to lower the SO.sub.2 concentration to below 10 ppm, b) the SO.sub.3 in the oleum is evaporated at 90-130.degree. C. in a falling film evaporator, c) sulfuric acid and nitrosylsulfuric acid traces are removed from the SO.sub.3 gas stream escaping from the evaporator by means of a demister, for example in the form of a candle filter, d) the high purity SO.sub.3 is enriched with inert gas, and e) the SO.sub.3 is absorbed in sulfuric acid of a concentration of 90-99% with cooling.

High purity deionized water is added to adjust the concentration of the high purity sulfuric acid to a desired concentration, the concentration adjustment being closed loop controlled by conductivity measurement.

- FIG. 1 is a schematic flow diagram of a plant according to the invention.
- FIG. 2 shows the schematic construction of an oleum evaporator useful in the process of the invention.
- FIG. 3 shows in turn the schematic construction of an absorber or absorption tower useful in the process of the invention.

In a particular embodiment of the process according to the invention, a portion of the high purity sulfuric acid stream obtained is recycled back into the absorption space.

meanings:

(5) SO, outlet

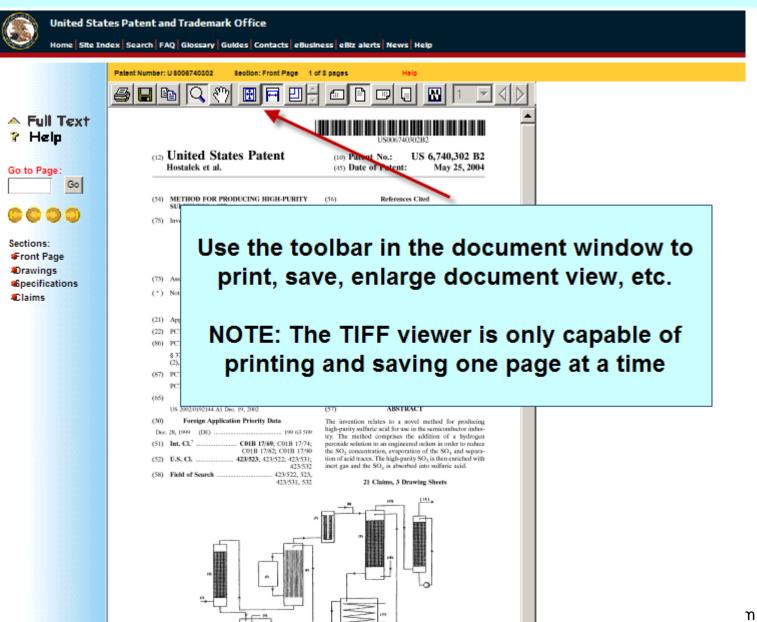

plants described and schematically depicted. The scope is to be understood as also including generalizations or modifications that occur to a person skilled in the art or equivalent components performing the same purpose.

- a) adding hydrogen peroxide solution having a concentration of 1-70% to 24-70% technical grade oleum in a sufficient amount to lower the SO2 concentration to 55
- b) evaporating SO<sub>5</sub> in the oleam at 90-130° C. in a falling film evaporator,
- c) removing traces of sulfuric acid and nitrosyl sulfuric acid from the resultant SO, gas stream escaping from 60 the evaporator by means of a demister,
- d) enriching the high purity SO<sub>3</sub> with inert gas, and e) absorbing the SO, in sulfuric acid at a concentration of

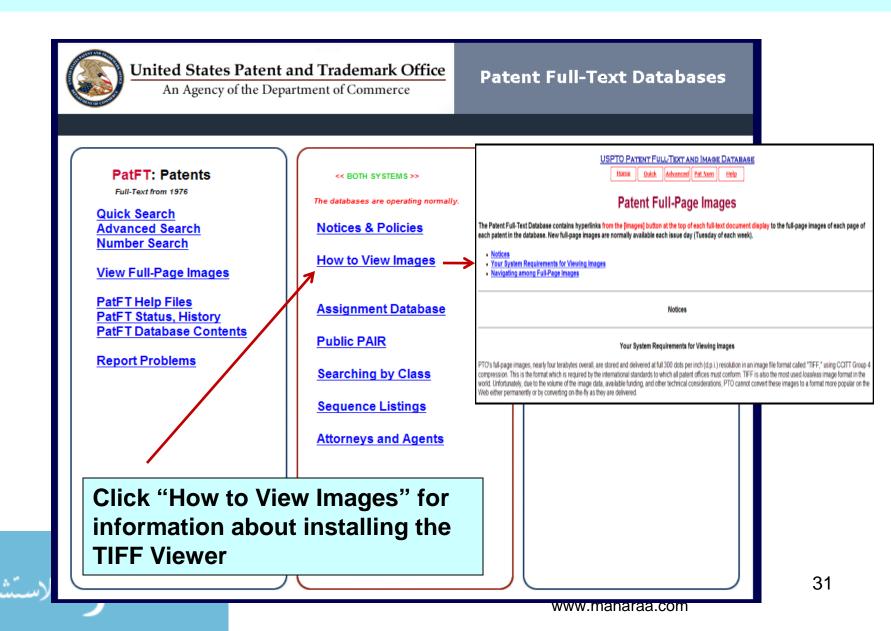

- 3. A process according to claim 1, wherein high purity deionized water is added to said high purity sulfuric acid to adjust the concentration thereof, of the high purity sulfuric acid to a desired concentration, the and wherein the concentration adjustment is closed loop controlled by conductivity measurement
- 4. A process according to claim 1, wherein the high purity sulfuric acid obtained is filled into PTFE-lined storage 30 vessels or containers.
- 5. A process according to claim 1, further comprising removing particles from the resultant high purity sulfuric acid using a three-stage filtration.
- 6. A process according to claim 5, wherein in the removal. 15 of particles by filtration PFA or PTFE filters having a pore size of 0.1 µm to 1 µm are used.
- 7. A process according to claim 1, wherein absorption of SO<sub>3</sub> is performed cocurrently in a PTFE-lined reactor con-20 taining packing elements of PFA.
- 8. A process according to claim 1, wherein the heat of reaction formed is removed in a tube bundle reactor made of PFA or fluorinated polyolefins under an inert gas cushion downstream of adsorption of SO<sub>3</sub>
- 25 9. A process according to claim 1, wherein said high purity SO<sub>3</sub> is enriched with ultrapure nitrogen or highly purified air as said inert gas to an inert gas concentration between 1 to 50%.
- 10. A process according to claim 1, wherein said demister is made of high purity PFA or fluorinated polyolefins.
- 11. A process according to claim 1, wherein vent gases from the absorption step are treated with pure suffuric acid in a sembler.
- 15 12. A process according to claim 1, wherein said demister is a candle filter.
- 13. A process according to claim 12, wherein said candle filter is made of high purity PFA or fluorinated polyolefin containing no cationic impurities.
- 14. A process according to claim 1, wherein said vent gases from the absorption step are treated with sulfaric acid at a concentration of 90-99%.
- 15. A process according to claim 1, further comprising The scope of the present invention covers not just the 45 removing particles from the resultant high purity sulfarie acid using a one- to three-stage filtration.
  - 16. A process according to claim 1, wherein hydrogen peroxide solution is added in an amount of 0.001 to 0.1%, based on the amount of oleum to be treated.
- L. A process for producing high purity sulfuric acid 50 17. A process according to claim L, wherein said inert gas is ultrapure nitrogen or purified air.
  - 18. A process according to claim 1, wherein the sulfuric acid formed by absorption is diluted with high purity water and cooled, and a portion of the resultant diluted, cooled sulphuric acid is passed back to the absorption step.
  - 19. A process according to claim 18, wherein absorption is performed in an absorption column and cooling is performed in a subsequent heat exchanger, and said high purity water is introduced at the base of said absorption column ahead of the subsequent heat exchanger.
  - 20. A process for producing product sulfuric acid com-

The invention relates to a novel method for producing high-purity sulfuric acid for use in the semiconductor industry. The method comprises the addition of a hydrogen peroxide solution to an engineered oclum in order to reduce the SO.sub.2 concentration, evaporation of the SO.sub.3 and separation of acid traces. The high-purity SO.sub.3 is then enriched with inert gas and the SO.sub.3 is absorbed into sulfuric acid.

Note: U.S. CL. 99-141 is an example of an older classification

The previous webpage shows the the Current US Classification as 426/548

Illustrative of the lower alkyl radicals denoted by the R term are methyl, ethyl, propyl, butyl, pentyl, hexyl, 25 heptyl and the branched-chain groups isomeric therewith.

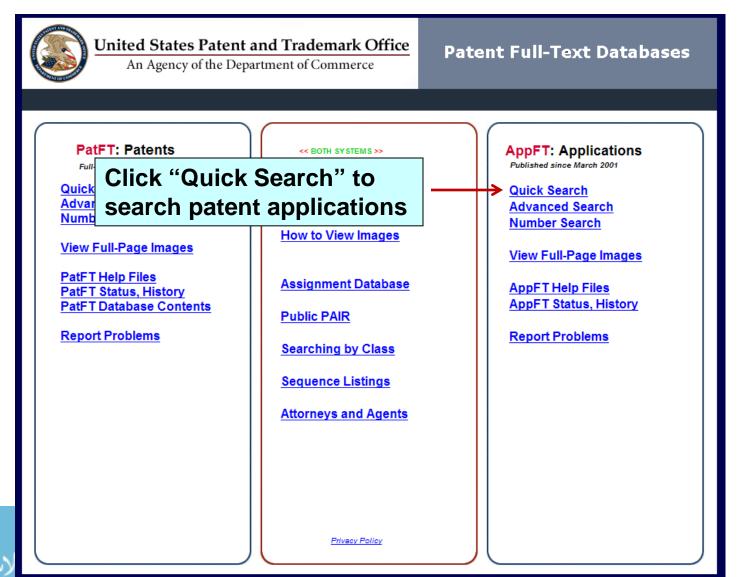

The surprisingly potent sweet taste of these dipeptide derivatives is completely unexpected and could not have been predicted from a consideration of their chemical structure. That property apparently is related to the polarity of the molecule as indicated by the fact that the compounds wherein R is hydrogen, i.e. the corresponding free carboxylic acids, are completely lacking in sweetness.

The sweetening property of the dipeptide substances is dependent also upon the stereochemistry of the individual 35 amino acids, i.e. aspartic acid and phenylalanine, from which the dipetides are derived. Each of the amino acids can exist in either the D or L form, but it has been determined that the L-aspartyl - L - phenylalanine esters are

The instant dipeptide sweetening agents are water soluble, stable substances which can be utilized in a variety of physical forms, e.g. as powders, tablets, syrups, etc. Liquid or solid carriers such as water, glycerol, starch, sorbitol, salt, citric acid and other suitable non-toxic substances can be utilized also. These compositions are particularly valuable as sweetening agents for edible materials. Examples of such materials are fruits, vegetables, juices, meat products such as ham or bacon, sweetened milk products, egg products, salad dressings, ice creams and sherbets, icings, syrups, cake mixes and beverages such as carbonated soft drinks and wines.

The invention will appear more fully from the examples which follow. These examples are set forth by way of illustration only and it will be understood that the invention is not to be construed as limited either in spirit

# **Using Kirk-Othmer and Ullmann's for Patents**

- Both contains over 1,000 articles on chemical substances, physical properties, industrial production, and process diagrams. Many include references to patents for those processes.
  - Kirk-Othmer Encyclopedia of Chemical Technology
  - Ullmann's Encyclopedia of Industrial Chemistry
    - Ullmann's is little more Eurocentric, but these two sources are complementary.
